The housing stock model was refined for the Energy Poverty Reduction Program. It adjusted the energy performance targets for retrofits to 60% efficiency improvement coupled with an additional 30% on-site or neighbourhood renewable energy generation. It also updated the capital costs for retrofits which were sourced from recent case data from local and provincial energy retrofit programs including the Clean Net Zero and Affordable Multi Unit Pilot programs. Connected technology solutions for both retrofits and new construction were added, and a redistribution of the housing archetypes based on extensive community surveying to identify the housing stock most affected by energy poverty was undertaken. All client properties will have access to the following energy management improvements, as long as they meet technical and financial feasibility criteria:

- On-site or neighbourhood renewable energy generation (solar hot water + solar PV)
- Highly efficient mechanical systems (targeting air source heat pumps)
- High levels of ceiling, basement and wall insulation, as well as a high degree of air sealing
- Energy efficient and smart appliances
- LED lighting
- Energy monitors, smart thermostats, and other connected technologies
- Energy management education and training

The housing infrastructure improvements function as the technical backbone of Energy Poverty Reduction Program. Energy efficiencies gained by the infrastructure improvements will be measured and monitored via the connected technology solutions discussed in detail in the **Technology chapter.** Energy and climate benefits calculated through our custom housing stock improvement model estimate 4.8 GWh of energy and 2.5 kilotonnes of greenhouse gas emissions (GHG) reduced by 2024-25, with an additional reduction of 10.1 GWh of energy and 5.9 kilotonnes of GHG emissions reduced by 2029-30 (cumulative).

- **Partnership development:** partnerships will be established with key players in the energy and housing landscape, including Efficiency Nova Scotia, Nova Scotia Power, the South Shore Housing Action Coalition, and a number

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Housing Energy Management System: Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Staff hiring & training							• staff hired & trained
Technical navigation services for clients							• technical navigation & support services provided
Detailed program design							• program design complete
Database setup - municipal enterprise resource planning (ERP) system							• data platform created
Database setup: energy management information system (EMIS)							• data platform created
IT system maintenance							• data and IT systems maintained (ongoing
Plan & implement retrofits and new construction		45/5	68/7	91/9	114/11	682/68	• units retrofitted/units constructed
Service & supplier procurement & coordination							• services & suppliers procured in cohorts (phase 2 onward) • performance management or procured services & suppliers (phase 2 onward) • dialogue and capacity building with related industries (phase 2 onward)
Community engagement							• clients consulted on design (phase 1) • clients consulted on prototype test (phase 2) • ongoing consultation with clients (ongoing)
Program administration							• program administration services delivered (ongoing)
Program evaluation & improvement							• program outputs and outcomes evaluated, and program improvements made (ongoing)

of government agencies. Key among partner activities is the sharing of information related to energy solutions and costs. Partners may participate in the program Steering Committee, support the development, implementation, and evaluation of the program, and may provide services under contract to the program or the program's clients.

- **Staff hiring & training:** staffing for the program will consist of the following:
  - 1.5 FTE positions for the "Technical Navigator(s)" who will be technical staff with training and experience in building science and energy efficiency and at least one of whom will be a professional Engineer licensed to practice in Nova Scotia. Staff will receive training in the program's administrative and technical systems, and ongoing professional development related to community-based energy management services and large scale community energy systems.
  - 1 FTE position for an Information Systems Specialist who will support the design and management of the program data platforms including the Energy Management Information System (EMIS). Staff will receive training in related data management systems: TownSuite, EMIS, and Real Time Operations systems.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- **Technical navigation services for clients:** services will be provided by the Technical Navigators to participating property owners. Services will begin with client intake and property registration, and depending on the property owner's needs, can involve a comprehensive suite of services including planning and assessment; monitoring and targeting; measurement and verification; performance verification; performance contracting; troubleshooting/ fault detection; risk monitoring and control; contractor coordination (turn-key services); auditing; financial planning; and energy management education services. Services will cater both to retrofits as well as to new construction.

- **Detailed program design:** led by program staff and guided by the program partners, a detailed program design will incorporate best practices in community-scale energy efficiency programming, with an eye to achieving deep energy retrofits and highly efficient new construction. Informed by leading programs in the region, from across Canada, and internationally, attention will be focused on ensuring program accessibility for clients, mitigating problems commonly faced by landlords, and on making use of emerging connected technologies such as smart submeters and smart thermostats to achieve desired energy efficiencies and related household energy savings.

- **Database setup - municipal enterprise resource planning (ERP) system:** we will work with our municipal data platform provider, TownSuite, to set up the Enterprise Resource Planning (ERP) system backbone to support the program. The ERP is described in detail in the **Technology chapter.**

- **Database setup - energy management information system (EMIS):** complementing the development of the ERP is the development of the EMIS module of the data platform. The module will interface with the ERP and provide the core energy monitoring and planning functionality of the program. Due to its complexity, the development of the core functionality of the EMIS will fully span Phases 1 and 2. The EMIS and its associated advanced functions (including real time operations systems) is described in detail in the **Technology chapter.** Technical risk involved with designing and deploying the EMIS system has been identified as a significant program risk, justifying the need for this time and effort. This is discussed in the Risk Management Section of the Project **Management chapter.**

- **IT system maintenance:** ongoing maintenance and licensing fees associated with the data platforms described above, and maintenance of equipment.

- **Service & supplier procurement & coordination:** the Technical Navigators will issue periodic calls for contractors and suppliers, collectively known as Energy Service Providers. Management of those procurements and contracts will require ongoing effort. Supply chain risk involved with procuring these services has been identified as a significant program risk, justifying the need for this time and effort.

- **Community engagement:** the Technical Navigators will be involved in engagement and consultation efforts with program clients (households-at-risk as well as property owners) both to inform program design and prototyping as well as for ongoing program evaluation.

- **Program administration:** administration of the program will involve ongoing program management, monitoring, reporting and human resource development.

- **Program evaluation & improvement:** partners participate in ongoing program evaluation and improvement, with

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

key service delivery partners actively participating in the evaluation process (see Overall Program Management later in this section). Evaluation will lead to periodic adjustments to the processes, policies and procedures of the service. Evaluation processes will be led and supported by staff, and will involve client feedback on a regular basis.

- **Communications & marketing:** we will design and implement a Communications Strategy for the Housing Energy Management System which will include the following: (1) developing a marketing strategy to engage property owners and households-at-risk in the program, which will likely involve branding the program without the use of the term "energy poverty"; (2) roll-out and maintenance of the Communications Strategy to inform all clients of the service; (3) ongoing communications with partners and funders to communicate the outcomes and evaluation of the service.

RETROFITS AND NEW CONSTRUCTION

The Town of Bridgewater will engage partners to create a common vision informed by the community for the development of affordable, green, and accessible housing in Bridgewater. The Town will conduct a housing needs assessment to identify demographics, gaps in housing provision and existing housing stock. The Town will undertake steps to incorporate policies into Town plans to ensure affordable and energy efficient homes are a council priority. Regulatory structures and incentives will be put in place in accordance with recommended actions outlined in Bridgewater's Community Energy Investment Plan (2018). The Technical, Investment, and Household Navigators will provide service coordination for homeowners and those in housing need to access programs available through the Housing Energy Management System, Financial Investment Vehicle, and Coordinated Access System.

The Town will take several actions to incorporate policies, create regulatory incentive frameworks, and enable financing opportunities to ensure that retrofit and new construction meets the energy efficiency and affordability targets of our application. First, the Town's Municipal Planning Strategy (2014) will be amended to include policies for housing energy efficiency targets laid out in the Town's Community Energy Investment Plan (2018). This may include creating a specific energy efficiency overlay zone to incent retrofits, upgrades and building to higher standards than the current building code requires. Further polices will be added in support of mixed tenure, affordable housing congruent with existing policies for supporting the construction of a range of higher density, mixed-use infill development in the Town's core. The Town's criteria for evaluating proposals for land use by-law amendments and development agreements will be amended to ensure that staff and Council shall consider the energy efficiency and affordability of housing when making decisions.

As per the Town's Community Energy Investment Plan (2018) additional policies outside of the land use planning documents will be pursued. These include:

- Maintain and expand annual financing limits for Property Assessed Clean Energy Financing to incentivize property owners to build to a higher energy efficient standard, and explore opportunities to expand program eligibility to include multi-unit residential, commercial, and institutional buildings.
- Establish incentives to support and encourage highly energy efficient building practices for residential development.

In Nova Scotia, the responsibility for affordable housing lies with the provincial government through Housing Nova Scotia. Municipalities do not have a legislated requirement, but a societal expectation to provide for the needs of their residents and community. Bridgewater Town Council identified the need to play a stronger role in providing affordable housing well

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

before the development of the Energy Poverty Reduction Program. But it did not have the broad community support for or deep understanding of the relationship between housing infrastructure, energy management and overall poverty to go beyond general policies of smart growth, residential infill and densification. Catalyzed by this deeper understanding of energy poverty, Council may develop policies to actively attract and support the development of affordable, energy efficient housing. This may include policies to facilitate the sale of town-owned land to a non-profit housing body for less than market value; and, to limit municipal taxes and/or fees for properties owned by a company or corporation established for the purposes of non-profit housing services.

The housing retrofit program will serve all major housing types in the community, including single detached, semi-detached, mobile home, and multi-unit resident buildings (MURBS). The Town's Community Development staff and the Technical Navigators will play a critical role in communicating these opportunities to property owners early in the development phase.

Community Energy Systems

COMMUNITY ENERGY SYSTEMS PROGRAM ACTIVITIES AND OUTPUTS

The development of utility grade services, either directly by the Town of Bridgewater, or procured through a third-party provider, has been selected as the most practical and economical pathway toward neighbourhood and community scale energy system development in Bridgewater. The activities described in Table 2.4 will be initiated by our technical project team (Project Coordinator, Technical Navigators, and Investment Navigator), with the support of externally-procured consultation and engineering services.

- **Technical resource assessment:** expanding on the preliminary work completed through the Community Energy Investment Plan, a detailed technical review of energy consumption and various energy generation sources (solar, wind, hydro etc.) will be assessed. This process will involve independent analysis of various renewable resources, and the cost to produce energy. Paramount to this step will be assessing fit between consumption patterns and renewable generation technologies, as poorly matched generation and consumption patterns can lead to technical and financial inefficiencies, and increase the requirement of energy storage.

- **Municipal utility detailed service design:** the first step of investigating and establishing a Municipal Utility Grade Service will be to establish the scope and design frame of this approach. In general, utility grade service can involve the generation, distribution and sales of electricity, data collection and assessment, and integration of connected technology such as demand control, sensors and energy storage. This first step will involve both a technical and a legal/regulatory review to define scope, best practices and to specific regulations and applications required.

- **Municipal utility setup and/or service procurement:** the most important part of this scope will be facilitating agreement with the incumbent utility, Nova Scotia Power. While the scope of utility service provision can vary significantly, there will always have to be a significant interaction with NS Power at the point of interface. This discussion would include such items as transmission and distribution system access, top up and spill provisions, emergency response, grid ancillary services and administration. The commercial terms of this agreement will have a major impact on the financial variability of power generation and sales in the community. An additional aspect to this set up process is determining the entity that performs this service. Three options exist: (1) expand existing municipal utility, (2) new stand-alone new municipal utility, and (3) a public-private partnership (P3)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

arrangement for service provision to a municipal utility.

- **Legislative and regulatory approval process:** while the regulatory process is defined, agreements will have to be in place with NS Power in order to proceed with any certainty through the application process. Of the three types of service noted above, only the generation and distribution of electricity is currently contemplated by the *Public Utilities Act*. Value added services through data and control of connected technologies such as demand control and energy storage would not require the regulatory process of establishing a municipal utility.

- **Database setup:** as detailed in the **Technology chapter,** the Energy Management Information System will be set up in such a way as to ensure future compatibility with community energy systems. While detailed IT integration in this regard cannot be completed until the time the specific technology is installed, a number of important functional components need to be prepared in the EMIS to enable this integration down the road.

- **Utility grade service management:** once all of the above is complete, Bridgewater will be in a position to offer utility grade energy services. With careful attention to financial considerations as discussed in the **Financial chapter,** work can begin in capitalizing the utility and providing service.

Community Energy Systems: Utility Grade Service Provision Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Technical resource assessment							• community-wide energy generation feasibility study complete
Municipal utility detailed service design							• utility grade services designed
Municipal utility setup and/or service procurement							• municipal utility established
Legislative & regulatory approval process							• legislative & regulatory approvals achieved
Database setup							• data platform created
Utility grade service management							• municipal utility services delivered (ongoing)

Table 2.4

SOLAR GARDEN DEVELOPMENT

The development of a community-owned "solar garden" has been selected as the preliminary technology for the neighbourhood-scale energy system for the Energy Poverty Reduction Program, as early assessments have suggested that such a system would lend itself well to delivering the outcomes proposed under this program. However, the final selection of the energy technology will be contingent on the outcome of the technical resource assessment described on the previous page. We are anticipating approximately 6MW of Community Solar Garden to be built in the first 5 years of our program. This will start in year 3, and supply the remaining load from the Housing Retrofit homes as well as 75-200 additional customers per year from the community. Each annual addition of solar generation capacity would be financed, so that payments made by the customers would cover the loan on the project. More detail on this and ownership structures can be found in the in the **Financial chapter.**

Conceptual design: a detailed assessment of the size and scale of the solar community garden would first be conducted. It would grow annually as more retrofits are completed. This stage

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

would also consider if additional community participation to that of the neighbourhood retrofits could be considered. The end result of this stage should be a detailed financial proforma for each year's installation, along with the cumulative cashflows of the facility.

Fundraising & financing: this stage will span the project schedule from start to operation. Different types of financing will be available at different stages of project development. The various contracts with customers for the sale of power from the facility will be the key asset upon which the community entity can raise the equity and debt investment for the project. More information is available in the **Financial chapter.**

Community consultation: early and open transparency regarding project location, timelines, construction and environmental impact will be essential to this project's social acceptance. Open house style engagements have proven to work well with previous renewable energy projects in Nova Scotia of a similar scale (ie. COMFIT, SolarCity).

Detailed engineering design: once the concepts and project financing are established, detailed engineering design will take place. This will involve geotechnical, structural, and electrical design. There are many firms with local representation that have experience in design projects of similar sizes, and public procurement of these services will take place.

Permitting: permitting requirements for the project will include municipal, electrical utility and any additional environmental permissions.

Procurement: procurement will take place in stages as solar garden components are funded over 3 consecutive years. The market for renewable energy equipment is well established in Canada and globally. Costs can vary over time due to market efficiencies and changes in tariffs. Delivery schedule is usually tied to the placement of a firm order and can range from three months to two years, though for a smaller solar project 1-2MW in size at a time it is expected be on the shorter end of that timeframe. Placing an order for equipment will also require deposits to be paid.

Construction: the solar garden would be ground mounted with power generated collected to common points and connected to the NS Power electrical system. Major scopes of work for construction would be: (1) supply of panels and related equipment, (2) civil/roads, (3) structural (foundations and racking), electrical installation, and commissioning/testing. It is common that many of these scopes be combined into a generation contractor agreement, or an Engineer, Procure, Construction (EPC) contract.

Community Energy Systems: Solar Garden Development Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Conceptual design							• conceptual design complete
Fundraising & financing							• financing & funding targets achieved
Community consultation							• community consultants complete
Detailed engineering design							• detailed engineering design complete
Procurement							• services & suppliers procured
Permitting							• permits achieved
Construction							• construction complete
Database & IT systems setup							• IT systems installed
Commissioning							• commissioned
Operation & maintenance							• maintained (ongoing)

Table 2.5

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Database & IT systems setup: all modern community scale energy generation systems come with internet addressable controls systems. It will be important to ensure that data from this system can be integrated to the Town's EMIS. Generally, this interaction is undertaken with the solar technology provider.

Commissioning: the designer and installers of the solar garden will take on performance risk of the installation, to help make sure that the solar garden performs properly before the Town and the project investors accepts the installation in to operation.

Operation & maintenance: modern solar energy systems come with 25 year warranties on panels, and 10 years+ on other components such as racks and inverters. The community solar garden will contract for spare parts provisions and maintenance service provision, as well as for operational oversight.

Mobility Improvement System

MOBILITY IMPROVEMENT SYSTEM PROGRAM ACTIVITIES AND OUTPUTS

This service receives client mobility information from the Housing Energy Management System through the Technical Navigators, and from the Coordinated Access System through the Household Navigators, and uses it to plan and implement transportation improvements in the community. Implementation of improvements must be approved by Town Council through annual budgeting processes, and if approved are implemented by the Bridgewater Transit system and Engineering Department. While the program is focused on transit and active transportation modes at this time, future integration with rideshare and paratransit services is a real possibility that would be further enhanced through the planning functionality provided by this program.

- **Detailed program design:** planning staff will work with community partners to finalize the program scope and develop its technical methodologies. This will take place over a two-year timeframe to ensure integration with the overall program data platform, and to involve the first year of program clients directly in the design process.

- **Partnership development:** partnerships will be established with key players in the transportation and accessibility landscape, including members of the Bridgewater Active Transportation Committee, a standing Committee of Council with strong ties to community service providers.

- **Database setup:** the municipal enterprise resource planning components of the municipal data platform will be expanded to include a Client Mobility Application module. This will link with the existing Land Management GIS module to enable transportation planning through the use of spatial data from other parts of the system. Specifically, the civic addresses of program clients will be linked with transit and active transportation routing maps, and made to perform transportation planning calculations, including walking distance to the nearest bus stop and sidewalk or trail network. Mobility indicators are tracked by neighbourhood, with the goal of seeing improvement over time as enhancements are made.

- **IT system maintenance:** ongoing maintenance and licensing fees associated with the data platforms described above, and maintenance of equipment.

- **Community engagement:** staff will be involved in engagement and consultation efforts with program clients (households-at-risk as well as property owners) to inform program design and prototyping as well as for ongoing program evaluation.

- **Communications & marketing:** we will design and implement an

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information
Page 951 of 1849

Mobility Improvement System: Program Coordination & Administration Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Detailed program design							• program design complete
Partnership development							• partnership established
Database setup							• data platform created
IT system maintenance							• data and IT systems maintained (ongoing)
Community engagement							• clients consulted on design (phase 1) • clients consulted on prototype test (phase 2) • ongoing consultation with clients (ongoing)
Program administration							• program administration services delivered (ongoing)
Program evaluation & improvement							• program outputs and outcomes evaluated, and program improvements made (ongoing)

Table 2.6

improved Communications Strategy for the community's transit and active transportation systems, which will include the following: (1) developing a marketing strategy to engage residents in the program, which will build on engagement recommendations from the renewed Active Transportation & Connectivity Plan; (2) roll-out and maintenance of the Communications Strategy; (3) ongoing communications with partners and funders to communicate the outcomes and evaluation of the service.

- **Program evaluation & improvement:** partners participate in ongoing program evaluation and improvement, with key service delivery partners actively participating in the evaluation process (see Overall Program Management later in this section). Evaluation will lead to periodic adjustments to the processes, policies and procedures of the service.

TRANSIT SYSTEM IMPROVEMENTS

Bridgewater Transit has been operating successfully since 2017. As a new municipal service, improvements to transit routing and service delivery have been occurring on a regular basis. The transit service can benefit substantially from the enhanced planning functionality provided through this program.

Transit service improvement planning includes: making periodic routing adjustments, improving transit service accessibility, quality improvement measures, improvements to communications and marketing systems, and the integration of connected technology functions to the bus service. Already, a GPS locator in the bus allows for real-time tracking of the bus for the public. Additional service and communication enhancements based on connected technologies may include the development of client notification, survey, and complaint functions, as well as opportunities to provide real-time transit information to service providers including agencies that support under-served residents. Transit improvements are subject to Council approval on an annual basis. Transit service improvements will be documented and evaluated on an ongoing basis.

ACTIVE TRANSPORTATION IMPROVEMENTS

Active transportation planning and evaluation efforts can benefit substantially from the enhanced planning functionality provided through this program. Active transportation improvements will build on the recommendations and solutions provided through Town's Active Transportation and Connectivity Plan, which was developed in 2008 and which will be comprehensively renewed in 2019.

The nature of AT infrastructure improvements will depend entirely on the neighbourhoods that

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

are selected for priority improvement. A budget has been proposed that represents approximately double the Town's current annual budget for these annual improvements. The budget allows for a combination of neighbourhood-based AT improvements, such as the installation of new sidewalks, replacement or upgrade of existing sidewalks, improved crosswalk paint and accessibility infrastructure, the addition of lighting in underlit areas, and making improvements to the Town's trail systems. AT improvements are subject to Council approval on an annual basis. Improvements will be documented and evaluated on an ongoing basis.

Investment System

MUNICIPAL CAPITALIZATION SYSTEM

This system provides core financial budgeting and capitalization services to the other program services. It is responsible for "specialized finance" stacking, assembling project opportunities and outcomes, and reporting to funders. It interfaces closely with the Financial Investment Vehicle, which brings additional private investment into the program. This program is explained in detail in the **Financial chapter** of this proposal.

- **Detailed program design:** program design will be carried out primarily by the Investment Navigator with the support of the program partners. Program design ensures that both the municipal capitalization system and the financial investment vehicle systems work cohesively and with fluidity. In order to do so, workflows and timelines need to be well-established. Focus groups and a gap analysis will determine the missing capacity to deliver on investment system outcomes, and controls designed to ensure operations do not derail.

- **Database setup:** the municipal database is to be defined and created in parallel with the detailed program design. The municipal enterprise resource planning platform will allow this financial budgeting and reporting functionality. Database requirements will be clearly articulated to the development team, and the developer and Town will correspond throughout the development process. The developer will receive a list of necessary components, and a testing team composed of various stakeholders, both internal and external to the Town, will be sourced to test its functionality.

- **Staff hiring and training:** staffing for this service will consist of 1 FTE position for the "Investment Navigator" who will have training and experience in financial management, analysis, and budget development, with preference given to someone with a background in large scale project finance and investment and an interest in the clean tech-sector and project-aligned social values. Staff will receive training in the program's administrative and technical systems, and ongoing professional development related to community-based financial planning services.

- **Partnership Development:** partnerships will be developed with three key groups: funders, investment vehicle services, and community capacity building organizations. The Investment Navigator will approach federal, provincial, and philanthropic funders to ensure robust funding streams are explored. Investment vehicle service partners are needed to set up and deliver the external investment vehicle described below. Community capacity building partners include local credit unions that are willing to act as financial literacy support organizations for program clients. Partners may participate in the program Steering Committee, and will support the development, implementation, and evaluation of the program.

- **Project financial planning:** on an ongoing basis, staff will calculate funding requirements for projects defined and projected by the Energy Poverty Reduction Program, and pool together project components into capitalizable groupings that are attractive

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

to traditional, community, and specialized investors. This budgeting exercise will be facilitated by partnership opportunities established through partnership development activities and will rely on the database module developed for the program. Dynamic data sharing with the Financial Investment Vehicle is a key activity throughout the planning stage.

- **Plan, confirm and administer funding (2021 through 2030):** once specific projects are identified and pooled into groups, the Investment Navigator seeks specific funders to commit to those investment raises, until funding targets are met. Understanding that most funders operate on annual budgets, a recurring approach to raising specialized sources of capital will be undertaken. Annual administrating tasks include updating the database and reconciling accounts.

- **Reporting to funders:** reporting will be automated to the greatest extent possible to allow for real-time monitoring of project outcomes specifically pertaining to funding obligations. It is expected that each source will require different reporting criteria and on different schedules. These activities will be administered by the Investment Navigator.

Investment System: Municipal Capitalization System Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Detailed program design							• program design complete
Database setup							• data platform created
Staff hiring & training							• staff hired & trained
Partnership development							• partnership established
Project financial planning							• project financial planning completed (ongoing)
Plan, confirm, and administer funding 2021-30		$1.71	$2.28	$3.03	$3.83	$25.82	• millions raised in project funding from specialized investors
Reporting to funders							• project reporting needs satisfied (ongoing)
IT system maintenance							• data and IT systems maintained (ongoing)
Program evaluation & improvement							• program outputs and outcomes evaluated, and program improvements made (ongoing)

Table 2.7

- **IT system maintenance:** ongoing maintenance and licensing fees associated with the data platforms and maintenance of equipment.

- **Program evaluation and improvement:** partners participate in ongoing program evaluation and improvement, with key service delivery partners actively participating in the evaluation process (see Overall Program Management later in this section). Evaluation will lead to periodic adjustments to the processes, policies and procedures of the service. For example, it is expected that new technologies, financing mechanisms, and funding sources will evolve throughout the 10-year program and arrangements that were once not well suited may become more feasible over time. Evaluation processes will be led and supported by the Investment Navigator, and will involve client feedback on a regular basis.

FINANCIAL INVESTMENT VEHICLE

This program complements the Municipal Capitalization System but is external to the Town of Bridgewater, with services procured through

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

an existing or new organization. The program is responsible for traditional financing (inclusive of community investments), cash disbursements through outcome-data shared by the municipal capitalization system, investing in energy poverty reduction program assets, and reporting to investors. This program is explained in detail in the **Financial chapter** of this proposal.

Investment System: Financial Investment Vehicle Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Investment vehicle organization creation and/or service procurement							• investment vehicle organization created
Administration & Reporting							• administration & reporting services delivered (ongoing)
Plan, sell, and administer investment raise 2021-30		$0.74	$7.69	$9.0	$8.86	$10.78	• millions raised in project financing from financial investors

Table 2.8

- **Investment vehicle organization creation and/or service procurement:** an organization that provides the best value to the Town and the Energy Poverty Reduction Program is procured. Target services include: the ability to set up community-based investment vehicles and organizational structures (see **Financial chapter** for details) the capacity to source traditional and community financing, adherence to appropriate best practices, and utilization of a comprehensive data-security and privacy plan. A unique organizational structure must be incorporated, appropriate bylaws must be drafted, and a governance structure that aligns with the Town's needs must be set up. Once sourced or built, an agreement with the Town must be drafted and executed. To support this service procurement process, financial investment vehicle and investor-related service delivery partnerships will be explored early in the partnership development process. For the purpose of this application the MaRS Centre for Impact Investing, whose SVX platform connects investment opportunities with impact investors, is being considered as a useful template for this service.

- **Administration and reporting:** Reporting should be automated to the greatest extent possible and allow for real-time monitoring of project outcomes specifically pertaining to what the funding source needs to access. It is expected that each traditional source will require different reporting criteria and varying schedules. These activities and the deployment of funds will be administered by the organization with data shared between the Municipal Capitalization System and the Financial Investment Vehicle.

- **Plan, sell, and administer investment raises (2021 through 2030):** activities are dependent on the two financing streams: traditional and community. Both require separate offering terms, due diligence activities and marketing narratives. The organization will be responsible for sourcing traditional debt investments paired with equity raises. These raises will be enhanced through third-party data and connected technology applications. Raising funds involves the development of a marketing strategy, inclusive of buying cycle projections, an elevator pitch and lead nurturing strategies. Investor onboarding activities continue throughout the "raise" and "manage" cycle and include subscription processing, and investor and financial institution correspondence. Monitoring investor satisfaction is a key component to ensuring investment raises are sustainable year-to-year. Additional information is provided in the **Financial chapter.**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

EVALUATION MODEL

In the Energy Poverty Reduction Program, there are multiple stakeholders and partners, a need to make quick decisions, prototyping of new programs, and high levels of uncertainty. Developmental evaluation is appropriate for this type of work because the governance and management team are ready and willing to test new approaches and make changes along the way to reach the goal of energy poverty reduction. Using these evaluation methods will allow the opportunity to blend qualitative and quantitative reporting.

As the evaluation process will be in tune with the evolving program dynamics, achievements, and struggles, it also plays an important role in the design and implementation of the program's risk management strategy and associated course correction checkpoints, which are described in the **Project Management chapter.**

Overall Program Management: Evaluation Framework

Phase	1: Prototype Program Setup	2: Prototype Program Testing & Refinement	3: Final Program Activation	4: Program Maturity
Ongoing Project Evaluation Priorities		• Continuous reflection of role clarification • Partner relations • Guiding principles • Project structure	• Quality of learning cultures • Existing and new project teams • Responsiveness • Moments of innovation	
Phase-Specific Evaluation Priorities	**Design by Core Team** • Partners – clarification of roles • Identify and build relationships with individual champions • Identify expertise of identified partners • Identify guiding principles and clarity of project charter • Leverage historical experiences • Establishment of project structure • Encouraging and identifying innovations in project design	**Early Changes** • Highlight new and emerging leadership • Consider internal and external creative tensions • Revisit guiding principles • Review lessons learned • Review and adapt project structure • Document innovations from prototyping • Consider emerging risk • Scaling project • Anticipate blocks to progress	**Systems Changes** • Revisit guiding principles • Review and adapt project structure • Leverage learned innovations • Establishment of ongoing project charter • The establishment of ongoing structure	**Population Changes** • New partners: funding, human resources, skills, leadership. • Operationalize the innovations
Desired Outcomes	• Project charter providing useful guidance • Core team/participants report feeling engaged in project • Systems to direct the project are established and useful	• New collaborations consistent with Guiding Principles are established • New funding and financing opportunities are identified • The practical usefulness of data collection systems are improved	• New resident and partner-informed programs and process are developed • New volunteer and agency leadership is engaged • Local collaborations to sustain impact post project are established	• Reducing Energy Poverty is considered a local 'movement' rather than a project • Residents pulled out of energy poverty are championing the impact • Local agencies, institutions and organizations are supporting counterparts in other jurisdictions to make changes to decrease EP.
Evaluation Outputs for Infrastructure Canada	• Phase 1 output report. Key output target: program governance, management, and evaluation systems in place	• Phase 2 output report • Phase 2 preliminary outcomes report	• Phase 3 output report. Key output target: Phase 3 program outputs and outcomes evaluated • Phase 3 final outcomes report	• Phase 4 output and outcomes reporting not applicable to Infrastructure Canada under this funding agreement

Table 2.9

Energy Poverty Reduction Program Outcomes Logic Model

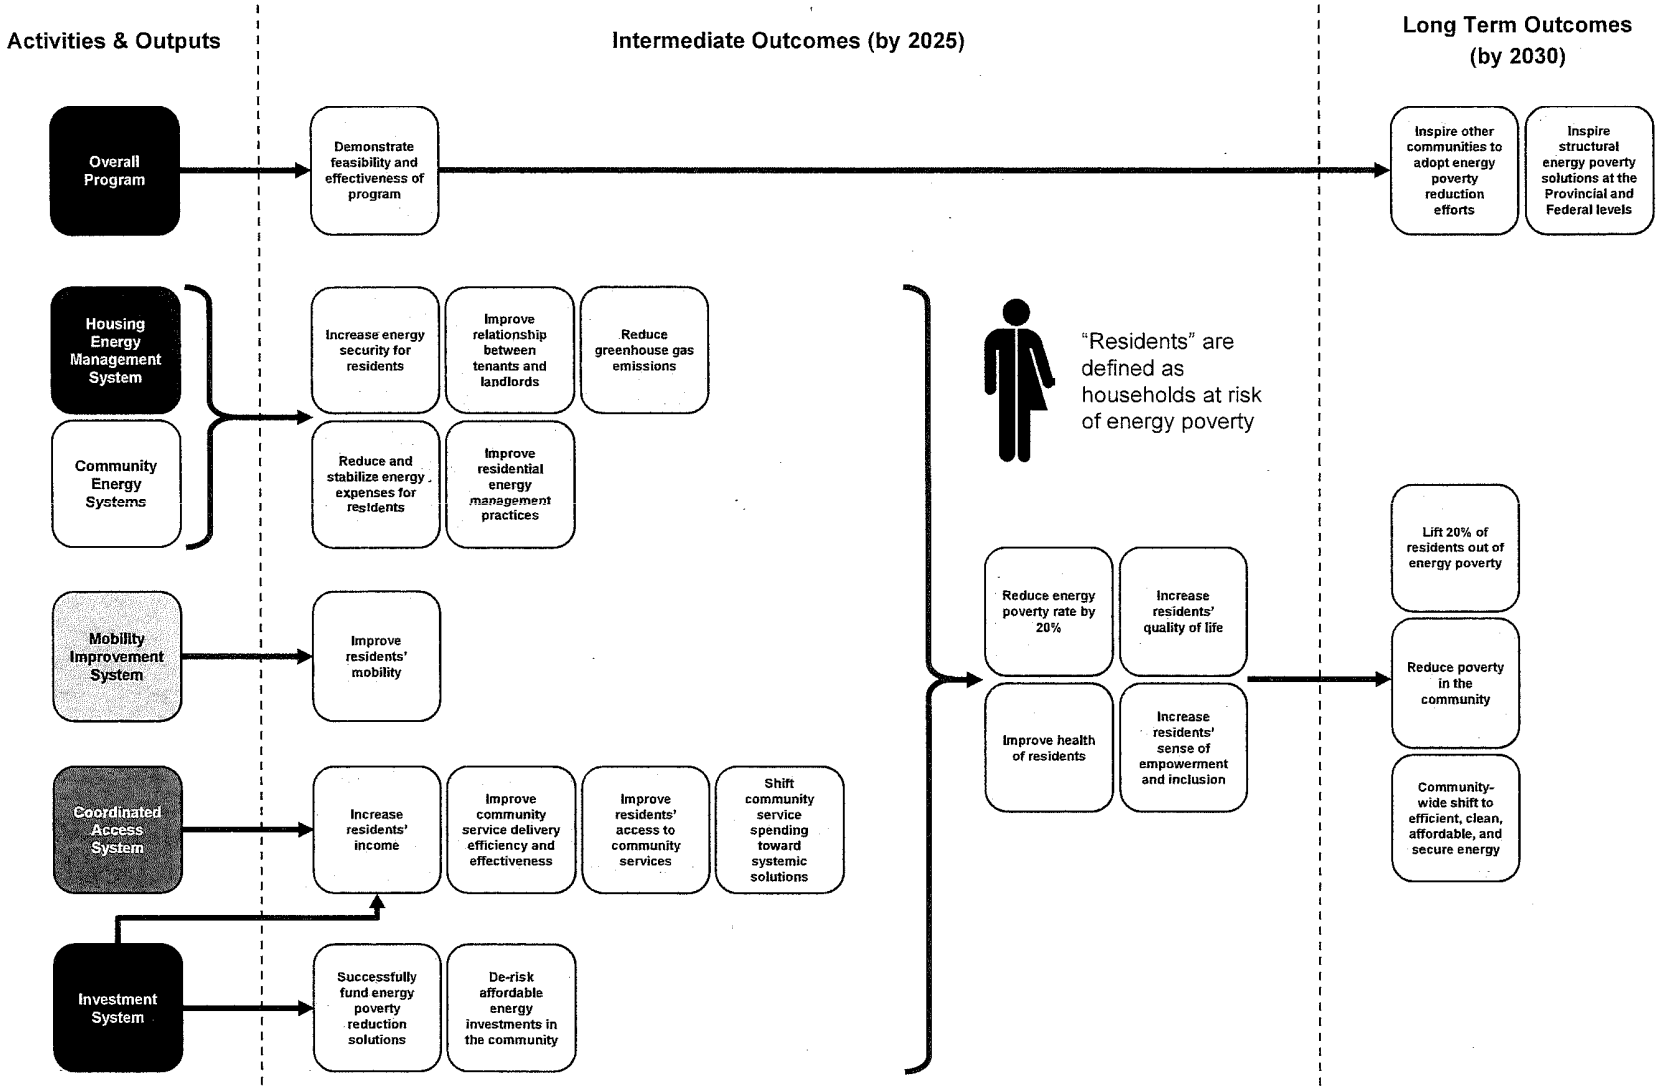

Diagram 2.1

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

PROGRAM OUTCOMES AND INDICATORS

The program activities and outputs described in the preceding section are expected to result in a set of 22 intermediate and long-term outcomes that benefit the program clients, program stakeholders, the community as a whole, the environment, and ultimately communities beyond Bridgewater. Diagram 2.1 summarizes the Energy Poverty Reduction Program outcomes logic model. Outcomes displayed in the "intermediate outcome" section of the Diagram 2.1 will be demonstrated by 2025. While the benefits of these outcomes will continue to accrue past the Smart Cities Challenge program an additional set of 5 long-term outcomes are displayed in the final section of the chart, indicating our community's continued benefits from the program.

Indicators chosen for each outcome are meaningful, measurable and monitorable via data collected through the program itself, through regular community-wide surveys or from Statistics Canada census information.

Program Outcome Indicators and Associated Measurement Methodologies, Sources, and Tracking Systems

Outcome Category	Outcome	Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Reduced poverty & improved wellbeing	1. Reduce energy poverty rate	Percent of households living in energy poverty	2018-19	38.5% (1,613 of 4,194)	2024-25	30.6% (1,362 of 4,452) = 20% rate reduction	Percent of households who self-report spending more than 10% of after-tax income on energy for the home and transportation and currently experiencing energy poverty. Measured through bi-annual community-wide survey. Percentages are based on projected future household growth as calculated in the Community Energy Investment Plan, with a basis in the 2016 Census.	Bi-annual community-wide Housing, Energy, and Transportation survey, to be conducted in 2028-29. Data stored on municipal platforms.	Overall Program
					2029-30	14.4% (660 of 4,577) = 62% rate reduction			Overall Program
	2. Reduce poverty	Percent of households living in core housing need	2016-17	27.9% (1,135 of 4,075)	2026-27	Decrease from baseline	Percent of households living in core housing need. A household is said to be in 'core housing need' if its housing falls below at least one of the adequacy, affordability or suitability standards and it would have to spend 30% or more of its total before-tax income to pay the median rent of alternative local housing that is acceptable (meets all three housing standards).	Census data (Statistics Canada). Target year will use 2026 Census.	Overall Program
	3. Improve health of residents	Amount of time program clients are able to meet their thermal comfort needs at home	Property intake year	Average property intake value	2024-25	Increase from baseline	Number of days per year that homes inhabited by program clients are sufficiently heated or cooled to a minimum level necessary for physical wellbeing. Subtracts the number of days that the temperature in main living area drops below 16 degrees C (threshold for respiratory illness) and 12 degrees C (threshold for cardiovascular illness), or above 27 degrees C (threshold for heat related illness) for a sustained period while occupants are home. Performance measured through change from baseline, pooled by property cohort (intake year).	Home energy monitoring system reports aggregated home temperature data. Data stored on municipal platforms.	Housing Energy Management System

Table 2.10

Outcome Category	Outcome	Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program/ System
			Year	Value	Year	Year			
Reduced poverty & improved wellbeing	3. Improve health of residents	Thermal comfort of program clients	Client intake year	Average client intake score	2024-25	Increase from baseline	Overall thermal satisfaction over the past year, based on a scale from 1 (very dissatisfied) to 10 (very satisfied). Self-reported assessment by client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
		Energy poverty-correlated population health index	2020-21	To be determined	2024-25	Improvement from baseline	Customized index of population health indicators to be designed and monitored by the Nova Scotia Health Authority using deidentified health system data. See letter of support.	Information to be collected and analysed by Nova Scotia Health Authority.	Coordinated Access System
	4. Increase residents' quality of life	Satisfaction of life in general for program clients	Client intake year	Average client intake score	2024-25	Increase from baseline	Satisfaction of life in general on a scale from 1 (very dissatisfied) to 10 (very satisfied). Self-reported assessment by client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
	5. Increase residents' sense of empowerment and inclusion	Frequency of social contact for program clients	Client intake year	Average client intake score	2024-25	Increase from baseline	Percentage of time in the past year that the client reports contact 'once a week or more' with relatives and/or friends. Self-reported assessment by client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
		Sense of belonging for program clients	Client intake year	Average client intake score	2024-25	Increase from baseline	Sense of belonging to the local community on a scale from 1 (very weak) to 10 (very strong). Self-reported assessment by client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
	6. Increase energy security for residents	Amount of time program clients are able to meet their home energy needs	Property intake year	Average property intake value	2024-25	Increase from baseline	Number of days per year that homes inhabited by program clients are sufficiently powered, heated, or cooled to a minimum level necessary for physical and mental wellbeing. Performance measured through change from baseline, pooled by property cohort (intake year).	Home energy monitoring system issues alert on days that the home is unpowered or minimal thermal comfort levels are not met. Data stored on municipal platforms.	Housing Energy Management System

Table 2.10

Outcome Category	Outcome	Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Better Housing	7. Reduce and stabilize energy expenses for residents	Spending on shelter by program clients	Client intake year	Average client intake value	2024-25	Decrease from baseline	Total annual spending on shelter by program clients (as applicable: rent, mortgage, insurance, property tax, maintenance, utilities, and energy contracts). Self-reported assessment from client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
		Affordability of housing energy costs	2018-19	37.4%	2024-25	Decrease from baseline	Percent of households who self-report having difficulty affording their home energy costs. Measured through bi-annual community-wide survey. Percentages are based on projected future household growth as calculated in the Community Energy Investment Plan, with a basis in the 2016 Census.	Bi-annual community-wide Housing, Energy, and Transportation Survey, to be conducted in 2024-25. Data stored on municipal platforms.	Overall Program
		Cost of home energy for participating properties	Property intake year	Average property intake value	2024-25	Decrease from baseline	Annual cost of all energy types consumed by homes inhabited by program clients, adjusted for annual climatic variability (heating degree days). Performance measured through change from baseline, pooled by property cohort (intake year).	Home energy monitoring system reports aggregated home energy consumption and cost data. Data stored on municipal platforms.	Housing Energy Management System
	8. Improve relationship between tenants and landlords	Level of trust between tenants and landlords - tenant perspective	Client intake year	Average client intake value	2024-25	Increase from baseline	Perception of trust in the landlord based on a scaled rating system on a scale from 1 (very low level of trust) to 10 (very high level of trust). Self-reported assessment from client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
		Level of trust between tenants and landlords - landlord perspective	Property intake year	Average property intake value	2024-25	Increase from baseline	Perception of trust in the tenant(s) based on a scaled rating system on a scale from 1 (very low level of trust) to 10 (very high level of trust). Self-reported assessment from client property owners or their property managers. Performance measured through change from baseline, pooled by property cohort (intake year).	Property owner survey facilitated by Technical Navigator. Initial intake, followed by periodic updates. Data stored on municipal platforms.	Housing Energy Management System
	9. Improve residential energy management practices	Cost savings resulting from energy management practices for participating properties	Property intake year	Average property intake value	2024-25	Increase from baseline	Total annual cost savings as compared to baseline energy consumption resulting directly from energy management practices (manual + automated) as calculated by home energy monitoring & control system. Accompanied by a property owner & tenant survey on energy conservation practices that is used to illustrate / educate opportunities for improved energy management. Performance measured through change from baseline, pooled by property cohort (intake year).	Home energy monitoring system reports aggregated home energy savings data. Property owner survey & tenant facilitated by Technical Navigator. Initial intake, followed by periodic updates. Data stored on municipal platforms.	Housing Energy Management System

PERFORMANCE MEASUREMENT

Outcome Category	Outcome	Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Increased Mobility	10. Improve residents' mobility	Community-wide transit ridership	2018-19	27,000 annual riders	2024-25	43,000 annual riders	Daily average transit ridership. Includes all passenger types.	Ridership counted hourly by bus drivers. Data stored on municipal platforms.	Mobility Improvement System (MIS)
		Mobility self-assessment rating by program clients	Client intake year	Average client intake value		Increase from baseline	Ease of mobility based on a scale from 1 (very low mobility) to 10 (very high mobility). Self-reported assessment from client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
		Affordability of transportation energy costs	2018-19	25.5%	2024-25	Decrease from baseline	Percent of households who self-report having difficulty affording their transportation energy needs. Measured through bi-annual community-wide survey. Percentages are based on projected future household growth as calculated in the Community Energy Investment Plan, with a basis in the 2016 Census.	Bi-annual community-wide Housing, Energy, and Transportation Survey, to be conducted in 2024-25. Data stored on municipal platforms.	Overall Program
More effective community services	11. Improve residents' access to community services	Level of satisfaction with access to community services for program clients	Client intake year	Average client intake value	2024-25	Increase from baseline	Satisfaction with access to community services based on a scaled rating system on a scale from 1 (very dissatisfied) to 10 (very satisfied). Self-reported assessment from client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
	12. Improve community service delivery efficiency and effectiveness	Self-assessment rating by Coordinated Access System partners	2020-21	To be determined	2024-25	Increase from baseline	Self-assessment rating using Coordinated Access System (CAS) Scorecard Guide which is a 23 question self-assessment tool to assist communities to take a snapshot local progress towards a quality Coordinated Access System.	Annual survey of coordinated access system partners facilitated by Household Navigator. Data stored on Coordinated Access System service provider server.	Coordinated Access System
	13. Shift community service spending toward systemic solutions	Percent of resources spent making emergency energy payments on behalf of clients, compared to other areas of support	2020-21	To be determined	2024-25	Decrease from baseline	Percent of annual dollars spent making emergency energy payments on behalf of clients, compared to other areas of support, for all service organizations that provide emergency energy funding for program clients.	Annual survey of coordinated access system partners facilitated by Household Navigator. Data stored on Coordinated Access System service provider server.	Coordinated Access System

Table 2.10

CONTINUED

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Outcome Category		Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Increased economic access & participation	14. Increase residents' income	Earnings from participation in energy systems by program clients	2020-21	To be determined	2024-25	Increase from baseline	Total annual dividends and other cashflow paid out to self-identified program clients from local energy investments.	Annual report on community investors produced by Financial Investment Vehicle. Data stored on Financial Investment Vehicle platform.	System
	15. Increase residents' participation in the green economy	Earnings from employment in the clean tech sector by program clients	Client intake year	Average client intake value	2024-25	Increase from baseline	Annual earnings from employment in the clean tech sector. Self-reported assessment from client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
Achieved Climate Targets	16. Reduce greenhouse gas emissions	Greenhouse gas emissions from participating homes	Property intake year	Average property intake value	2024-25	Increase from baseline	Number of days per year that homes inhabited by program clients are sufficiently powered, heated, or cooled to a minimum level necessary for physical and mental wellbeing. Performance measured through change from baseline, pooled by property cohort (intake year).	Home energy monitoring system reports aggregated home energy consumption and emissions data. Data stored on municipal platforms.	Housing Energy Management System
	17. Community-wide shift to efficient, clean, affordable, and secure energy	Achieve the goals of the Community Energy Investment Plan	2016-17	2016 performance values	2024-25	Decrease from baseline	Key performance metrics articulated in the plan include: (1) community-wide energy consumption, (2) community-wide greenhouse gas emissions, (3) community-wide spending on energy, (4) community-wide investment in energy improvements, and (5) job creation resulting from energy investments. Implementation of the Energy Poverty Reduction Program will contribute strongly toward achieving these outcomes.	Annual indicator update by Planning & Recreation Department staff, and update of CEIP model and targets every 5 years. Data stored on municipal platforms.	Overall Program
Investment in communities	18. De-risk affordable energy investments in the community	Investment leverage ratio of capital improvement projects funded by the program	2020-21	To be determined	2024-25	To be determined	The ratio of all public instruments versus private sector investment in the program's capital projects (housing, transportation, and community energy systems). As both the costs of the public instruments as well as the energy investments occur over time, the present value of the costs and investments are used to calculate the investment leverage ratio. It is currently unclear what investment leverage ratio would be considered ideal for the program. This metric will be investigated during the program design stage.	Annual indicator update by Investment Navigator. Data stored on municipal platforms.	Investment System

Table 2.10

PERFORMANCE MEASUREMENT

Outcome Category	Outcome	Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Investment in communities	18. De-risk affordable energy investments in the community	Carbon abatement cost of capital improvement projects funded by the program	2020-21 Property intake year	To be determined	2024-25	Decrease from baseline	The present value of the incremental costs of the energy project investments divided by the greenhouse gas emission reduction potential. Reported as dollars per tonne of carbon abated. Climate change mitigation indicator. This metric will be investigated during the program design stage.	Annual indicator update by Investment Navigator. Data stored on municipal platforms.	Investment System
	19. Successfully fund energy poverty reduction solutions	Funding and investments toward the program	2018-19	$250,000 Smart Cities Challenge finalist grant	2024-25	$45.7 million	Total funding and investments in energy poverty reduction program, including local investments and stacked funding (e.g. grants, rebates, etc.).	Annual indicator update by Investment Navigator. Data stored on municipal platforms.	Investment System
	20. Demonstrate feasibility and effectiveness of program	Achievement of program outcomes	2018-19	No outcomes achieved	2024-25	Phase 3 outcomes achieved, positive evaluation by partners and participants	Achievement of program outcomes, and evaluation by partners and participants. Measured though comprehensive evaluation process for program partners and participants.	Annual indicator update by program managers. Data stored on municipal platforms.	Overall Program
Demonstration of impact	21. Inspire structural energy poverty solutions at the Provincial and Federal levels	Government policies or programs have been influenced by the Energy Poverty Reduction Program model	2018-19	No reported instances yet	2029-30	Increase from baseline	Number of senior government articles of legislation, policies, or programs that have been definitively influenced by the Bridgewater program. Measured through information sharing with Provincial and Federal governments.	Annual indicator update by program managers. Data stored on municipal platforms.	Overall Program
	22. Inspire other communities to adopt energy poverty reduction efforts	Other communities in Canada have been influenced by the Energy Poverty Reduction Program model	2018-19	No reported instances yet	2029-30	Increase from baseline	Number of other communities in Canada that attribute all or part of their energy poverty reduction efforts to the Bridgewater program. Measured through information sharing with other communities.	Annual indicator update by program managers.. Data stored on municipal platforms.	Overall Program

Table 2.10

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

GOVERNANCE STRUCTURE

As a municipal service, the Energy Poverty Reduction Program falls under Bridgewater Town Council's oversight, and under management of the Chief Administrative Officer (CAO). Final design and implementation of the program will be the responsibility of the Community Development Department, with a number of related functions taking place through other departments. The following elements are proposed within the governance and management structure:

- **Energy Poverty Reduction Program Steering Committee:** a formal Committee of Council that will provide advice to Council and staff on the design and implementation of the program. The Steering Committee will assist with maintaining community partnerships, and participate in program evaluation and quality review. It will participate, as appropriate, in client dispute resolution through an ombudsperson, and meet periodically with a Client Advisory Circle to receive client feedback. It is envisioned as a 6-10 member group, consisting of key program partners from the local community sector as well as regional organizations with expertise in energy and housing, such as Efficiency Nova Scotia. A member of Town Council will also sit on the Committee. Committee members do not receive compensation for their role through the Town, though some members may be paid staff from other organizations. The Committee will be resourced and supported by Town staff who coordinate and implement the program. A Terms of Reference for the Committee will be developed, and the Committee positions will be filled as one of the earliest activities in Phase 1.

> Collaborating as a group to help solve problems is often much more effective than organizations trying to do it on our own.
> – COMMUNITY SERVICE ORGANIZATION

- **Ombudsperson:** clients whose complaints about the program are not able to be resolved by program management may escalate their complaint to the Ombudsperson. This person is charged with representing the interests of program clients by investigating and addressing complaints. The Ombudsperson is recommended by the Steering Committee, and will be an external, independent expert with knowledge of the program. They will receive compensation for their work on a per diem basis. A role description for the Ombudsperson will be developed during Phase 1.

- **Client Advisory Circle:** prospective, current, and past clients of the program are recruited to participate in this advisory structure to provide periodic feedback to the Steering Committee and the program management team. The Client Advisory Circle is consulted on matters related to program design and implementation, quality, accessibility, affordability, fairness, and overall impact of the program. As the program clients include both households-at-risk as well as property owners, the Client Advisory Circle will represent both. Client Advisory Circle members receive a per diem to cover their participation, to reduce the risk that financial barriers will prevent effective participation. A Terms of Reference for the Client Advisory Circle will be developed as one of the earliest activities in Phase 1.

- **Technical Advisory Circle:** an ad-hoc working group that supports the program management team in the design and implementation of the program. The Technical Advisory Circle provides voluntary, independent, expert advice and project support to Town staff. A Terms of Reference for the Technical Advisory Circle will be developed as one of the earliest activities in Phase 1.

- **Program Coordinator:** the Community Development Department will put its staff

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

in charge of the overall coordination of the program. The Energy Poverty Reduction Program Coordinator reports to Senior Manager and through the CAO to Town Council. This staff is also the main resource to the Steering Committee. As this coordination role is critical to all components of the program, the job description(s) for staff will be developed and/or updated, and any necessary hiring completed before Phase 1 begins.

- **Municipal Program Management:** day-to-day management of the 4 linked municipal services (the Housing Energy Management System, Community Energy Systems, the Mobility Improvement System, and the Investment System) will fall to municipal staff. Activities within each program will be a combination of staff effort and procured third-party services. Technical Navigators and an Investment Navigator provide services both to program clients and to program managers, while an Information Systems Specialist provides data management services within the program. Quality control and evaluation is carried out by staff, in partnership with the Steering Committee. Full descriptions of these positions will be developed before Phase 1 begins, and any necessary hiring will commence as one of the earliest activities of Phase 1.

- **The Coordinated Access System** will be managed by a third-party service provider with its own management and governance systems. Household Navigators are employed by the service provider. A partnership or service agreement defines the relationship between the Town and the external organization, as well as the responsibilities of both parties. See the **Performance Measurement Chapter** for a more detailed description of the service procurement process and anticipated timelines.

- **The Financial Investment Vehicle,** a sub-component of the Investment System, will be managed by a third-party service provider with its own management and governance systems. A partnership or service agreement defines the relationship between the Town and the external organization, as well as the responsibilities of both parties.

  See the **Performance Measurement chapter** for a more detailed description of the service procurement process and anticipated timelines.

The relationship between most of the governance and management structures described above are illustrated in the following in Diagram 3.1.

A Bridgewater resident views an exhibit on energy poverty at a Smart Cities Challenge Open House.

> It would help so that we wouldn't have to scurry around, one call request for assistance requires 8 other calls; if we would just network it would make it easier.
>
> – COMMUNITY SERVICE ORGANIZATION

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Program Governance and Management

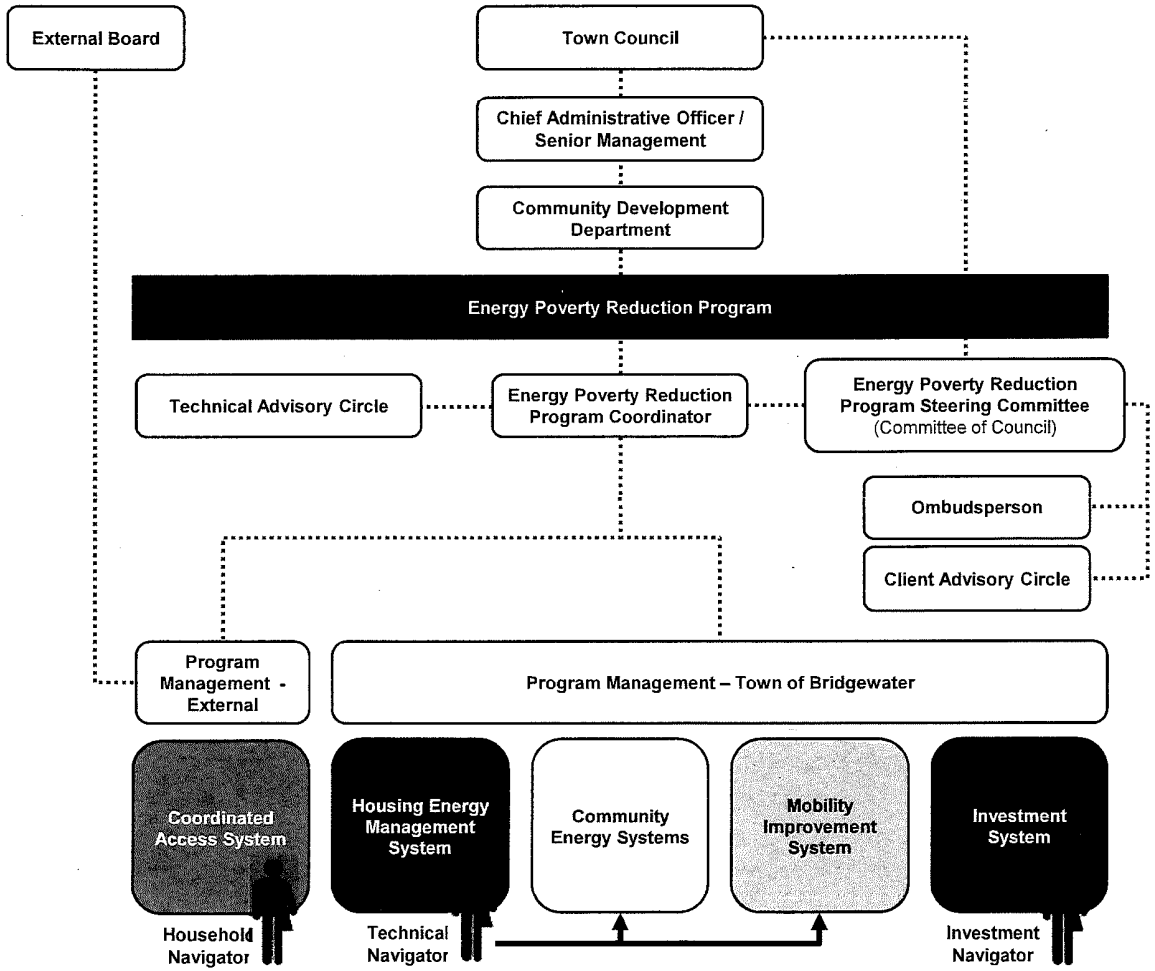

Diagram 3.1

EVALUATION, RISK MANAGEMENT, AND QUALITY CONTROL

Program staff will lead ongoing monitoring and reporting of program outputs as well as outcome indicators throughout all phases of the program. Monitoring and reporting responsibilities are divided by program, as defined in the **Performance Measurement chapter.** Performance measurement for activities that fall under "overall program management" are the primary responsibility of the Energy Poverty Reduction Program Coordinator, with the support of the Steering Committee. Annual reports will be generated for all program services, and shared widely with program stakeholders including Bridgewater Town Council. In its reports, staff will ensure that all identifying personal and business information is reported in aggregate unless express permission is given to share the information publicly.

See the **Engagement chapter** for information on how the program will maintain evaluation engagement with all its stakeholders.

All structures and members within the program governance and management system also have defined roles to play in the program's risk management and quality control processes. While risk management and quality control oversight ultimately rests with Bridgewater Town Council

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

and the Chief Administrative Officer, the lead role for ongoing risk management and quality control activities will be delegated to program staff throughout all phases of the program. The risk management framework and quality control processes, including program governance risks, are described in the **Project Management chapter.** These activities will involve all other structures and members on a periodic basis, with additional involvement as needed. Key among these will be the Energy Poverty Reduction Program Steering Committee, which will be kept informed of emerging risk and quality control issues, and consulted on mitigation strategies.

PARTNER COMMITMENTS

We are pleased to report that a large and diverse group of program partners and supportive organizations have pledged their support for Bridgewater's proposed program. Partner commitments are described below, grouped by program service:

HOUSING ENERGY MANAGEMENT SYSTEM AND COMMUNITY ENERGY SYSTEMS

- **Green Power Labs** – Committed to the development and integration of the Energy Management Information System, engineering and integration of the real time operations (RTO) system, general technology development, and support and operations in the Town of Bridgewater up to 2030.
- **Efficiency Nova Scotia -** Committed to partnering on detailed program design and delivery of the Housing Energy Management System. This includes the provision of energy efficiency services and financial incentives for retrofits and new construction. Advisory support is provided through the Energy and Financing Working Group.
- **TownSuite Municipal Software** – Expressed interest in exploring the expansion of existing municipal software with the addition of an energy management information system (EMIS) module, with the eventual expansion into real time operations (RTO) functionality. Supportive of exploring the possibility of the enterprise resource planning (ERP) system backbone to support the program and develop the Client Mobility Application module.
- **Clean Foundation -** Committed to the provision of expertise, service delivery and design for the residential energy efficiency retrofit program. Clean Foundation will share data, and related financial and technical learnings of a recently piloted Net Zero retrofit program in Bridgewater.
- **Nova Scotia Power -** Nova Scotia Power will support access to the AMI and the Green Button initiative, offer financing for heat pumps for home retrofits, and provide support for connected technology solutions and applications, as well as expertise for charging stations for electric public transport.
- **St. Mary's University – Faculty of Science** – Committed to the provision of significant contributions in collaboration with Green Power Labs towards Big Data Management, Data Science, Machine Learning, and other aspects of Artificial Intelligence of the project.
- **Dalhousie University – Faculty of Computer Science -** The Smart City Research initiative of Dalhousie University is committed to partnering with Bridgewater to implement the Energy Poverty Reduction Program by providing advisory support. Advisory support is provided through the Energy and Financing Working Group.
- **Nova Scotia Department of Energy and Mines** – Committed partner on the implementation of the Community Energy Investment Plan and the Energy Poverty Reduction Program. Advisory support is provided through the Energy and Financing Working Group.
- **Affordable Energy Coalition** – Continued efforts to influence provincial policy and programs to further support energy poverty reduction efforts and inspire other communities to adopt Bridgewater's model. Further aid in knowledge sharing on how to best work with landlords in implementing energy retrofits.
- **Housing Nova Scotia** – Committed to exploring a partnership for upgrade

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

referrals and continuing to provide up to date information on programs, funding, and housing stock. In addition, exploring a relationship to monitor and reduce the energy consumption of public buildings.

- **Ecology Action Center** – Committed to providing program education, advocacy, and engaging landlords in the proposed retrofit program.
- **Quality Urban Energy System of Tomorrow (QUEST)** – Prepared to disseminate program information to other municipalities through a Municipal Energy Learning Group and the QUEST NS Buildings Working Group. As one of five regional advisors for the Partners for Climate Protection program, QUEST will share replicable aspects of this program widely within the country. Committed to providing advisory support through the Energy and Financing Working Group.

MOBILITY IMPROVEMENT SYSTEM:

- **Nova Scotia Community Transportation Network** – Committed to promoting Bridgewater's transportation model to other rural communities in Nova Scotia and strengthening the network of relationships between non-traditional for-profit and non-profit community-based transportation providers.
- **Bridgewater Active Transportation Advisory Committee** – Committed to advising the town in its efforts to become an active transportation-supportive community, including putting an AT lens on town infrastructure, programs, policy and projects, and increasing partnerships promoting active transportation.

INVESTMENT SYSTEM:

- **New Dawn Enterprises** – Committed to potentially partnering with the Town of Bridgewater to establish a centralized CEDIF platform if it is selected as a community-investment tool. Advisory support is provided through the Energy and Financing Working Group.
- **Energy Services Association of Canada (ESAC)** – Members are committed to engaging in a competitive tendering process to demonstrate innovative ways to work with and be an integral part of Bridgewater's Smart City vision.

COORDINATED ACCESS SYSTEM:

- **Freeman House in association with Family Services of Western Nova Scotia** – Committed to partnering with the Town to administer the Coordinated Access System, provide guidance and support for system setup, on-going operations, communications, and in-kind support through staffing.
- **Nova Scotia Health Authority** – Committed to championing work within their networks and among community members through a Coordinated Access System, working with experts to develop an energy poverty index using health system data, and facilitating collaboration with other NSHA programs.
- **Nova Scotia Community College, Lunenburg Campus** - Committed to providing education and training opportunities through the Work Integrated Learning Programs, partnering with their Women Unlimited program to help showcase women in non-traditional trades and technology workplaces, integrating into a Coordinated Access System, and ultimately exploring the creation of new programming opportunities in the areas around Green Energy and Technologies.
- **South Shore Housing Action Coalition** - Prepared to support the program in an advisory capacity, engage its broad spectrum of members, and to support and facilitate the sharing of information about the project.
- **Service partners** committed to continued project engagement for the planning of a measurable, manageable and effective Coordinated Access System, and acting as referral and outreach agents, in the promotion, enhancing, and navigation of community resources through the system. These partners include: **Society St. Vincent de Paul; The Ark and Support Services Group;**

Processed under the provisions of the Access to Information Act/Révisé en vertu de la Loi sur l'accès à l'information

Second Story Women's Center; Lunenburg County YMCA; United Way Lunenburg County; Salvation Army Bridgewater, N.S; South Shore Family Resource Center; Big Brothers, Big Sisters of South Shore; Be the Peace Institute; Bridgewater and Area Lions Club; Bridgewater Law Office (Nova Scotia Legal Aid); Nova Scotia Works; Bridgewater Food Bank; Family Support Center; Souls Harbour Rescue Mission, Bridgewater; SchoolsPlus; Small World Learning Center.

OVERALL PROGRAM SUPPORT

- **Halifax Regional Municipality –** Committed to sharing information on climate change related initiatives.
- **Government of Nova Scotia –** Committed to supporting the Town as a climate change leader.

Letters of support confirming all these commitments are provided in the Appendix. Additional letters of support that are confidential in nature because they contain sensitive market information are provided in the Confidential Annex.

DATA AND INFORMATION GOVERNANCE

Data and related infrastructure, along with the technologies and services for the Energy Poverty Reduction Program are key to the success, transferability and replicability of the program. Data governance must ensure that digital solutions both improve the liveability and wellbeing of the households-at-risk of energy poverty, and also meet democratic, privacy, and quality standards appropriate for a project of this scale.

At the core of municipal data governance lies the question of what communities can do in order to manage data in the best interest of their community members and the stakeholders at large without jeopardising privacy and security, and the potential business opportunities that lie within municipal data sets. This eventually leads to a fundamentally new form of public-private partnerships with data as the instrument. In developing this Energy Poverty Reduction Program, we have begun to develop a data governance policy which will need further refinement in the early stages of the program development. This needs to be undertaken in conjunction with the technology and data platform development process. This is discussed in further detail in the **Data and Privacy chapter.**

To develop a strong municipal data governance system for our Energy Poverty Reduction Program, the Town will be carefully considering the following questions and working with our community partners and participants to determine how we will manage the great deal of data and information sharing that is inherent in a smart cities approach.

- What strategies and approaches do communities need to follow to enable third-parties to share their data with the Town of Bridgewater?
- How can the Town remain the decision maker about data usage in public-private partnerships or in data-driven projects that impact the common good?
- What are the lines of decision making and how can the Town create transparent systems that show the existing trade-offs between public and private interests?
- What resources and skills are needed in Bridgewater to moderate data-related decision making?
- How can communities successfully initiate and steer pilot projects on municipal data?
- How do communities ensure ownership of the data in public contracts?
- What data should be provided as open data by the Town and how can communities arrive at a decision about this?
- How can communities embed their policy requirements in municipal data platforms?

The **Data and Privacy chapter** provides preliminary responses to the above questions. Additional work needs to be done during the detailed program design process to fully develop the Energy Poverty Reduction Program data governance framework. Concerns about data are detailed in the risk management section in the **Project Management chapter.**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

COMMITMENT TO INNOVATION AND ENERGY POVERTY REDUCTION

Over the past decade, the Town has been an active partner in multi-sectoral initiatives around topics as diverse and complex as food security, affordable housing, youth retention, health services planning, seniors safety, transportation, gender-based violence prevention, alcohol harm reduction, economic development, and a variety of community development initiatives.

The implementation of our ground-breaking Community Energy Investment Plan (2018) remains Town Council's key area of focus, and holds a priority status in the Town's Economic Development Action Plan (2018). The Town has publicly affirmed its commitment to implementing a broad spectrum approach to energy transition and energy poverty alleviation, including the new and innovative solutions that participation in the Smart Cities Challenge has helped us to identify and design.

PROJECT MANAGEMENT CAPABILITY

The Town of Bridgewater has worked hard to expand its highly qualified staff team to the point where it can confidently manage the detailed design and set up of the Energy Poverty Reduction Program. Initial lead staff on this file will include:

- Tammy (Crowder) Wilson, CAO. Tammy has over 20 years' experience in municipal government. She has worked on energy projects including wind energy and anaerobic digestion projects under the Nova Scotia's COMFIT program. She has also facilitated a partnership with the private sector to see landfill material turned into a marketable commodity and increase landfill diversion. Tammy has led the regionalization of some municipal services along the south shore, including participating in the development of several municipal corporations.
- Jessica McDonald, Director of Community Development. Jessica spent over a decade coordinating multi-sectoral environmental policy initiatives and programs for the Province of Nova Scotia. In Bridgewater, her accomplishments include stewarding the design and implementation of the Town's ambitious Pijinuiskaq Park and King Street streetscape enhancements, and overseeing the development of its first fixed route public transit service.
- Leon de Vreede, Sustainability Planner. Leon has managed the Town's sustainability program for over 10 years. Specializing in innovative planning, program design, and community engagement practices, Leon's work has been recognized by the Province of Nova Scotia through an inaugural Clean Climate Leader award in 2015, and by the Federation of Canadian Municipalities through his designation as a PCP Local Climate Change Hero in 2016. Leon will function as Program Coordinator for the proposed program.
- Greg Goubko, Energy Finance & Development Coordinator. Greg has spent the past 4 years working at the Toronto Renewable Energy Co-op/Tapestry Community Capital as the Community Investment Manager. He has recently joined the Town of Bridgewater to help with the implementation of the Community Energy Investment Plan and the Smart Cities Challenge project. He brings a wealth of knowledge related to community financing and local investment.
- Myles Cornish, On-Site Energy Manager. Myles is a Professional Engineer, working for Bridgewater under contract for Efficiency Nova Scotia. Aided by his extensive network throughout the Efficiency Nova Scotia organization as well as to external trade partners, Myles brings the core engineering expertise to the table that is needed to design and implement the infrastructure solutions proposed by the program.

Project management decisions will be made by the Director of Community Development and the CAO, and key decisions that affect town services (e.g. selection of technology partners, and key program design considerations) will be brought to Council for direction. The Steering Committee

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

will review all project documentation (including staff-generated reports, RFPs and Terms of Reference, and consultant and legal reports) and provide feedback and guidance to staff throughout the process.

PROGRAM DEPLOYMENT

Lifting our residents out of energy poverty is an ambitious outcome outcome, which will many activities and deliverables along the way. A detailed discussion of the program activities and outputs (deliverables) are contained in the **Performance Management chapter** and includes a comprehensive list of indicators to help us measure and monitor our progress. Resource assessment for each element of the Energy Poverty Reduction Program is also discussed in that chapter. This includes details on program design, staffing, technology, partner and stakeholder engagement, procurement processes and needs, legislative and regulatory approvals, database and technology needs, administration, communications and evaluation. Costs associated with each program area, including the proposed use of the Finalist Grant, is provided in the **Financial chapter,** Tables 9.1 through 9.14. Strategies for engagement with partners, stakeholders, and target clients for the program are discussed in the **Engagement chapter.** This includes strategies for ensuring that our program is designed to be meaningful, fair and impactful for the broad range of residents who find themselves struggling to pay their energy bills in the face of all the other household priorities and hurdles.

The Energy Poverty Reduction Program consists of a set of 5 interconnected systems that will be deployed in 4 phases; each building off each other with some overlap in the early phases.

1 **Prototype Program Setup -** This phase includes partnership development; detailed service and technical design; service procurement; client consultation; a comprehensive Privacy Impact Assessment (PIA) on the detailed program design and an overarching privacy policy.

2. **Prototype Program Testing & Refinement -** This phase involves a gradual ramping up of client intake; continuing design and implementation of services and technologies; and monitoring and evaluation of results. Program outcomes become measurable by end of this phase.

3. **Final Program Activation -** This phase requires the finalization of program service design and technical components; extensive documentation of program outcomes; and the development of learning materials for other communities and senior governments. The completion of the Final Program Activation phase marks the end of Smart Cities Challenge contribution agreement.

4. **Program Maturity -** This phase includes ongoing client intake; program evaluation and improvement as well as the integration of new and emerging community energy technologies and solutions.

Program Deployment Phases and Households Served by Program Year

Program Year	2020-21	2021-22	2022-23	2023-24	2024-25	Total
Phase	1: Prototype Program Setup					
		2: Prototype Program Testing & Refinement				
				3: Final Program Activation		
						4.Program Maturity
Households Served	0	50	75	100	125	750 over 5 years
Relationship to Smart Cities Challenge (SCC)	Within SCC Program & Funding					After SCC

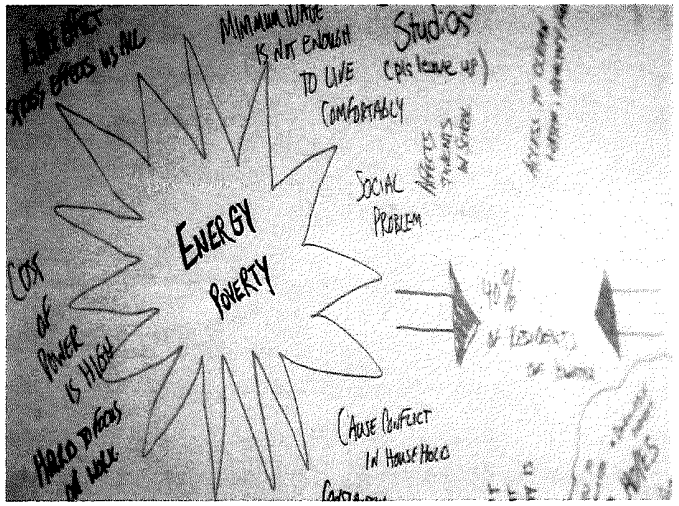
Table 4.1

Page 971 of 1849
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

> When people are in a crisis, they need manageable steps to be able to navigate the system of services.
> – RESIDENT, TOWN OF BRIDGEWATER

Table 4.1 describes the timing of phases and the number of households served. As stated early on in the project overview, households-at-risk are less likely to also be the property owner. So the number of households served will account for both the inhabitants and the property owners of the properties they inhabit.

The extended period of prototyping, evaluation and improvement ranging from fiscal year 2021-22 to 2024-25 has been purposefully planned in recognition of the complexity of the program and the need for frequent review and adjustment of goals and solutions. This approach to prototyping is in line with smart cities approaches that revolve around continuous learning and feedback cycles using program metrics and client and partner evaluation.



This approach has also been selected to support a robust risk management process that will ensure program risks and challenges arising from program activities, outputs, and outcomes are mitigated in real time and that emerging risks are being identified before they create problems. In particular, 4 key program risks will be continuously assessed and mitigated through this phased deployment:

- Program uptake risk: uncertainty as to the willingness of households-at-risk and property owners to participate in the program
- Financial risk: uncertainty in program costs and sources of funding and investment
- Technical risk: uncertainty in database development timeframes and functionality
- Supply chain risk: uncertainty in the availability of skilled labour to complete the envisioned infrastructure improvements

The project risks and mitigation strategies are comprehensively discussed in the next section of this chapter.

Risk Management Framework

Project risks and their respective mitigation strategies related to all other chapters in this application are fully described in this section. As described in the **Performance Measurement chapter,** the Energy Poverty Reduction Program will measure the progress toward its outputs and outcomes through an iterative process of design, prototyping, and evaluation. This approach will ensure that program risks and challenges arising from program activities, outputs, and outcomes are being mitigated in real time. It also supports the program's governance, evaluation, and quality control needs.

Notes from a discussion at a Smart Cities Challenge workshop.

Connecting these elements is the program's risk management framework, which consists of the following components:

- an analysis of program risks
- a set of overarching risk management strategies
- a series of course correction checkpoints and risk mitigation options for the program

ANALYSIS OF PROGRAM RISKS

Table 4.2 identifies significant program risks based on the theme of specific chapters within this application, as well for the overall program. Risk probability and risk impact are both measured on a relative scale of 1 (low), 2 (moderate), and 3 (high).

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

Risk Assessment by Program

Risk Category	Risk	*Risk Probability	*Risk Impact	Description of Impact	Risk Summary	Monitoring & Reporting on this Risk
Overall Program	Smart Cities Challenge grant not achieved	3	3	Lack of funding for program development. Program unlikely to be implemented as proposed, and/or over much longer timeframe.	Significant risk, not easily mitigated	Proposal evaluation by Jury
	Substantial economic downturn affects overall ability to secure financing & funding	1	3	Lack of program funding. Program may need to be implemented over much longer timeframe.	Significant but unlikely risk, partially mitigatable	Investment System
	Program fails to lift residents out of energy poverty, or affect systemic change as envisioned	2	3	Affects program targets, performance measures, and ability to meet outcomes.	Significant risk, partially mitigable	Overall Program Management
	Program is too complex for clients, partners, and service providers to navigate or maintain	2	2	Affects ability of clients/partners/service providers to navigate program structures and processes. Reduces client, partner, and service provider participation rate. Delays program implementation. Adds to program cost. Affects program targets, performance measures, and ability to meet outcomes.	Moderate risk, partially mitigatable	All program services
Performance Measurement	Performance indicators cannot be measured as expected	2	1	Affects performance measurement and outcomes monitoring.	Minor and mitigatable risk	All program services
	Actual energy poverty rate is different than currently understood (38.5%)	2	2	Affects program targets, performance measures, and ability to meet outcomes. May not be able to be measured accurately.	Moderate but mitigatable risk	Overall Program Management
Governance	There is insufficient capacity/interest by program partners to maintain effective program governance & evaluation	1	2	Program implementation responsibility rests too heavily on Town of Bridgewater. Community champions lacking. Reduced program uptake. Reduced program quality.	Moderate but unlikely risk	Overall Program Management
	Client or partner makes complaint that is unable to be resolved	2	2	Additional strain on program resources & management. May escalate into legal or regulatory action against program. Affects public perception of program.	Moderate but mitigatable risk	All program services and Ombudsperson
Project Management	Contractor & supply chain capacity is lower than anticipated	3	3	Delays program implementation. May affect program quality. Likely to increase program costs.	Significant risk, not easily mitigated	Housing Energy Management System, Community Energy Systems, and Mobility Improvement System
	Key service delivery partner defaults on contract or experiences loss in capacity to carry out responsibilities	1	3	Delays program implementation. May affect program quality. May increase program costs. May lead to client/partner dissatisfaction as a result of interrupted service.	Significant but unlikely risk, partially mitigatable	All program services
	Regulatory, cost, and project management uncertainty in deployment of development and financing structures	3	2	Program design cannot be finalized until development and financing structures are confirmed. Affects cost and project management assumptions, as well as procurement and partnership design. Creates overall program uncertainty. Lack of resolution within reasonable timeframe affects program targets, performance measures, and ability to meet outcomes.	Moderate risk, partially mitigatable	Investment System and Community Energy Systems

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

PROJECT MANAGEMENT

Risk Category	Risk	*Risk Probability	*Risk Impact	Description of Impact	Risk Summary	Monitoring & Reporting on this Risk
Project Management	Challenges finding or retaining qualified staff to manage the program	1	2	May delay program implementation or affect program continuity. May affect program quality. May increase program costs. May lead to client/partner dissatisfaction as a result of interrupted service.	Moderate but unlikely risk	All program services
Technology	Legislative & regulatory barriers prevent deployment of community energy solutions or delay their deployment	2	2	Delays project implementation. Affects program targets, performance measures, and ability to meet outcomes. May result in energy affordability and security goals not being met.	Moderate risk, partially mitigatable	Community Energy Systems
	Technical assessment/due diligence studies of community energy systems yield unfavorable results or take longer than anticipated	2	2	Delays project implementation. Affects program targets, performance measures, and ability to meet outcomes. May result in energy affordability security goals not being met.	Moderate but mitigatable risk	Community Energy Systems
	Development of core data platform solutions is more technically complex, costly, or time-consuming than anticipated. Scope creep.	2	3	Delays program implementation. May affect program quality. Likely to increase program costs.	Significant risk, not easily mitigated	All program services
	Anticipated data platform partners not interested in participating	2	2	Delays program implementation. May affect program quality. Likely to increase program costs. May result in interoperability challenges.	Moderate risk, partially mitigatable	All program services
	Technological disruption causes dramatic change in cost or ability to implement planned technological solutions	1	2	Effects generally unknown - may enhance or hinder program implementation, including costs and ability to meet outcomes.	Moderate but unlikely risk	All program services
Data and Privacy	A data security breach occurs in one or more data platforms	1	3	May compromise client and partner data, including personal and corporate information. May result in program shutting down operations to address security breach. May erode trust in the program and affect the program's ability to attract clients and service providers, affecting program outcomes.	Significant but unlikely risk, partially mitigatable	All program services
	Program participants' concerns about privacy are not satisfied, leading to low uptake rates/negative publicity	1	2	May affect the program's ability to attract clients and service providers, affecting program outcomes.	Moderate but mitigatable risk	All program services and Ombudsperson
	Program partners are unable or unwilling to share all or part of anticipated data	2	2	May affect program's ability to track clients, partners, and outcomes indicators. May affect program quality.	Moderate risk, not easily mitigated	All program services
	A data platform experiences a service delivery problem or unexpected failure	1	3	May result in program shutting down operations temporarily. May erode trust in the program and affect the program's ability to attract clients and service providers, affecting program outcomes. May affect program quality. May increase program costs. May lead to client/partner dissatisfaction as a result of interrupted service.	Significant but unlikely risk, partially mitigatable	All program services
Engagement	Program delays or challenges result in negative publicity in community and beyond	1	2	May affect the program's ability to attract clients and service providers, affecting program outcomes.	Moderate but mitigatable risk	All program services

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Risk Category	Risk	*Risk Probability	*Risk Impact	Description of Impact	Risk Summary	Monitoring & Reporting on this Risk
Engagement	Program is ineffective at reaching clients who are most in need	2	2	Program outcomes not achieved. Energy poverty rate not reduced as quickly as anticipated. Negative publicity may affect the program's ability to attract clients and service providers, further affecting program outcomes.	Moderate risk, partially mitigatable	Housing Energy Management System and Coordinated Access System
	Program uptake (households-at-risk) is lower than anticipated	1	2	Program outcomes not achieved. Service contract thresholds not reached. Energy poverty rate not reduced as quickly as anticipated.	Moderate but unlikely risk	Coordinated Access System
	Program uptake (property owners) is lower than anticipated	2	3	Program outcomes not achieved. Service contract thresholds not reached. Energy poverty rate not reduced as quickly as anticipated.	Significant risk, not easily mitigated	Housing Energy Management System
	Program uptake in general is higher than anticipated	2	2	Additional strain on program resources and management. Dissatisfaction in community if waiting list grows.	Moderate but mitigatable risk	Housing Energy Management System and Coordinated Access System
Financial	Legislative & regulatory requirements are not met or delayed, including expectations around regulatory changes	2	2	Delays project implementation. Affects program targets, performance measures, and ability to meet outcomes. May result in energy affordability and security goals not being met.	Moderate risk, partially mitigatable	All program services
	Major regulatory change causes disruption to program	1	2	Effects generally unknown - may enhance or hinder program implementation, including costs and ability to meet outcomes.	Moderate but unlikely risk	All program services
	Program costs are higher than anticipated. May arise from currency risk	2	3	May make housing, transportation, and community energy system improvements unattainable or only partially attainable. Increases demands on funding/financing. Delays program implementation. May affect program quality.	Significant risk, partially mitigable	All program services
	Funding from financial investors lower than anticipated	2	3	May make ROI components of program unattainable or only partially attainable. Increases demands on non-investor funding. Delays program implementation. May affect program quality.	Significant risk, not easily mitigated	Investment System
	Funding from social investors (government, foundations) lower than anticipated	2	3	May make non-ROI components of program unattainable or only partially attainable. Increases demands on debt financing. Delays program implementation. May affect program quality.	Significant risk, not easily mitigated	Investment System
	Home energy savings are lower than anticipated as result of inaccurate estimates	1	3	Affects cashflow of property owners and possibly tenants. May not achieve poverty reduction outcomes. May make poverty issues worse. Negative client experience. Affects public perception of program.	Significant but unlikely risk, partially mitigatable	Housing Energy Management System
	Home energy savings are lower than anticipated as result of insufficient funding	2	2	Affects cashflow of property owners and possibly tenants. May not achieve poverty reduction outcomes. Affects public perception of program.	Moderate risk, not easily mitigated	Housing Energy Management System
	Home energy savings are lower than anticipated as result of conventional energy prices being lower than anticipated	1	2	Affects cashflow of property owners and possibly tenants. May not achieve poverty reduction outcomes. May make poverty issues worse. Negative client experience. Affects public perception of program.	Moderate but mitigatable risk	Housing Energy Management System

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Risk Category	Risk	*Risk Probability	*Risk Impact	Description of Impact	Risk Summary	Monitoring & Reporting on this Risk
Implementation Phase Requirements	Collaboration with First Nations communities is less robust than expected	2	1	Missed opportunity for reconciliation, partnership, economic development, and cultural exchange.	Minor risk, not easily mitigated	All program services
	Diversity targets not met for recruitment, training, and procurement as per Community Employment Benefit (CEB) reporting	2	1	Inequitable distribution of community economic benefits. Missed opportunity to build program strength by learning from disaffected segments of the community.	Minor and mitigatable risk	All program services
	Legislative & regulatory requirements are not met or delayed, including expectations around regulatory changes	2	2	Delays project implementation. Affects program targets, performance measures, and ability to meet outcomes. May result in energy affordability & security goals not being met.	Moderate risk, partially mitigatable	All program services
	Major regulatory change causes disruption to program	1	2	Effects generally unknown - may enhance or hinder program implementation, including costs and ability to meet outcomes.	Moderate but unlikely risk	All program services

Table 4.2

RISK MANAGEMENT STRATEGY 1: ESTABLISH CORE RISK MANAGEMENT STRUCTURES & PROCESSES

During the first year of the program (fiscal year 2020-21) a set of 7 program structures and processes will be put in place to establish an overall risk management process.

- Governance Structure & Commitments: establish an effective program governance structure as described in the **Governance chapter.** Effective risk management across all risk areas begins with strong governance. Effective governance requires long-term commitments from key program partners as they participate in key roles on the Energy Poverty Reduction Program Steering Committee.
- **Management Structure & Capacity:** establish an effective program management team with the capacity to implement the program, as described in the **Governance chapter** and earlier in this chapter. Qualified staff working under diligent oversight by Bridgewater Town Council and the Chief Administrative Officer will ensure that a broad range of program risks are minimized by having outputs achieved effectively and on budget. Management relationships with external organizations, in particular for the Coordinated Access System and the Financial Investment Vehicle, will reduce program risk through strong service contracts and/or partnership agreements, with responsibilities, deliverables, and timelines clearly defined.
- **Evaluation Process:** Phase 1 of the program will start with the program evaluation process already active, so that the process can support the program setup work from the very beginning, allowing staff and program partners to identify, communicate, and manage any and all program risks as they emerge. Effective and timely performance tracking mitigates risk through the early identification of areas where program deliverables are falling short or experience implementation delays, allowing for course corrections. Year 1 of this process will also involve the review of program indicators so that adjustments can be made to performance measurement methodologies and targets. The evaluation process and the program outputs and

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

outcomes it will measure are described in the **Performance Measurement chapter.**

- **Communications System:** ensuring timely and effective communications between program governance, program management, program partners, and program clients mitigates program risk by reducing opportunities for misunderstanding, speeding up processes, and maintaining cohesion across the multiple service areas. Detailed communications strategies will be developed for program services with high community engagement and marketing needs. Program communication will ensure cautious and transparent communication with residents on their rights related to sharing data, who will be able to see their data, and how it will be stored. Strong communication regarding the confidentiality of participants' sensitive information will be ensured to maintain trust with participants and ensure that at-risk, and vulnerable populations are insulated from potential risks for sharing sensitive information when accessing services. Program communications are the responsibility of all program managers, and are overseen by the Program Coordinator.

- **Quality Control / Quality Assurance Process:** The system to maintain the standards of the Energy Poverty Reduction Program consist of a three-level hierarchy of controls. The first level, and closest to the client, consists of an Ombudsperson and a Client Advisory Circle. These roles relate to communicating client experiences directly to the program governance and management teams, and resolving client complaints, program quality concerns, and program impact deficiencies. They are further described in the **Governance chapter.** If quality control has not been assured via the first-level supports, then issues can escalate to the Program Steering Committee where authority to make program decisions to ensure ongoing quality will be granted in the Terms of Reference. If quality control concerns exist after this second-level support, concerns can be directly expressed to the Town Council, who maintains the ultimate authority over all municipal programs.

- **System Gap Analysis Review Process:** Through the evaluation framework, emergent risks are continuously monitored across all program areas. Among these, a key risk relates to a lack of program accessibility. This is mitigated by continuously asking about whether client and stakeholder needs are being met, or whether people are 'falling through the cracks' as a result of system gaps. System gaps are also mitigated through regular contact with the Client Advisory Circle, which provides a direct channel for program clients to communicate unmet needs.

- **Privacy Review Process:** To ensure all privacy related precautions are met and data and privacy breaches are mitigated, the entire program will be evaluated from a privacy perspective through the completion of a comprehensive PIA coupled with an overarching Privacy Policy. To ensure both documents are adequate and adhere to standard privacy practices the Town will consult with privacy experts throughout the first year of the program and for all aspects of the program design.

These structures and processes will be designed, implemented and evaluated by the program management team as part of the delivery of outputs related to Overall Program Management. Major risk management checkpoints for this strategy are 6 months into year 1 (October 2020), and 11 months into year 1 (February 2021). These timeframes allow critical course corrections to be made through the risk mitigation options available at each stage (see below).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès

RISK MANAGEMENT STRATEGY 2: CONFIRM FEASIBILITY OF PROGRAM

Each program service will undergo a detailed feasibility reviews 6 months before the end of Phase 1 (October 2021), and 6 months before the end of Phase 2 (October 2023), so that overall program feasibility can be assured by Phase 3 (Final Program Activation). Completing feasibility checks, and making any necessary course corrections, also helps ensure that Phase 1 and Phase 2 outputs can be achieved on time. As a risk mitigation strategy, feasibility will be assessed based on 9 areas of program performance.

These feasibility assessments will be completed by the program management team, and will allow critical course corrections to be made through the mitigation options available at each stage (see Table 4.2).

RISK MANAGEMENT STRATEGY 3: ESTABLISH CONTINUOUS MONITORING & IMPROVEMENT SYSTEM

Following the successful completion of Phases 1 and 2, risks related to program feasibility will have been assessed and mitigated, and the program will transition through Final Program Activation (Phase 3) into Program Maturity (Phase 4). This transition will require an amended risk management strategy, which is to deliver these risk management functions through a system of continuous monitoring and improvement.

Program Feasibility Assessment and Criteria

Feasibility Assessment	Feasibility Assessment Criteria
Client Participation	• Client participation rates are sufficient to meet program objectives and performance measures • The program sufficiently meets client satisfaction and needs • The program is sufficiently accessible to intended clients
Service Costs	• Current and future service costs are sufficiently known to enable service delivery planning and contracts • Service costs are within tolerable thresholds to meet program objectives and performance measures
Service Capitalization	• Current and future revenue sources are sufficiently known to enable service delivery planning and contracts • Revenue sources are within tolerable thresholds to meet program objectives and performance measures • The program sufficiently meets funder and investor satisfaction and needs
Data Availability	• Data governance processes and agreements meet partners' and clients' needs • Sufficient data is available to enable service delivery planning and contracts • Key partners and service organizations are able to share sufficient data to meet program objectives and performance measures
Data Platform Setup	• Data platforms have the minimum functionality required to achieve program objectives and performance measures • Data platforms have sufficient oversight, quality control, and security in place to meet partners' and clients' needs
Technical Solutions	• Energy management solutions are sufficiently known to enable service delivery planning and contracts • Performance of energy management solutions is sufficiently measurable to meet program objectives • Energy management solutions are sufficient to meet program objectives and performance measures • Energy management solutions sufficiently meet client satisfaction and needs
Supply Chain & Procurement	• Procurement processes for program services and products results in adequate value and contractual security to meet program objectives and performance measures • Program service providers and product suppliers have sufficient capacity to meet program objectives and performance measures over the long term • Procured services and products meet partners' and clients' needs
Regulatory Limitations	• Current and future legislation and regulations are sufficiently known to enable service delivery planning and contracts • Legislation and regulations enable program services to meet program objectives and performance measures
Program Impact	• Program outcomes and indicators are sufficiently measurable to understand program impact • Program outcomes are achieved • Program impact is defined holistically, and current and emerging gaps in program impact are reevaluated on a regular basis

Table 4.3

This system will be designed in full during Phase 3, and will likely retain a number of risk management, quality control, and performance measurement elements from Phases 1 and 2, as well as additional elements to address emerging risk issues. The continuous monitoring and improvement system will be carried out by the program management team, and will work in

Processed under the provisions of the Access to Information Act / Révisé conformément à la Loi sur l'accès à l'information

conjunction with the core risk management structures & processes defined in the first risk management strategy.

PROGRAM COURSE CORRECTION CHECKPOINTS AND RISK MITIGATION OPTIONS

The primary program course correction checkpoints discussed above allow the program management team to implement risk mitigations to improve service design and delivery should the program experience feasibility challenges or fall short on its performance expectations. Depending on the severity of risks identified through risk management and quality control activities, mitigation options may include the following:

- **Change program outputs** – revising program activities and deliverables may address a wide variety of risk, quality, and performance needs.

- **Reduce data platform functionality** – as a major source of program risk, the cost and technical complexity of the data platform may be need to scaled back in scope in order to achieve a minimum viable product (MVP) that is manageable while still achieving program outcomes.

- **Change performance indicators** – altering indicators may more effectively or more practically measure progress toward program outcomes.

- **Change partners** – program partners and service providers may be unable to achieve program deliverables, share data, or participate as meaningfully as originally intended. Finding new partners may allow the program to better meet its outcomes.

- **Increase supply chain capacity** – a major source of program risk, service provider and product supplier capacity may be insufficient to meet the significant needs of the program. Issuing stable long-term contracts, requiring capacity building activities as part of contracts, collaborating with regional trade networks and training programs, and advocating for government policies that increase trade sector capacity may all be necessary to bolster the quality and capacity of program suppliers and service providers.

- **Improve communications** – as insufficient client uptake is a major program risk, altering communication strategies may be required. Improved communications may also be necessary to attract greater interest from funders and investors.

- **Increase funding** – as a town with a very limited ability to draw additional resources from its tax base, Bridgewater lacks the means to put substantial program dollars on the table should funding levels be insufficient to meet program needs. Should program revisions described above yield insufficient risk reduction or quality improvement, or fail to build the necessary program capacity, additional funding sources may be needed to achieve program outcomes. This may result in program implementation delays.

- **Lobby for regulatory change** – municipalities are created and regulated by legislation. If any regulatory impediments or barriers are discovered, we may need to lobby to the provincial and federal governments for change, which can take time and may lead to delays in program delivery and or achievements.

- **Change outcomes** – as a last resort, program outcomes may need to be shifted to become more manageable, or abandoned altogether, if other mitigation options cannot allow the program to achieve the outcomes while also resolving program risks and quality issues.

Table 4.4 provides a preliminary assessment of the risk mitigation options that may address program risk and quality concerns at key course correction checkpoints.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Program Feasibility Assessment and Criteria

Risk Management Strategy		Course Correction Checkpoint(s)	Risk Mitigation Options								
			change program outputs	reduce data platform functionality	change indicators	change partners	increase supply chain capacity	improve communications	increase funding	lobby for regulatory change	change outcomes

Table 4.4

Project Continuation After Smart Cities Challenge

Continuation After Smart Cities Challenge Smart Cities funding will create the prototype for the Energy Poverty Reduction Program and will ultimately demonstrate the feasibility and value of this initiative continuing over the long term.

Our dedication to energy poverty reduction is evidenced in the **Performance Measurement** and **Financial chapters,** where program considerations for years 6 through 10 are described. Commitment for Town Council's ongoing role in Bridgewater's energy future was proclaimed on January 8, 2018 with the formal adoption of the 32-year Community Energy Investment Plan.

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

ENERGY POVERTY REDUCTION THROUGH CONNECTED TECHNOLOGY PLATFORMS

From streamlining client intake, to enriching investment tools, to improving energy flows, connected technology plays a crucial role in all aspects of the Energy Poverty Reduction Program. A central feature of the program design is to empower households-at-risk by providing them with control over their home energy options through building upgrades that measure and monitor usage so that they can actively manage and control their energy costs.

Emerging connected technologies for household energy management built on the internet of things (IoT), big data and intelligent energy management systems are fundamentally changing the practices of households and their daily, monthly and annual energy budgets.

Evidence suggests that energy security is a significant stress factor for households-at-risk. There are cascading negative effects of missing payments on energy bills that result in financial impacts critically affecting all aspects of household life. The ability to optimize energy supply and consumption and to deliver energy reserves such as stored electrical power on demand, particularly in emergency situations, is an emerging requirement directly attributable to connected "smart" technologies and distributed energy resources.

Such technology includes smart thermostats for residential houses and smart thermal optimization for multiunit residential and municipal buildings as well as connected clean technology solutions for energy generation such as residential microgrids, virtual community loads and power plants and electricity micro market management.

At a high-level, this connected technology solution is based on three energy management "pillars" that are interoperable with one another and are all housed within an **energy resource planning platform:**

- An advanced **enterprise resource planning (ERP) system** for municipalities to ensure their housing and mobility assets are integrated with existing applications to support the households-at-risk in the community and will rely heavily on the diligent use and interoperability with the Energy Management Information System (EMIS) and Real Time Operations (RTO) system.

- an **energy management information system (EMIS)** focusing on housing energy management and community energy systems and solutions that will enable energy data monitoring and analytics. The EMIS will operationalize the efficiency of foundational and advanced applications related to energy productivity for the households-at-risk, and broader municipal energy efficiency programs. The EMIS is fully connected to the ERP system to ensure fluidity of information without compromising accuracy.

- a **real time operations (RTO) system,** enabled through supervisory control and data acquisition (SCADA) and energy management system (EMS) solutions, that will leverage the value of the program assets and coordinate its controls in real time. The RTO system is a crucial component to minimizing energy use and maximizing efficiencies, and represents the final stage of the energy resource planning platform development once the municipal ERP system and EMIS are deployed and in operation.

These pillars will enhance the experience of households, sustain optimal levels of performance and reduce the costs of household energy use. The coordinated connected technology solutions focused on the buildings where households-at-risk live will make their homes highly efficient, more comfortable, healthier places to live. In addition to direct benefits, households will be empowered by having greater control of their energy use while encouraging household interactions and knowledge sharing.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ENTERPRISE RESOURCE PLANNING (ERP) SYSTEM

Enterprise resource planning (ERP) systems are packaged application software suites that support the common business processes, functions and data for the systems of record in an enterprise. The ERP is the system of record - the authoritative source of data that any stakeholder in an enterprise can reference to support their activities. The ERP achieves this by enabling the flow of information across the organization, in end-to-end business processes, through a comprehensive set of interconnected systems modules. Modules can be utilized in different combinations, presenting unique ERP options to meet different administrative, management, operational, analysis and reporting needs. This element of the data platform can be replicated and scaled according to local conditions.

Bridgewater's existing municipal ERP is TownSuite Municipal Software. The platform is used for finance, asset management, land management, human resources, eBilling, and customer service functions. This modified data platform would house the three pillar systems and will be operated in connection with the external Coordinated Access System data platform (HIFIS) as well as an external Financial Investment Vehicle dealing with traditional and community investors. An early conceptual diagram of the integration of the municipal ERP, EMIS, and RTO functionality is provided in Diagram 6.1.

Dialogue with Townsuite has suggested that the Energy Poverty Reduction Program can be built onto this ERP but a full assessment of functionality options, development requirements, and timelines is needed to establish an agreement.

> A one stop shop aided by technology for navigation of services would dramatically improve access to services for clients.
>
> - COMMUNITY SERVICES ORGANIZATION REPRESENTATIVE

ENERGY MANAGEMENT INFORMATION SYSTEM (EMIS)

To provide community energy management support services and achieve the outcomes of the Energy Poverty Reduction Program, it will be necessary for the Town to collect and monitor energy data, and to manage energy information on behalf of participating program clients. This functionality is achieved through the addition of the energy management information system (EMIS). The EMIS will provide relevant information to households-at-risk, property owners, and municipal departments, enabling them to improve the energy performance of their assets. The EMIS will operationalize the municipality's energy management objectives and provide an efficient means to audit and depict Energy Poverty Reduction Program outcomes.

The principal objectives of the EMIS proposed in the program is to support the municipality's energy management programs through:

- A comprehensive operations, sustainability and planning information system
- Visualizing and understanding the consumption of various types of energy through a set of energy dashboards and other analysis-based tools
- Quantifying energy use of individual home, buildings or processes
- Early detection of poorly performing buildings, systems or processes
- Reporting functions including auditing and the ability to identify performance trends

These functions, and their relationship to client homes and other community energy assets, are visualized in Diagram 6.2.

Features of the EMIS in the EPR system include a user focused web-based dashboard, the storage of data in a usable format, the calculation of effective targets for energy use, and comparison of actual consumption with these targets. Elements include sensors, energy meters, hardware and software, which may already exist as process and business performance monitoring systems.

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

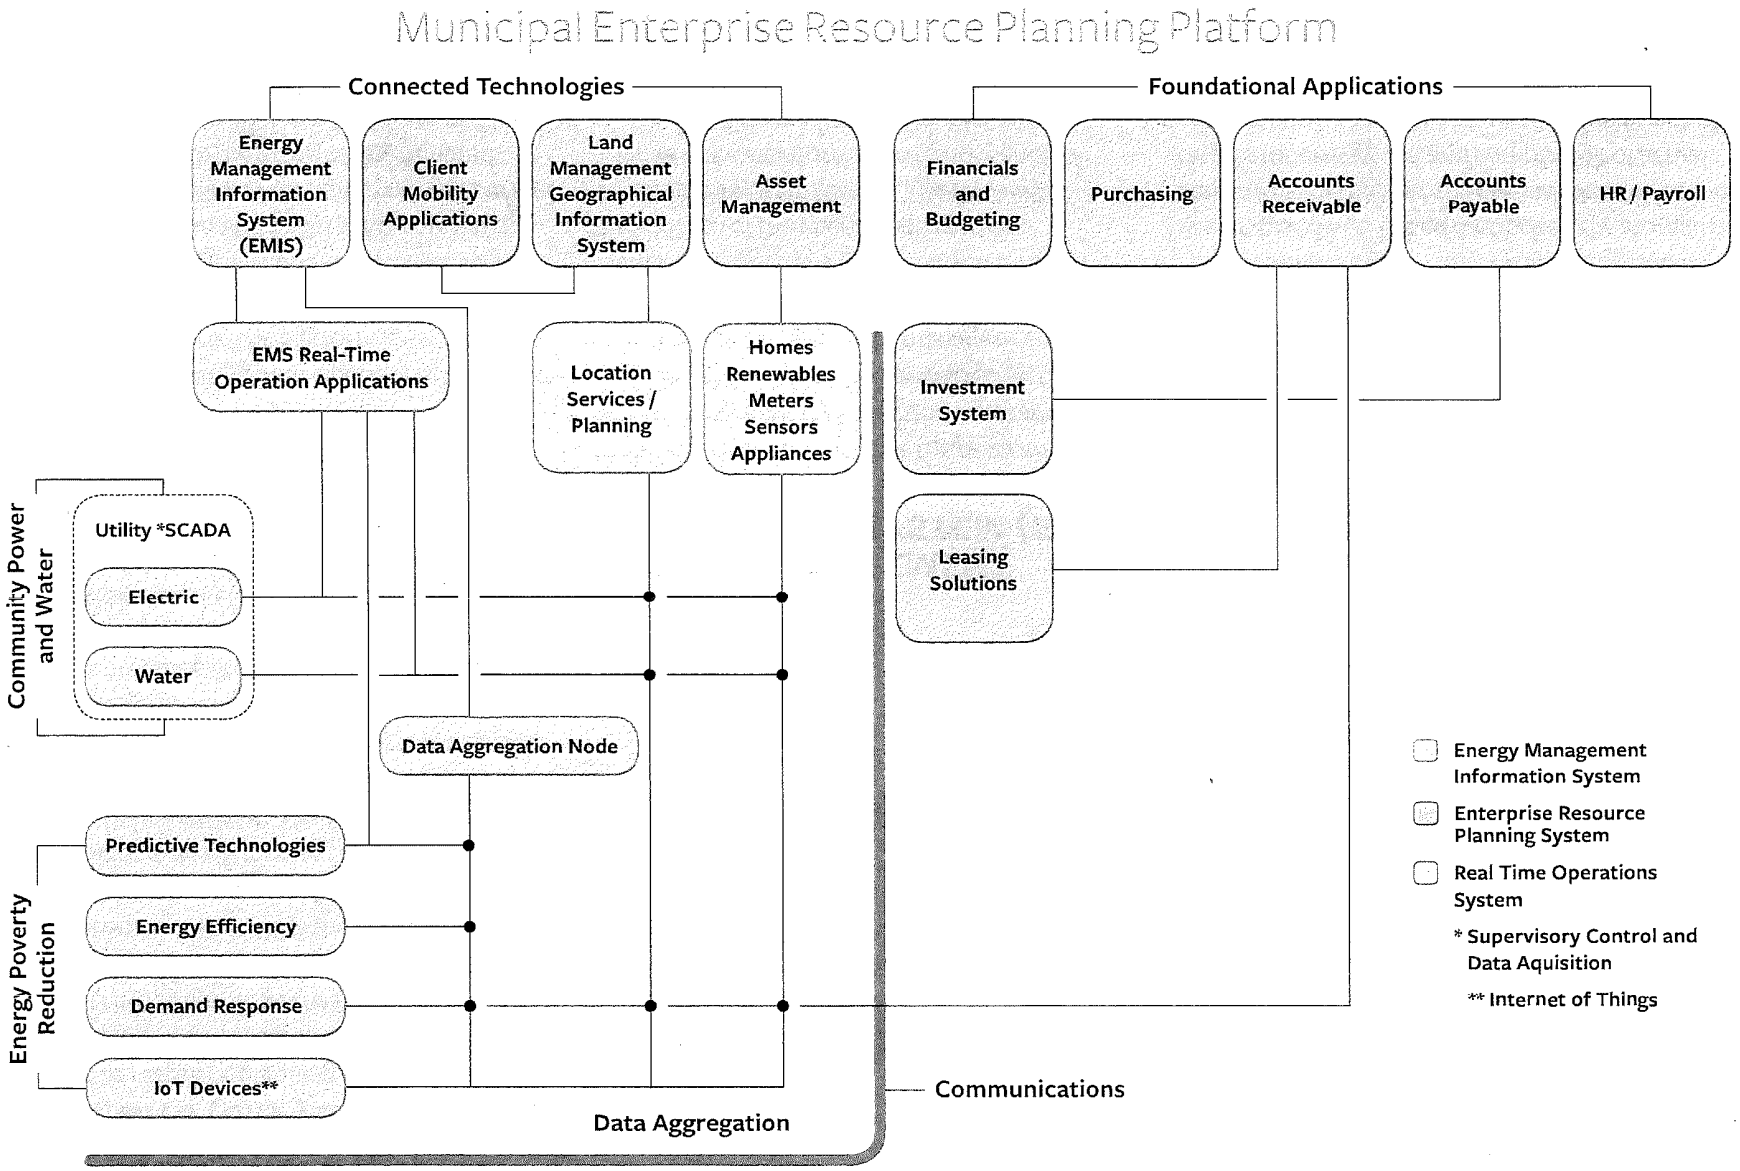

Diagram 6.1

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Energy Management Information System Overview

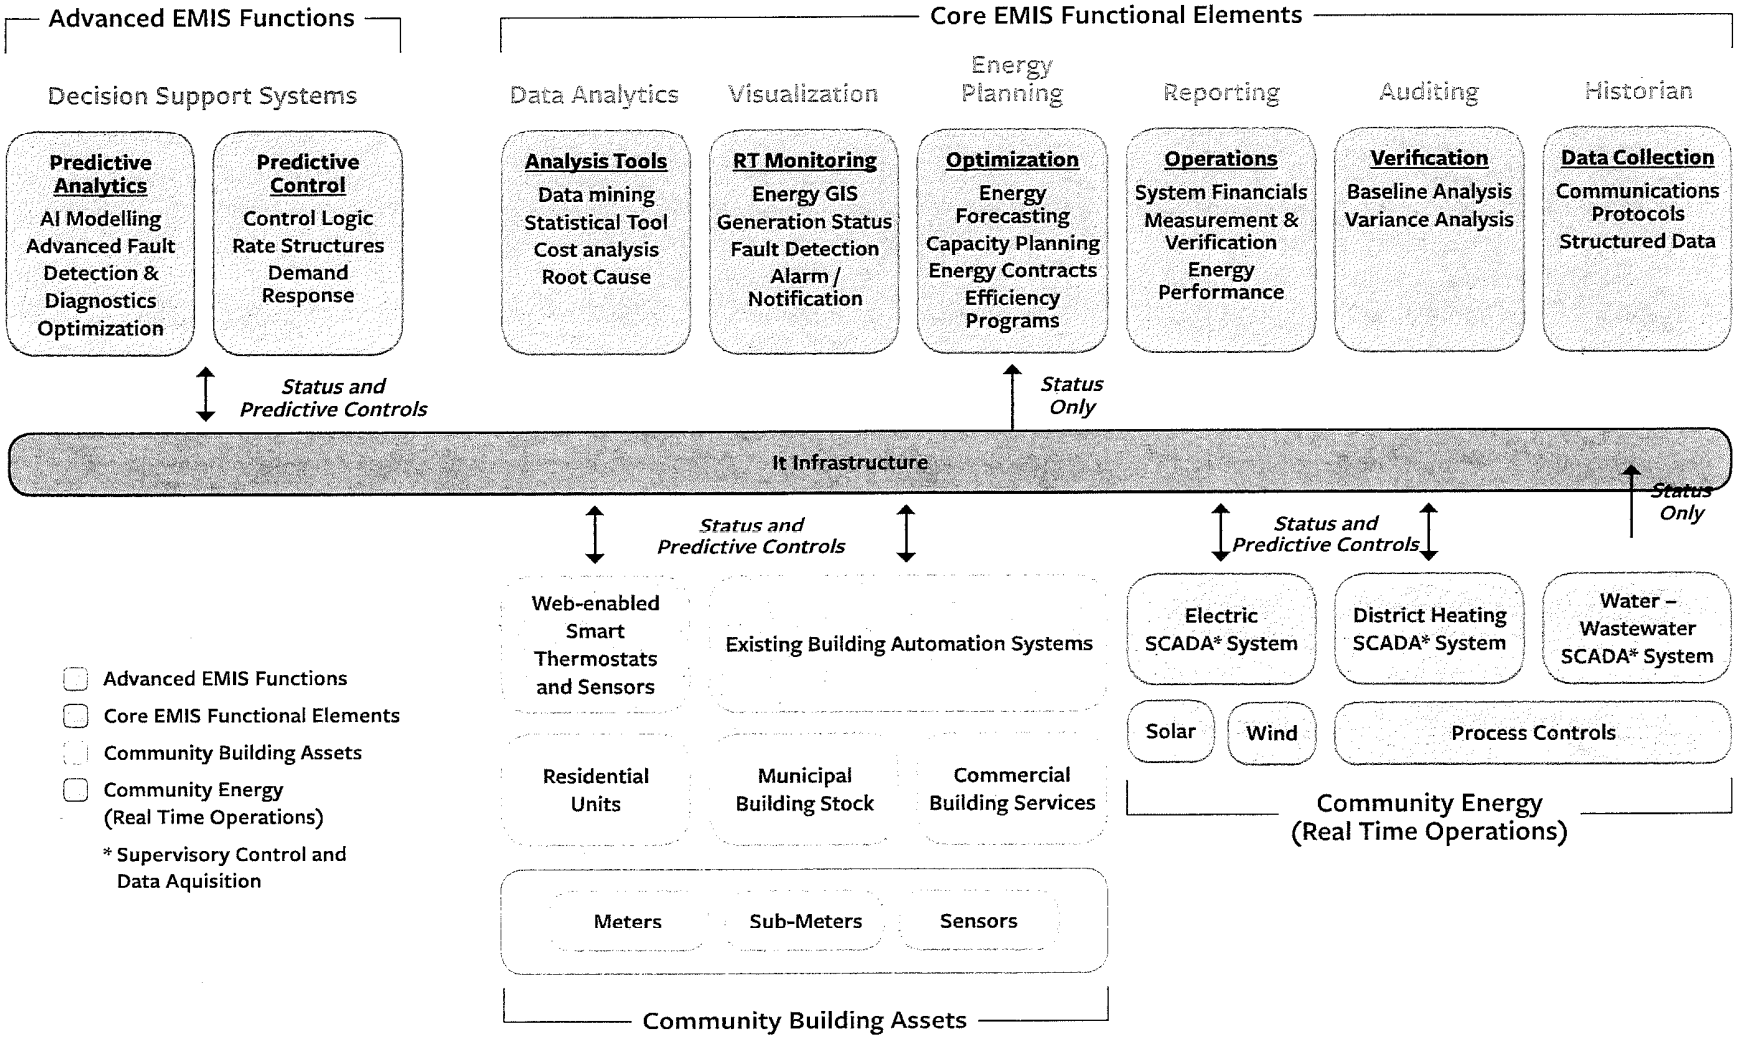

Diagram 6.2

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

EMIS functionality relies on the following three components:

- **Monitoring:** the EMIS coordinates the monitored data flow from all existing real estate and energy assets. It includes energy use, generation and storage for each of the project assets in energy units - expressed in kilowatt hours (kWh) and/or gigajoules (GJ) - as well as carbon footprint - expressed in tonnes. It also includes related energy costs and the costs of energy improvements. Finally, the EMIS also includes exterior environmental conditions such as ambient weather and interior environmental conditions such as room temperature and humidity. To visualize the project outputs and results, the EMIS intends to have a comprehensive dashboard as a key program tool. It also has an advanced historian to archive compressed data without overloading the server.

- **Descriptive Analytics:** a performance and auditing tool that analyzes historical data to define the reasons for past performance successes and/or failures.

- **Predictive/Prescriptive Analytics:** an advanced analytics component that leverages real time operations (RTO) controls of energy assets and utility resources. It combines real time energy data with external data on any scale, which allows it to estimate the future energy consumption patterns of a single home, a multi-unit residential building, a neighbourhood energy system, or even the Energy Poverty Reduction Program or community as a whole. Prescriptive analytics goes beyond predicting future outcomes by suggesting beneficial energy management actions and showing the implications of each decision option.

REAL TIME OPERATIONS (RTO) SYSTEM

The real time operations (RTO) system leverages the value of the program assets and coordinates its controls in real time. The RTO system becomes active at the final stage of the program development when the core operations of its municipal enterprise resource planning system and energy management information system are deployed and in operation. The RTO system leverages the operations of the household and community energy assets in real time thus bringing additional hourly, daily, monthly and annual value to the community.

The two key parts of the RTO system are the supervisory control and data acquisition (SCADA) and the energy management system (EMS).

Supervisory Control and Data Acquisition

SCADA is a category of software application programs and hardware devices for process control. These systems gather data in real time from remote locations in order to control equipment and conditions. SCADA is used in power plants, power distribution, as well as in oil and gas refining, telecommunications, transportation, and water and waste control.

SCADA systems allow the community to:

- control distributed energy resources and industrial processes locally or at remote locations
- monitor, gather, and process real-time data
- directly interact with devices such as sensors, heating ventilation and air conditions (HVAC) equipment, photovoltaic (PV) generators, and more through human-machine interface (HMI) software
- record events into a log file

SCADA systems offer important functionality for the Energy Poverty Reduction Program's more advanced operations as they help to maintain efficiency, process data for smarter decisions, and communicate system issues to help mitigate downtime.

Energy Management System

The main goals of sustainability in the grid revolve around economic operation, reliability, and environmental impact. One of the main advantages of the energy management system

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

(EMS) is that it can supply households with electricity and guarantee the reliability and intelligence of the power system.

The EMS can receive supervisory control signals based on requirements of the main grid. The system's operation policy depends on the ownership structure, connection status and market model.

The major reasons for the RTO-enabling energy management systems are as follows:

- accommodates intermittent distributed energy resources such as solar panels or energy storage in the grid
- reduces grid operation cost and emissions, thereby increasing energy efficiency
- improves grid stability, reliable fault ride-through and seamless mode transitions making the entire system more resilient

RTO - Energy Management Cycle

The RTO energy management cycle, presented in Diagram 6.3, illustrates the power of RTO functions when they work together to reduce energy poverty. This cycle forms the heart of the data and connected technology-driven energy performance improvement process, as communications between smart systems increase energy savings and energy generation. This enhances financial returns, enabling further investments in energy solutions.

CONNECTED TECHNOLOGY APPLICATIONS FOR ENERGY POVERTY REDUCTION

Connected energy technology applications are the practical on-the-ground solutions that work in unison with the data platforms described in the previous sections, and whose functions are enabled and enhanced through those platforms. These applications have a common purpose in reducing energy costs and increasing energy security for Bridgewater residents. They fall into 2 categories: connected energy efficiency solutions and connected clean energy solutions.

CONNECTED ENERGY EFFICIENCY SOLUTIONS

These are digital controls that use advanced analytics to generate energy savings:

- Smart Appliances: a smart appliance is connected to other devices or networks via wireless protocols such as Bluetooth, Wi-Fi, 3G, etc., that can operate to some extent interactively and autonomously. Smart appliances utilize modern computer and communications technology to make functions faster, cheaper and more energy-efficient.

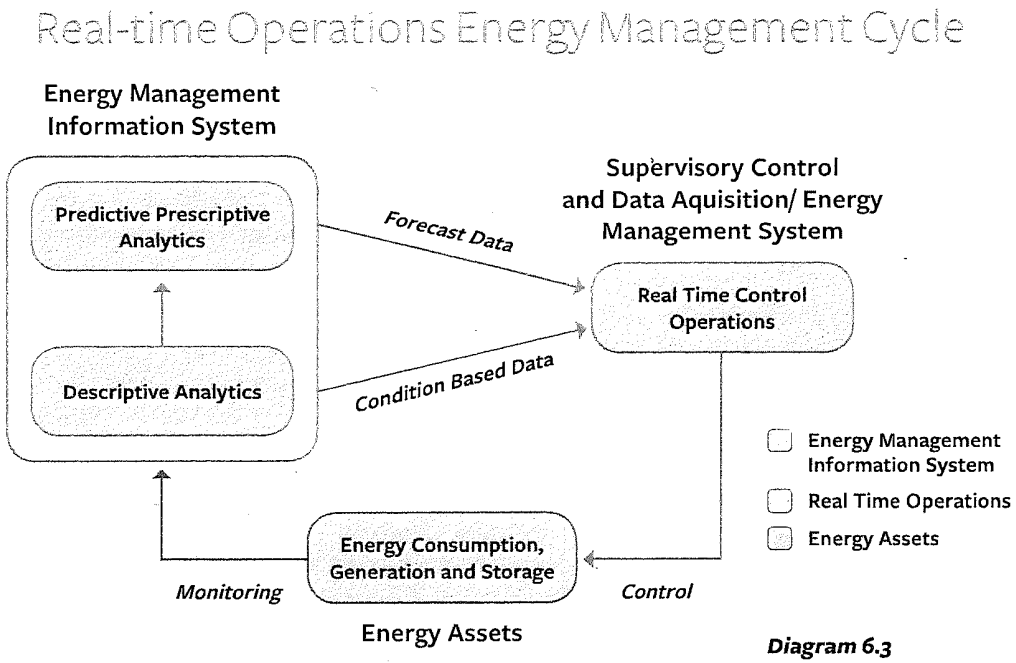

Diagram 6.3

Processed under the provisions of the Access to Information Act by Bridgewater | Technology à l'information

- **Smart Thermostats and Smart Meters for Households:** smart thermostats and smart meters form a two-stage approach to the connected technology strategy. When coupled with advanced analytics and artificial intelligence, smart thermostats can be networked or clustered together in the community to participate in a broader energy management control system.

- **Smart Thermal Optimization:** smart thermal optimization for multi-unit residential buildings (MURBs) improves the efficiency of a building's energy use by anticipating and reacting to the changing weather conditions and requirements for heating and cooling in real time. Because weather and heating/cooling loads can vary significantly throughout the day, the impact of intelligent prediction is significant. This allows for reducing building heating and cooling energy costs by on average by 10% to 25% while improving tenants' thermal comfort.

CONNECTED CLEAN ENERGY SOLUTIONS

Electricity grids are experiencing a major transformation. Connected technologies improving energy efficiency of electrical loads (such as buildings and electric vehicles) and distributed energy resources (like solar PV and energy storage) make grid operations increasingly complex. They also maximize the potential of clean, robust and flexible power grids in a low carbon future. The following connected clean energy solutions allow for the development of residential microgrids, which has a transformative impact on the power grid:

- **Residential Solar PV for Households:** residential solar PV systems can supply households-at-risk with clean, reliable and affordable electricity. When enabled with connected technology, they help coordinate the household's electricity use with the rooftop solar energy generation potential.

- **Combining Solar PV and Storage:** adding energy storage to a grid-connected PV system allows households-at-risk to store surplus solar energy for use later in the day, and provides a back-up power supply in the event of a power outage, thereby increasing energy security.

- **Predictive Energy Management (PEM) for the Community:** an emerging connected technology for reducing energy use for heating, ventilation and air conditioning (HVAC) of houses and buildings while enabling on-site solar energy generation and storage to provide auxiliary services to utilities in real time. It features coordinated supervisory predictive control of energy consumption, on-site generation, storage and ancillary services for hosting utilities. PEM promises to be a flexible distribution system infrastructure that promotes increased levels of distributed renewable energy generation and enables improved control and automation on the electricity distribution grid. The PEM solution also provides flexibility within smart grid implementation to support future innovative applications, such as energy storage, and incorporate principles of modularity, scalability and extensibility into smart grid planning.

FEASIBILITY ASSESSMENT

The feasibility of the connected technology solutions discussed above, has been confirmed by the research done in this final application development stage. Town of Bridgewater and our Townsuite Municipal Software service provider have experience and expertise with advanced ERP systems. We can confirm that key features of the software are well known, understood and tested in the municipality.

The EMIS Planning Manual and Tool[4] and the Canadian Industry Partnership for Energy Conservation (CIPEC), as well as EMIS practices and documentation have been reviewed by our technical team. The NRCan's EMIS approach is

[4] Developed and tested by Natural Resources Canada

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

based on innovative energy management and strong experience in the industry and makes the proposed EMIS completely feasible for the Town of Bridgewater, and a new standard for municipalities in Canada. The key innovation in the Energy Poverty Reduction Program is related to high resolution predictive analytics and its focus on improving lives of at risk households rather than those who can afford it.

The real time operations (RTO) system for the Town of Bridgewater is based on digital SCADA coupled with energy management systems (EMS). These systems are used in many industries throughout Canada and abroad, thereby strengthening the program's ability to be replicable and scalable. Based on a review carried out by the program's technical team the proposed digital SCADA/EMS combination is highly feasible for municipal utility applications.

OPEN TECHNOLOGY PRINCIPLES AND ARCHITECTURE

One of the major inhibitors to the adoption of connected technology in smart buildings and smart cities has been the lack of interoperability between different building systems. The program's connected technology solution ensures that all connected devices are speaking the same language, allowing them to 'talk' to each other and exchange information.

Adopting open protocols for houses and buildings, such as LonWorks or ASHRAE's open-source BACnet, allows all systems to communicate in a common protocol language. These common protocol languages define the arrangements under which devices and systems interact and communicate with each other.

One key advantage of open standards architecture and open protocol systems is that they enable the integration of new devices and internet of things (IoT) sensors and systems, as long as these devices also communicate using an open protocol language. A building that adopts open architecture standards is, therefore, effectively 'future-proofed' against vendor-generated proprietary constraints through the international standard EN62402 Obsolescence Management Safeguards. Thus, new functions and devices can be easily installed when enabling technologies are developed. This is further supported by our commitment to a local workforce that will be trained to implement and operate the technologies and systems going forward.

GENERATING INTELLECTUAL PROPERTY

The program will generate intellectual property (IP) for the community and the households-at-risk related to social and technical navigation, solutions, services, and related connected technology. The program team recognises that free access to, and reuse of, these open licences is an essential part of making the program replicable to other communities and the Town is committed to sharing IP so long as privacy is not compromised.

The program will support the distribution of connected technology IP through:

- the release of IP for connected technology using open licences or other relevant instruments - while respecting intellectual property rights - so that no restrictions or charges are placed on the re-use of the information for non-commercial or commercial purposes, save for exceptional circumstances;
- the release of IP for connected technology using application programming interfaces (APIs), where appropriate, to ensure easy access to the most regularly updated and accessed connected technology; and
- encouraging innovative uses of our IP for connected technology through mentoring for its users nationally and internationally.

TECHNOLOGY IMPLEMENTATION PLAN

TECHNOLOGY IMPLEMENTATION TIMELINE

The timeline for the program's connected technology solution is described in Table 6.1.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

STANDARDS AND GUIDELINES

Enterprise resource management, EMIS, SCADA/EMS, and connected technology guidelines and standards will be communicated to, coordinated with, and confirmed by connected technology partners, vendors and energy service providers to ensure full technology interoperability where necessary.

These standards and guidelines will also be discussed with and confirmed by the connected technology partners, vendors and energy service providers to ensure and guarantee the replicability and scalability of program during the Smart Cities Challenge timeframe, toward 2030, and beyond.

The following standards and guidelines have been thoroughly reviewed for consideration:

- Canadian Standard on Enterprise Resource Planning Systems
- ISO 50001 Energy Management Systems Standard
- The International Society of Automation - Standard ISA112 SCADA Systems
- International Electrotechnical Commission - IEC 61968 Standards Based Integration for Distribution Management System
- Natural Resources Canada - Energy Savings Toolbox
- Natural Resources Canada - Energy Management Information System

ROLES AND RESPONSIBILITIES OF TECHNOLOGY PARTNERS

The program team over the finalist proposal phase has built strong relationships with a variety of connected technology solution partners and has communicated accessibility and usability of the connected technology solutions to the households-at-risk, community energy owners/operators, energy service providers, investors, and other stakeholders that support their uptake and acceptance in the program. This allows the program team to keep confident in the commitments of the partners during the program timeframe and towards the community's long-term objectives, to ensure the value to the households-at-risk and to the municipality, and to enable and train the municipal and community services' workforce. These partners are identified in the **Project Management chapter.**

Technology Implementation Plan:
Energy Poverty Reduction Project Connected Technology Solution Timeline

Relationship to Smart Cities Challenge (SCC)	**Within SCC Program & Funding**			**After SCC**
Phase	1: Prototype Program Setup	2: Prototype Program Testing & Refinement	3: Final Program Activation	4: Program Maturity
Timeframe	2020-2022 (2 years)	2021-2024 (3 years)	2024-2025 (1 year)	2025-2030 (5 years)
Municipal Enterprise Resource Planning (ERP) System	Definition and Deployment of Modifications to Existing ERP Module	Definition and Deployment of EMIS Connectivity	Full Operation	Full Operation
Energy Management Information System (EMIS)	Definition and Deployment (houses)	Development and Deployment (MURB) RTO Monitoring/ Analytics Integration	Full Operation	Full Operation
Real Time Operations (RTO) System	Municipal RTO System Design	Deployment and Testing (houses, MURB and municipal buildings) Community Energy Integration	Full Operation	Full Operation

Table 6.1

Page 989 of 1849
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The Town of Bridgewater proposes that the use of data and connected technology will catalyze energy related activities and outcomes. The data platforms selected will apply industry best practices to secure highly sensitive data collected from the Coordinated Access System, Municipal Enterprise Resource Planning (ERP) platform, Community Energy Systems, and Investment Systems. Further, it will defend against security breaches and protect personal information and privacy. Through continuing Energy Poverty Reduction Program efforts, Bridgewater will demonstrate to the community a commitment to responsibly managing data through its lifecycle with security and privacy considerations addressed.

ENERGY POVERTY REDUCTION DATA

DATA TYPES AND SOURCES

The Energy Poverty Reduction program expects to process data related to the following groups: household, property/asset, energy efficiency solutions and services, and investors.

TYPES AND METHODS OF DATA PROCESSING

The types and methods of data processing in the program include collection, generation, analysis, storage, and transmission of important data related to existing foundational ("legacy") technologies and connected technologies.

- **Open data:** this is all data that is (a) non-privacy-restricted and non-confidential, (b) produced with either public or private resources and (c) made available without any restrictions on its usage or distribution. The municipal methodologies to manage open data are an open data portal and an open data policy.
- **Personal information, personal health information, and non-personal information** (as defined in *FOIPOP act*): this is data that is restricted and/or licensed and requires permission to be published or distributed; it includes data held privately because its value has not yet been identified. The municipal instruments to manage private data are data security and privacy policies, procedures, legislation and regulations, as well as authentication and access controls.
- **Commercial data:** these are all types of licensed data with a financial value for use and distribution. Commercial data may be produced with either public or private resources. The municipal instrument to manage commercial data are data security and privacy policies, procedures, legislation and regulations, contracts, licenses, data transaction platforms, and data policies and principles.

The program's data platform concept also enables re-use and re-distribution of data, as well as derivative production, archiving, and preservation of data that reflects the entire data lifecycle in the Energy Poverty Reduction Program's design. This includes individual data related to households-at-risk processed in the Coordinated Access System, energy poverty reduction solutions and services data as well as energy use, generation and storage and environmental data processed in the municipal enterprise resource planning (ERP) platform, investments and other related data processed by the Investment Systems.

DATA USE

Accurate and timely data disseminated through technologies described in the **Technology chapter** is a crucial component to all 5 systems defined in the VISION chapter for the following reasons:

- **Community Energy Systems:** Energy produced by these systems credit participating household energy use.
- **Housing Energy Management Systems:** Energy use from the household level down to the appliance level define energy savings and promote it through demand-side-management and analytics.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- **Coordinated Access Systems:** Data stored in the system streamlines Town and community service organization operations.

- **Mobility Improvement Systems:** Data shared through the above systems allow Town Planning and Operations to increase the ability of at-risk residents meet their mobility needs.

- **Investment Systems:** Energy savings and production earnings need to pass to investors in accordance to investment offerings.

DATA SECURITY

In alignment with the philosophy of "privacy by design", the program has applied focused efforts to integrate data security and privacy considerations into the project design; this was particularly important for the households-at-risk but is valued by all stakeholders.

The Town of Bridgewater and/or contracted proponents will control and own all data collected using the program's data platform including any modifications, improvements, and derivatives of such data. The data is personal and confidential and will not be disclosed or made available unless approved by the Town of Bridgewater. This data will be assessed using a Threat and Risk Assessment methodology prior to holding any live data.

IDENTIFICATION OF RISKS

Through the development of this application, we have been progressing with the identification of risks and the development of appropriate mitigating strategies for data management of the households at-risk of energy poverty. This includes completion of a preliminary Privacy Impact Assessment as part of this proposal.

ENERGY POVERTY REDUCTION DATA PLATFORM

CONCEPT

The Energy Poverty Reduction data platform will harvest the data generated by energy efficiency and clean energy solutions for households-at-risk, inform decision-making of households, the municipality and the stakeholders, and will advance and improve the performance and application of the connected technologies used. The Energy Poverty Reduction Program will also leverage its resources to build and maintain in-house analytics. The Town will develop an Energy Management Information System (EMIS) to collect, process and analyze the data provided.

STRUCTURE

The Town of Bridgewater sees the program's data platform as a leading smart city platform ensuring interoperability of/integration with existing federal, provincial and community data platforms and has identified high quality candidates for these functions.

> We understand that data and connected technologies can tremendously benefit cities or small communities enabling the discovery and more in-depth understanding of the needs of the local population
>
> - DALHOUSIE UNIVERSITY PROFESSOR

The data platform will include three major components: Coordinated Access System, Municipal Enterprise Resource Planning (ERP) platform and Investment Platforms.

The Coordinated Access system is planned to allow community organizations and service providers to collect and manage personal and personal health information on clients who are housing-insecure or homeless. This data platform will reside outside of the Town's municipal services and be used by community partners for the Coordinated Access System that would support households at risk.

The connected technology solutions enabled through the ERP platform will coordinate the households and the municipality's real estate and energy assets and energy solutions. This will be a split internally- and externally-accessed platform providing all necessary analytics and controls data for real time and planning/ reporting operations.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information
Page 991 of 1849

There will be an internal and external investment platform orchestrated by an Investment Navigator. Community and traditional investment data will be housed in a secure database, abiding to federal and provincial rules and regulations hosted by an organization procured by the town.

FUNCTIONALITY

The data platform provide the following functions:

- **Acquisition/Interconnection:** These provide data capture mechanisms from the collection systems.
- **Data/Knowledge:** These support data processing, adding value and transforming information into knowledge.
- **Interfacing:** These enable access to information at different levels.
- **Service support:** These coordinate all the possible services involved in each action developed out of interoperability functions.
- **Security and management:** These provide horizontal functionalities such as audits, monitoring and security.

Two key interfaces allow for communication between the above group of functions:

- **Acquisition:** This interface with the program data platform enables information collection from the external elements.
- **Interoperability:** This interface with the program data platform enables communication with external data providers and the third-party computation systems.

INTEROPERABILITY WITH CONNECTED TECHNOLOGY SOLUTIONS

DATA SERVICE PLATFORMS ENABLED BY CONNECTED TECHNOLOGIES

The Energy Poverty Reduction Program data platform will have access to different information sources, share resources, analyse capacity and coordinate services, usually based on predictive analysis. The concept referred to as "horizontality" is to be applied to the program. Through "horizontality" information from various sources interact with one another in order to provide streamlined services and operations.

INTEROPERABILITY WITH DATA SERVICE PLATFORMS

Data service platforms enabled with connected technologies provide various services in specific areas. These service platforms (known as "verticals") are provided by supervisory control and data acquisition (SCADA) or more complex platforms. Most of the time these platforms are independent and do not share resources, or they do so sparingly.

The introduction of the program's data platform will enable the integration and optimization of vertical service platforms and facilitate the exchange of information and resources between these vertical service platforms. On one hand, the resources and systems used by the vertical platforms supporting the same functions can be pooled and on the other hand, the information that is stored and processed by one vertical platform can be used by the others, enabling the generation of cheaper, more valuable and more complex services.

Vertical platforms will be integrated with the program's data platform in two ways. They can be deployed inside the program or can be integrated using open interfaces, in which case the processes and resources required by the vertical platform could not be deployed inside the Energy Poverty Reduction program.

Open interfaces are required to interconnect the program's data platform with other municipal platforms enabling other systems to interoperate with the program more efficiently. In the integration process some resources, such as data source, can be shared. Since the services can access more data sources, it is possible to create new services and improve those that already exist. Predictive analysis is also facilitated, because more data sources are accessible.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The program's data platform could interoperate with external providers' platforms, and its interfaces are required to be adapted. The adaptation of these interfaces will depend on the type of platform.

DATA PLATFORM SECURITY

The Town of Bridgewater will control and own all data collected by the Energy Poverty Reduction Program data platform including any modifications, improvements, and derivatives of such data. The data is personal and confidential, and thus will not be disclosed or made available unless approved by the Town of Bridgewater. At all times the program's data platform and related technologies must be compliant with all applicable privacy legislation provincially. Cyber management is examined in further detail in the preliminary Privacy Impact Assessment (PIA).

NETWORK SECURITY

The network provider will take a number of steps to ensure the security of their networks. A dedicated team of security professionals will focus on network security and security governance. This will include, but is not limited to, multiple levels of security such as service security authentication mechanisms, secure access to client locations/sites, change control validations/ processes/policies and network monitoring tools/ applications/audits. This will be confirmed through the completion of a Threat and Risk Assessment. The Office of the Information and Privacy Commissioner for Nova Scotia (OIPCNS) has outlined the importance of designating a Chief Security Officer who is responsible for security: IT system maintenance and security, security awareness, ensuring digital and physical security, etc. for both the program and municipality. The Town will act on this recommendation as part of the detailed program design.

RESILIENCY

The Energy Poverty Reduction data platform will ensure the ongoing operation of services according to established service level agreements. These services may require availability 24x7 and a service level of over 99.9% annually. Providers may offer solutions complying with these requirements.

CYBER THREATS MANAGEMENT

Cyber threats to the program's data platform will be addressed through cybersecurity scanning and tests in the Platform, for threats such as malware, phishing, spear phishing, lost or stolen devices, distributed denial of service.

OPEN DATA AND BIG DATA STRATEGIES

THE OPEN COMMUNITY

The municipality's need for transparency and accountability has always been seen as fundamental by the Town of Bridgewater. The community is very supportive of the Open Government Partnership (OGP) created in 2011 and having Canada among its 75-member countries.

OPEN DATA FOR THE ENERGY POVERTY REDUCTION PROGRAM

The Town will make certain data types open to public stakeholders through online portals. This will come at no cost to the user and a standard license to allow re-use and distribution may apply.

Municipal data, like any data collected by public institutions, are subject to privacy legislation for personal information and other restrictions which limit it being made public (e.g. intellectual property).

The program defines the data spectrum including closed data (internal access), shared data (with group-based access) and open data (with public access and open to everyone).

The program data management addresses important Open Data strategy development related to high resolution environmental data and data analytics, public housing and mobility data and data analytics as well as public data on energy efficiency and clean energy solutions and services for the Bridgewater community.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

COMMITTING TO G8 OPEN DATA CHARTER: BEST PRACTICES

The EPR project is committed to all 5 Open Data Charter[5] best practice principles, in accordance with Federal and Provincial legislation and regulations.

BIG DATA STRATEGIES

Big data that is collected through the Energy Poverty Reduction Program will allow municipal policies makers to make decisions based on real information, enabling them to further improve energy performance, related energy use, mobility and transportation decisions, etc.

PERSONAL DATA AND INFORMATION PRIVACY

PERSONAL INFORMATION FOR ENERGY POVERTY REDUCTION

The Smart Cities Challenge approach uses real-time and actionable data to inform the operation of community-wide systems and services. The Energy Poverty Reduction Program demonstrates the inclusion of measures to protect personal information and privacy and respects the fair information principles.

Personal information is data about an "identifiable individual." It is information that, on its own or combined with other pieces of data, can be used to identify a specific individual. In some circumstances, information that may appear to be non-identifiable may still qualify as personal information if there is a risk of re-identification. See Preliminary PIA for *FOIPOP act* considerations.

Health information in the Energy Poverty Reduction Program can include, items as defined by Nova Scotia's PHIA act. See Preliminary PIA for PHIA act considerations.

The program's information will be combined and analyzed with data from different sources and could become identifiable personal information. To mitigate this risk, the program team will seek to de-identify personal information at the earliest opportunity, and always pursue the least privacy-invasive options wherever possible. See the Preliminary PIA for further details surrounding data consent, data sharing opt-out options, server locations, data ownership and governance, safeguards and transparency.

HOMELESS INDIVIDUALS AND FAMILIES INFORMATION SYSTEM (HIFIS)

The Homeless Individuals and Families Information System (HIFIS) software is owned by Service Canada which it shares nationally with communities to assist services delivery agencies track and report on their efforts, ultimately supporting vulnerable households; those who are homeless or at risk of being homeless. The HIFIS system is undergoing upgrades to a cloud-based system allowing for fluid information sharing between services organizations. Individuals seeking homeless related services, through local service providers, no longer have to repeat their stories multiple-times to each party, as their HIFIS profile is now shared amongst services organizations granted the client provides consent. Two service organizations within the Town currently use HIFIS (Freeman House and Second Story Women's Centre), and it's expected this number will grow as the newest iteration rolls out.

Through attending a HIFIS training session, correspondence with community service organizations, dialogue with the Affordable Housing Association of Nova Scotia (AHANS), and examining research that suggests energy poverty contributes to housing insecurity, the Town has identified HIFIS as being a key component to the Energy Poverty Reduction program. One has the ability within HIFIS to create unique fields and surveys, for specific programs, which can be partitioned off from other community service programs and organizations at the household's request. The Town will create its own survey and fields for the purposes of tracking program outcome indicators.

[5] G8 Open Data Charter: Technical Annex https://opendatacharter.net/g8-open-data-charter/

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Energy meters on the side of an apartment building.

This data platform would reside outside of the Town's municipal services and an agreement would need to be established between the municipality (or to be determined service organization) and AHANS, who has a contract with Service Canada, or Service Canada itself. This would allow our household indicators to be stored on AHANS's HIFISNS Network host (Canada Web Hosting) which meets Federal Government security standards.

The Office of the Information and Privacy Commissioner for Nova Scotia (OIPCNS) has outlined their concerns related to HIFIS . These concerns include creating a more robust view of a household through information gathered by the program and potentially Federal government access to this information. The Town will address these concerns through a Privacy Impact Assessment (PIA) as outlined in the Preliminary PIA.

PRELIMINARY PRIVACY IMPACT ASSESSMENT

To support the selection and design of a comprehensive data management system, the Town of Bridgewater developed a preliminary privacy impact assessment (PIA) for the Energy Poverty Reduction Program. The PIA includes a map depicting all of the program's anticipated data flows for the key project activities: Intake, Service Delivery, and Monitoring and Analytics and qualified their associated security and privacy risks. While developing the preliminary PIA the Town of Bridgewater staff actively consulted with the Office of the Information and Privacy Commissioner (OIPC) of Nova Scotia to ensure that the program design conforms with all applicable privacy laws and best practices. Project staff also worked with the Town's Finance Department and the Municipal Joint Services Board (MJSB – IT Services) to ensure that project IT needs can be met and are compatible with existing services and infrastructures.

Through the PIA, the Town of Bridgewater demonstrates that relevant privacy authorities were consulted, and their guidance was considered during the program and application development. The PIA reviews and supports the Energy Poverty Reduction Program's compliance with relevant municipal, provincial/territorial, and federal privacy regimes.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Page 995 of 1849

ENGAGEMENT ACTIVITIES UNDERTAKEN TO DATE

INITIAL APPLICATION PHASE: JANUARY – APRIL 2018

We looked to the public to teach us about energy poverty, their experiences, core concerns, and suggestions on how a Town strategy could reduce energy poverty. Feedback from over 200 residents reinforced public support for reducing energy poverty. The submission of the Town's initial application to Smart Cities Challenge, and its eventual selection as a Finalist, was met by enthusiastic support from the community and our stakeholders, a support that has continued to grow continuously over the course of the Final Application development phase.

FINAL APPLICATION PHASE: JUNE 2018 – MARCH 2019

We produced a comprehensive Community Engagement Plan that identified the project's primary stakeholders and identified the outcomes of the program that were relevant for each group. For each group, it planned a schedule of engagement activities, complete with desired engagement outcomes. The Community Engagement Plan was implemented through the following activities:

1. Energy Poverty Research Program

This program sought to document and better understand the lived experience of energy poverty. It included the following:

Interviews: 20 interviews were conducted, consisting of 12 women and 8 men with a broad age distribution of 18 – 65 and over; 75% of interviewees were renters, 10% lived in affordable housing, and 15% owned their home; and 12 participants received income assistance and 8 did not.

Focus Groups: 57 individuals participated in the focus groups, consisting of 38 females, 16 males, and 2 transgendered females; 45 renters and 11 owners; and 50% of participants were on income assistance.

Key Findings:

- Many individuals living in energy poverty have developed energy management strategies for dealing with their energy burden;
- Several demographics are more at-risk for energy poverty including: single mothers, African Nova Scotians, seniors, and those with health conditions and disabilities;
- Energy poverty has a severe impact on a household's ability to spend on other essential goods and services, forcing trade-off decisions on food, health, and entertainment;
- Residents are highly supportive of long-term community-based solutions which provide greater access to quality housing, affordable energy, and greater mobility options.

The research program provided the opportunity to build early relationships with our eventual clients and include our learning into the program design. To promote involvement, the Town offered an honorarium of $20/hour for program participants.

2. Engagement of Community Stakeholders

Workshops. A series of 8 workshops involved open discussion on almost every component of our application. Over 30 organizations have been represented at workshops, with over 140 representatives in attendance. Some of the key learning outcomes that were achieved through the workshops include:

- Service organizations with a diverse range of mandates identified energy poverty as one of their clients' key challenges and a core service priority;
- Service organizations endorsed addressing the systematic causes of energy poverty;
- Data and connected technology solutions were identified as essential to increasing collaboration and efficiency of resource allocation for service organizations.

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

Interviews: We undertook 15 one-hour interviews with representatives of partner organizations. From these interviews we learned that:

- Partners have insufficient resources to address the basic energy, housing, and transportation needs of their clients;
- Partners are supportive of a coordinated access system for their clients;
- Spending on energy related services constitutes a large portion of many organization's budgets;
- To reduce costs, there needs to be a shift from spending on emergency services to preventative services.

3. Engagement of the Public at Large

The Town involved a substantial number of individuals by utilizing a range of in-person and online engagement activities.

Youth Video Documentary: The Town worked with the HeartWood Center for Community Youth Development, the Department of Community Services, and Picnic Studios to bring together a video team comprised of 5 youth-at-risk from Bridgewater and area. The youth team created a video documentary called *Living in Energy Poverty* which was premiered at an Open House on January 17, 2019. Parts of the footage was incorporated into the Town's 5-minute Smart Cities Challenge video pitch. The documentary has received regional recognition for how it captured the lived experience of energy poverty and was featured in a CBC Nova Scotia article about energy poverty in Bridgewater.

Community-Wide Paper Survey: A paper survey yielded a total of 585 responses, representing 15% of Bridgewater households. Important program information received through the survey included:

- 38.5% of respondents said that they had difficulty affording energy costs and spent more than 10% of their after-tax income on energy and transportation costs. This indicator will act as a baseline to track our energy poverty rate as part of program performance and measurement.
- Responses were tracked by housing type and neighbourhood, which informed the mix of housing ages, forms, and heating systems used to inform this proposal's financial outcomes and energy analysis.

Thematic Surveys: We received a total of 278 responses from 4 different thematic surveys, covering housing; transportation; health; finances; and employment and training. Some of the key findings from the surveys include:

- 74% of respondents stated that they had faced difficulty paying rent, energy bills, or transportation in the last five years;
- Middle income households can also suffer from energy poverty.

Social Media: Town staff routinely engage residents using social media to answer questions, and provide further information related to the Energize Bridgewater and Smart Cities Challenge programs.

Video and Image Media: 10 videos were produced to document the Town's workshops with partners, engagement with residents, and illustrated the Town's application. This content was shared over the Energize Bridgewater and Town of Bridgewater social media pages. An interpretive exhibit was created that featured quotes shared by participants from interviews and focus groups. The exhibit has been displayed in four locations across town to initiate further engagement with the community on energy poverty.

Open Houses: On January 17, an open house was held for the public at large that premiered the youth video documentary described above. On March 29, a final open house will explain the community's final application to the public.

ENGAGEMENT PRINCIPLES GOING FORWARD

The design of the community engagement approach for the Energy Poverty Reduction Program is founded on 5 principles:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ATIA - 21(1)(b)

1. **Consideration of full-spectrum needs:** engagement efforts will be designed based on an integrated understanding of the needs and aspirations of program clients and partners. This ensures that their voice matters, and that emerging risks and challenges are addressed in a timely fashion. Design and evaluation of engagement efforts will consistently refer to the broad set of desired program outcomes.

2. **Inclusion and accessibility:** these principles will continue to inform the design of the program. Ongoing efforts to understand the needs of clients, use a trauma-informed lens for service design and delivery, evaluate which voices are not being heard, and challenge assumptions and stereotypes, will help meet inclusion goals. The accessibility of the program will also constitute an important evaluation criterion for program partners, in particular the Coordinated Access System and the Housing Energy Improvement System.

3. **Empowerment:** the central purpose of the program is to enhance energy management capability for program clients and throughout the community. This principle extends toward ensuring that program clients have a say in program design, delivery, and evaluation. It is operationalized through engagement structures such as the Client Advisory Circle and the role of the Ombudsperson, continuous feedback from clients and partners, and the use of connected technologies to better access information and communicate needs. For program partners, it means participation in the program governance structure, and through ongoing feedback and evaluation processes.

4. **Consent:** obtaining informed consent to receive program services and to share data is critical for fostering trust and encouraging participation. The Town and its service delivery partners must ensure that clients are appropriately informed about the services that they will be receiving, as well as their rights and responsibilities as clients.

5. **Navigation support:** the provision of extensive navigation services is necessary to help clients overcome difficulty in navigating community and government support systems and bureaucracies. The Household Navigator, working through the Coordinated Access System embodies this principle for households-at-risk, as do the Technical Navigator and Investment Navigator roles for property owners and investors, respectively.

PROGRAM CLIENTS, STAKEHOLDERS, AND ENGAGEMENT TOOLS

Energy Poverty Reduction Program stakeholders are described below, along with engagement objectives and tools that have been tailored to their needs:

Households at Risk of Energy Poverty

Currently estimated at 38.5% of Bridgewater's population, these residents are a primary client of the program. Engagement objectives and tools:

1. ***Ensure that clients' voices and needs are heard as part of the program design and evaluation.*** Engagement activities include representation on the Client Advisory Circle, active participation in program design through focus groups, interviews, surveys, and service testing, and through feedback from program partners who serve these clients.

2. ***Connect clients to the community and energy services they require.*** Engagement activities will be driven by the Coordinated Access System and its Household Navigators. It will provide high quality, accessible services that are designed specifically with an eye to serving the broad range of needs and levels of urgency experienced by households-at-risk. In delivering coordinated access services,

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

clients will be educated on their options, rights and responsibilities in sharing their personal data. A Communications Strategy will be developed to attract clients.

3. ***Empower clients to better manage their energy systems.*** Engagement activities will include the provision of energy management services for clients who are also homeowners, and referral of landlords to these services if the clients are renters. A home energy 'dashboard' will be provided to clients, with an ever-growing set of energy management solutions as those become available from the evolving Energy Management Information System and community energy systems. Clients receive energy management training to build their skills and knowledge, and to share with other clients those energy management practices that they have already developed and refined.

Property Owners

Bridgewater property owners whose properties are inhabited by households-at-risk of energy poverty are a primary client of the program. Engagement objectives and tools:

1. ***Ensure that clients' voices and needs are heard as part of the program design and evaluation.*** Engagement activities are the same as for households-at-risk.

2. ***Connect clients to the technical solutions they require.*** Engagement activities will be driven by the Housing Energy Management System and its Technical Navigators. High quality, accessible services will be provided, with attention to the needs of landlords to help them overcome split incentive issues that often complicate energy improvement efforts. Clients will be educated on their options, rights and responsibilities in sharing their personal and property data. A Communications Strategy will be developed to attract program clients.

3. ***Empower clients to better manage their energy systems.*** Engagement activities are the same as for households-at-risk.

Investors

Program capitalization will be achieved by attracting and retaining investments from specialized funders, as well as traditional and community investors. Engagement objectives and tools:

1. ***Ensure that investors' voices and needs are heard as part of the program design and evaluation.*** Engagement activities will centre around direct outreach during the program design and prototyping phases to ensure that program outputs, outcomes, and financial returns represent adequate value for investment.

2. ***Achieve investments for the program.*** Engagement activities will centre around continuous outreach, marketing, and reporting to investors. Investors will learn about investment opportunities and their benefits, including the ability to leverage further funding, and to reduce long-term costs to these agencies through efficiency gains that come from coordinated housing improvements and community services provision. Traditional and community investors require detailed financing prospectus documents to attract their investment interest. Maintaining investor relationships is a key activity for the Investment Navigator and the Financial Investment Vehicle.

Service Delivery Partners

Program governance and service delivery will involve multiple levels of relationships with project partners and service providers. Engagement objectives and tools:

1. ***Develop a strong and committed partner network.*** Engagement activities will involve building on existing relationships with essential program partners such as Efficiency Nova Scotia,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

TownSuite Municipal Software, the South Shore Housing Action Coalition, Family Services of Western Nova Scotia, and others. Stakeholders will continue to advise on goals, metrics, data needs and benefits, use cases for data, budget, policy, operations, end-user needs, and program governance. Partners will be invited to apply to the Energy Poverty Reduction Program Steering Committee and Technical Advisory Committee to support the program's governance and advisory functions as described in the **Governance chapter.** Broad participation from community partners will be required to design the Coordinated Access System and to provide access points throughout the community. Led by the Program Coordinator, ongoing evaluation processes with partners will ensure continued engagement.

2. ***Maintain program quality and manage risks.*** Once program services have started, engagement activities will revolve around quality control and evaluation. All service delivery partners will be involved in the processes described in the **Project Management chapter.** This will extend to engagement with regional trade networks and supply chain capacity building.

Acadia First Nation

The Town of Bridgewater is in Kespukwitk (Land Ends) on the unceded territory of the Mi'kmaw. Acadia First Nation (AFN) is the Mi'kmaw Nation within whose territory Bridgewater is located. Guided by the Community Engagement Plan, Bridgewater Town Council issued a formal expression of interest in 2018 to initiate government-to-government relations with AFN. The Town will **continue to develop this relationship.** Engagement activities will focus on cultural exchange, knowledge transfer, and the identification of partnership opportunities for energy-related initiatives that achieve mutually beneficial outcomes.

Senior Government and Other Communities

The Province of Nova scotia and the Government of Canada have jurisdiction over legislation, regulations, policies, and programs that influence energy poverty risk factors for Bridgewater residents as well as for other communities. Engagement objectives and tools:

1. ***Inspire positive change across the Province and the country.*** Engagement activities will be centred on knowledge transfer and advocacy, so that energy poverty solutions developed in Bridgewater can achieve broader systems-level impact. Participation in the Smart Cities Challenges offers a powerful platform to do so.
2. ***Inspire energy poverty reduction actions in other communities.*** Engagement activities will be centred on knowledge transfer. The Town will also use its regional networks and its membership in the Federation of Canadian Municipalities to achieve these ends.

General public

The community of Bridgewater at large, plus surrounding communities, will have ongoing interest in the program, and receive direct and indirect benefits from it. Engagement objectives:

1. Openly communicate program outcomes and benefits to the community.
2. Receive feedback on broader program benefits and outcomes.

MONITORING AND EVALUATION

The evaluation processes described in the **Performance Measurement chapter,** and the quality control and risk management processes described in the **Project Management chapter** will ensure that that outputs and outcomes associated with stakeholder engagement are monitored and evaluated on an ongoing basis. Program risks associated with engagement efforts are identified in the **Project Management chapter.**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

MODERN TREATY OBLIGATIONS AND DUTY TO CONSULT WITH INDIGENOUS GROUPS

The Town of Bridgewater received confirmation through the Nova Scotia Office of Aboriginal Affairs that The Town is not required to consult with the First Nations in this province at the application stage of this project. The Town has consulted with Acadia First Nations based on Duty to Consult principles and as a good governance practice in accordance with the *Government of Nova Scotia Policy and Guidelines: Consultation with the Mi'kmaq of Nova Scotia.* The Town intends to undertake further consultation and build a partnership with Acadia First Nations regardless of the outcome of the application.

COMMUNITY EMPLOYMENT BENEFIT

The Town will be participating in the Community Employment Benefit Initiative. In order to do so, the Town will create a Community Employment Benefit policy to guide training, hiring, and procurement processes. The policy will result in a revision to our existing HR and Procurement Policies which do not yet include the principles of the Community Employment Benefit Initiative.

The Town will identify employment and procurement opportunities for three groups targeted by the initiative soon after the funding decision is made. Through feedback we received in consultation of residents and partner organizations, the Town is already aware of several groups who could be identified for employment and procurement opportunities.

No one individual can be held accountable, but we can hold a community accountable.
– RESIDENT, TOWN OF BRIDGEWATER

The Town will adhere to the following plan in the selection of the employment and procurement opportunities:

1. The Town will consult with community partners to come to a consensus on the needs of employment and procurement opportunities for the inclusion of those who are traditionally underrepresented.
2. A needs assessment will be undertaken to identify employment opportunities.
3. The town will develop partnerships for resident recruitment through partner organizations.
4. Measurable indicators will be created to monitor progress.
5. Dispute resolution mechanisms will be drafted.
6. A reporting framework will be created.

CLIMATE LENS ASSESSMENT

The Town of Bridgewater is not required to undertake a Climate Lens Assessment for the purposes of this application because we are in the $5 million prize category. Even so, a key focus of the Town's application is on a reduction in GHG emissions. The Town quantified and set targets for GHG emissions reductions of 80% by 2050 in our 2018 Community Energy Investment Plan (CEIP). The Plan provides guidance for many climate mitigating project outcomes and details their climate impacts. The Town was one of only two communities in Atlantic Canada who submitted to the Carbon Disclosure Project (CDP) in 2018 and received an overall score of B, higher than the regional and global averages.

Community stakeholders watching a presentation at a Smart Cities Challenge workshop.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The project will draw on a wide array of partners and stakeholders who are working at the ground level on poverty reduction, transportation, and employment to identify opportunities for shared solutions.

– COMMUNITY SERVICES ORGANIZATION REPRESENTATIVE

OTHER APPLICABLE LAWS, REGULATIONS AND POLICIES

FEDERAL POLICY

- **Reaching Home: Canada's Homelessness Strategy** Bridgewater's proposed outcomes for the provision of affordable, secure housing is closely aligned with *Canada's Homelessness Strategy*. The Town will utilize Employment and Social Development Canada's Homeless Individuals and Families Information System (HIFIS) software as the data platform for our Coordinated Access system.

- **A Place to Call Home: Canada's National Housing Strategy (2018)** Our project aligns with the Government of Canada's National Housing Strategy with activities aimed at providing preventative actions for reducing homelessness, helping households to find suitable housing and ensuring housing remains affordable.

- **Opportunity for All: Canada's First Poverty Reduction Strategy (2017)** Our project aligns with the Government of Canada's commitment to reducing poverty by 50% by 2030. In many ways, the Town's Energy Poverty Reduction Program mirrors the approach being taken nationally but with a more specific focus on the energy element of poverty and a course of action that is meaningful, measurable and monitored.

PROVINCIAL LEGISLATION AND POLICY

- **Municipal Government Act** As a municipal unit will operate in accordance with legislation laid out in the Nova Scotia Municipal Government Act and related regulations.

- **Housing Act** The Town of Bridgewater will develop policies in accordance with the legislation.

- **Building Code Act** The Housing Energy Management System within the Energy Poverty Reduction Program will adhere, at minimum, to the requirements set out in the Act and related regulations.

- **Access by Design 2030 Achieving an Accessible Nova Scotia:** The Town is aligned with the Act's acknowledgement that accessibility is a human right and through our Mobility Improvement System.

- **The 2005 Environmental Goals and Sustainable Prosperity Act (EGSPA)** Our proposal aligns with goals on sustainable prosperity, such as emission reduction, energy efficiency programs, climate change adaptation and improving the Province's environment and economy for future generations.

- **Nova Scotia's Electricity Plan 2015-2040** Our conforms with key themes of Nova Scotia's Electricity Plan to ensure stable electricity prices for residents, create innovative energy systems that promote customer control, integrate systems, and increase the value of renewable energy resources in home heating and transportation.

- **A Housing Strategy for Nova Scotia (2013)** Our aligns with and supports the Province of Nova Scotia's goal to ensure that Nova Scotians can find the housing choice that's right for them and their families, at a price they can afford, in a healthy, vibrant community that offers the services, supports and opportunities they need.

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

INTRODUCTION

For Bridgewater to lift 20% of its residents out of energy poverty in 10 years, $89.8 million dollars needs to be invested into the community. The $5 million prize of the Smart Cities Challenge is just a fraction of the overall cost but is the catalyst that will enable the Town to make this bold step forward to ensure no family is left behind. It is also an investment in the shift required to achieve a clean, efficient, affordable and secure energy future for our community.

By the end of the Smart Cities Challenge program in 2025, our community will have been the recipient of $45.7 million worth of investments in housing, transportation, community energy systems, and community services. As Table 9.1 indicates, that will increase by another $44.1 million over the next 5 years as the program matures through years 6-10. The large majority of these investments relate to 'hard' costs and come with financial returns (labeled "with ROI" in the tables and charts in this chapter). By undertaking strategic de-risking activities, and leveraging the power of connected technologies such as home energy monitoring systems, Bridgewater will be able to bundle these investment opportunities and make them attractive to a diverse group of investors. Pooled capital implements the energy poverty reduction solutions described in the previous chapters, which systematically lifts Bridgewater residents out of energy poverty. These capitalization activities are explained in detail later in this chapter.

To deliver on these opportunities, the Energy Poverty Reduction Program will incur $5.42 million in core operating costs over the first 5 years. These costs consist of program development, operations, and administration. They can be offset by the $5 million Smart Cities Challenge grant, which acts as a catalyst that allows the community to leverage the additional $40.3 million over that same timeframe, an investment leverage ratio of 1:8 for the grant. The remaining core operating cost can be achieved with an in-kind contribution of $420,000 from the Town of Bridgewater. As indicated in Table 9.2, 2.6% of the Smart Cities Challenge grant would be held in reserve as a contingency. If unused, this amount can help subsidize home energy improvements for program participants.

> Through our proposed solutions, we will make sure those among us who are most vulnerable and least able to afford the transition, are the first ones we help across the threshold. Those residents have the most to lose and through the betterment of their lives, our community has everything to gain. - MAYOR MITCHELL

Energy Poverty Reduction Program Total Costs by Activity for Each Program Year

Program	Activity	2020-21	2021-22	2022-23	2023-24	2024-25	Years 1-5 Total	Years 6-10 Total	Grand Total
Sub-Totals	Program Development	$1,295,000	$700,350	$128,778	$130,710		$2,254,838		$2,254,838
	Program Operations & Administration	$207,500	$624,225	$691,539	$750,274	$890,219	$3,163,756	$4,385,043	$7,548,799
	Capital Planning & Improvements- No ROI		$1,185,013	$1,452,617	$1,905,749	$2,366,841	$6,910,219	$14,693,023	$21,603,242
	Capital Planning & Improvements- With ROI		$1,731,945	$9,199,368	$11,015,163	$11,442,793	$33,389,270	$25,012,945	$58,402,215
	Total	$1,502,500	$4,241,533	$11,472,302	$13,801,896	$14,699,852	$45,718,084	$44,091,010	$89,809,094

APPENDIX: LETTERS OF SUPPORT

The Town of Bridgewater received letters of support from the following people and organizations for our Smart Cities Challenge Finalist application:

1. Affordable Energy Coalition
2. Affordable Housing Association of Nova Scotia
3. Be the Peace Institute
4. Big Brothers, Big Sisters of South Shore
5. Bridgewater Active Transportation Advisory Committee
6. Bridgewater and Area Lions Club
7. Clean Foundation
8. Dalhousie University - Faculty of Computer Science
9. Ecology Action Centre
10. Efficiency Nova Scotia/ EfficiencyOne
11. Energy Services Association of Canada
12. Family Services of Western Nova Scotia
13. Green Power Labs
14. Housing Nova Scotia
15. Lunenburg County Seniors Safety Program
16. Lunenburg County YMCA
17. Halifax Regional Municipality
18. New Dawn Enterprises Limited
19. Nova Scotia Community Transportation Network
20. Nova Scotia Department of Energy and Mines
21. Nova Scotia Health Authority
22. Nova Scotia Power
23. Nova Scotia Works
24. Nova Scotia Community College – Lunenburg Campus
25. Quality Urban Energy Systems of Tomorrow
26. RNDT Development
27. SchoolsPlus
28. Second Story Women's Centre
29. Small World Learning Centre
30. Society St. Vincent de Paul
31. Souls Harbour Bridgewater
32. South Shore Family Resource Association
33. South Shore Housing Action Coalition
34. St. Mary's University - Department of Mathematics and Computing Science
35. The Ark and Support Services Group
36. The Honourable Mark Furey, MLA Lunenburg West
37. The Honourable Steven McNeil, Premier of Nova Scotia
38. The Salvation Army, Bridgewater Corps
39. TownSuite Municipal Software
40. United Way Lunenburg County

These letters are appended in alphabetical order as presented above.

00 Executive Summary

Our Challenge Statement is to be the city that breaks the cycle of Indigenous youth incarceration by creating a new cycle focused on building purpose, belonging, security and identity.

We worked closely with an Indigenous Youth Advisory Group and with community allies and institutional partners who provide programs and services to Indigenous youth. Understanding and incorporating the experiences and ideas of Indigenous youth is at the centre of this challenge.

The insight that emerged was that the cycle of incarceration begins with a series of harmful decisions. These decisions were often the result of preventative programs and services being too difficult, or unknown to the youth, for them to access in the moment they needed it. By contrast, a series of well-made decisions can give youth a plan and a path to a healthy cycle.

A smart city enables its citizens to use technology to make smart decisions.

The ConnectYXE program described in this proposal uses technology to connect people with programs and services, and to make decisions that will improve their lives. It is a program that supports empowerment, strengthens collaboration and harnesses innovative technology.

Empowerment of Indigenous youth and their families: providing real time information and options for how to access services throughout the city, every day, all day. For example, when a youth finishes school for the day, ConnectYXE will give that youth the information to plan out their afternoon and evening: play pick-up basketball in a community gym, have a meal, find a place to sleep, connect with an Elder, and find the public transportation options to reach their destinations.

This information, or the "front-end" of ConnectYXE, will be accessed through a variety of venues ranging from interactive kiosks and public touch screens in malls, stores, and even main transit stops located throughout the city, to a phone app, to a website at a school, or a public library computer. Targeted locations throughout the city will have free Wi-Fi, to ensure ConnectYXE is as available as possible for those critical decision-making moments.

Collaboration among partners: creating a repository of data of all relevant programs and services available throughout Saskatoon. Community-based Organizations (CBOs) have been operating in an environment of resource scarcity and fragmented information. Those who participate in ConnectYXE will be provided coordination support and technological capacity to input their activity data into

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

a data hub, the "back-end" of ConnectYXE. They will be able to access real-time services on an individual use-basis.

Harnessing innovative technology: connecting systems, sharing data and leveraging artificial intelligence. The collective data in ConnectYXE will provide a city-wide picture of what is available and the demands on those supports at any time. This enables CBOs, institutional partners, and decision-makers to regularly analyze and to identify gaps, trends, and better ways to respond.

The foundation of ConnectYXE is authentic and on-going engagement with Indigenous youth, community allies and institutional partners. This priority has been built into the governance model of ConnectYXE, with working groups engaging with each other and feeding into a decision-making Council comprised of youth, allies, institutional and technology partner representatives.

A whole-of-community approach, with youth at the centre, is needed to address the complex challenges that urban Indigenous youth face. These challenges are rooted in historical injustices, intergenerational trauma, and racism. And the cycle of family disruption, crime, and incarceration is both a human and economic tragedy that affects the entire city.

Cities across Canada are facing these same challenges, resulting in specific Truth and Reconciliation Commission Calls to Action that address them. Call to Action 38 is: We call upon the federal, provincial, territorial, and Aboriginal governments to commit to eliminating the overrepresentation of Aboriginal youth in custody over the next decade.

The challenge in Saskatoon is profound. Youth incarceration is double the national average. As youth move into the incarcerated adult population, 92 percent are Indigenous men and 98 percent are Indigenous women. The loss in human potential is immeasurable.

ConnectYXE can begin to transform the cycle of Indigenous youth incarceration into a healthy cycle. There is too much at stake if a new cycle is not created.

01 Vision and Challenge Statement

Our vision is to transform Saskatoon into a city where Indigenous youth lead lives with purpose, belonging, security and identity. Our mission is to reduce the incarceration rate of Indigenous youth in Saskatoon to no higher than the rate in the nonindigenous population. Our approach is to empower Indigenous youth, their families and their communities to make smart decisions by accessing critical information in the moment they need it most.

1.1 Challenge Statement

Our challenge statement is to be the city that breaks the cycle of Indigenous youth incarceration by creating a new cycle focused on building purpose, belonging, security and identity.

Saskatoon is a growing city with a diverse population. On Treaty 6 Territory and Homeland of the Métis, it is the economic hub of Saskatchewan. As in all cities, growth and overall prosperity mask major inequities in both opportunity and outcome. Urban Indigenous youth face challenges rooted in historical injustices, intergenerational trauma, and racism. It is difficult to maintain cultural and spiritual traditions in the contemporary urban setting. Combined, these realities and experiences can deeply affect their sense of identity, purpose, belonging and security.

Among the consequences is an escalating cycle of family disruption, crime, incarceration, and alienation. This is both a human and economic tragedy that affects the entire city. Human potential is wasted. Children are forced to grow up too fast and navigate an often dangerous and hostile environment. Many lack the support or skills to make good choices. The programs and services meant to address these challenges are largely reactive. The criminal justice system warehouses young people in prisons at huge public expense, where they are more likely to become hardened career criminals than rehabilitated citizens.[1]

1 Government of Canada. Office of the Correctional Investigator. Backgrounder: Aboriginal Offenders – a Critical Situation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Community-based organizations (CBOs) do their best but the system remains fragmented; there are critical gaps in the capacity to respond to needs in real time, and most of the money is spent on repairing the damage rather than creating opportunities. The cycle becomes normalized and perpetuates itself through generations.

All cities want to solve these problems; in Saskatoon it is an urgent priority.

No one – not the youth and their families, the police and judicial system, CBOs, Indigenous leaders, business leaders – thinks the system is working now. To have different outcomes, we need a new approach. The adverse impact is enormous and will worsen over time. The gap between where we are and what we could be is wide. Therein lies the challenge and the opportunity.

Tragic statistics have spurred the Truth and Reconciliation Commission Calls to Action. Our ConnectYXE program would enable Saskatoon, and many other communities, to make direct progress on the following specific Calls to Action:

30. We call upon federal, provincial, and territorial governments to commit to eliminating the overrepresentation of Aboriginal people in custody over the next decade, and to issue detailed, annual reports that monitor and evaluate progress in doing so.

38. We call upon the federal, provincial, territorial, and Aboriginal governments to commit to eliminating the overrepresentation of Aboriginal youth in custody over the next decade.

These formative experiences replicate in the older adult population, where incarceration rates are at least five times higher than in the non-Indigenous populations.[2]

2 Estimates in this section are based on the following calculation: In Saskatchewan about 22% of the on-reserve Indigenous population is aged 10 to 19, of whom 60% are aged 12 to 17, our target population. Applying these figures to Saskatoon's 31,000 Indigenous population yields an estimate of (31,000 x .22 x .6) or 4092 Indigenous youths aged 12 to 17 for 2016.

1.2. The Approach

A smart city enables its citizens to use technology to make smart decisions.

The core of our approach is empowerment: equip Indigenous youth, families and allies with the information and the support networks to make smart decisions. This means that youth and Indigenous culture are central in how we build the technological solution. At our first meeting, the Elder we had invited said we need to find a way to bridge tradition and technology. Doing this will create an environment that enhances the opportunities and outcomes we aim to change.

The complexity of Indigenous youth incarceration cannot be solved by a simple solution. Listening to the voice of youth and their families was our first step. We invited CBOs and institutions who represent and provide services to at-risk youth to work with us. This became a committed coalition of partners. We worked together and with the youth to understand where to start and what could make a difference.

The insight that emerged was that the cycle begins with a series of harmful decisions. These decisions were often the result of preventative services being too difficult, or unknown to the youth, to access. By contrast, a series of well-made decisions can give a youth a plan. As one of the youth advisory members stated, "When we don't have information about where else we could go or what else we could do, we choose Plan A. With information, we could choose Plan B. B is for better."

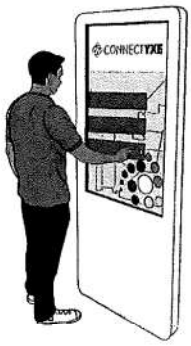
It is in these moments of decision that the cycle of Indigenous youth incarceration can be broken. And based on this, we developed ConnectYXE.

> *ConnectYXE is not a provider of front-line services, it is a connector of those services to the youth, families, and allies who need them. It is like an Amazon.ca of services. Through Amazon, you can purchase a product that Amazon does not produce – rather Amazon connects you to the company that produces that service. ConnectYXE will connect people to the services being offered by CBOs and institutions in the city.*

ConnectYXE connects youth, their families and community allies with real-time information on services that are being offered, and the logistics they need to access those services. For example, when a youth finishes school for the day, ConnectYXE will give that youth the information to plan out their afternoon and evening: play pick-up basketball in a community gym, have a meal, find a place to sleep, or connect with an Elder or mentor. ConnectYXE will also provide information on public transportation options to reach their destinations. This information, or the "front-end" of our technology, can be accessed through a variety of venues ranging from interactive kiosks located throughout the city, to an app, to a website at a school or public library computer. Targeted locations throughout the city will have free Wi-Fi, to ensure ConnectYXE is as available as

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ATIA - 21(1)(b)



possible for those critical decision-making moments. Self-determination and self-actualization are critical in supporting youth to make their own decisions.

ConnectYXE also provides coordination support and technological capacity to CBOs who have been operating in an environment of resource scarcity and fragmented information. CBOs who are part of ConnectYXE will provide their activity data into a data hub, the "back-end" of our technology. They will be able to access real-time services on an individual use-basis. In addition, the collective data will provide a city-wide picture of what is available and the demands on those supports at any time. This enables organizations and decision-makers to regularly analyze and to identify gaps, trends, and better ways to respond.

A "Use Case" – a step-by-step narrative that describes user's interactions with a system – illustrates how ConnectYXE might function.

1.2.1 An illustrative Use Case: Youth is looking for short term housing

This illustrates the planned functionality of ConnectYXE using a scenario that emerged from the Youth Engagement Workshops. In this scenario a youth finds for one reason or another that he or she cannot sleep at home for that night.

YOUTH	YOUTH	CONNECTYXE	YOUTH	CONNECTYXE
finds access point to connect to the internet	connects to ConnectYXE	asks how it can help	asks if there is a place to spend the night	locates accommodation available and reccommends an option

YOUTH	CONNECTYXE	CBO	CONNECTYXE	YOUTH
accepts recommendation of a meal and conversation	references history of requests and determines services frequently bundled with a request for a bed. System offers a meal, and a meeting with an elder	advised to expect a youth for the evening	communicates to CBO that a youth has requested a bed for that night. System may put "hold" on a bed. List of available beds is updated	accepts recommendation

CONNECTYXE	CBO	CONNECTYXE	YOUTH
locates meal for the youth	A meal-provider is advised that a youth has requested a meal for that evening. A cultural CBO receives a request that an elder join a youth for a meal	asks if the youth would like transportation arranged to the location of the meal, and/or to the location of the overnight housing	the youth accepts the offer of transportation

YOUTH	CBO	CONNECTYXE	YOUTH	CONNECTYXE
Takes transit to the location of the meal. He or she meets and shares a meal with an elder, then travels to the location for overnight housing	Saskatoon Transit issues a free ride or rides. This is communicated as a token to the youth's phone, or to the bus	arranges for bus pass with Saskatoon Transit	accepts transportation offered	connects to Saskatoon Transit and determines transportation alternatives. The BOT offers these to the youth

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Our strategic approach is grounded in the following three outcomes. Examples of outputs are included below; a complete picture of how we are measuring outcomes is in the Performance Measurement section.

1. Empowerment of Indigenous youth and their families. This includes providing real time information and options on how to access services; ensuring information is available throughout the city, every day, all day. These will be measured by outputs such as: number of queries to the system from public kiosks or websites; number of users; and level of uptake of services.

In the finalist phase, significant progress has been made through consultation with youth to identify what information and services, would make the most difference to how they make decisions.

2. Collaboration between partners. This includes creating a repository of data of all relevant services available throughout Saskatoon. Outputs will include: number of CBOs, programs and services in the database, number of partnerships with CBOs, number of trend reports produced.

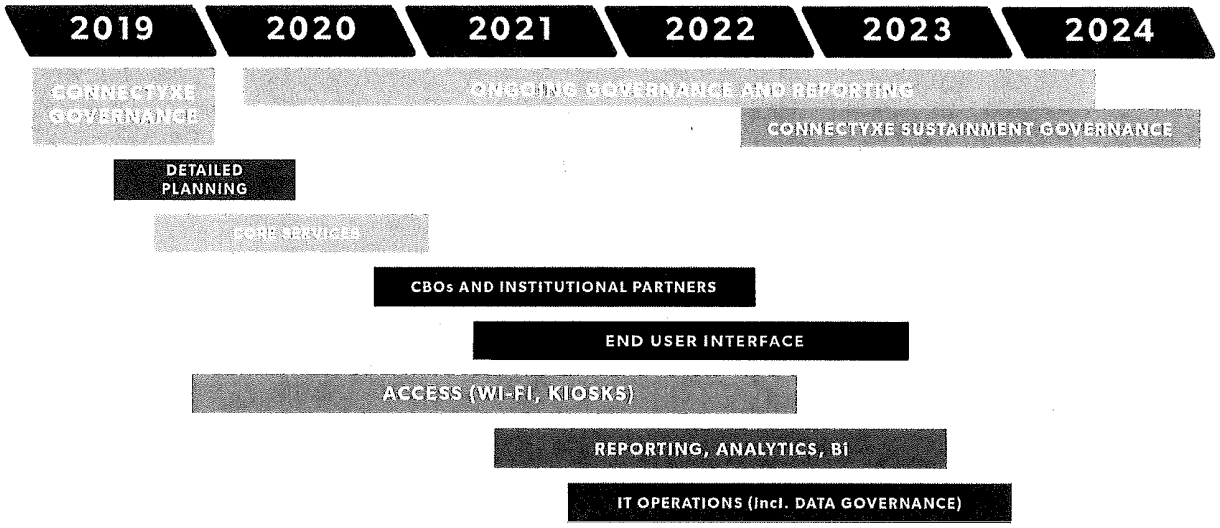
In the finalist phase, we have developed and strengthened partnerships with both CBOs and institutional partners who have agreed to provide data, participate in our governance, and assist in implementation of ConnectYXE. Their commitments are described in their Letters of Support in Appendix Five. We have also worked with them and the youth to identify the preferred order of onboarding of services, based on the priority given by youth and the readiness of the partners involved.

3. Harnessing of innovative technology. This includes connecting systems, sharing data and leveraging artificial intelligence to:

a. Enhance understanding of support-seeking behaviours and have insight into patterns to improve service coordination;

b. Enable continuous refinement of programs and services in response to real-time insights generated by ConnectYXE;

c. Identify critical gaps in programs and services that create barriers to better outcomes.



Outputs include number of community needs reports produced and number of trend reports produced

1.3 Implementation Plan

The ConnectYXE Program has a five-year plan. We will first develop our governance structure and processes followed by a detailed analysis of the systems and infrastructure of our CBOs and institutional partners. From this, we will build our core system (the back-end) and the interfaces to connect to and incorporate our CBOs and institutional partners. In a parallel track, we will initiate the projects that deliver the User Interface to youth, their families and allies (the front-end). Real benefits will

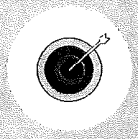
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

begin to multiply as youth are then able to use to the system to connect to a growing set of options and services, and as our partners will be able to perform analyses and gather insights based on aggregation of the data. We will build this program to transition to an independent sustainable organization. This figure demonstrates the multiple streams of our plan and the mix of technical and non-technical projects.

FIVE-YEAR IMPLEMENTATION PLAN

1.4 Years of Collaboration Is Our Foundation

This program is not the starting point; it is the culmination of years of deliberation, community engagement, collaboration, and mobilization. The history of our engagement is detailed in Section 2, "Community Engagement Journey."



To frame and develop the challenge statement for this program, we designed engagement workshops to identify and prioritize issues and to fuse the narrative of at-risk Indigenous youths with rigorous thinking about pathways to improvement. Over the course of eight workshops we refined the challenge statement into four pillars, developed by the youth and their allies.

Embedded in each pillar is mentorship and culture. Youth recognized that positive adult support, both on a regular basis and in crisis situations, is critical to building capacity to make good decisions. They also expressed a desire to connect with their cultural traditions to strengthen their sense of self and develop a sense of belonging.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Security: The overall top priority for the youth. Within that, the main priorities are housing security and public safety. Security also includes food, financial, family security, and accessibility (transportation) to services.

Purpose: Helping individuals feel motivated and comfortable, and empowering those individuals to help themselves and others make life better.

Belonging: A genuine sense of attachment to important elements of community and how it positively shapes their understanding of self and their place in society. Belonging can refer to any or all of the home, family, community, workplace, and other structures.

Identity: Knowing who they are, where they came from; a foundation for self-mastery and pride, expressed in values, personality, sense of autonomy; the product of historical culture, place, inherited and discovered elements; a source of inspiration and strength.

1.5 ConnectYXE Program is Transformative, Scalable and Replicable

Our ambition is to change relationships, systems and outcomes. We have designed a program that will be transformational. It is built upon an underlying logic, experience-based learning, and co-design by a diverse and committed partnership. Our approach is both ambitious yet cognizant of the multi-faceted challenges that are part of reducing Indigenous youth incarceration rates.

ConnectYXE program will be scaled up to include more communities, increased CBOs, programs and services, and additional technological advances as we progress. Particularly related to technology, predictive analytics and artificial intelligence are already being used for many commercial purposes and in everything from health care to transit planning. They are powerful tools for dealing with complexity over time, where effects have multiple causes, key factors interact to magnify socio-economic risks, and individual circumstances can vary greatly from day to day. Scaling our program towards incorporating these technology tools will magnify and expand our impact.

Our challenge is tragically one that many communities across Canada struggle to address. ConnectYXE has the potential to be expanded or adapted to other communities, and to include other related issues.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Among the main innovations of the program are:

1. It is grounded by the insight that success comes from empowered youth making good decisions in critical moments. This respects the agency of Indigenous youth.

2. It addresses problems defined and described by the people we are aiming to help: Indigenous youths, their families and allies.

3. It targets an outcome that improves the quality of life for at-risk individuals and their families, and the entire city. Reducing incarceration changes lives, increases safety and well-being for everyone, and reduces costs from the program level up to provincial and federal budgets.

4. It envisions a systems approach to systemic problems. All partners recognize the need to change. They are committed to informed experimentation, evaluation, and agile adaptation.

5. It aims to unleash the power of information at all levels:

   a. Create a network of access points that provide vital information for Indigenous youth to get the help they need when they need it.

   b. Integrate data to identify at-risk youth, tailor supports to individual needs, and identify what works, what doesn't, and in what circumstances.

   c. Enhance understanding of how Indigenous youth use programs and services to inform decisions about how they might be better organized and deployed.

   d. Record and analyze patterns to identify risks, coordinate services, reduce inconvenience and redundancy, and stimulate new approaches. Collaboration and coordination are currently thwarted by the absence of information and connectivity.

6. It is financially feasible and sustainable. It does not require transformational success in a short time period to produce a return on investment.

The Economic Costs of Failure

Continuing the over-representation of Indigenous people in the justice system instead of investing in education and alternative measures will cost Saskatchewan alone as much as $13 billion over twenty years.[9]

Every youth who gets caught in the cycle of despair and crime costs society an enormous amount of money. **Incarcerating one youth costs the province approximately $75,000 per year.**[10]

1.6 Turning Around Unrealized Economic Potential

The costs of dealing with the consequences of criminal behaviour are sub-

9 Estimates in this section are based on the following calculation: In Saskatchewan about 22% of the on-reserve indigenous population is aged 10 to 19, of whom 60% are aged 12 to 17, our target population. Applying these figures to Saskatoon's 31,000 indigenous population yields an estimate of (31,000 x .22 x .6) or 4092 indigenous youths aged 12 to 17 for 2016.

10 http://publications.gc.ca/collections/collection_2018/dpb-pbo/YN5-152-2018-eng.pdf

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

stantial, but the economic impact does not stop there. Far more significant is the lost opportunity to participate in and contribute to the broader economy, which has a direct impact on a youth's sense of purpose, identity, belonging and security. Yet the current trend sees the general population unemployment rate at 5% while the Indigenous unemployment rate is 15.1%.[11]

There is a great deal to do. The Indigenous youth high school graduation rate hovers around 50%. Lifetime earnings double for Indigenous high school graduates.[12] It is estimated that the educational gap between Indigenous and non-Indigenous people costs Saskatchewan over a billion dollars a year in lost economic productivity.[13]

Even a small investment can generate enormous returns. An incarcerated youth conservatively costs approximately $73,632 a year, and once incarcerated, the likelihood increases that the criminal youth will become a criminal adult. The lifetime costs of further incarceration, addiction services, income support, and other supports reach into the millions. If the program empowers only 3 or 4 of the 4,100 youths each year to choose to complete high school and avoid crime, the combination of reduced costs and positive economic contributions to society over a lifetime will produce a net benefit in the millions of dollars for each one.

The workforce of tomorrow will have to be significantly Indigenous if the province is to prosper. The problem cannot be quarantined; **the future of Saskatoon, and this nation, is inextricably linked to the future of Indigenous youth.**

The Case Study of Nanna

The Province of Saskatchewan and our technology partner, Information System Management (ISM), did an analysis of the program usage of one family and the impact on costs. This case study is focused around 'Nanna' who is in her late 50s, has four children, 19 grandchildren and one great-grandchild. Nanna and her children have never been employed. Nanna received support from six different community-based organizations, suffers from depression, addiction, was a victim of abuse and was apprehended as a child. Her family continually struggles with alcohol and drug abuse, domestic violence, child neglect, gang activity and other issues.

The Province and ISM estimate that program costs to support Nanna's family range from $5-7 million annually and forecasting forward to the next generation this number increases to $17-19 million. There are 2,500 families like Nanna's in Saskatchewan. This case study emphasizes the urgency of breaking the generational cycle of trauma, both because the costs to sustain people being supported to this extent are significant, and more importantly, the costs to the family in lost opportunity are devastating.

1.7 Bringing ConnectYXE to Our Community

We began our Smart Cities journey knowing we wanted to find a way to address safety and community well-being. Over the past year, we have been inspired by the courage and generosity of the Youth Advisory Group, the dedication shown by the front-line organizations and community allies, and by the commitment of the institutional partners who are prepared to break out of silos and make systemic change. We have built relationships over this past year that will weather the challenges of the future, a future that includes moving forward to build a new cycle of identity, purpose, belonging, and security for Indigenous youth.

> *Had ConnectYXE been available a few years back, perhaps my decisions as a teenager wouldn't have been so misguided. I would have had direct access to mentorship, recreation, or even that art class I always wanted to take. Instead of sneaking my friends through the window so they had somewhere to sleep, we could have found a better solution. This technology is going to answer questions we all as youth, struggling or not, need an answer to. It'll guide us places we deserve to be.*
>
> - MORGAN, SMART CITIES YOUTH ADVISORY MEMBER

ConnectYXE Will Be Built

The experience of the past year with the youth and partners has convinced the community of the important need for ConnectYXE. There has been a commitment made by many organizations in the community to work with the City of Saskatoon in finding a way to deliver ConnectYXE, in all or part, regardless of the Smart Cities Challenge final result.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

02 Community Engagement Journey

2.1 Introduction

Engagement has been and will continue to be at the heart of the ConnectYXE program. We developed our challenge statement as the result of comprehensive community and stakeholder engagement. The success of our program will depend on how well community members are engaged in both the design and implementation. Key objectives are that program and platform models are evidence-based, informed by stakeholder input, and address the barriers and needs of the youth, youth supporters, and community-based organizations (CBOs). Achieving this will require a deep and sustained level of community engagement throughout the program lifespan. The governance model as shown in Section 6 "Governance" provides a clear picture of these relationships, and their role in decision-making. This engagement process will continue to involve building relationships, establishing trust and understanding, and continuing communication.

> *Community Engagement increases community cohesion and allows for the community to have ownership over the outcomes that will ultimately impact them.*
>
> -TAMARACK INSTITUTE

2.2 Where We Have Been

good, extensive engagement

The table below outlines key elements of the engagement process to date.

Stakeholder Group	Sessions	Engagement Techniques
Youth Advisory Group	5	• **Sharing Circle:** Elder leading a smudge, opening & closing the circle; sharing life stories • **Scenario Mapping:** describing day to day routines in detail to pinpoint and identify gaps and opportunities Priority Identification: arriving at key project priorities, desired purpose and impacts, and key constraints • **Design Thinking:** exercises to encourage creative thinking, and tactile activities such as building their ideal neighbourhood and creating user personas
Institutional Partners Table	4	• Input meetings • Discussion around current progress of the program • New ideas and feedback on where ConnectYXE activities could be helpful • Identifying which administrative units would be appropriate to help out in certain sections • Governance Planning session to provide input on governance model design
Community Allies Advisory Group (including CBOs)	2	• **Feedback Forums:** sharing youth feedback, providing a chance to ask questions and share current work, activities to identify gaps and opportunities, and share new ideas for the challenge • **Scenario Mapping Workshop:** built upon the youth maps, adding comments, questions, and ideas
Technology Advisory Group	2	• Input meetings • Reviewed and built upon the ideas developed in the Youth Advisory workshops • Added in comments, ideas, questions regarding scenario maps and what types of solutions could be implemented • Brainstorming session

TABLE 1: ENGAGEMENT PROCESS TO DATE

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The program team also conducted eight meetings with individual institutional partners to identify areas of support and collaboration and convened a group of 50 staff and volunteers from 20 different CBOs in the housing and food sector for a presentation and discussion about the project.

To ensure that Indigenous youth with lived experience had a central voice, the team reached out to community groups and agencies. These organizations identified youth with whom they had established relationships and invited them to join the Youth Advisory Group. The youth represented a range of age, backgrounds and in-crisis experiences. From the beginning, the Youth Advisory Group has involved an Elder and traditional approaches through teachings, sharing circles, and continued support through the process. This intentional approach has built trust between participants and has created a safe space for exploration.

2.3 What we have learned

Over the course of the engagement, we identified several key insights that have shaped the current proposal.

Key Insights	Source	How they shaped the proposal
Dependence of youth on several key services – ex.transportation	Youth Advisory Group	Helped to prioritize services and what we should be onboarding first
Importance of traditional knowledge and culture	Youth Advisory Group	Led us to see identity not as a separate pillar but interwoven
Importance and impact of positive adult support for youth	Youth Advisory Group	Reinforced the importance of mentorship as key part of the project strategy
Importance of ongoing communication and relationship building	Institutional Partners	More consistent engagement approach with clear roles, expectations, and responsibilities based on capacity
Need to focus not just on youth as individuals but working with their families and allies	Youth Advisory Group and Community Allies	Important to involve community allies and support systems when working with youth. Our focus went from being simply on youth to understanding the importance of youth supports and allies and how they will also use the technology.
Role of CBOs and differing levels of capacity and technological maturity	Community Allies	Important to respect and reinforce the work of CBOs and their importance to the solution; Created a 3-tiered technology maturity strategy to ensure CBOs are on boarded easily.
Collaboration between technology and community worlds	Technical	To bring the two areas together at an earlier stage to understand the social complexities from the community view and the technological complexities and possibilities from the other side.

TABLE 2: INSIGHTS LEARNED FROM ENGAGEMENT ACTIVITIES

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Our team has learned that the different stakeholder groups approach the program from different perspectives, which impacts how we engage them. For example, institutional partners are most focused on big picture strategy, while community allies are most focused on operations, and the youth tend to focus on immediate use and current situations. To address this with CBOs, we started acknowledging their operational realities and shorter-term needs before moving into strategy and vision conversations. We are now customizing our approach to each group. By portraying how everyone contributes to the whole, we have also seen more ownership and empowerment among participating groups

We must continue to build trust with partners so that they are willing to be candid about their challenges and processes and areas that need improvement. This is essential to design services that will truly work for all users and espouse confidentiality.

2.4 Where We Are Headed

2.4.1 Guiding Principles

Good

We have identified seven guiding principles that will be embedded in the engagement approach. These values will assist in creating meaningful participatory processes and in building ownership within the community.

1. Inclusivity and Diversity: Ensuring that all affected and interested groups are involved, with proactive inclusion of groups that may be marginalized or facing barriers.

2. Honouring Treaty Responsibilities: Bridging the distance between Indigenous and settler worldviews on wellness of the individual, family, and community. (see Section 11.1 for full description)

3. Transparency: Open and consistent communication about the program. Commitment to explaining decisions, why they were made and how input was used.

4. Deliberation: Creating environments that encourage sharing, vulnerability, and provide opportunities for participants to shape solutions and work toward consensus.

5. Influence: Engagement must inform and shape decisions. Participants understand their level of influence and are involved in the decisions that most affect them.

6. Accommodation: Using approaches that will welcome a diversity of voices and ensure convenient, accessible methods of participation.

7. Ongoing and Iterative: Engagement continues throughout the project lifespan and will be adapted based on feedback and learning.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

2.4.2 Decision Making Process – Governance

The Governance model described in Section 6 has a direct connection to the engagement plan. This is because engagement is about working with the community to have ownership over the outcomes that will ultimately impact them. The engagement process is always linked to decision-making, and therefore to governance. As the governance model evolves, so too will the engagement plan.

The ConnectYXE Council is the ultimate decision-maker. The Advisory Groups and Working Groups are at a collaborate level. There will also be engagement beyond these formalized structures, at a variety of levels. The program team will look to these governance groups for support with designing and leading engagement efforts to ensure they will resonate with the intended participants.

2.4.3 Community Relationships

The table below outlines the main stakeholder groups that have been and will continue to be engaged through the course of the program.

Key Stakeholder	Level of Engagement	Engagement Mechanism	Description	Purpose or Role
Youth with lived experience	Collaborate	Youth Advisory Group	15 Indigenous youth representatives recommended by 9 youth-serving agencies in Saskatoon	Provide lived experience voice to share experiences, identify needed supports and prioritize needs; foundational input for the program focus and approach
	Involve	Design and Testing Workshops or Stations	Wider group of Indigenous youth to engage with user experience design and testing	Provide lived experience and user voice to the process, ensure diversity of users are engaged
Government and Public Institutions	Collaborate	Institutional Partners Table	Representatives from 11 public institutions and levels of government, including Indigenous government	Provides overall strategy and approach based on input from lived experience and community, involved in developing governance model
	Involve	Individual Meetings	Meetings with individual institutional partners	To identify areas of program and data support that aligns with the ConnectYXE program
Community Based Organizations & Allies	Collaborate	Community Allies Advisory Group	25 organizations with a primary focus of working with at-risk youth in Saskatoon	To build awareness of ConnectYXE and gather ongoing input
	Involve	Outreach Meetings	Organizations from housing, food, recreation, and cultural sectors	To build awareness of ConnectYXE and gather ongoing input
Technology Partners	Consult	Technology Advisory Group	Representatives of key technology partners	To provide input and guidance with respect to the technology solution
	Collaborate	Weekly Update Meeting	Meeting with ISM as major tech partner	To build on the platform to support development
Residents	Inform	Communication Channels	Communications of key program milestones and opportunities for involvement	To keep interested residents aware of the program, key milestones, and ways to support

TABLE 3: ENGAGEMENT ACTIVITIES

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

2.4.4 Projected Engagement Goals and Activities

The table below outlines projected activities that correspond with an engagement goals. This represents an iterative and agile-thinking approach to the engagement processes.

Engagement Goals	Activities
1. Broaden the base: all appropriate supports and stakeholders are engaged and involved in program development. Active participation of Indigenous-led groups and allies.	• Identify and build relationships with Indigenous and community-based service providers, organizations, and allies that have not yet participated. • Reach out to service providers in neighbouring First Nations outside the city to identify possible partnerships and involvement (because of the high rate of migration between surrounding reserves and the City). • Solidify governance model through participatory involvement of stakeholders, and ensure clear understanding of purpose, roles, and responsibilities of various bodies. • Recruit for membership within working groups.
2. Gain a holistic picture: stakeholders are deeply involved in needs assessment processes to ensure barriers and needs of youth, youth supporters, and CBOs are addressed in the design	• Convene collaboration and input workshops with community allies to test the scope of current initiatives and gain feedback • Involve working groups in needs and opportunity assessments • Continue to support youth advisory group and build processes for onboarding new members if there are transitions • See goal #5
3. Build trust and change-readiness: CBOs see program value, feel respected, and are ready to make changes to support the program success. Participants have trust in the program; are willing to disclose what's not working and to express ideas that may be uncomfortable.	• Ongoing communication about program status, opportunities for participation and influence, and next steps. • One-to-one relationship building meetings with CBOs to build deeper understanding of operational realities and to discuss what's working and not working. • Create guidelines for advisory and working groups that emphasize importance of confidentiality, non-judgement, and productive discomfort. • Facilitate a series of workshops that build social capital and trust among participating groups, using a variety of facilitation methods for courageous conversations.
4. Strengthen community interconnections: enhance awareness and connections between service providers, to promote reinforcing activities and reduce unnecessary duplication. Work in a way that advances community reconciliation.	• Through engagement gatherings, create a collective system map of what each CBO is doing, and where there are overlaps, gaps and opportunities. • Broker partnerships and collaborative activities between CBOs, as appropriate, to leverage other strengths. • Convene courageous dialogue about areas of possible duplication or necessary redundancy. • Indigenous inclusion at every layer of the program and its governance, including both membership, cultural protocol, and modern treaty considerations.
5. Iterate based on testing and feedback: leverage design thinking approaches to put users at the centre of development and iteration. Ensure the right people are engaged at the right time in key design phases.	• Build capacity in design thinking methods and tools, increase stakeholder familiarity and comfort with these processes. • Host prototype testing experiences with incarcerated youth, affected families, youth advisory group, community allies, and members of the broader public. • Host feedback forums to gather feedback from institutional partners, subject matter experts, and other key allies.

TABLE 4: PROJECTED ENGAGEMENT GOALS AND ACTIVITIES

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

2.5 Communications, Marketing and Change Management

Communication to and from the youth, partners, and broader community will be a key activity towards building ConnectYXE success, and organizational and social change. Once ConnectYXE has been identified as a successful program, we will develop a communications plan that will include a news release and media announcement event, social media content shared across the City's Facebook, Twitter and Instagram channels, and updates on saskatoon.ca/smartcities.

We will then begin the next steps of program development and implementation. When ConnectYXE is ready to be launched to the community, we will create awareness by using a combination of advertising elements using both digital (social media, search engines, online) and traditional (radio, print, billboards, posters) media.

In the lead-up to the launch, we will work with the youth advisory group to develop plans for how best to reach other youth. We will also work with institutional partners and community allies to identify the best way for them to market ConnectYXE through their networks and how we can support them to do this.

After the launch, we will develop training and resource materials for onboarding additional CBOs to ConnectYXE and use these when approaching targeted groups to invite to ConnectYXE. We will also host information sessions for the general public to understand how ConnectYXE works, while at the same time using this as an opportunity to test it as part of an on-going iterative development process.

ConnectYXE will introduce a new tool and new ways of thinking about how youth, their families and their allies might find available options and services. The program will be successful only if those end users actually use the service – that is, change how they do things. Introducing a change in the way individuals think and act is the discipline of Organizational Change Management (OCM). The change we seek to achieve is the use of ConnectYXE to make informed decisions.

ConnectYXE incorporates two frameworks to achieve the art and science of OCM: the McKinsey 7S model, and the PROSCII model. These formal methodologies have these broad steps in common:

- We identify what change we are introducing
- We identify who is impacted by the change, and
- We identify who influences whom

Based on this, we then seek to introduce the change in a managed way:

- We start by creating "Awareness" of the change
- We communicate the potential advan-

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

tages of the system, to build "Desire"

- Then we provide information as to how to use the system – or to build "Knowledge"

- We work with our users to build skill or proficiency is using the system – or to build "Ability", then

- We seek to "Reinforce" the newly-learned behavior

This "ADKAR" framework will – like other aspects of the ConnectYXE program -- evolve as we learn from early deployment efforts, as we listen to our end users, and as we monitor and measure the adoption of the solution.

2.6 Issues & Risk Identification

Risk Management cuts across each of the sections of this proposal, and risks frequently overlap domains. We have consolidated the risks, and the discussion of the risk log in Section 9 "Risk Management". We have provided our current risk log in its entirety in Appendix Four: Entire Risk Log.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

03 Technology

Using a technology-based solution to address a social issue such as breaking the cycle of Indigenous youth incarceration is ambitious. We believe technology can play a critical role in connecting Indigenous youth, their families and allies, with a wider range of choices, empowering them to make decisions, and to seize existing opportunities. Technology can be a tool to help connect them to people, programs, and activities related to their cultural identity, that enhance their sense of life purpose, that give a sense of belonging, and provides security.

3.1 What is ConnectYXE? An Overview of the Technological Solution

ConnectYXE is both a data hub of programs and services (the back-end) as well as multiple interfaces for youth, their families, their allies and service providers to access those programs and services in real time. For example, access to the service will be available using a phone, a computer in a public library, or a public touch screen in a mall (the front-end).

Each Community-Based Organization (CBO) and institutional partner presently provides a subset of these services for youth and their families. However, they often work in isolation. ConnectYXE will collect existing programs, services and capacity information and connect it to youth, their families and their allies, in the moments they need it most.

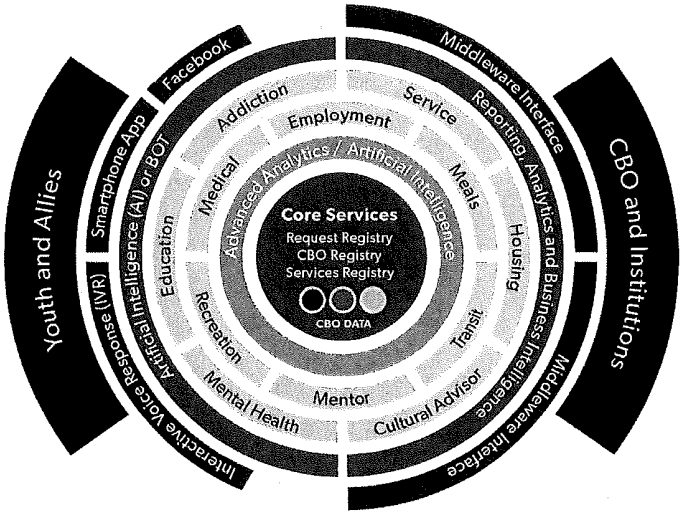

FIGURE 1: CONNECTYXE INTERFACE LAYERS

Through analytics, ConnectYXE will provide a city-wide picture of what services are available and the demands on those supports at any time. This can be used by organizations and decision makers to identify gaps, trends, and opportunities, and recommend policy and program changes.

In this section, we explore each of the elements of the technological solution shown in the image, and "build" the system conceptually layer by layer.

We discuss data and privacy in detail in a subsequent section, but at this point we are clarifying that we will not collect data that contains personally identifiable information (PI) or Personally Identifiable Health Information (PHI).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3.1.1 Core Services

The core of ConnectYXE is a repository of data from CBOs and institutional partners, services those organizations offer, and a repository of requests. Data from CBOs and institutional partners reside here in the form in which it was received from the partner organization. This design is modeled after Saskatchewan's Social Innovation Hub (SIH), developed with our technology partner, Information System Management (ISM).

FIGURE 2: CORE SERVICES

Detailed planning of the system core will include several elements:

- **Core Services** provide access to the system for administrators and partners. A secure process to log into the system will allow administrative users to access their own data. Authentication (that is, who logs into ConnectYXE) is discussed in Section 7.2 "User Access".

- **Requests** collect the metadata associated with requests by youth, their families and their allies. Collecting and analyzing this data can identify metrics associated with the system, which will help CBOs determine services that are most in demand and those service requests that most often cannot be met.

- **A Registry of CBOs** collects key organizational data about the CBO. This information is used to implement and maintain interfaces as a part of the Core Services.

- **Contacts** are integrated to both the authentication service and the repository of CBOs. This data will maintain roles and contact information.

- **CBO Data** is provided by CBOs and partners in their own format, sidestepping a long and difficult effort by each partner to transform into a highly structured/normalized model. *Note: Each CBO's data is isolated from other CBO's data. Staff from a given CBO will be able to view only their own data.*

Is ConnectYXE a Tool for Case Management?

The design outlined in this section specifically calls for a system in which the identity of an end user is not identified. While we recognize potential benefits of tracking and recognizing trends in the interactions of an individual, respect for the privacy of the end user has prevailed. The system is *not* designed to be a Case Management System.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3.1.2 Core Interface with Advanced Analytics

Advanced Analytics are built into the Core Services of ConnectYXE through the Registry Interface. This interface includes enhanced Artificial Intelligence (AI) – a variety of AI tools – to bridge the gap between data received from CBOs and the services offered by ConnectYXE.

Data provided by CBOs and institutional partners stored in the core will be both structured and unstructured. Highly structured and normalized data, for example, is housing data or data about recreational services stored in a database. Highly unstructured data might be published in a document or maintained on a spreadsheet that is stored on a server or on a local workstation of a CBO.

Knowledge from this data will be extracted using a set of Advanced Analytics tools and methodologies. This approach is trusted and used in a similar fashion to extract meaning from disparate data sets in the Saskatchewan Social Innovation Hub. AI is used to help deliver the right information, at the right time.

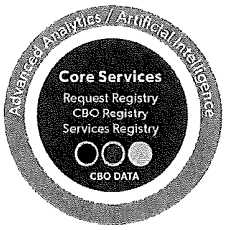

FIGURE 3: CORE INTERFACE WITH ADVANCED ANALYTICS

3.1.3 Services Offered by CBOs

The primary function of ConnectYXE is to connect organizations providing services to Indigenous youth and their families. These service connections will live in the Services layer of ConnectYXE. This information is populated by the Advanced Analytics Interface from CBO data maintained in the core.

Initially the services provided will start with Meals, Housing, Transit, Recreation, Cultural Interactions, and Mentorship. Additional services will be added as CBOs are on-boarded under the direction of ConnectYXE program governance.

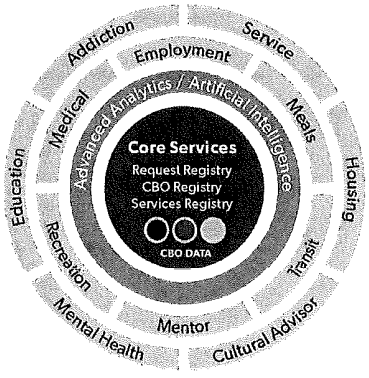

FIGURE 4: SERVICES ONBOARDED

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3.1.4 A Public Request Interface Enhanced Through Artificial Intelligence

A Public Request Interface is where youth who are requesting services can interact, make requests, and receive context-sensitive information to enable them to make informed decisions. It acts as a layer brokering the interactions between the youth and the services. This public layer is enhanced by a Chatbot utilizing Natural Language Processing (NLP) and other forms of Artificial Intelligence (AI).

This feature is a differentiator of this proposal. It allows users to interact with the system in language and terminology that is meaningful to the youth. Whether the youth is speaking to the system using a phone or is "talking" to the system using text, the Chatbot can be a primary handler of conversational interactions.

Chatbots are becoming more prevalent. Apple's *Siri*, Amazon's *Alexa*, Microsoft's *Cortana* and Google Assistant are examples of interfaces that are on a smart phone or voice-activated personal assistant, or as a first encounter in calling customer service at several companies.

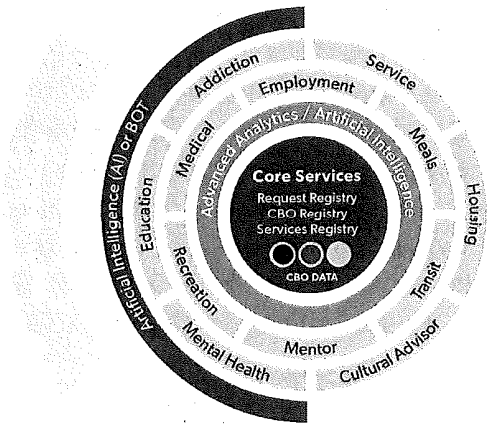

FIGURE 5: ADDITION OF ARTIFICIAL INTELLIGENCE

A Chatbot can be implemented in multiple languages. Future iterations of ConnectYXE may provide access in French. As the vision of ConnectYXE is scaled beyond the immediate objectives, the front end can be enhanced to speak other languages.

3.1.5 User Front End

A layer of web services wraps the public request interface to provide a seamless experience connecting the user to the service they need. Social Media and interactive voice response will allow youth, families and allies to interact with ConnectYXE by whatever method suits them. Together, with the front-end options and the Chatbot, information on programs and services will be available 24/7 with an interactive experience.

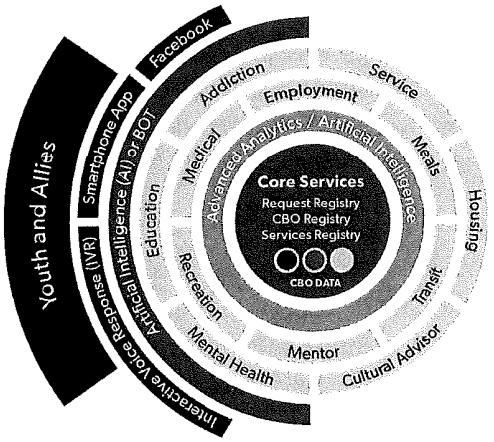

FIGURE 6: USER FRONT END

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ConnectYXE Public Interface Uses Two Forms of Artificial Intelligence

Artificial Intelligence, or AI, is used in two distinctive ways in ConnectYXE's Public Interface.

The AI Chatbot handles the phrasing and conversational interaction, working with short, snippet-based conversation. Examples are phone calls, text message or a Facebook conversation or post. It uses Natural Language Processing and can "learn" from previous conversations.

The second AI dimension is learning what a person is looking for, even when they have difficulty articulating their needs in terms of services. Here, AI tools search for relationships in data. This is Advanced Analytics or machine learning applied to the ConnectYXE context.

In ConnectYXE, data will be analysed by a rich set of analytic tools in the ISM Data Lab. The richness of the analytics, too, grows over time.

3.1.6 Operations Interface Supporting Reporting, Analytics and Business Intelligence

ConnectYXE includes an operations interface comprised of reports, analytics and business intelligence (BI). This interface includes prepared reports that will be available to authorized partners (e.g. CBOs, institutional partners, etc.) This interface layer will support the exchange of data between ConnectYXE and each partner.

ConnectYXE partners – CBOs, Institutional partners, policy makers and researchers will connect to these reporting, analytics and BI services through a web portal. They will have access to information that is related to their services that will allow them to understand the efficiency of the programs they provide, and also understand the landscape of the entire city to understand what the needs are of at-risk youth. This allows them to understand the funding required to run their programs and which social services are at greatest demand. The intelligence gathered will allow us to position social services funding to optimal advantage.

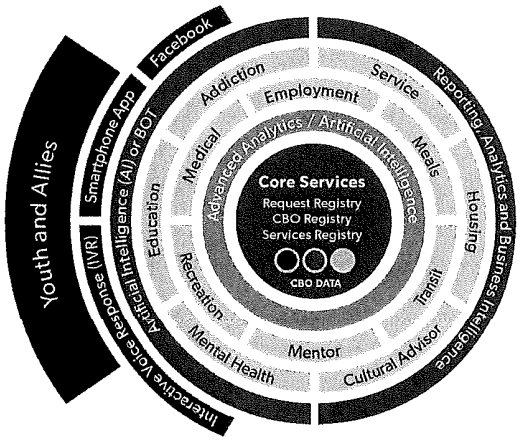

FIGURE 7: ADDITION OF OPERATIONS INTERFACE

A report is analogous to driving a car while looking in a rear-view mirror while Business Intelligence is analogous to looking through the front windshield.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

A Partnership with Saskatoon Housing Initiative Partnership (SHIP)

The Government of Canada National Homeless Individuals and Families Information System (HIFIS) has developed a software solution to enable CBOs to manage shelter and food services, and to share and collaborate their current status and use. In Saskatoon, SHIP is working to promote the use of the current version of HIFIS. CBOs that sign-on with HIFIS publish available shelter space and meal information. This makes SHIP an ideal partner for ConnectYXE-IFIS data are available to ConnectYXE by an Application Layer Interface (API) that has already been developed. This means that the rich dataset maintained by HIFIS for shelter housing and for meals is available to ConnectYXE.

Conversely, ConnectYXE promotes the objectives of SHIP and works to promote the adoption of HIFIS 4.0. As ConnectYXE onboarding process identifies CBOs that do not have a technical solution to managing services, the program will work with HIFIS to meet that need.

3.1.7 Middleware Connector

A middleware layer will connect the data repository to ConnectYXE partners. This is a set of APIs that pull data from our partners' data sources. The nature of the interface will depend on the level of IT maturity of the CBO or institutional partner. Each partner will have a different level of technological maturity. This is discussed further in Section 3.5 "Technical Onboarding of CBOs and Providers".

ConnectYXE is not imposing a standardized, normalized data model on its partners. The approach described above proposes to receive data as it is available, and using AI, will extract information that can be provided to the users of the service. This data will be received by the system by creating APIs. Collectively, these APIs can be thought of as comprising a "Middleware" between the partners and ConnectYXE.

Data provided to the system from the CBOs and institutional partners will be stripped at the source of any PI/PHI.

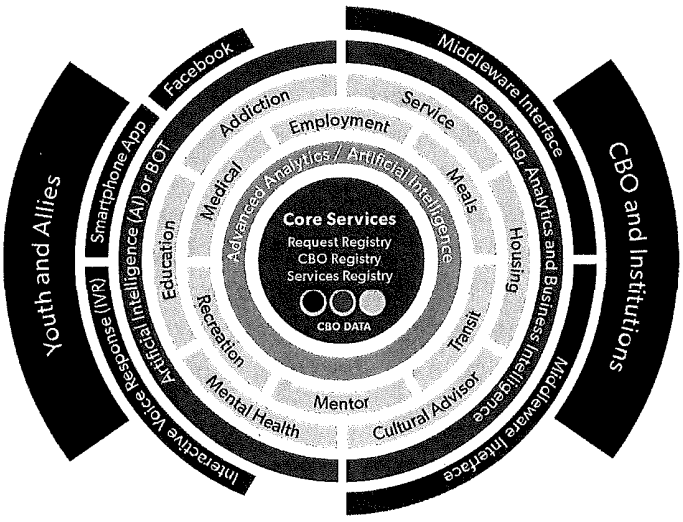

FIGURE 8: FULL FUNCTIONING CONNECTYXE SYSTEM

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ConnectYXE and 211 Saskatchewan

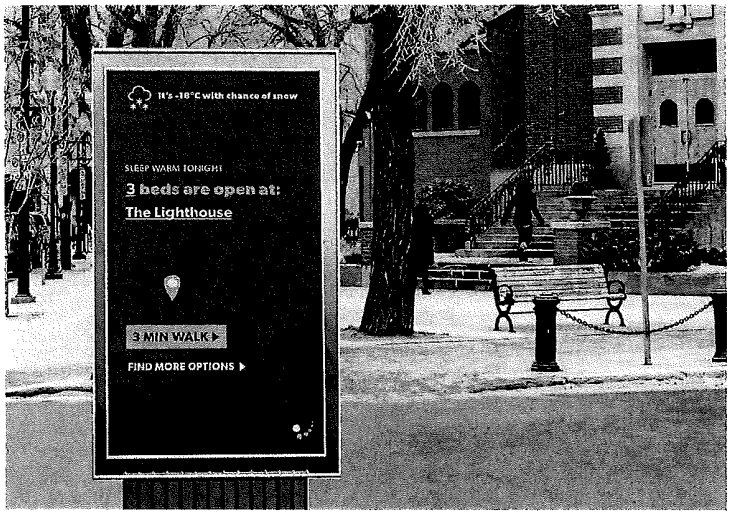
The Province of Saskatchewan has implemented 211 Saskatchewan "to be THE provider of real time community information and referral in Saskatchewan."

211 Saskatchewan is a free, confidential, 24/7 service that connects individuals to human services in the province by telephone, text, or web chat, plus a searchable website with over 5,000 listings of social, community, non-clinical health, and government services across the province.

This service is available by voice or text, from a phone or computer, and is available 24 hours a day, 365 days a year in 100 languages, including 17 Indigenous languages.

ConnectYXE is different from 211 in that ConnectYXE connects to the services offered by partner CBOs – in addition to connecting the individual to the CBO. ConnectYXE will collaborate with 211 Saskatchewan in three ways:

- ConnectYXE will connect to 211 Saskatchewan, facilitating an additional means of access to this service;
- 211 Saskatchewan data will be connected to ConnectYXE so that it is accessible by the analytical and AI tools of the ISM Data Lab. This will provide a rich source of data to match requests for services with ConnectYXE user's requests; and
- 211 Saskatchewan will be onboarded as a partner CBO, providing 211 with access to the services offered by constituent ConnectYXE CBOs.



3.1.8 Public Access Kiosks

Public kiosks will be strategically placed throughout Saskatoon where Indigenous youth meet and congregate. These will present information about programs, services and transit information.

The potential for public kiosks beyond the ConnectYXE program is significant. They can be integrated with current events to promote tourism, and to advise of public services. These would provide the justification for an independent sustainable organization to advance the number of public kiosks beyond what would be funded by the program. We will monitor the use of the initially-provided kiosks as input for a business case to leverage public funding to extend this service.

3.1.9 Internet Exchange

CIRA (Canadian Internet Registration Authority) is a non-profit organization that manages all .CA domains in Canada. One of the goals of CIRA is to keep internet traffic within Canadian borders. The City of Saskatoon is a member of the Saskatoon Internet Exchange. The goal is to ensure all communications (internet traffic) between CBOs and ConnectYXE is within Canada. Combined with all data residing in Canada, we have an opportunity to keep all interactions in Canada.

SAMPLE OF CONNECTYXE PUBLIC ACCESS KIOSK

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3.1.10 Free Wireless Internet to Strategic Locations

Another aspect to improving access to ConnectYXE is to enhance the opportunities for connecting to the Internet in locations where Indigenous youth and their families are likely to be. We know that Wi-Fi access is a limiting factor for many youth who have access to a smart phone, but cannot afford monthly data plans. Current practice is for these youth to hang around schools after hours where they can get a Wi-Fi signal.

Providing broad public Wi-Fi access throughout Saskatoon is beyond the scope of the ConnectYXE program. The ConnectYXE program will improve Internet access by placing wireless access points in neighbourhoods that we identify as having a high concentration of Indigenous families, combined with socioeconomic indicators that indicate high rates of poverty. Using the Stats Canada data overlaid with Geospatial data we have determined where Indigenous families with the lowest income are located. The map shown here illustrates this approach. We will install Wi-Fi Access Points (WAPs) on light standards in one of these neighbourhoods and then use results of utilization of this service to build a business case to secure funding to extend it to additional neighbourhoods.

FIGURE 9: WI-FI ACCESS POINTS IN CORE NEIGHBOURHOODS

3.2 Storage and Application Infrastructure

Access to ConnectYXE is required 24/7, comparable to emergency services. We will leverage Microsoft's Cloud solutions to host the environment required for ConnectYXE. This solution keeps all aspects of the solution within Canadian borders and allows ConnectYXE to be scalable across Canada. Microsoft's Cloud solution includes disaster recovery, backup/restore, archiving, auditing and redundant Internet services. With a high level of redundancy, this will ensure that ConnectYXE users will have a consistent experience.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3.3 Getting Connected to ConnectYXE

ConnectYXE will be valuable to youth, families and allies only if they have the devices to access the system, and if there is an internet connection available. ConnectYXE will address this by increasing the points of access to the system. ConnectYXE will:

1. Provide enhanced access to free Wi-Fi,

2. Place kiosks strategically throughout the city,

3. Be promoted on existing computers in schools and libraries,

4. By text or by voice using an individual's own device, and

5. (In the future) provide free Wi-Fi on public transit

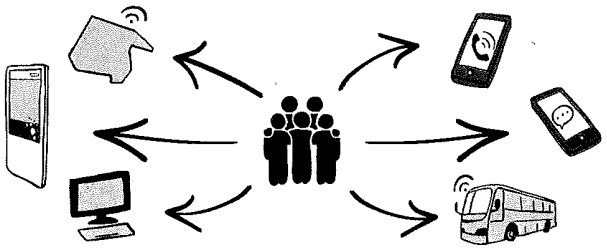


FIGURE 10: CONNECTING TO CONNECTYXE

3.4 IT Governance

IT Governance fits within the context of the overall Program Governance. In the governance model proposed, the execution of the program will reside with a Program Team, led by a Program Director. That team will deliver projects as directed by the ConnectYXE Council (documented in Section 6) and will provide IT Operations support (see Section 4.7 "Transition to Operations").

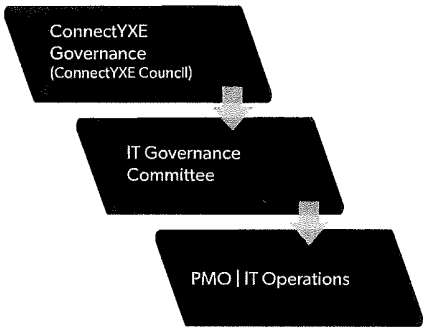

FIGURE 11: IT GOVERNANCE

The system delivered by ConnectYXE requires IT Governance to ensure the IT operation is compliant with legislation, regulations and privacy. IT Operations will be responsible for Data Governance, including data retention and disaster recovery. IT Operations is responsible for ongoing financial accountability, preparing ongoing operating budgets and applying accounting regulations to costs and expenditures.

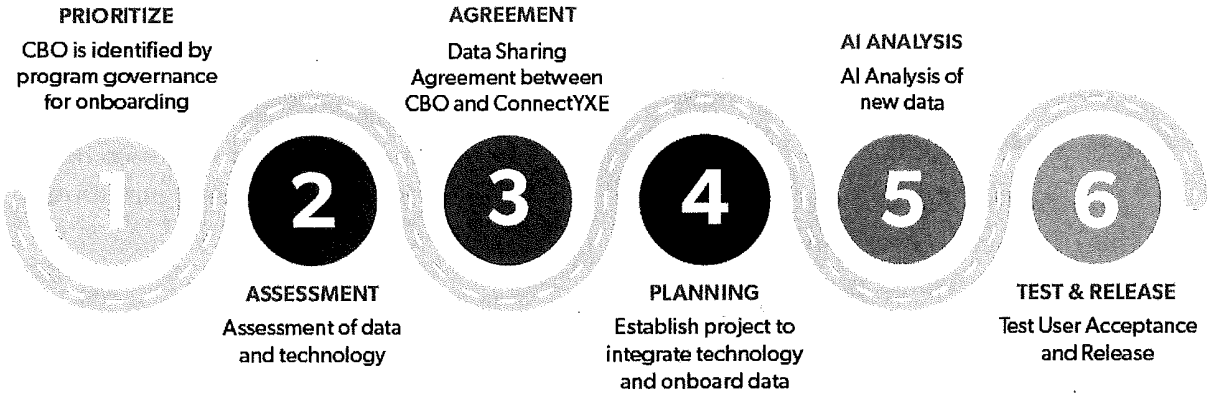
The IT Department of the sponsoring organization – the City of Saskatoon – employs an ITIL-based Governance framework and uses IT Service Management. The City has offered an instance of the ITSM service as an in-kind contribution to ConnectYXE.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3.5 Technical Onboarding of CBOs and Providers

There are two dimensions to the onboarding of a CBO or of an institutional partner: one is the onboarding of the partner at an organizational or partnership level. This is a product of engagement and is managed by ConnectYXE Program Governance. The second dimension is to establish a project to onboard the partner at a technical level.

CBOs can be broken into three broad categories:



- **"No Tech"** organizations present different challenges. These are CBOs who do not have data in a form that can be shared. For these, the onboarding process will work with the CBO to establish basic administration of the services offered. Some funding will be allocated to this purpose. For these CBOs, our agreement will include supporting them to establish IT systems as appropriate. Once systems are developed, these CBOs may then be integrated into the ConnectYXE system.

- **"Low Tech"**: These are CBOs who have basic IT technology. For example, they may manage their services using spreadsheets or a local database. Data from these CBOs may be integrated into ConnectYXE.

- **"High Tech"**: Institutional partners have well-developed IT infrastructure in place and can be considered "High Tech". For example, Saskatoon Transit, City of Saskatoon Recreation and Community Development, Saskatoon Public Schools and Greater Saskatoon Catholic Schools have existing mature systems with which we can build interconnections. CBOs that use HIFIS are also "High Tech."

The roadmap provided below will vary depending on the CBO and their level of technological maturity, but will generally follow this roadmap:

Community-Based Organizations Onboarding Roadmap

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

1. Prioritize: ConnectYXE program governance will identify that a CBO is a candidate for onboarding. This process is managed by the Portfolio Management Process discussed in Section 4.6 "Program Governance."

2. Assessment: We will complete a detailed assessment of the CBO's technological maturity and of their data. This will include identifying whether the CBO's data includes, or is likely to include, any PI/PHI.

3. CBO Agreement: The CBO and ConnectYXE will complete an agreement that includes a Data Sharing Agreement and a Privacy Impact Assessment.

4. Planning: The CBO and ConnectYXE will charter a project to onboard the CBO. This step completes the planning for the onboarding, complete with a project team from the CBO and ConnectYXE. Planning will include identifying the process(es) by which any PI/PHI will be removed from the data sent to ConnectYXE.

5. AI Analytics to Extract Services: Once CBO data has been onboarded and resides in a secure partition, the AI Toolkit of the ISM Data Lab will begin to extract meaning from it – which will populate the services that end users will access.

AI Analytics to Provide Insights: This same ISM Data Lab will, once it has a sufficiently large set of data, analyze the aggregated data, producing trends, deeper analysis and insights.

6. Testing and Release: Once the new data has been tested by the CBO and other User Acceptance Testers, the data will be made available to the youth, families and allies of ConnectYXE.

3.5.1 Integration with CBOs and Institutional Partners

ConnectYXE does not replace nor compete with applications delivered or being developed by other partner organizations. ConnectYXE will connect users to other partner applications. Here are a few examples:

CBO/Institutional Partners	Technology Integration
211 Saskatchewan	211 Saskatchewan (S211) maintains a database that connects individuals with over 5000 agencies and social services. It provides access to this list of services 24 hours a day, every day, by voice (dial 211), text (text to 211), or as a web chat. This database has a published API with which ConnectYXE will directly connect. As discussed, partnering with S211 provides a "safety net" such that users who cannot otherwise find a ConnectYXE service can connect – in real time – with S211. ConnectYXE.can be configured to seamlessly connect to 211 Saskatchewan – either text or voice.
HIFIS	The Homeless Individuals and Families Information System (HIFIS) is a federal government system, providing real-time information about emergency shelter and food services. This system as a published API with which we can integrate ConnectYXE.
Central Urban Metis Federation Inc.	CUMFI uses HIFIS and is moving to HIFIS 4.0 for all of their locations. There is an opportunity for ConnectYXE to expand other services that CUMFI offers, an example is laundry.
EGADZ	EGADZ maintains a SQL database stored on servers at Innovation Place. They currently have an interface used by outreach workers that provides ConnectYXE an integration opportunity. Integrating with EGADZ, we can tap into services that it provides – for example, the "I am not for sale", or the "runaway" apps.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Saskatoon Transit	Saskatoon Transit is a major institutional partner. Through the API to their TRAPEZE system, we can provide real-time transit information. Through ConnectYXE, we can connect to, and use "Trip Planner". Of particular significance, we can provide pre-paid transportation, using new functionality coming with the "Mobile Ticketing" feature.
Saskatoon Recreation and Community Development	ConnectYXE can connect to City of Saskatoon Recreation and Community Development systems, to provide real-time access to drop-in programs, longer term recreational opportunities and other services.

TABLE 5: TECHNOLOGY INTEGRATION WITH CBOS

3.5.2 Technical Collaboration Partners ISM and the Social Innovation Hub (SIH)

ISM Canada is the major technology partner in the development of the Saskatoon Smart Cities Challenge and will be the major contributor of the technical solution of ConnectYXE. The design of ConnectYXE is based on the design of the existing and successfully deployed Social Innovation Hub (SIH), as mentioned earlier. ISM Canada, in conjunction with the Government of Saskatchewan, has invested significant research and development over the past two years to create this innovative data hub in the social sector.

3.6 Scalability, Replicabiility and Future Proofing of the ConnectYXE Design

The ConnectYXE program has been developed to meet the needs of Indigenous youth in Saskatoon. However, the design is:

- **Scalable** – that is, it can be extended to meet the needs of other marginal communities in Saskatoon;
- **Replicable** – it can be applied to other cities in Saskatchewan, in Canada, and globally; and
- **Is "Future-Proof"** - it will only improve as AI tools, Natural Language Processing Tools and other technologies emerge.

3.6.1 Scalable

The proposed design can be scaled to benefit other communities than the initial target community of Indigenous youth. What tailors the system to Indigenous youth is the fact that services identified by the Youth Advisory Board are those services that will be on boarded and in the priority identified. Other related services can be added as needed.

3.6.2 Replicable: A Framework for Canada

The specific data collected by ConnectYXE will apply to Saskatoon and people moving to Saskatoon. However, the system as designed has a much broader reach. The solution is built on the ability for any service provider to be added. This framework approach allows any city in Canada to add their services.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Part of what makes this solution replicable is that it is cloud based: it is not contingent on a locally-placed server infrastructure. This solution can be scaled upwards to meet the needs of other cities in Saskatchewan, in Canada, and globally.

3.6.3 Future Proof

AI is emerging as a technology that is bringing new capabilities and automating tasks that humans currently do. Institutions and businesses around the world are increasingly using AI for a multitude of purposes including medical diagnosis (e.g., IBM Watson), analysis of "big data" for purposes of marketing, or for stock optimization to mention only a few examples. ConnectYXE seeks to use the same technology to address a social challenge.

Future improvements to AI and to Natural Language Processing (NLP) are coming rapidly. We have seen firsthand NLP provide translation between languages. In the future, we anticipate support for local Indigenous languages

The technology incorporated in the design of ConnectYXE is best practice, available, and used in other industries today. What distinguishes ConnectYXE is what the technology is being used for, how the application will make itself available and accessible to those who will benefit from the service, and the provision of powerful and meaningful analytics delivered to stakeholders.

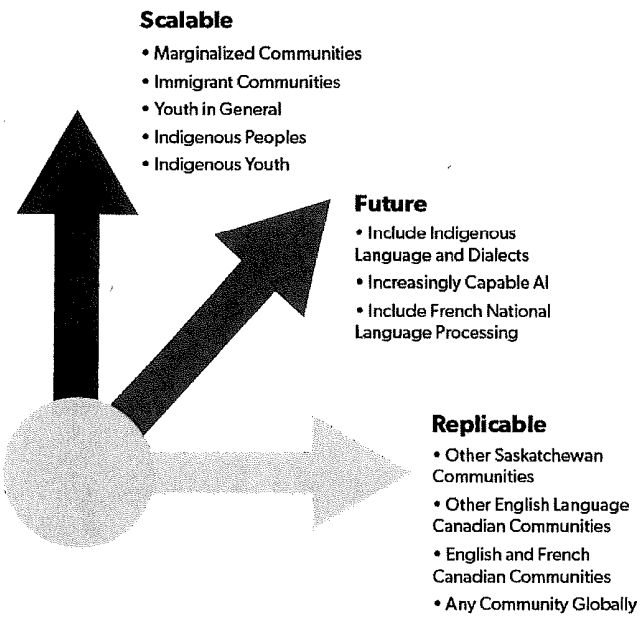


FIGURE 12: FUTURE EXPANSION OF CONNECTYXE

3.7 Risk Management

Risk Management cuts across each of the sections of this proposal, and risks frequently overlap domains. As a result, we have consolidated the risks, and the discussion of the risk log in Section 9 "Risk Management." That section shows those risks that, overall, received the highest impact profile: we have provided our current risk log in its entirety in Appendix Four: Entire Risk Log.

EXECUTIVE SUMMARY

As finalists in the Smart Cities Challenge, the Tri-Council region in Manitoba is pleased to submit this proposal on behalf of our communities; the Rural Municipality of Kelsey, Opaskwayak Cree Nation, and the Town of The Pas. Our challenge statement is as follows:

Our community will utilize LED Smart Farm technology to support local nutritious food growth and promote food security, create a smart phone distribution system and integrate wearable technology to achieve a 40% reduction in the number of imported vegetables and a 20% reduction in community diabetes rates by 2023.

The goal of this project is to both demonstrate a decrease in diabetes incidence rates within our region, as well as create the infrastructure necessary to inexpensively scale the solution to many other communities in Northern Canada. The two major barriers that currently hinder wide-scale consumption of fresh fruits and vegetables in the Tri-Council region, as well as many other northern communities, is the cost and quality of these products. To decrease transportation costs while increasing the quality of produce, it is necessary to bring production of these goods to the local scale.

Our proposal will flow in a logical manner as outlined by the finalist guideline. In Chapter 1 we discuss our vision and our transformative approach to solving it, utilizing connected technology and innovative solutions in our approach to develop critical levers that will positively and uniquely impact our goals. Establishing these levers is the focus of our Smart Cities project.

In Chapter 2 we developed our performance measurement outcomes, creating a logic model and ensuing narrative that describes the activities required to complete our project, outcomes statements, indicators to measure the outcome statements and data source identifiers that inform indicator measurement. We have also included a payment schedule in this chapter. The content of this chapter informs the content of an outcomes-based contribution agreement.

Chapter 3 contains the elements required for successful project management including a work breakdown structure, which identifies tasks associated with completion of each activity as presented in Chapter 2. This information is also presented graphically in a Gantt chart which illustrates the project's critical path and corelates financial reporting periods and project activities. Furthermore, this chapter identifies required resources, risks, stakeholders, and considerations for long term project sustainability.

The technology that will be utilized for the success of our project is described in Chapter 4.

The first formalized governance structure of the Tri-Council will be the not for profit corporation that has been established for this project. The Board of Directors that will have equal representation from each of the three governments and the articles of incorporation are such that each of the members will have equal voice at decisions made. This has been described in Chapter 5, in which we also indicate who our partners are and their readiness to participate in this project.

In Chapter 6 we discuss our engagement strategy and tools used for gathering the thoughts and ideas from our community members. The population of our communities and our long-established history of living

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

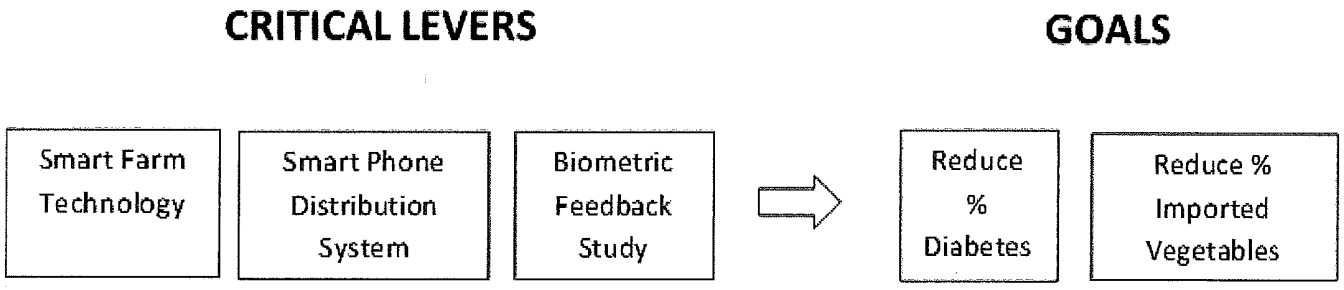
together has allowed us to create pathways of communication that supported the development of this proposal and will allow us to continue to receive the feedback we need to ensure that we are aware of and addressing the needs of our community members as we proceed with the project.

Chapter 7 is an overview of the initial steps we have taken to understand the legislative authorities that guide all aspects of our project that are associated with personal information or personal health information. Because we have both provincial and federally regulated entities within out partnership, we have both provincial and federal authorities to consider when implementing our project. We have completed preliminary impact assessments with both and will complete more comprehensive assessments upon implementation.

Our financial plan is detailed in Chapter 8 and corresponds to the performance measurement outcomes and project management requirements that were detailed earlier in the proposal.

Chapter 9 identifies our plans for meeting policy requirements pertaining to Duty to Consult with Indigenous groups, modern treaty obligations and community employment benefits required under the Investing in Canada plan.

Beyond the benefits to our own community, we recognize the potential of our project to be adaptable and scalable to any community in Canada. We trust that our contribution to addressing food sovereignty in our own community, similarly, contributes to the national food security issue. We also trust that our innovative approach to addressing diabetes will be widely used across Canada as we know that too many of our fellow citizens suffer with the same affliction.



We recognize that our efforts in developing this proposal have created new synergies among our communities and welcome the opportunity to build upon these in the future.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

1 CHAPTER 1: VISION

The Smart Cities journey for the Tri-council communities began by identifying that good health is a priority for our community members. Diabetes is the single greatest health issue in our region and so decreasing diabetes rates was identified as a goal that could be achieved through a Smart Cities approach. Further, we understand the link between healthy, nutritious food and combating diabetes. Our definition of nutritious food means food that is grown, is fresh, does not contain harmful chemicals or pesticides and is not preserved or modified. Food security means that this nutritious food must be accessible and affordable; not impacted by factors such as weather, distance, fuel costs and international trade. Accessibility and affordability have been an ongoing issue for our remote geographical location, as it is to many Canadians. During the process of engaging stakeholders, we identified our goals as a 40% reduction in the number of imported vegetables and a 20% reduction in community diabetes rates. Further, we created a list of critical levers that could be developed to achieve these identified goals. Establishing these levers, as listed below, is the focus of our Smart Cities project.

- Utilize Smart Farm Technology to facilitate year-round local food growth
- Create a smart phone enabled distribution system, leveraging electric vehicles for low cost operation, and
- Integrate wearable continuous glucose monitoring (CGM) device technology to cultivate community knowledge and demonstrate the impact of healthy food on physical biometrics

Our approach is transformative, utilizing connected technology and innovative solutions in our approach to develop critical levers that will positively and uniquely impact our goals.

1.1 Critical Levers

1.1.1 Smart Farm

The Smart Farm Technology, known in the community as the Smart Farm, is a technology that addresses many of the factors currently impacting our accessibility to healthy fruits and vegetables. This technology allows us to have year-round product availability with output that can readily be expanded to meet demand. With a three-week growth cycle, the technology allows for nimble response to demand and alternate growing cycles for product reliability. As this growth is indoors, it is climate agnostic and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

geography independent: food can be grown in this manner in the tundra, above the tree line, on bedrock or anywhere that people find themselves living in an environment that does not lend itself to outdoor gardening. This technology is also environmentally friendly, reducing the need for transportation of our food from the southern states, reducing refrigeration costs, and reducing land and water resources. Additionally, we create employment for our own community members to grow our food rather than paying people we will never see to do this for us. Using this technology, we obtain food sovereignty – a right that we choose as important to us.

The Smart Farm Technology is a critical lever to the success of our outcomes for these reasons:

- Enables local year-round food growth
  - Freshness of food and the impact of fresh food on diabetes
  - High food cost and early food spoilage are associated with long transport routes which can be mitigated through local food growth
  - Year-round local food growth necessitates indoor production due to harsh climate
  - Existing Korean technology is a preferred option because of their proven production rates and a previously established collaborative relationship on technology, research, and learning from their advancements.

The transformative impact to the community has a broad reach. Fresh, affordable, accessible food has not e everyday life of most community members for decades. However, the transformation at. This technology allows community members to raise food for their families, neighbours well as create jobs within the community.

Very replicable

n technology is both scalable and replicable in any community, regardless of size, as it can be pace as small as a shipping container or as large as an airplane hangar. The input or operation of Smart Farm technology include water, electricity, heat, nutrients, and seeds.

Phone Distribution System

The smart phone distribution system consists of two parts. One Is the **smart phone application** (app), which serves as an online marketplace, and the other is the physical distribution of food, utilizing an **electric vehicle distribution** system, that is dispatched through the smart phone app.

The smart phone app provides community members with a means to connect to the distribution system by providing an interface to access to goods. The app will resemble any other online marketplace, providing customers with information such as product availability, price, a purchasing platform, and incentives. The [redacted] complementary second function which provides knowledge and support for the use of n by providing information such as recipes and nutritional information. Additionally, a indicating times and locations of local community cooking classes or food sharing ll also be available. Popular lunch and learn sessions on issues pertaining to health and e advertised in this manner. Options for payment will include use of popular credit cards and its to a user's account.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Through extensive community engagement, we have determined that direct to door distribut increase the possibility that community members will begin to consume more healthy food. an identified barrier to accessibility is that many community members do not have access to small children to care for, or are unable to get to the grocery store in a timely manner. In ord operating costs as low as possible, physical distribution of food will be done through the utili electric vehicles; an order generated through the smart phone app triggers dispatch of the de

Our decision to use electric vehicles has been encouraged by the clear signal from automakers and government policies that electric vehicles are here to stay and the way of the future. As a Tri-council, we know that a smart cities approach is to look to the future and to consider how we can leverage resources for more than one purpose. As such, we look to the potential of tying into the growing provincial infrastructure of electric vehicles, as outlined in Manitoba's Electric Vehicle Roadmap document, offering our community members the infrastructure support required to operate electric vehicles within the region.

As it pertains to our goals, we considered how the use of electric cars could ensure adopting healthy food choices in the daily lives of our citizens. Our considerations focus on the reality that our electricity rates are the lowest in North America and that this is a cheaper source of energy than the imported liquid fuel we currently rely on. Using electric vehicles, we can reduce operating costs and, in this way, pass the savings on to the customer thereby eliminating one of the identified barriers to healthy eating: astronomical costs for low quality produce.

The Smart Phone Distribution System is a critical lever to the success of our goals because it increases the distribution system's capacity and efficiency. Most community members utilize their smart phone to communicate with each other and their broader social networks, so it is anticipated that this approach will be effective in connecting customers with the products they want.

Although electric vehicles have been chosen as the vehicle platform for the project, the distribution system can utilize any form of transportation, coupled with the smartphone platform, to functionally accomplish distribution. For example, delivery can be made by foot, bicycle, canoe, drone, or even conventional vehicles. Furthermore, the use of smartphone technology is convenient for reaching larger populations, however, in smaller communities, or communities without reliable access to wireless internet, product selection and ordering could be accomplished through alternative means.

1.1.3 Biometric Feedback Study

Wearable CGM devices, used to measure blood glucose levels in real time, will be worn by a **voluntary study group** as part of an academically led research project that will link the impact of healthy eating on physical biometrics including blood glucose. Furthermore, we see this group as creating the beginnings of a critical mass of community members who recognize the impact of healthy eating and, with this knowledge, influence change for the entire community. A study group provides a quantifiable metric for the impact of our project, allowing us to evaluate the effectiveness of dietary choices on human health; particularly the onset of diabetes. The study group will be guided and supported by health professionals at one of our two

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

local primary care centers. Nurses will input biometric data from the participants into the electronic medical record (EMR) system. In this way, the data of the participant will be confidential, and allow for simplified feedback over time as the EMR generates graphs and reports that participants can observe. This feedback has proven to be a useful tool to incentivize and encourage individuals in their health journey. Participants will also have professionals to assist them with any health concerns including mental wellness support, group counselling support, or other medical needs.

Throughout this research project, we will support Individuals from all of our communities who wish to participate. One of the Tri-Council members, Opaskwayak Cree Nation (OCN), has adopted an integrated care team (ICT) model of care based on the Alaskan South-Central NUKA model of care. The ICT is nurse led and supported by a physician and/or nurse practitioner, a social worker and clinical assistants. The team is further supported by learning circles which support groups of community members that are facing similar issues to meet and support each other. The seven sacred teachings have been incorporated into all programming at OCN's Beatrice Wilson Health Centre, which offers traditional and non-traditional spiritual care to support the choice of the individual. Our non-First Nation partners also utilize the knowledge of Beatrice Wilson Health Centre staff for Indigenous Cultural training for their non-Indigenous health staff. Through our collaborative Statement of Intent, discussed later, the provincial Northern Health Region and OCN have agreed to share health resources and work together to learn how to best meet the needs of

[redacted]embers who seek health care in any of our local health facilities, including the local hospital.

feedback study is a critical lever to the success of our outcomes for these reasons:

ne biometric readings provide a strong feedback mechanism corelating dietary decisions and ugar levels, thus cultivating participant and community knowledge of the importance of a / diet

ng a powerful data collection mechanism for academic analysis and healthcare best practice dge

The value of the wearable CGM device is in its use for real-time blood sugar monitoring to facilitate personal health knowledge acquisition. However, real-time monitoring is not critical in gaining this knowledge; conventional point measurement approaches to blood sugar monitoring, although less powerful in providing feedback, also serves the purpose of providing feedback on dietary choices.

1.2 Goals

We will measure our goals utilizing a variety of data collection methods.

1.2.1 Reduction in diabetes rates

Although we have been aware that the lives of many of our community members are impacted by diabetes, it is through the collection of data that we have been able to quantify this. Every five years, the Northern Health Region, under the direction of the provincial government, completes a community health needs assessment that captures many of the health issues, health care utilization rates, morbidity and mortality rates and other factors that measure the overall health care needs of the population. While some of the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

data of the population of Opaskwayak Cree Nation is captured in this assessment, it is only as it pertains to such factors as hospitalization, cancer care and dialysis usage. To capture the data for the entire Tri-Council region in a uniform manner, OCN utilized the same data collection methodology and reporting structure to complete a community health needs assessment for OCN that can be directly compared to the provincial data. In this way, we have managed to complete an overall picture for the region and this data serves as a baseline that can be utilized as a comparator for future assessments. Given that this is recent data, we will complete community health needs assessments in a similar manner in five years and ensure t' evaluating the impact of our project on diabetes rates in the region.

[redacted]

Good baseline -

The data for residents of The Pas and RM of Kelsey, as captured in the provincial Northern He (NHR) 2016 aggregated data, indicates that in Manitoba 28.1% of the population was recorde from diabetes and prediabetes with a projected rate of 31.3% by 2026.

Data for Opaskwayak Cree Nation was collected in the identical manner as the NHR, utilizing t epidemiologist so that data could be compared and aggregated geographically rather than jur In 2017, 46% of those living in OCN had been diagnosed with diabetes according to OCN's Cor Health need's assessment report. In 2017, two primary care physicians began practicing at Beatrice Wilson Health Centre. In February 2019, data from the medical records indicate that 60% of their patient population of 1800 people have Type 2 diabetes. The increase of 14% over two years could indicate that community members are now receiving better primary care so previously undiagnosed individuals are now diagnosed and are receiving treatment.

The high rates of diabetes in the Tri-Council region and the monetary and human costs associated with the disease has resulted in the citizens and leadership of the region to determine that real solutions to the escalating problem need to be developed and has therefore become a priority in planning. This was confirmed through our community engagement process detailed in Chapter 6.

The primary care clinics in both The Pas and Opaskwayak utilize the same electronic medical record and patient records can be accessed from either clinic. This data sharing has been secured through a privacy impact agreement signed by leadership in both communities. The patient data in the electronic medical record can be anonymized and collated into reports that assist us in evaluating diabetes rates and reductions in diabetes indicators such as blood glucose levels, Hemoglobin A1C levels, and other biometric measurements. The consistency of data resulting from this shared electronic medical record is an evaluation tool that is useful for us to look at regional population health as we evaluate the impact of our project on the health of our community members.

1.2.2 Reduced in % of Imported Vegetables

In the initial months of our implementation phase, we will monitor current fruit and vegetable import rates into the community. This will serve as our baseline measurement against which we will monitor the success of our project over time. As reflected in the responses from businesses and community members in our community engagement strategies detailed in Chapter 6, we anticipate that fruit and vegetable

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

consumption rates will increase, particularly as it pertains to the utilization of local food, given that our project will be addressing the two main barriers to fresh fruit and vegetable consumption: cost and quality.

Current fruit and vegetable import rates can be measured by:

- Communication with existing distributors
- Partnership with existing grocery stores

Accurate assessments of import reduction can be done by comparing baseline data to the ratio of locally produced to imported produce at the end of the project. These two factors provide us with an overall accurate reflection of percentage of food import and community utilization over time.

1.3 Progress towards outcomes during the finalist phase

During the finalist phase we have made the following progress towards outcomes:

- Increased community awareness of the project
- Solidified the vision with the Tri-Council
- Steps towards localizing consumables required for growing food
- Development of requirements document for software
- Laid foundations for a biometric study with the University of Manitoba
- Identified partners for our project
- Identified suppliers for all materials
- Secured real estate and preliminary designs for the smart farm
- Establishment of a governance model for the project

1.4 Reasons to be selected as winner

Our project is unique in many respects and aligns with the Smart Cities Challenge guidelines as well as other priorities for Canadians. These include:

- Tri-Council governance model – a unique model that includes Opaskwayak Cree Nation, The Town of the Pas, and the Rural Municipality of Kelsey
- Scalable and adaptable to any community in Canada – food production can adapt to population size and consumption rates and can be established within existing infrastructure; deployment of food can be adapted using a range of deployment methods
- Local food sovereignty – communities can grow food according to community preferences and scaled to meet community consumption rates
- National Food Security – reduced reliance on imported goods
- Carbon Reduction – decreased transport energy consumption
- Health care costs – reduction in hospitalizations, amputations for diabetics
- Community job creation – more northern/local employment opportunities

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Northern development – vendor agnostic modular approach
- First Nation partnership – enhanced community independence
- Multi-jurisdictional health partnerships – reduction in service delivery gaps caused by jurisdictional issues

Our project is transformative in that we are using connected technology to facilitate the grow connect community members with that source of food as well as utilizing wearable technolog insight into the correlation between dietary choices and health outcomes.

Throughout this project, we have considered and prioritized a design that is both scalable, to future expansion as well as easily replicable in other regions of Canada to accommodate local resources and existing infrastructure.

transformative model

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

2 CHAPTER 2: PERFORMANCE MEASUREMENT

2.1 Project Activities and Outcomes

The overarching philosophy of this project is that increasing access to fresh fruits and vegetables, as well as promoting knowledge of the correlation between dietary choices and diabetes, is the pathway to achieving the community identified goals of decreasing diabetes rates and decreasing imported food rates. Community feedback through surveys, interviews, and conversations clearly indicates that fresh fruit and vegetables are currently inaccessible due to either excessive costs, low quality, or absence from grocery store shelves. Therefore, the activities necessary to increase access to fresh fruits and vegetables have been identified as building and operating the three critical levers introduced in Chapter 1; a Smart Farm, smartphone distribution system, and biometric feedback study. Ongoing community engagement, as described in Chapter 6, is necessary to ensure operation of these tools is efficiently and effectively achieving the desired outcomes.

The first lever that will be developed is the Smart Farm. The function of the Smart Farm is to enable, using indoor food growth technology, the year-round localization of economical fruit and vegetable production. Localization of production of these foods mitigates the transportation time and cost from the current procurement model, which are identified as key drivers of cost and early spoilage (products are 1-2 weeks old by the time they reach shelves).

The second lever that will be developed is a smartphone distribution system. The smartphone distribution system is comprised of both a smartphone application software component as well as a vehicle-based delivery service component. The function of the smartphone software application is twofold. The first function is to provide an online marketplace to enable selection of desired products, facilitate purchase, and dispatch packaging and delivery activities. The second function is to provide recipe ideas and cooking guides on community recommended applications for food products as well as community cooking events. The function of the vehicle-based delivery service is to provide direct-to-door delivery of food products so that additional barriers to accessing grocery stores, such as not owning a vehicle or having young children to care for, are overcome.

The third lever that will be developed is a biometric feedback study. This study involves the use of real-time blood sugar monitoring technology to provide feedback, to the study participant who is wearing the device, on the correlation between dietary choices and diabetes. The participant may also share this information with their primary care provider for health management support. This feedback is expected to enhance awareness of the link between diet and diabetes in the study participants, and in turn, enhance community awareness of this link. Furthermore, by partnering with the University of Manitoba, publication of the study results can further assist in enhancing awareness throughout the community.

2.2 Project Implementation: timelines, deliverables, milestones

The implementation phase of our project is constructed to have four milestones over five years. Within these four milestones, we have a list of project activities. These activities centre on the three critical levers discussed above. The implementation process for this project takes each of these three critical levers and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

divides them into two stages of development: **building** and **operating**. As such, our implementation activities, outcomes and indicators capture the two stages of each of the levers: **building** of these critical levers and **operation** of the critical levers. The milestones and activities are depicted on the logic model below. They are further discussed from a project management perspective in Chapter 3 and illustrated in chronological order on the accompanying Gantt in that chapter.

2.3 Logic Model Overview

The logic model, shown in Figure 1, provides a summary overview of the activities and outcomes associated with the project. A more detailed logic model, including indicators, milestones and data sources is shown in Figure 2 on the next page. A legend, identifying the information that is conveyed on the detailed logic model is shown in Figure 3.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 1 includes a list of outcome indicator data sources and the data source number that is used in Figure 3.

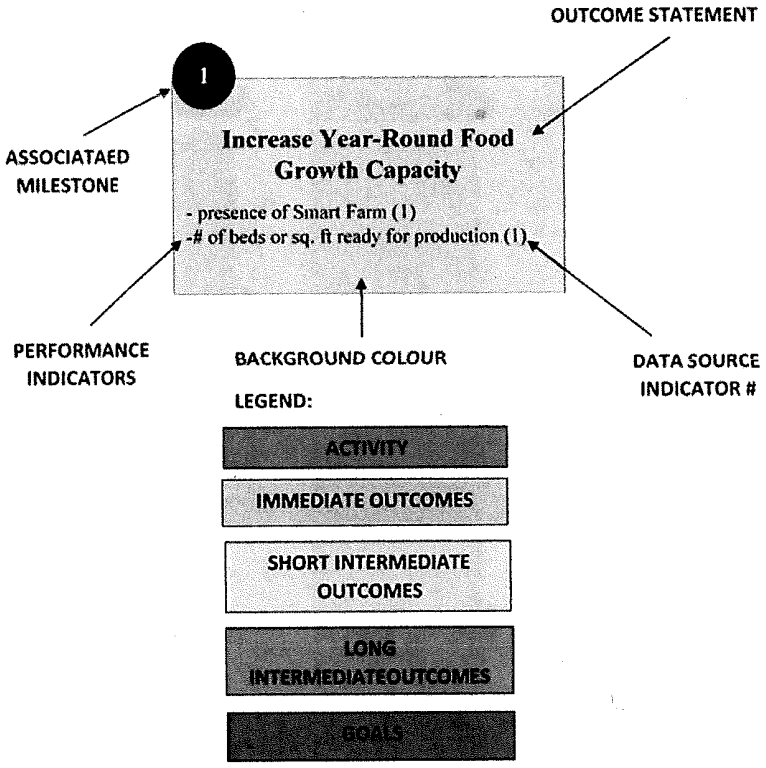

Figure 3 detailed logic model legend

2.3.1 Description Of Detailed Logic Model

MILESTONE 1:

The activities associated with achievement of MILESTONE 1 will involve:

- **Build** the Smart Farm
- **Build** the smartphone distribution system
- **Build**, or create, the biometric feedback study framework.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

This phase is anticipated to take roughly 21 months as outlined in the Gantt chart.

Outcomes associated with MILESTONE 1, bulleted below, with sub-bulleted indicators, and indicator data source number as per the table above (in parenthesis), include:

- Increase year-round food growth capacity
  - Presence of year-round food growth facility (1)
  - # of beds or sq. ft ready for production (1)
- Increased distribution capacity
  - Presence of a software integrated order system (2)
  - Presence of a software integrated packaging system (2)
  - Presence of a software integrated delivery distribution system (2)
- Presence of a health impact research study design
  - Timeliness of: (4)
    - Approvals
    - Partnership agreements
    - Participant consent forms
    - Study schedule
    - Participant selection criteria
    - Outcome measurements

MILESTONE 2:

The activities associated with achievement of MILESTONE 2 will involve:

- Initiate **Operating** the Smart Farm
- Initiate **Operating** the distribution infrastructure system
- **Perform** Community Engagement activities

It is anticipated that achieving this level of operational maturity will take approximately 9 months, and with the inclusion of a 3-month allowance time for milestone report and review, this milestone is achieved at roughly month 33 of project implementation.

Outcomes associated with MILESTONE 2, with sub-bulleted indicators, and indicator data source number as per the table above (in parenthesis), include:

- Greater number of locally produced foods
  - # of market ready products per harvest (1)
  - # of different product options (1)
- Enhanced employee expertise in Smart Farm operations
  - # of employees with completion of training certificate (1)
  - # of employees with return of demonstration of acquired skills (1)
- Enhanced employee expertise in Smart Farm distribution operations
  - # of employees with completion of training certificate (1)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Presence of community engagement activities
    - # of engagement processes utilized (3)
    - # of campaigns deployed (3)
    - Amount of donated produce to schools, businesses and care homes (1,2,3)

MILESTONE 3:

The activities associated with achievement of MILESTONE 3 will involve:

- Optimize **Operation** of the Smart Farm
- Optimize **Operation** of the smartphone distribution system
- Implementing (**operating**) the biometric feedback study
- Perform Community Engagement Activities

The primary outcome for achievement of MILESTONE 3 is the implementation of the biometric feedback study. Implementation of the study as well as synthesis of the produced data and creation of a final report is expected to take 18 months, with completion occurring at roughly month 51 of the project implementation. We are also continuing to increase production at the Smart Farm during the implementation of the biometric feedback study.

Outcomes associated with MILESTONE 3, with sub-bulleted indicators, and indicator data source number as per the table above (in parenthesis), include:

- Increased Smart Farm production
    - % increase in active grow beds (1)
    - % increase in species grown (1)
    - % increase in market ready products per harvest (1)
- Decreased cost of food
    - % reduction in cost of food produced (1)
- Increased Smart Farm Efficiency
    - % reduction in unsold produce (1)
    - % reduction of spoiled product (1)
    - % reduction in amount of energy input to Smart Farm per active bed (1)
- Increased distribution efficiency
    - Presence of software driven dispatch (2)
    - % increase in orders delivered within scheduled time block (2)
- Presence of CGM wearable systems
    - # of study participants (4)
    - # of CGM wearable systems deployed (4)
- Increased presence of academically verified data connecting dietary choices and diabetes
    - Presence of academic paper (4,5)
- Enhanced participant awareness of the relationship between diet and diabetes
    - % of participants who feel better informed (4)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- % of health professionals who report increased study participant awareness (4,5)

- Increased awareness of Smart Farm operations
  - # of participants responding to surveys (3)
  - # of participants attending focus groups (3)
  - # of participants engaging in forums (3)
  - % increase in overall community satisfaction (3)
- Increased community plant factory sourced food consumption
  - % increase in orders (2)
  - Increase in reported consumption (3)
- Enhanced community awareness of relationship between diet and diabetes
  - # of community forums sharing results of study (3)
  - % of community engagement survey responses indicating enhanced awareness (3)
- Increased confidence in business direction
  - % of elders supporting business activities (3)
  - % of community members with high degree of overall satisfaction (3)
  - % of government leadership supporting business activities (3)

MILESTONE 4:

The activities associated with achievement of MILESTONE 4 will involve:

- Collaborate with knowledge translation partners in producing reports on outcome/goal achievement indicators
- Optimize operation of the Smart Farm
- Optimize operation of the smartphone distribution system
- Perform Community Engagement activities

Working with our knowledge translation partners, the Northern Health Region, Opaskwayak Health Authority and the University of Manitoba on identified aspects of creating the final report, our expected timeline of these activities is 6 months, with expected completion occurring in five years (60 months).

Outcomes associated with MILESTONE 4, with sub-bulleted indicators, and indicator data source number as per the table above (in parenthesis), include:

- Decrease in diabetes rate
  - # of occurrences reported in community health needs assessment (3,5)
  - % decrease in occurrences reported through EMR anonymized data (3,5)
  - % decrease in biometric indicators among research study participants (4,5)
- Decrease in imported food
  - % decrease imported produce, as reported by grocery store surveys (3)
  - Ratio of operating cost to sales revenue (1,2)

This final milestone will include completion of the final report which will include information from three different sources to evaluate the impact of our project on diabetes rates in the Tri-Council region. Theses

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

sources include the NHR and OCN Community Health Needs Assessment reports with a comparison of diabetes rates benchmarked in 2017/18 to those in 2024, anonymized data from the EMR, and the results of the research study. Furthermore, a comparison of benchmarked community food import quantities from 2018 will be compared against those values in 2024 to determine the percent change in imported foods. Optimization of the smart farm and smartphone distribution system is anticipated to have reached a level of economic self-sustainability, where revenue from produce sold exceeds the operating costs and profits can be redirected to further improve the health of community members.

Payment Schedule and performance indicators

Achievement of each project milestone, identified above, will be associated with financial resource release from the project's funding partner, Infrastructure Canada. The milestones are again listed in Table 2 below along with reporting project outcomes used to identify achievement of the milestones.

Table 2 Payment Schedule

Project Milestone	Installment ($)	Project Outcomes Reporting Schedule
Initial	6.22 million	
1	1.11 million	➢ Increase year-round food growth capacity ➢ Increased distribution capacity ➢ Presence of a health impact research study design
2	2.41 million	➢ Greater number of locally produced foods ➢ Enhanced employee expertise in Smart Farm operations ➢ Enhanced employee expertise in distribution operations ➢ Presence of Community Engagement activity
3	0.26 million	➢ Presence of CGM wearable systems ➢ Increased academic data connecting dietary choices and diabetes ➢ Increased Smart Farm production ➢ Decreased cost of food ➢ Increased Smart Farm efficiency ➢ Increased distribution efficiency ➢ Enhanced participant awareness of the relationship between diet and diabetes ➢ Increased awareness of Smart Farm operations ➢ Increased confidence in business direction ➢ Increased plant factory sourced food consumption ➢ Enhanced community awareness between diet and diabetes
4		➢ Decrease in diabetes rate ➢ Decrease in imported food

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

2.4 Risk Identification and Mitigation

One of the main risks associated with any strategy for impacting health outcomes is that the ownness for action lies with the individual. The three-lever approach presented in this project is designed to efficiently remove as many barriers as possible between community members and fresh fruits and vegetables with the goal of decreasing diabetes rates and decreasing imported foods. However, the assumption then is that each of the three levers are operational. Therefore, risk mitigation must extend into operation of each of the three levers. These risks are identified and presented with mitigation strategies in Chapter 1.

The Smart Farm, just like any other farm, has inherent risks such as pests or farmer error such as inappropriate nutrient supply or premature/late harvest. There is likely to be a learning curve that, throughout the first year or so of operation, results in some degree of crop failure. Mitigating measures include partnership with the OCN pilot Smart Farm in order to acquire as much knowledge from local experts as possible, thereby increasing the probability of success. Furthermore, segregation of vertical farming beds into quarantine or containment rooms to minimize the spread of pests, should they arise, and the use of air showers at entrances to ensure no foreign species are introduced can also minimize the risk of pests.

Software solutions are powerful in their ability to reach many people, but also present risks. The use of a smartphone application to facilitate online ordering of fresh food products presents the risk of excluding those who are less familiar with technology, or do not own a smartphone, from participating in the purchase of goods. In order to mitigate this issue, the ordering platform will also be accessible through a web browser, or orders can be placed in person at the Smart Farm location in the local mall. Furthermore, although direct-to-door delivery is designed to be the primary dispatch pathway, the Smart Farm is also intending on working with local grocery stores to make products available through the more conventional distribution pathways.

Offering a direct-to-door delivery service is risky due to the potential unreliability of vehicles, weather conditions, and variable costs associated with vehicle maintenance. In order to mitigate these risks, electric vehicles have been selected as the desirable platform for performing delivery. These vehicles have a significantly lower operating cost and decreased maintenance requirements. Cold weather driving range of electric vehicles is the primary drawback. In order to overcome this issue, installation of level 3 charging stations which can recharge an electric vehicle in as little as 15-20 minutes will be installed both at the Smart Farm and at the furthest operational location; Kelsey's Cranberry Portage. Secondly, by selecting a vehicle that has a suitably large battery back, the deteriorated cold weather range can be managed.

The biometric feedback study is intended to serve two purposes; provide an opportunity to showcase the effects of fresh produce on diabetes indicators in an academic setting, and to nucleate first hand community knowledge of the correlation between dietary choices and diabetes using real-time blood sugar monitoring technology. As with any study, participant drop-out is a risk to the integrity of the study (too few study subjects indicate the study is not statistically significant). Two measures have been considered to deal with this; providing a financial incentive for study participation as well as increasing the study design size so that if some participants drop out, the study does not become invalidated. The second risk that has

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

been identified is the participants emotional response to being presented with their body's real-time blood sugar data. Stress and frustration are possible outcomes that may arise with this data. In order to address these risks, the study will be designed to occur in a series of small groups that include several study participants, a nurse and a dietician. This design is anticipated to offer the required support throughout the study process.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

3 CHAPTER 3: PROJECT MANAGEMENT

The scope of this project includes the development and operation of the three critical levers; Smart Farm technology, smartphone distribution system, and biometric feedback study. Operation of each of these business units is required in order to successfully leverage the desired community outcomes; achieve a decrease in imported fruits and vegetables and a decrease in diabetes rates.

It is important to bring each one of these business units to an operational state at the correct time and in the correct order to ensure both economical and effective project execution. The project work breakdown structure (WBS), which identified tasks associated with each activity, their resource type, duration, and predecessor, is presented in Figure 4 at the end of this chapter. Each task in the WBS is identified with a unique WBS#. These numbers are then called out in predecessor column to identify the tasks which must be completed prior to the task in that row; its predecessor task. The information contained in the WBS is presented in graphical form through the Gantt chart show in Figure 5 at the end of this chapter. The Gantt chart also illustrates the project's critical path. The critical path is defined as the shortest possible sequence of activities that achieves completion of an activity or project, considering duration and predecessor tasks. Financial milestones are overlaid on the Gantt chart to identify corelating trigger points for progress reporting (red diamonds) and subsequent funding installation release dates (green diamonds).

The project management critical path for this project is defined by 4 activities corelating to Chapter 2:

1. Build the plant factory
2. Initiate operation of the plant factory
3. Perform the biometric feedback study with community members
4. Distribute fresh food products to the community while tuning operational protocols to increase efficiency

Each of these four major activities can be broken down into tasks, some of which are serial and some of which are parallelizable. Scheduling of tasks must prioritize serial tasks on the critical path while ensuring timely completion of parallel non-critical path tasks.

Smart Farm operation and smartphone distribution system operation can be thought of as two pillars that support operation of the biometric feedback study; the biometric feedback study requires products from the plant factory to be delivered through the smartphone distribution system to participants to produce measurable biometric effects.

There are four categories of resources that are required in the development of this project:

1. Material
    a. Standard building materials (for example lumber, ventilation, electrical, etc)
    b. Real-estate (space to house the plant factory)
    c. Vehicles and supporting charging infrastructure
    d. Plant factory equipment (vertical farm, refrigerators, computers)
    e. Continuous Glucose Monitoring devices

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

2. Contract labour
    a. Project coordinator / manager
    b. Engineer/architect
    c. Construction contractor for plant factory renovations
    d. Software developers / maintenance experts
    e. Nurse / researchers for biometric feedback study implementation
3. Operation labour
    a. Plant factory manager / supervisor / seeders / harvesters
    b. Delivery drivers
    c. Bookkeeper
4. Financial

One of the primary goals throughout the design of this project has been to maintain a vendor agnostic design so that this project can be replicated in any geographic location without being hindered by dependency on a particular supplier. Furthermore, this design serves to de-risk schedule delays and cost overruns that can arise with sole service / material providers.

3.1 Impacts on Stakeholders

The following list identifies the stakeholders that are impacted by our project or conversely, impact our project. We have also identified these groups in our engagement strategy in Chapter 6. Characteristics that make each of these stakeholders unique are:

1. Community members
    - Community members are the primary stakeholders in this project as its success impacts their access to more fresh fruit and vegetables options and thus may impact their health over time. Additionally, there will be employment opportunities created at the Smart Farm.
2. Businesses
    - Opportunity for synergies and supply of local fresh produce for their own enterprises.
3. Schools/youth
    - Opportunity for lunch program options, employment, and influencing family choices.
4. Citizens with disabilities
    - Increase access through direct to door delivery, food choice options
5. Elders/seniors
    - Increase access through direct to door delivery, food choice options, education
6. Government leadership
    - Increased community health, business opportunities, funding synergies, electorate satisfaction
7. Health partners
    - Health professionals can provide nutrition counselling to patients, knowing that there is access to healthy foods - a criteria for treatment of many chronic diseases including diabetes; data collection to support practice

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Response to feedback from these stakeholders is paramount in ensuring success of the project. Feedback is anticipated to come in the form of monitoring the relative popularity of the various food products, customer feedback via delivery driver interactions, surveys, and other forms of community engagement as outlined in Chapter 6.

3.2 Long-term Sustainability Considerations

The five-year project through Smart Cities Challenge is viewed as an incubator period, during which time external financial resources are leveraged to build capital assets, the Smart Farm and smartphone distribution system, and establish a sustainable business for long term operation and community impact. Upon commencing food production and distribution, it will be necessary to establish:

a) suitable pricing models that make these products more widely available

b) high value export markets in the form of product contracts to support revenue

c) administrative protocols that are efficient and effective

d) community awareness of the dietary decisions on health outcomes to promote increased community health

Following completion of the biometric feedback study, the three remaining business units will continue tuning these four variables with the goal of achieving financial self-sustainability so as to ensure the goals of decreased fruit and vegetable imports and decreased diabetes rates are sustained beyond the five-year lifecycle of the project.

3.3 Risk Identification and Mitigation

Except for the CGM devices, of which there is presently only one Health Canada certified device available, the Dexcom G5, the material resources required for this project can be provided from many different vendors. There are presently two known additional companies working to bring Continuous Glucose Monitoring devices to the Canadian market. Given that these devices are not required until partway through year 2 (approximately fall 2021) as outlined in Chapter 2, there may be alternative hardware available on the market by then. Furthermore, although much less insightful as to the relationship between dietary choices and diabetes indicators, point measurement blood sugar monitoring technology is readily available and could be performed more frequently amongst study members of the biometric feedback study.

Contract labour is used for those tasks which are not part of the ongoing operation of the plant factory. All tasks to be assigned to contract labour require specialized skills but are not locked in to any particular vendor. Construction contractors, nurses and researchers, as well as project coordinators are available either locally or within Manitoba. Some software developers are available in Manitoba, but these services may be solicited from elsewhere in Canada based on project scheduling.

Operational labour is readily available within the tri-community. Several of the OCN community members responsible for operation of the Smart Farm pilot project are already skilled with the operation of the Smart

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Farm technology and are acting as partners in the project to provide required training and knowledge transfer to the incoming staff.

The two greatest risks of the project are expanding lead times and cost over-runs related to resource procurement.

We have mitigated risks related to **procurement** through the preparation of requirements documents in advance during the finalist phase of the project, which were used to acquire more accurate quotes and lead times from several potential suppliers. Furthermore, many of the required material resources for this project are off-the-shelf items, for which quotes and lead times have also been secured. Consequently, the assignment of resources, human resources, material resources and financial resources, has been performed with a high degree of confidence. Further discussion on the financial resources required are discussed in Chapter 8.

The project schedule, as outlined in the Gantt chart below, is a comfortable, yet aggressive timeline identifying a step-by-step approach to timely project completion. Should resource procurement timelines slip, mitigating actions such as re-sourcing resource procurement or increasing labour resources will be taken to bring the project back on schedule. Financial resources have been assigned with a buffer in order to facilitate these types of de-risking measures. A dedicated project manager that monitors project progress is necessary to identify risks, should they arise, and take the required remedial action.

Procurement of materials and contract labour will generally be performed following acquisition of three quotes for materials that meet the project requirements and selection of the quote that offers the best combination of economy and lead time (de-risking schedule delays through selection of higher cost, lower lead time equipment may be desired as project delays also carry an embedded cost). Exceptions to this system are anticipated in those instances, such as real-estate, where selection will be performed based on greatest value add to the project and necessary duty to consult.

4 CHAPTER 4: TECHNOLOGY

Development of internet connected smart devices has grown exponentially over the past 5-10 years. The impact of this development has revolutionized many industries by providing technology solutions to overcome barriers that were otherwise insurmountable. This project will leverage several of these powerful, cutting edge technologies to address the challenges identified by our community.

Technologies leveraged by this project, further described below, include Smart Farm technology, a smartphone distribution system, and wearable biometric feedback devices.

A Smart Farm is the merger of vertical farming and the internet of things (IOT) connected technology, combined with cutting edge LED lighting control algorithms used for the year-round cultivation of food.

A smartphone distribution system connects community members with the Smart Farm and its products by leveraging the combination of an online marketplace smartphone application for the placement of orders, and a direct-to-door delivery system that utilizes electric vehicle powered distribution infrastructure to complete orders cultivated and packaged at the Smart Farm.

Wearable biometric feedback devices, specifically continuous glucose monitoring devices, provide a real-time window into the wearers blood sugar levels as well as a data logging solution so that this information can be shared with healthcare providers.

These technologies work together to provide a complete system which provides both the tools and feedback systems to improved health outcomes and local food security to the community. These technologies have been selected as they are familiar and have each been previously demonstrated to be effective at achieving their desired outcomes. A diagram illustrating the connection between each of the technologies used in this system and their location in the overall system operation is shown at the end of this chapter in Figure 6 below.

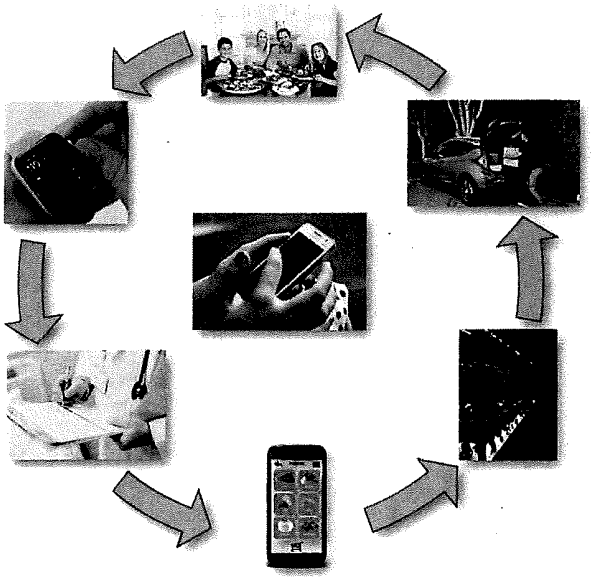

Figure 6 system flow diagram

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

4.1 Replicability and Scalability

Although certain suppliers have been selected for the execution of this project based on the particular geography of this project site, their availability, price, and the established business relationships of the community, it should be clear that the framework laid out in this project, namely food production, food distribution, food ordering interface, and biometric feedback, are technology agnostic; many different types of technology can be used to fill the function of each block. This allows for utilization of alternative suppliers or technological approaches, depending on the availability and requirements for deployment of this project to other locations in Canada. This ensures that the project is both replicable and scalable. For example, the use of electric cars is recommended for this project; however, any vehicle ranging from conventional cars to drones to hovercrafts to helicopter could be used if this technology was more suitable for operation in another geographical region. Similarly, the Smart Farm technology supplier has been selected from Korea based on a multi-year business relationship that has previously been established with OCN and the fact that many staff are already quite familiar with this system. However, any vertical farm technology from an alternative supplier, and even similar technologies such as aquaponic systems, could be substituted for this role; so long as they facilitate year-round food growth.

4.2 Detailed Discussion

4.2.1 Smart Vertical Farm

Vertical farming technology leverages hydroponic technology, combined with "bunk-bed" style layered grow beds, to increase food growth capacity per unit area of indoor floor space. Hydroponic technology, the practice of growing plants without the use of soil, has been practiced in various forms since the early 1600's. OCN, in partnership with the Korean Agricultural Systems and Technology (KAST), installed one of KAST's Smart Farms as part of a demonstration project that commenced in 2016. The Smart Farm, or more generally a vertical farm, has successfully demonstrated the ability to produce 98 different species of plants ranging from leafy greens and herbs to calorie dense root vegetables and fruit. Demonstrating the ability of an agricultural technology's ability to grow calorie dense vegetables and fruits year-round is critical to address issues of food security in Northern Canada.

KAST is one supplier amongst a multitude of suppliers for vertical farming hydroponic equipment, so procurement from this supplier is not critical for project success. However, KAST has poured extensive research into development of their now patented lighting control system which increases energy efficiency while accelerating plant growth.

The KAST Smart Farm technology is far from experimental. KAST has deployed system that are successfully operating all over the world, with key markets including Japan, China, Korea, and USA.

Through implementation of the demonstration project, KAST was required to establish cUL certifications for all their equipment to ensure its conformance with electrical safety standards in Canada. This was successfully established and now they are fully prepared to provide equipment for this project and more projects into the future. There are no regulations surrounding the use of vertical farming technology for the cultivation of food; however safe food handling regulations will need to be followed and periodic

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

testing will be required to ensure quality of the plants. Clean and safe work environment practices will also need to be followed to ensure staff and customer safety. As part of the demonstration project in OCN, all staff have received safe food handling certification, a practice which will continue on to new staff throughout this project, supported by the management staff of OCN's Smart Farm pilot project.

All seeders, harvesters, and packagers will be trained on the operation and maintenance of the equipment as required. Only trained staff will be permitted to operate or become involved in the Smart Farm operations. This will ensure contamination free high-quality product.

One of the risks to using foreign technology is bottlenecks in the supply chain for consumable items. This has already been experienced through the demonstration project and local suppliers are being sought out to mitigate future supply chain issues. Since the Smart Farm is remotely controllable, another risk could be remote high jacking of the control systems. This is primarily mitigated through the use of encrypted communication protocols and high security login credentials.

4.2.2 Smartphone Distribution System

4.2.2.1 Smartphone Distribution - Software

Online marketplaces have been growing in popularity over the last decade because they are easily accessible to a large group of people (those with smartphones or a computer), they minimize the requirement for a bricks and mortar location for the business, and they are deployable over a much larger customer area. Online banking is an example of how a software application has revolutionized rural locations. Prior to the development of smartphones, it was necessary to travel, sometimes hundreds of kilometers, to deposit a cheque or transfer funds. Online banking, accessible through the smartphone application interface, has made it possible to perform these tasks quickly, regardless of geographic location.

A smartphone ordering application will be used to connect community residents with products from the Smart Farm by providing an online marketplace where users can see available products and order those products for delivery to their door. To ensure community members are provided with up to date product information, regular updates will be required by the Smart Farm manager to ensure the products available so that they are reflected in the online storefront.

Customers can view these items through the ordering application and select which items they would like to purchase. Accompanying the available products display will be a list of recipe suggestions for that particular product. Selecting a recipe will provide a list of required ingredients with the option of filling the shopping cart with all of the items offered by the Smart Farm that are required for that particular recipe. Alternatively, browsing can be done by recipe. Selecting a recipe will display the required ingredients, and, again, the option to fill the shopping cart with products available from the Smart Farm will be available. Through the customer application, there will also be an option for viewing order history and account information.

Drivers will also have an application interface that shows the delivery destination and the order number that needs to be dropped off at that particular address. This will ensure the driver brings the correct package to the correct destination.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Like any online store, there will be a requirement for a central product database to store product information as well as account information of users. Minimizing the amount of information that is stored for each customer is step one. Secondly, security will be maintained using standard SSL encryption techniques on all communications as well as encryption of the data on the server. Payment processing will certainly be a required task for this software solutions, so a secure eCommerce platform such as Magneto, an industry standard Adobe product, will be used. Although the majority of Canadians carry at least one credit card, there are still individuals who do not prefer to own a credit card or use if for online shopping purposes. Therefore, one of the other features that will be incorporated into the smartphone ordering application will be the ability to carry an account balance that can be recharged using cash at the Smart Farm. Privacy considerations for the commercial activity of the Smart Farm fall under the authority of the Office of the Privacy Commissioner of Canada (OPC) and specifically the Privacy Information Protection and Electronic Documents Act (PIPEDA) that is discussed further in Chapter 7. Upon implementation of this project, we will work closes with OPC to ensure that we comply with all necessary legislation and privacy considerations.

Compatibility of the smartphone application will comply with iOS and android operating system standards so as to ensure that, regardless of a user's desired platform, this service will be accessible. Furthermore, updates will be made available as needed to ensure customer feedback can be incorporated into the operation of the software, and that compatibility with future operating systems is supported. Making the application available in the Android Play Store and the Apple App Store will ensure that it is easily distributed to anyone in the community, and with potential future expansion of the distribution infrastructure, scaling services into additional communities can happen seamlessly.

The vertical farm requires several consumable items for its operation and securing a timely supply of those consumables is critical for de-risking successful ongoing operation of the vertical Smart Farm. These include Styrofoam rafts for floating the plants above the nutrient rich water, nutrients for mixing with the water, and foam cubes for germination of the seeds. As the demonstration project between OCN and KAST has progressed, it has been identified that there are often delays when procuring these items from Korea and so local suppliers are currently being sought out.

4.2.2.2 Smartphone Distribution - Vehicles

There are several technologies included with the electric vehicle distribution system including electric vehicles and electric vehicle charging stations. As with each of the four portions of this project, the particular vehicle which is selected is not overly critical for success of the project; although suitable size and range are certainly considerations for effective completion of tasks.

Electric vehicles have been gaining popularity around the world due to their decreased operating cost, zero emission characteristic, and decreased maintenance cost over their liquid fuel powered predecessors. As battery technology advances, the range that an electric vehicle can travel is ever increasing which makes these vehicles increasingly viable for more people living in Canada's sparsely populated Northern regions. Consideration of these characteristics provided the foundation for exploration of the viability of electric vehicles for this project.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The RM of Kelsey's Cranberry Portage is located 80km North of OCN and The Pas. In order to complete a round trip, it was established that a minimum range of 160km with a 30% margin was needed as a minimum; 200km range. Furthermore, since battery chemistry yields decreased energy delivery at cold temperature, accounting for an additional 50% range reduction was determined to be required in order to ensure that 200km could be travelled in cold weather. This left two currently available vehicles as options, the Tesla Model 3 or the Chevrolet Bolt. Based on many Canadian owner reports of cold weather performance, the Chevrolet Bolt will lose up to half of its range when operating below -30C, which means a range of roughly 190 km. In order to further de-risk the possibility of running out of energy on the highway, a rapid electric vehicle charging station will also be placed in Cranberry Portage so that recharging can take place before returning to the Smart Farm.

Installation of 50kw+ rapid DC electric vehicle stations (Level 3 charging stations) are required in Canada in order to enable inter-city and rural travel. Given the 600km journey from The Pas to Winnipeg, and that the best electric vehicles have a range of 400-500km per charge, there is still a requirement for rapid reenergization of vehicles. By contrast to Level 2 recharging stations which are commonly installed for around $2,500 and will recharge an electric vehicle in 6-9 hours, a Level 3 charging station costs roughly $50,000 and enables vehicle recharging in 15-30 minutes; this is currently the only path forward for Canadian highways and rural destinations.

There are several manufacturers of level 3 charging stations around North America and they all offer CSA and/or cUL compliance and compatibility with the two universal charging connector standards; CCS1 and CHAdeMO. One of the leading Canadian suppliers for this technology is a company called FLO which is located in Quebec. FLO offers charging stations that are unparalleled in their cold climate functionality and tolerance, and are also partners with the US giant Chargepoint, which means they have a reciprocal agreement for payment account usage at stations. Use of FLO or Chargepoint hardware is not required for recharging functionality, but since they are leaders in charge station location software and payment logistics, it makes reasonable sense to work with them.

One of the leading electric vehicle manufacturers today is Tesla Motors. Tesla has designed and is deploying their own proprietary supercharger stations which accomplish a similar rapid recharging function as the Level 3 chargers, however Tesla vehicles also use a proprietary connector for interfacing their cars. In order to increase adoption rates of Tesla vehicles by making them more universally usable, Tesla provides an adapter to their proprietary connector which enables compatibility with the CHAdeMO connector. There is no reciprocal connector, however, which would enable a non-Tesla electric vehicle to charge at a Tesla supercharging station. With this in mind, a Level 3 charging station with the universal CCS1 and CHAdeMO connectors ensures compatibility with all future electric vehicles.

Electric vehicle charging stations do not operate in the same way as conventional fuelling stations insofar as an attendant and cashier are waiting to take your payment. Electric vehicle stations operate more like the cardlock system used for long distance trucking organizations, where fueling is done in a self-serve manner and payment is done by card at an unattended kiosk. One of the advantages to this system is that there is

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

no labour cost to operation of the system so installation of these Level 3 provides a benefit to not only the Smart Farm distribution fleet, but also the community at large with no additional cost to Smart Farm.

4.2.3 Biometric Feedback System

Continuous glucose monitoring (CGM) technology is a wearable device that samples blood glucose continuously throughout the day and provides real-time feedback to the person wearing the device. There is one company currently operating in Canada called Dexcom that provides this CGM device. This device uses a very small subcutaneous needle to monitor glucose levels of the wearer. The device that Dexcom provides also houses a Bluetooth transmitter so that the readings from the glucose sensor can be broadcast to the smartphone of the user for real-time display. The user can then establish correlations between dietary habits and blood glucose levels, choose to optionally share their data with family and friends, or choose to share their data with a healthcare provider for greater insight into their health and health care requirements.

Dexcom G5 CGM devices are currently used successfully by patients all over the world. The Dexcom G5 device became available in Canada in 2016 after certifying that it complied with all required regulations. In 2018, Health Quality Ontario released a report indicating it is strongly in favour of publicly funding the use of CGM devices for those with severe diabetes since the results are very positive. Although Dexcom is currently the only CGM device available in the Canadian market, there are several other companies including PKVitality and Medtronic that promise CGM devices to become available in the coming year or two.

The scope of this project's use of CGM devices is for the monitoring of a study group to assist in increasing community knowledge by providing real-time feedback on the correlation between dietary choices and biometric parameters. As such, training on the device use will be provided by health care professionals to ensure individuals feel secure on the proper use and operation of the device. Individuals in the study group sign a consent form indicating that they choose to share data collected via the CGM device with their health care providers. As per the provincial legislated authority, the Personal Health Information Act (PHIA), the personal health information of the study participant will be maintained in a confidential manner. We have met with the provincial Ombudsman in Manitoba and have discussed, in Chapter 7, our review of this legislation and the necessary steps we will take during the implementation phase to comply with all legislative and regulatory requirements.

One of the risks of using this type of technology is that by providing new information to the study group participants, these individuals may become anxious or overwhelmed. Meetings with health care providers and learning circles, provided at the health centre, provide opportunity for study group participants to receive support throughout this process.

4.3 Purpose for Using Technology

Local production of food using vertical farming technology is seen as an excellent approach to making high quality fresh produce available year-round since it removes the requirement for international trucking to

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

connect farms located in the southern US, Mexico, Central America, and other various tropical destinations with communities in Northern Canada. This means that food produce:

- Is fresh, as it can be consumed on the same day it is harvested
- Cost has a decreased dependence on liquid fuel and other transport costs
- Security is less dependent on international trade politics, and
- Availability is not impacted by weather and road conditions

The main barrier to year-round food production in Canada is the sub-zero climate. This is experienced for over half the year depending on location; The Pas, OCN, and Kelsey can experience sub-zero temperatures from early October through late April. Vertical farming technology enables local year-round growth of fruits and vegetables regardless of the outdoor climate.

Vertical farming systems are manufactured all over the world, with maturities ranging from home built to commercial grade. OCN, in collaboration with the Korean Agricultural Science and Technology organization (KAST), a Korean manufacturer of advanced commercial vertical farming technology, commissioned a pilot project to demonstrate the effectiveness of KAST's vertical farming technology in Canada. The project was initiated in 2015 and has successfully demonstrated the ability to grow 75 varieties of various fruit and vegetable species.

KAST's vertical farming technology leverages a unique lighting control system to accelerate plant growth. It is claimed that this control system provides accelerated plant growth over competitor lighting systems. While this is a challenging claim to prove or refute, KAST's vertical farm technology has become familiar to many of the community members in OCN, The Pas, and Kelsey, and the established business relationship is valued by community leaders.

One of the shortcomings that has been identified with many other hydroponic systems that have operated in Northern Canada is that they primarily produce leafy greens and low-calorie products. The demonstration project plant factory that was installed by OCN in 2015 has successfully demonstrated the ability to grow high calorie vegetables such as beets, radishes, kohlrabi, cabbage, broccoli, cauliflower, and carrots. The ability to grow high calorie vegetables with this system proves its viability as a Northern Canadian food security solution.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

5 CHAPTER 5: GOVERNANCE

As per our challenge statement, we as the Tri-Council entered the Smart Cities Challenge for the purpose of the health and well being of the community. This goal has led us to determine that the appropriate governance model for the project is a not for profit corporate structure. To this end, each of the three governments has signed a council resolution in which they agreed to proceed jointly in this manner and to create a Board of Directors for the not for profit entity which will see equal representation from each of their respective governments, as depicted on the Figure 7 below.

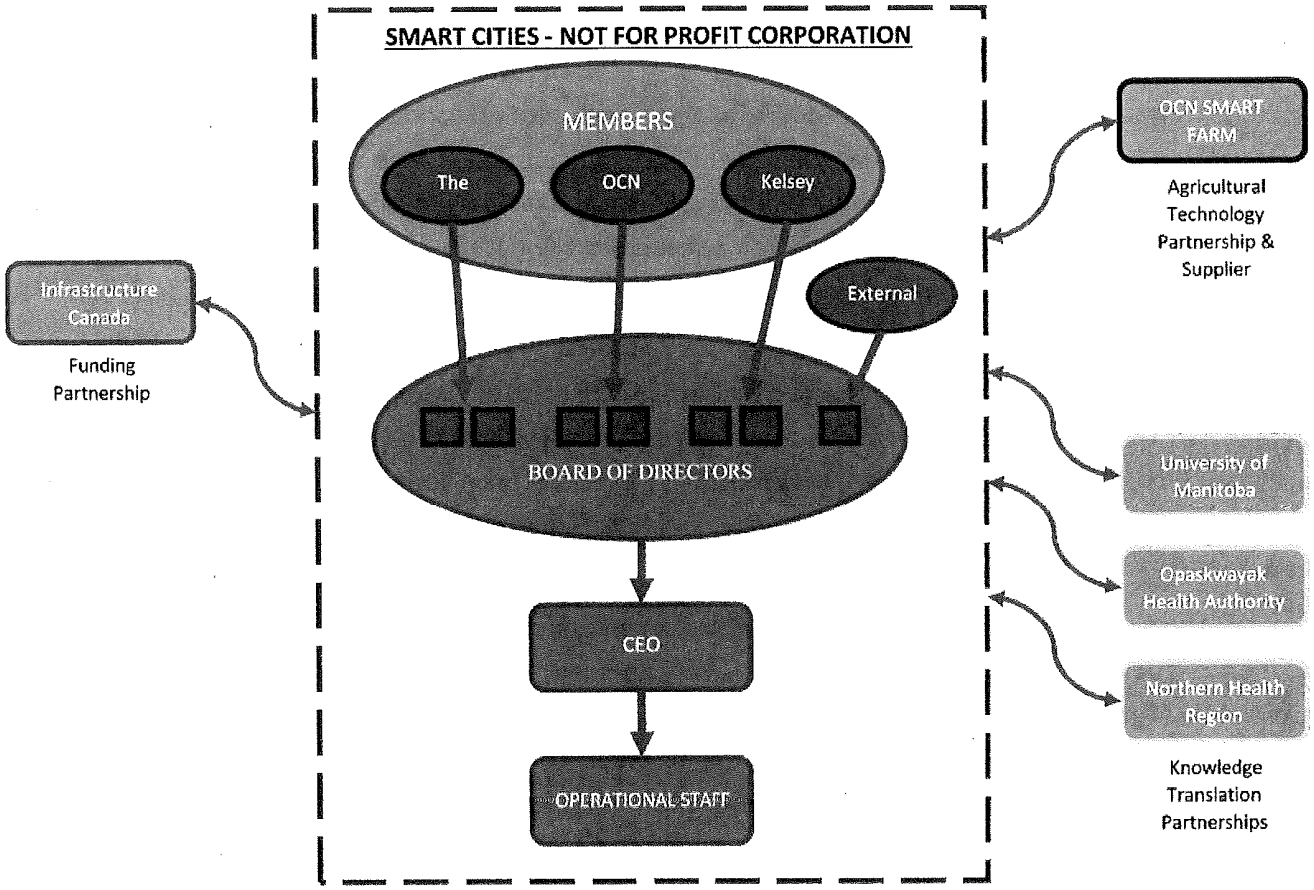

Figure 7 not-for-profit corporate structure diagram

Our not-for-profit corporation will be established under the auspices of The Corporations Act (Manitoba). Figure 7 above depicts our structural organization. In green, we have our membership which will be comprised of the elected officials that make up the three government bodies of the Tri-Council. Each of these governments appoints two representatives to the Board of Directors which will also have an external member, appointed jointly by the Tri-Council. The Board of Directors is responsible for hiring the CEO to provide operational management to the business as per this proposal and oversight to the operational staff working in the business.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The diagram also depicts our partners, colored differently to denote that they have different functions as partners. Our partners include:

- Infrastructure Canada, the **funding partnership** who will release funds as per our outcomes-based agreement and to whom the Board will provide ongoing reports as required
- Opaskwayak Cree Nation LED Smart Farm, is the **agricultural technology partnership**, providing knowledge, training and ongoing technological advancements to the vertical smart farm as well as the supplier of the smart farm technology.
- University of Manitoba and the Northern Health Region, the **knowledge translation partnerships**, work with us to move our research and data into the hands of our health care providers and community members to put the knowledge we gain into practical use to reach our intended outcomes.

Our partnerships have been established over time and each have strong governance structures and resources, such that they make stable partners with whom we can collaborate and build our success.

5.1 Readiness of partners

- OCN LED Smart Farm - has developed and operated the Smart Farm over the past four years with support from their relationship with the Korean Institute of Science and Technology (KIST) and Korean Agriculture System and Technology (KAST). This partnership began with Opaskwayak Cree Nation in 2015 and is ongoing as the vertical smart farm is currently functioning as a test and training site as well research and development of at least 75 food products, feeding approximately 100 people at this time. OCN has obtained distribution rights for the Korean technology and the have an agreement in this regard.
- University of Manitoba – will provide a researcher for our project by the name of Dr. Miyoung Suh. Dr. Suh is an Associate Professor in the department of Human Nutritional Sciences. She has experience in research and translating knowledge to the medical profession as well as the general public. She has experience in the area of practice-based research for dietetics. Having completed prior research in the area of prenatal health in Opaskwayak Cree Nation, she is respected and trusted by community members.
- Northern Health Region - through ongoing collaboration on program development and resource sharing as per our joint steering committee on health, the NHR is a long-time partner and has agreed to continue to work together to support this project. In particular, the NHR will provide the primary health care support for the research participants and any other community members willing to consider health care support and changes to lifestyle to improve the quality of their health. They have provided physicians and the electronic medical record to the Beatrice Wilson Health Centre located in Opaskwayak Cree Nation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Opaskwayak Health Authority (OHA) – OHA is responsible for the health services delivered on reserve at the Beatrice Wilson Health Centre. We submitted the required Research Lens in Ethical Decision-Making as directed by the OHA Board of Directors, and they have approved it. Furthermore, they have indicated that this research is very necessary for the community and are grateful for the opportunity.

Over time, we have built relationships based on policies and agreements, but more importantly, on trust, which enables us to move nimbly as we set directions for our Board of Directors and their staff. With our business model, governance model, and overall plan, these strong partnerships also enable us to expect the success we are bound to have with this project.

The role of the Board of Directors is one of policy governance, although will function as an operational Board at the early stages of project implementation. The operational role of the Board will be to hire an Executive Director and determine policies and procedures that will support the Executive Director to carry out the goals and objectives and achieve the outcomes as documented in Chapter 3 of this proposal. When the Executive Director is comfortable in carrying out the functions of the business, he or she will report regularly to the Board. The Board will then shift from an operational focus to one of setting strategic direction, establishing governance policies, and supervising the Executive Director. The Board will have policies outlining the relationship between the Executive Director and Board members.

The governance structure we have created to proceed with our project is based on sound principles of governance. These are as follows:

1. Well defined goals and objectives
    - We have completed extensive community engagement, examined current research and developed a model, created a five-year plan of business milestones and supported this with outcomes-based performance measurement goals
2. Evaluation of resources
    - We are supported by cohesive relationships among governing partners, experience in working with corporate structures, strong workforce, supportive and contributing partners, business knowledge and access to external expertise
3. Planned processes
    - Details of the business have been created within this proposal and lessons have been learned from the three years the smart farm has been in development prior to this project was proposed
    - Financial accountability following best business practices, including an annual audit, is a key process of the Board

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

4. Governance lead
    - Membership of the not for profit corporation consists of the elected official from the three government bodies that comprise the Tri-Council including:
    - OCN - Onekanew (Chief) and 7 Onuschekewak (Council)
    - RM of Kelsey – Reeve and 6 Councillors
    - Town of The Pas – Mayor and 6 Councillors
    - Membership will lead the Board of Directors with a mandate, through election, from the community members they represent
    - Membership, and the Board, will also be informed of the needs and wishes of community members through ongoing engagement as described in Chapter 6
5. Scalable documentation and processes
    - The utilization of technology such as the server database of the smart farm and distribution business, central to this project, allows for anonymized data and trends to be gathered in a clear and concise manner. This would include details such as logistic costs, consumption patterns, customer preferences, utilization of delivery versus pick-up, etc. This documentation in turns assists the Membership, Board of Directors and Executive Director to make ongoing business and business process decisions based on information that can be compartmentalized to each of the processes within the system.

5.2 Strengths of our governance structure include

- Local control
    - Members of the not for profit are elected by community members
    - Board of Directors is appointed by Members
    - Board of Directors hires the Executive Director
    - The Executive Director hires community members to work in the business
    - Products of the business enhance the health and well being of the community members
- Transparency of the not for profit corporation
    - Public by-laws
    - No hidden owner
    - Business enterprise is invested into the community
    - Distribution pathways are clear
    - Financial management as per the Canada Not for Profit Corporations Act
- Value for investment
    - Product of the business improves health and well being of the community
- Simplicity
    - Strong governance structure in its simplicity

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

5.3 Risk Identification and Mitigation

1. Disagreement among members of the Board of Directors
    - Mitigation: We have developed a list of items in our unanimous member agreement which require approval by Extraordinary Resolution. "Extraordinary" approval is an 80% threshold, so for all intents and purposes, the requirement is unanimity considering the three parties identified as members.
2. OCN no longer acts in its capacity as agricultural technology supplier
    - Mitigation: We have a preference for the Korean technology which is supplied to the Smart Farm project for which OCN acts as a supplier. However, should their ability to act as a supplier become compromised, the success of the project is not dependant on them: alternative suppliers can be sought.
3. Knowledge translation partnerships dissolve
    - Mitigation: If the University of Manitoba partnership dissolves, alternative researchers at other Universities can be identified and hired. If NHR and OHA do not want to contribute towards supporting the research project, the University of Manitoba has identified that they will send up research assistants from their facility.
4. Delayed payment from Infrastructure Canada
    - Mitigation: Clearly defined timelines, outcomes, punctual reporting practices, early discussion on schedule changes.
5. One partner discontinues ongoing participation
    - Mitigation: The Board of Directors will reorganize themselves to accommodate for circumstances but continue to function as oversight for the project.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

6 CHAPTER 6: ENGAGEMENT

The nature and size of our three communities, along with our long-established methods of intra-community communications, has enabled us to conduct broad and diversified engagement activities throughout the project definition and scoping processes, leading to our current position as a finalist in the Challenge. Our initial engagement involved brainstorming sessions with community leadership and active community members to identify key community needs. As we worked through development of our initial proposal, we broadened our engagement to further assist in sculpting the project. Our ongoing engagement activities look for the ideas, opinions, needs and vision of our diversified population ranging from youth, elders, families, businesses, special needs groups and our elected government officials. Through these activities, we have established a framework for engagement that we will continue to use throughout the implementation phase of our project.

The tools that we have utilized throughout our engagement process include:

- Surveys – business and general population
- Forums – special needs groups, business, leadership, health
- Social media – Facebook
- Scheduled feedback - groups that hold regular meetings and include Smart Cities on their agenda including governments, business, health, Boards
- Focus groups – people living with diabetes, disabilities, high risk youth, elders

Our engagement throughout the development phase has provided us with valuable insight and perspective as we shaped our project for future success. Insights gained are summarized below.

6.1 Community Engagement

6.1.1 General population

To ensure that the community would benefit from and support the goals of this project, our initial information was collected from the general public in all three communities by utilizing online and paper surveys that were completed at focus groups, the local grocery stores, schools, workplaces and community-based organizations. In order to obtain unbiased and comprehensive data to use moving forward, the surveys were completed by community members of all ages and demographics such as mothers, at-risk youth, elders, families with and without children, single adults, and people living with and without diabetes. Surveys were filled out anonymously to allow participants the opportunity to complete them openly and honestly. They were able to supply contact information if they wished to participate in further data collection such as focus groups or if they wished to be part of the future study group. We have had success in the past on other projects utilizing this method of data collection to engage community members and stakeholders and will continue to use it moving forward to collect information while informing the community about the status of the Smart Cities Challenge.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The surveys focused on:

- Impact of diabetes on the community
- Barriers to purchasing fresh produce
- Types and frequency of vegetables being purchased by the community
- Amount of the produce purchased thrown away due to spoilage
- Interest in and benefits of a delivery service
- Interest in a smart phone app to order produce and access recipes
- Interest in participation in a research group that utilizes wearable technology to monitor blood sugar to assist with controlling or preventing diabetes for the wearer.

We learned that 92% of community members feel that diabetes is a high priority issue that needs to be addressed immediately, 49% of participants said that either themselves and/or a spouse/child suffered from diabetes and 28% said that someone in their extended family is currently living with diabetes. The majority of those who are living with diabetes in their family would be willing to make changes to their diet and eating habits to minimize the impact on their bodies. They stated that being supplied with fresh vegetables would be a great incentive for them to participate in a group study and that they would participate in a study using wearable technology to track and monitor their blood sugar.

The most popular type of fresh produce currently being purchased in the community is leafy greens; 83% of participants who purchase produce at least once/week purchase leafy greens. To date, leafy greens are the main type of crop grown at the OCN pilot Smart Farm and are also one of the dietary items that can be beneficial in combatting diabetes. When asked if they would be more likely to consume fresh produce if it was locally grown, cheaper to buy and free of pesticides/chemicals, 88% of all participants answered that they would eat more if it was healthier and more accessible.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

[redacted]

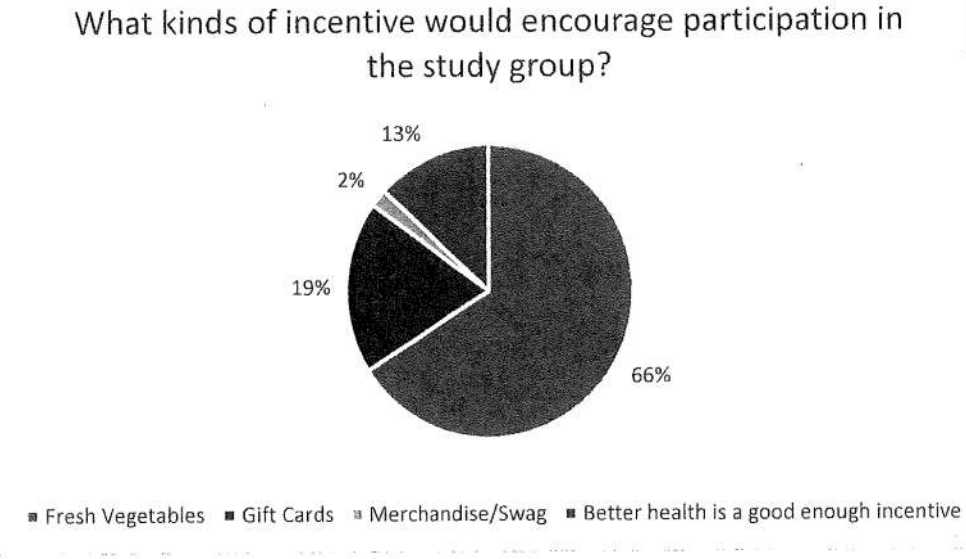

Figure 9 community feedback on desired study group participation incentive

This chart demonstrates that having access to fresh vegetables provides incentive for people living with diabetes to eat better which will help to control their blood sugar. Having locally grown produce available that is cheaper and more accessible will be beneficial in diabetes management for the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Social media is another common form of communication and source of feedback in our community. Our working group utilized Facebook to build our online presence, communicate with the tri-community and encourage participation in the challenge and community engagement strategy. The OCN pilot Smart Farm has an existing page with well established followers that is used to share posts, events, progress and online surveys. Posts made on this Facebook page reach anywhere from 500-5000 people who engage in the information being provided. Posts include information on diabetes education sessions, telehealth information sessions, cooking classes, services available, diabetes and health eating educational/informational posts, produce availability at the farm, online surveys for community members and businesses, Smart Cities updates, meetings and events, news stories, recipes and information on partners and stakeholders. We will continue to utilize the Facebook page to engage community members with targeted and scheduled posts. The page also gives us the ability to communicate and engage with people and potential consumers throughout the region, province and country.

Information and resources were provided to those who filled out surveys or participated in focus groups so that they could access services and support if needed. They were provided with contact information for health care professionals of both the Opaskwayak and Northern Health Authorities as well as information on up and coming education and information sessions. They were also provided with information on how to keep up-to-date with the Smart City Challenge progress and happenings.

6.1.2 Business Leadership

- ✓ Chamber of Commerce (150 members), Rotary Club (50 members)

A forum was held with members of the local Rotary Club. The club is comprised of local business people and professionals from many different vocations such as health care, education, finance, human resources, communications, media, agriculture, and other business representatives. The Club was provided with information on the Smart Cities Challenge project proposal. Following interest in this opportunity, there was further discussion regarding the current Smart Farm's production capabilities including the different kinds of crops and harvest times. Club members were asked to provide information on:

- quality and quantity of produce they are currently purchasing
- barriers they may face in purchasing fresh produce
- whether or not their family were impacted by diabetes, and
- what could be done to encourage more consumption of fresh produce.

The group responses indicate that one of the biggest barriers or concerns with current produce availability was the shelf life, stating it is much too short which leads to spoilage and waste. They further stated that if there were locally grown options with a longer shelf life it would very likely increase their consumption rates. The group had a lower rate of diabetes amongst themselves and their family at 27%, however the majority said they would still find information and education regarding diabetes and healthy eating beneficial.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The local Chamber of Commerce participated in a focus group and were asked to complete a survey for local businesses. The survey focussed on:

- The type of produce shipped
- Quantities
- Cost
- Shelf life
- Amount of waste/spoilage
- Challenges with current produce suppliers
- Frequency of shipments
- How likely they would be to use/purchase produce from the Smart Farm

The results of this survey are shown graphically in Figure 10. Of the businesses who were surveyed, 57% indicated that they use or sell fresh produce in their business with the most common being fresh leafy greens, root (potato, carrots) and edible plant stem (celery, asparagus) type vegetables, cruciferous vegetables (cauliflower, broccoli) allium (garlic, onion) and marrow (cucumber, tomato) type vegetables.

43% of businesses that use fresh produce receive shipments 2-3 times/week, 15% receive shipments 4-5 times per week, 42% receive shipments once per week. The average shelf life of the produce being delivered is anywhere from 3-10 days. Leafy greens have the shortest shelf life while root vegetables have the longest shelf life. 100% of businesses who use fresh produce stated they would be likely or very likely to use a local option that is less costly, has a longer shelf life and is free of pesticides/chemicals. 67% of these businesses feel they would definitely sell or use more fresh produce if there was a local, clean, less costly options and 33% feel they probably would sell/use more produce.

This information will be beneficial for the implementation phase of the project as it provides information for consideration and identifies what type of produce may be the focus to best meet consumer needs.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

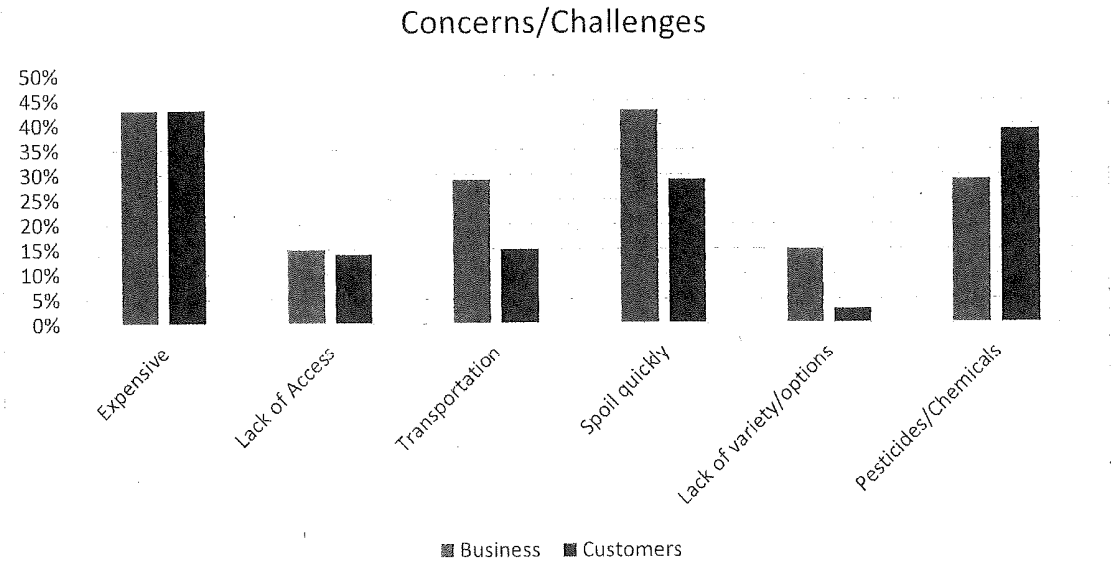

Figure 10 community feedback on present food source concerns

This graph indicates that our proposal recognizes and addresses primary concerns of both businesses and customers. The three most critical concerns are expense, spoilage rates and use of pesticides, closely followed by transportation. Transportation is a greater concern for businesses, spoilage is a consequence of transportation.

6.1.3 Youth - Ages 13-21

- ✓ University College of the North
- ✓ MBCI
- ✓ PACE
- ✓ Oscar Lathlin School

In order to engage the youth of the tri-community, focus groups were held and surveys were completed by schools in each community. We also used the opportunity to provide education and resources on the benefits of eating fresh produce. Lack of access to fresh produce was revealed as a huge barrier for the youth in the community. With 47% of youth who participated stating that they did not have access to fresh produce at home. Some of the top reasons provided by youth as to why parents/caregivers did not buy fresh produce were high costs, quick spoilage, as well as the convenience and cost efficiency of buying frozen alternatives. This feedback is illustrated in Figure 11 below. The clear message that came from the youth was that there was a desire to eat fresh vegetables, but lack of accessibility was a major roadblock. They also stated that school cafeterias were not able to provide many options to purchase fresh produce for lunches due to high costs and short shelf life, and if there were more options available, they would likely consume more fresh vegetables. Youth identified that access to cooking classes and education sessions would be highly beneficial to them and make it easier for youth to eat more fresh produce because they would know what to do with it.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Almost all of the youth who participated stated they would be interested in using a smart ph
they could order fresh produce for delivery as well as accessing recipes and videos to assist
preparation. Culinary students expressed an interest in producing videos to post on Faceboo
smart phone app. Youth who are impacted by diabetes also stated they would be willing to
study group utilizing wearable technology to monitor blood sugar and other biometrics to le
control their blood sugar, thus managing their diabetes. Youth said it would be cool to parti
competition amongst their peers.

6.1.4 Elders/Seniors

- ✓ McGillivray Care Home residents
- ✓ Council of Elders

Focus groups with the Elders of the community revealed that they would consume more fresh produce and leafy greens if they were taught how to incorporate them with the traditional dishes that they are used to preparing. This information is illustrated in Figure 11 below. Half of the elders who participated in the focus group disclosed that they were living with diabetes. Of those who had been diagnosed with diabetes almost all said that they would be interested in further information and learning more about how making dietary changes could improve their health and assist them to have better control over their blood sugar. The Elders would be willing to participate in the study group and use wearable technology to monitor their blood glucose. Fifty percent of the Elders who are living with diabetes would use a smart app for produce delivery and recipes. This information is illustrated in Figure 8 above.

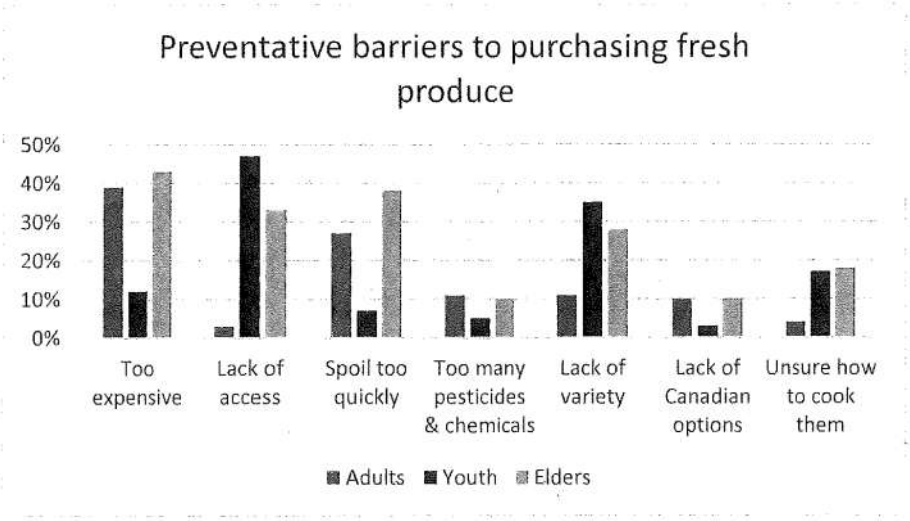

Figure 11 community engagement feedback identifying barriers to purchasing fresh produce

The diagram depicts their perspective barriers of purchasing fresh produce across the demographics.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

6.1.5 Elected Leadership: Three elected governments

- ✓ Opaskwayak Onekanew and Onuschekawak (Cree words for Chief and Council)
- ✓ Town of The Pas Mayor and Council
- ✓ Rural Municipality of Kelsey Reeve and Council
- ✓ Tri-Council project team

The three governments that form the Tri-Council are heavily engaged and very supportive of the challenge, each appointing a representative to serve on the working group as well as participating with the project team to make decisions, act as a liaison for their respective council and provide feedback. The Smart Cities Challenge is a standing agenda item for the Tri-Council, which meets quarterly. As a Tri-Council they agreed on the Challenge Statement and concurred that the issues being addressed within the proposed project are a priority for each of the communities.

Reports and updates are provided at each quarterly meeting, and each council has the opportunity to provide insight and engage in open discussions regarding the project, to make suggestions, and to assist with establishing the plan to move forward. Each of the three councils have individually passed resolutions to support and assist with sustaining our Smart Cities Challenge Statement in addition to passing resolutions as a Tri-Council. Resolution was passed by each council to support the submission of the original proposal on behalf of the Tri-Council to Smart Cities, resolutions were passed for a Funding Authorization Process which outlined the project committee members financial responsibility, and resolutions were passed to approve the hiring of the proposal manager and coordinator. The appointed representatives from each council are empowered by the resolutions to make decisions and provide approval when required. Each council receives updates from their respective representatives at least once a month during council meetings. These processes and approvals allow the working group to obtain quick authorization when decisions need to be made while maintaining open and steady communication with each of the councils.

6.1.6 Health Partners

- ✓ Northern Health Region/Opaskwayak Health Authority Joint Steering Committee
- ✓ Opaskwayak Health Authority Board of Directors
- ✓ Public Health Programs

The Northern Health Region (NHR) manages the hospital and clinics that provide health care services in the Town of The Pas that is funded by the provincial government. Opaskwayak Cree Nation manages and provides health services at the Beatrice Wilson Health Centre which is located on reserve territory and is funded by the federal government. The issues created by the jurisdictional policies and resource allocations have resulted in fractured health care service delivery that have historically not effectively met the needs of either jurisdiction. As a result, health leadership officials agreed that finding a better way to work together would be beneficial to all community members. As such, a Statement of Intent on collaboration on health services was signed by senior official between Opaskwayak Cree Nation and the Northern Health Region.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The purpose, as written within the Statement of Intent, reads as follows:

OCN and NHR agree to have a written statement on their intention to work together in a continuing partnership on health care and health services delivered in the area. The vision for the collaboration is to develop and enhance programs between these entities and to agree to an ongoing commitment and process for developing programs and infrastructure management. The two service entities, working together with the existing authorities in the federal and provincial governments, will achieve improved health outcomes.

Representatives from OHA and NHR meet once a month as a joint steering committee on health at which issues on health care service and service delivery are discussed and solutions are created. This joining of forces is a significant factor in the anticipated effectiveness of the Continuous Glucose Monitoring technology study group. Ongoing engagement with participants and health care providers will play a significant role in supporting the participant study group, other community members wishing to address health issues such as diabetes and supporting evaluation of the impact of our project on our anticipated outcomes.

Opaskwayak Health Authority Board of Directors and leadership staff have acknowledged their support of the Smart Cities Challenge project. They have approved the formation of a continuous glucose monitoring study group for the purpose of diabetes research and approved OCN's Research Lens in Ethical Decision Making that has been developed by OCN for the purpose of diabetes Type II research and was completed by OHA staff for the purpose of this proposal. Additionally, they have recommended the creation of an integrated care team, consisting of a physician, registered nurse, medical and clinical assistants and social worker to specifically support the population living with diabetes. The team will be supported by a Learning Circle which pulls groups of people together who have common concerns or interests. The Learning Circles at Beatrice Wilson are also responsible to ensure that the cultural component which is integral to the guiding principles of OHA are incorporated into all teaching sessions.

The Northern Health Authority Board of Directors has similarly expressed their support for ongoing collaboration between the NHR and Opaskwayak and support the anticipated research and program expansion as we continue to work together to reduce jurisdictional issues and meet the issues addressed in our challenge statement. The Northern Health Region has also established and formalized an Indigenous Cultural Training program that involves staff from OHA at every training day. The impact of this is reflected in the program development between the two organizations.

The integrated care team works directly with the Northern Health Region Diabetes Education Resource (DER) team which consists of dieticians and registered nurses also working to support individuals living with diabetes. This team is part of the provincial health region's primary care division and works out of health offices in The Pas. The NHR supports the work that the DER team does at Beatrice Wilson and their work with the integrated care team. The fluidity of services provides the basis for citizens of the Tri-Council region to have the choice of accessing care in either The Pas or Opaskwayak and to have the basis of care remain consistent. Participants of the study group with the wearable technology will also have the option of attending either facility for supportive care and follow up. Mental health is also provided for all citizens, with alternate providers within a similar structure.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The public health team provides educational opportunities throughout the Tri-council region offering lunch and learn opportunities, cooking classes and dietary counselling for anyone who requests. The food grown at the existing Vertical Smart Farm has already been introduced into the population over the past two years, and school education programs have been part of this effort. They have agreed that this form of support will continue and grow during the implementation phase.

6.2 Implementation Plan

We have found that community engagement serves as an effective tool for providing feedback on alignment between project outcomes and community expectations. Therefore, ongoing engagement with already established stakeholders as well as those that will be identified as the project progresses. Utilizing the engagement processes we have already completed, we will continue with a similar approach during the implementation phase as part of a feedback system to ensure our project is effectively meeting outcomes amongst our diverse population.

Ongoing feedback will identify the following information that can be provided by specific stakeholders and consumers.

6.2.1 General Population

Questions for all community members including those target groups listed below

- Consumption rates
- Awareness of relationship between diet and diabetes
- Smartphone distribution system effectiveness
- Study participation
- Product preference
- Overall satisfaction

6.2.2 Business Leadership

- Ordering, distribution of plant factory products
- Synergistic business opportunities – discussed below

6.2.3 Schools/Youth

articipation (with parental consent)
:e on families
nces for lunch programs

s with Disabilities

)ility of Smart Farm produce
:d foods – consideration in preparing, cutting, swallowing
use of Smartphone distribution system
:d options

including in project design

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

ATIA - 21(1)(b)

6.2.5 Elders/seniors

- Accessibility of Smart Farm produce
- Project alignment with traditional values
- Project alignment with community values
- Project alignment with family values

6.2.6 Government Leadership

- Feedback from electorate
- Alignment with community priorities
- Potential synergies with other community development work

6.2.7 Health Partners

- Patient feedback
- Study group feedback
- Health professional feedback
- Public health feedback

6.3 Risk Identification and Mitigation

1. Competition with Local Farmers

   It is foreseeable that local farmers may feel the smart farm is in direct competition with their production. Mitigating this possibility will be done through collaboration. The growing season for local farmers is short. Therefore, the smart farm could schedule non-conflicting products during the season that farmers are selling their produce or offer farmers an opportunity to expand their market reach through project collaboration and leveraging the smartphone distribution system.

2. Competition with local businesses – grocery stores

   Local businesses have embraced the smart farm project; however, this position may chan[redacted] point during the implementation phase of the project. If this were to happen, mitigating s[redacted] would include:

   - Discussion regarding the possibility of using the smart farm as a supplier (considering distribution contracts that they may already hold with other suppliers)
   - Exploring potential business synergies or non-competing add-on products options eg meal kits that include fruits and vegetables from the smart farm with products such as rice, bread, pasta, condiments, and so forth from their own store

3. Smartphone operation challenges

   Smartphone operation familiarity may vary greatly amongst community members, so it is anticipated that some individuals may find it stressful adopting this ordering platform. Training sessions or tutorials can be offered for these individuals to teach them how to use the smartphone app. Additionally,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

instructional videos could be made available on the user-friendly website, offering step-by-step instructions, access produce, incentives and recipes.

Elders have indicated that their grandchildren assist them with their technology issues, so ensuring youth are familiar with operation of the smartphone application is important in reaching elders.

4. Unexpected technical issues

   Partnership with the OCN pilot Smart Farm provides the project team access to personnel experienced in the operation of the Smart Farm technology for troubleshooting potential issues with the Smart Farm. An ongoing relationship with the software development firm, as well as budgeting financial resources, will facilitate resolution of any major software issues that may arise.

5. Smartphone access

   The Smart Farm will have a website for online ordering so a computer can be used in place of a smartphone. In addition, we will also have a pickup location at the Smart Farm where community members can purchase fresh produce directly.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

7 CHAPTER 7: DATA AND PRIVACY

Our project team has worked in cooperation with officers of the Manitoba Ombudsman's Office to understand and ensure that our project meets the applicable data and privacy legislation regulations. It is the objective of the project that all legislation be followed to ensure protection of our community members' privacy and confidentiality.

The Manitoba Ombudsman's Office suggested we consider the following authorities in completing our data and privacy impact assessment, as well as provide us with their privacy impact assessment tool. The Manitoba Ombudsman's Office further suggest that we consider Fair Information Principles throughout this process. The data protection authorities that were considered in identifying the impacts of data security throughout this project include:

- The Personal Health Information Act (PHIA)
- The Freedom of Information and Protection of Privacy Act (FIPPA)
- The Personal Information Protection and Electronic Documents Act (PIPEDA)

We are grateful for the staff at the Manitoba Ombudsman's Office and for the Office of the Privacy Commissioner of Canada for their review and comments during the completion of the Preliminary Privacy Impact Assessment Tools that are required for this project. We have provided these documents under separate submission.

To identify information transaction, including collection and distribution, it is necessary to identify the legal entity with whom the transaction is taking place. The commercial activity detailed in this proposal occurs between the community members (customer) and the not-for-profit corporation (to be established in the implementation phase, detailed in Chapter 8, herein referred to as the NFP). *Figure 12* illustrates the information flow considerations of the overall project and differentiates personal information transactions between the customer and the NFP (and financial institution), and health information transactions between the biometric feedback study patient and the healthcare authority in blue and orange respectively. This diagram serves to clearly identify that customers' personal information provided to the NFP is not disclosed to the healthcare provider, and the health information provided to the healthcare provider is not disclosed to the NFP; the customer/study participant is the only common link between these two aspects of the project.

A further discussion about each of the data protection authorities is included below.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

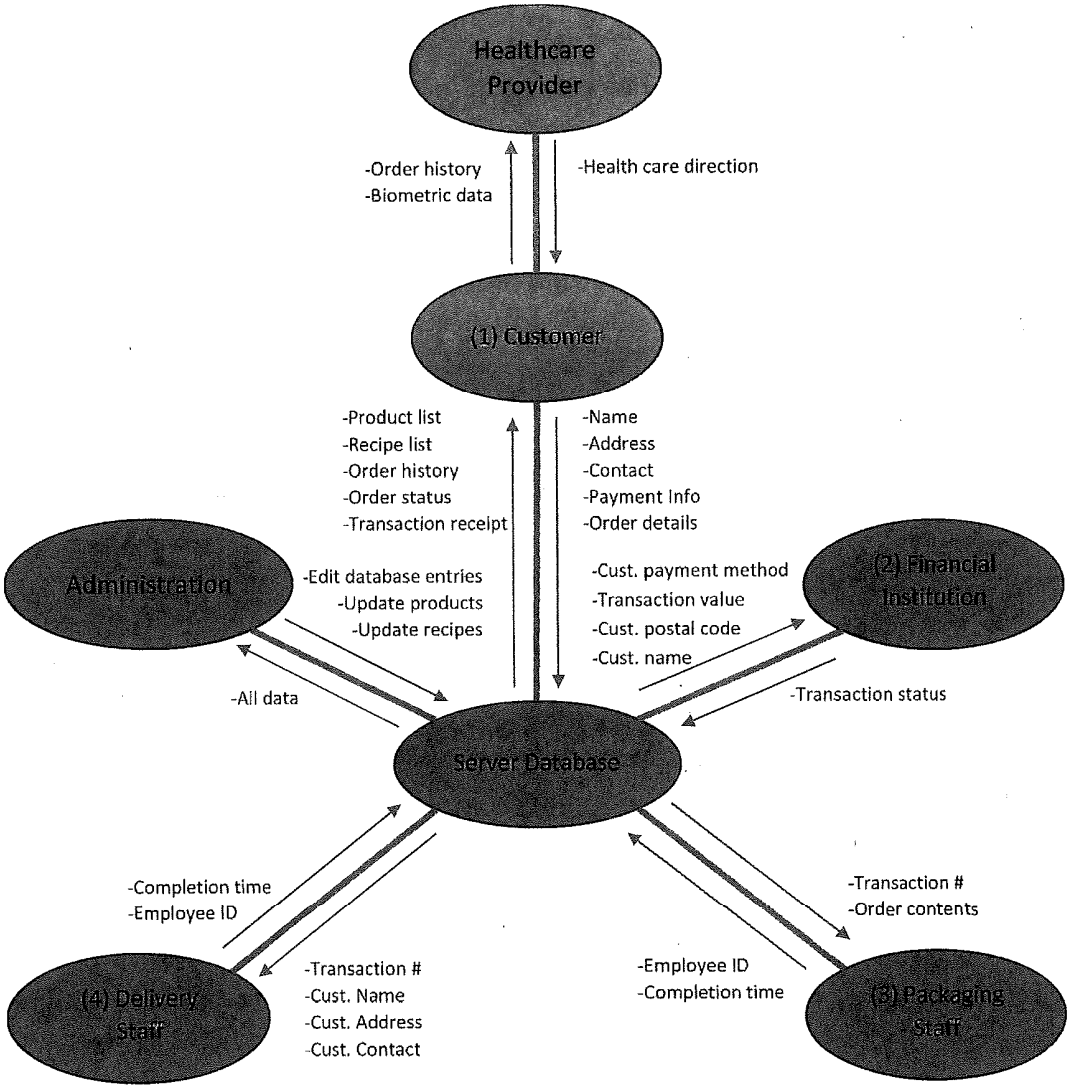

Figure 12 PIPEDA vs PHIA data

7.1 Consideration of Data Protection Authorities and Principles

7.1.1 The Personal Health Information Act (PHIA)

As per Manitoba legislation, PHIA provides access to information and protection of privacy rights concerning personal health information. PHIA allows individuals to examine and receive a copy of their own personal health information from a trustee holding this information. PHIA imposes obligations on trustees for the protection of personal health information, specifically its collection, use, disclosure and security. In our detailed analysis of the PHIA implications on this project, we will demonstrate that all personnel working with individuals in our health centre or performing research in any way that is related to this project, must always have completed PHIA training and signed agreement to maintain patient confidentiality. This applies to all records, information and conversations that have anything to do with personal health information of any sort.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information
Page 1097 of 1849

7.1.2 The Freedom of Information and Protection of Privacy Act (FIPPA)

Upon consultation with the Manitoba Ombudsman's Office and their review of this submission, they have concluded that the Manitoba public bodies associated with this project (RM of Kelsey and Town of The Pas) will not be engaged in the collection, use or disclosure of personal information subject to FIPPA. Therefore, consideration of the requirements of FIPPA to personal information associated with the project is not required.

7.1.3 The Personal Information Protection and Electronic Documents Act (PIPEDA)

As per federal regulation and the Office of the Privacy Commissioner of Canada, PIPEDA is the federal privacy law for private-sector organizations not otherwise subject to provincial legislation which are engaged in commercial activity. It determines how businesses must handle personal information in the course of the commercial activity. The business activities of the NFP includes the growing and selling of food at the Smart Farm. This commercial activity includes the collection of the individual's name, address, contact information, payment information and order details. This information is subject to PIPEDA. We have addressed the requirements of PIPEDA in our Privacy Impact Assessment and sought response and contribution from both the Province of Manitoba Ombudsman's Office and the Office of the Privacy Commissioner of Canada in assuring that we are legally and appropriately managing personal information associated with this business.

7.1.4 Fair Information Principles

The fair information principles, provided by the Manitoba Ombudsman's office for our use, have been considered in our business plan and will continue to be addressed as we proceed. These principles include:

- Be accountable
- Identify the purpose
- Obtain valid, informed consent
- Limit collection
- Limit use, disclosure and retention
- Be accurate
- Use appropriate safeguards
- Be open
- Give individuals access
- Provide individuals with an avenue for recourse

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

7.2 Privacy Impact Assessment Tool

We have highlighted details of our plan for the collection, use and disclosure of information through completion of the Privacy Impact Assessment Tool (detailed below). We have identified how we plan to mitigate risks to the public as it pertains to the collection and use of their personal and personal health information as it relates to their interface with our planned project. As such, we have identified the following areas that must be considered:

- Data-minimization – we plan to collect, use and disclose only what is necessary for the customer to receive the goods and services that have identified as something they want and that they provide full consent for all information they share.
- De-identification – we plan to de-identify personal information wherever possible, such as package labelling using a QR code and utilizing a scanner to access information. Similarly, the health care follow-up and research will be done using the strict codes of ethics and research as established by the Canadian Institute for Health Research and the University of Manitoba, which includes de-identification as much as possible as well as early destruction of information collected when its use has expired. Additionally, this is only done with the individual's full knowledge and consent.
- Opt-out strategy – individuals may opt out of doing business with the Smart Farm at any time. Options for doing so may be that they opt-out of paying with a credit card and simply use an alternative such as preloading their account with cash at the Smart Farm. Alternatively, they may cancel their account with the business at any time. For financial reasons, the business must keep record of any financial transactions for seven years, but any personal information is deleted.
- Data governance and Privacy Management program – our proposed business will be supported by a policy that ensures the administrator of the data required to operate the business of the Smart Farm and delivery system is aware and compliant with PIPEDA and the importance of the confidentiality that each customer requires and can be ensured of receiving from the business regarding their information. The administrator will be the privacy lead and will report to the CEO or the business, who in turn reports to the Board of Directors of the business regarding auditing and compliance as well as managing breach of compliance. This will be supported by the policy. There are no other partners to consider as any other entities associated with the business are vendors and accessing their technology will also require agreements and conditions that support current legislation and controls.

  All health care data is protected by the personal health information legislation. Two health clinics will be utilized for the purpose of working with and supporting individuals who wish to be participants in the study group. One health clinic, Beatrice Wilson Health Centre, is operated by Opaskwayak Health Authority. The other clinic, The Pas Primary Care Clinic, is located within The Pas Health Complex in The Town of The Pas and is operated by the provincial Northern Regional Health Region. Both clinics follow the PHIA legislation and all staff have received PHIA training and have signed agreements of confidentiality under this legislation. All personal health information is

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

stored on an electronic medical record, Accuro, and the data is shared between the two sites. The Northern Regional Health Authority is the trustee of this data. Each of the clinics has a privacy officer, responsible for maintaining confidentiality, auditing, and to whom individuals may go to regarding concerns or any real or perceived breaches of their confidentiality that they wish to discuss.

- Community engagement and project transparency – we have completed comprehensive community engagement strategies including:
  - Surveys – business and general population
  - Forums – special needs groups, business, leadership, health
  - Social media – Facebook
  - Scheduled feedback - groups that hold regular meetings and include Smart Cities on their agenda including governments, business, health, Boards
  - Focus groups – people living with diabetes, disabilities, high risk youth, elders

  No privacy concerns were raised by users, residents, community members or other stakeholders during the community engagement process.
- Consent – individual consent is built into every step of our proposed project. Consent is necessary to access the server database of our business so that the individual may order and pay for food from the Smart Farm and have it delivered to their door. They may also access food by driving to the Smart Farm and ordering it directly and paying for it in any method they choose, so it is not that this food is inaccessible if they do not provide personal information. Consent is also required if individual's wish to participate in the study or research project associated with our proposal. All information shared by the individual at the health clinic's is covered by PHIA and consent of patients under that legislation.

7.3 PIPEDA Preliminary Privacy Impact Assessment

The NFP provides food production and distribution services to customers. Customers are able to purchase food products in two different ways from the NFP; pickup in person at the NFP business location, or delivery-to-door service through the smartphone application. Pickup of food products at the NFP business location in person does not require the collection of any personal information. However, customer's personal information must be collected by the NFP for the provision of food delivery services. Interaction between the NFP and the customer begins with the customer's downloading of the smartphone application.

Upon downloading the smartphone application used for placement of order to the NFP, customers will be required to create an account before they can access information and resources provided by the application. Creation of an account will involve the **collection** of personal information and is thus subject to PIPEDA considerations. The minimal amount of personal information needed in order to effectively deliver services will be collected.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Personal information items that will be collected by the application include:

- Name
- Address
- Contact information
- Payment information
- Order details

This information will be **used** by the NFP for internal business operations including:

- Packaging identification
- Product identification
- Location of order delivery

Information will only be provided to employees of the NFP on a need to know basis, in further pursuit of compliance with PIPEDA. This data will be re-used every time the customer places an order to minimize the number of steps that must be takes to place a food order; the easier it is to order food the higher probability this procurement path will be take and consequently the greater the impact on health.

There are two methods that will be available to customers for processing payment; credit card or preloaded account balance. Preloading of the customer's account can occur by depositing cash or cheque at the plant factory. However, processing of credit card payments requires the **disclosure** of personal information to the financial institution in order to process the transaction.

It is understood that any personal information **collection** or **disclosure** event must solicit the express consent of the customer in order to ensure compliance with PIPEDA legislation.

*Figure 13*Figure 13 below illustrates the data flow between the customer (green), NFP (blue), and financial institution (yellow); data collection and disclosure events are highlighted with red arrows. In pursuit of compliance with this legislation, a notice of data collection window will be displayed to the customer upon prompting the creation of an account with the NFP and must be agreed to prior to submission of any personal data. Secondly, a notice of disclosure window will be displayed, and must be acknowledged by the customer, prior to processing any transaction via credit card to ensure informed consent regarding NFP's required **disclosure** of personal information to perform this activity.

Customers will, at any time, be able to delete their account with the NFP through the smartphone application interface, thus deleting the existence of their personal information from the customer database. However, in compliance with financial legislation, there will be a record kept of any purchase transactions that the customer processed with the NFP. Furthermore, under PIPEDA legislation, customers have the right to request a copy of their personal information or request a correction of this information held by a business entity at any time. This will be observed by the following two measures:

1. Customers have 24-hour access to their personal information held on the NFP server through the smartphone application
2. Customers can contact the manager of the NFP in order to access their personal information

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The smartphone application required for this project currently does not exist. Therefore, a software development contractor will be hired for the purposes of creating the required software solution. Furthermore, this company may be used from time to time to provide application updates to ensure compatibility with future operating system releases or to increase/modify features incorporated into the smartphone application. However, there is no anticipated disclosure of personal information through this process. To make this delineation clear, the following is a brief overview of the software architecture.

The smartphone application software will operates using three components:

- A frontend application
- A backend application
- An information database

The frontend application is the smartphone application that customers will download and run on their smartphone. This application will be placed on the Android Play store and the Apple Store so that it is easily accessed by all who desire to use the services of the NFP. The backend application resides on a server that will be located on the NFP business premises. The frontend application communicates with the backend application over the internet. The function of this backend application is to process commands and translate/organize information stored within the database so that it is correctly displayed on the smartphone application. To ensure data security at the place of residence, user information will be encrypted on the server hard-drive. To ensure data security within all internet-based communication links, industry standard TLS encryption will be used.

The software developer will create the code for the frontend application, the backend application, and the framework for the information database. During the development of these codes, or during the updating of these codes at a future date, the software developer does not require access to the database, they only require access to the frontend application and/or the backend application. Consequently, there is no disclosure of personal information to this third party at any time.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

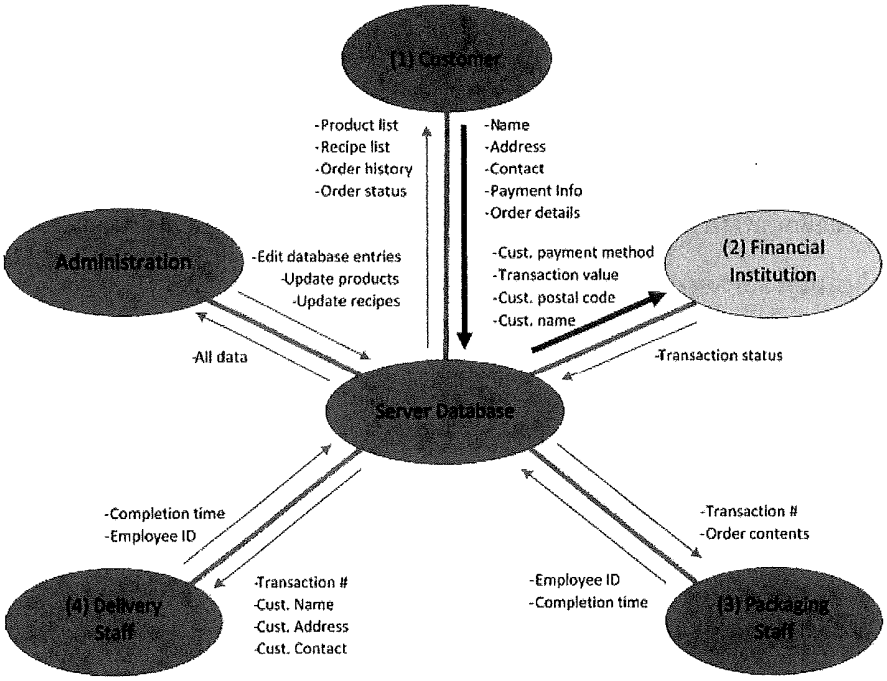

Figure 13 personal information flow diagram

Personal Information Collection and Disclosure Notice Statements

A notice of personal information collection statement must be agreed to by the customer prior to the NFP's collection of personal information. This statement will be displayed when the customer initiates account creation within the NFP's smartphone application. An example of a notice of personal information collection statement is:

By continuing with the creation of an account with the NFP corporation, you are agreeing to the collection and use of your personal information for the purposes of providing the services that the NFP corporation is offering.

A notice of personal information disclosure statement must be agreed to by the customer prior to the processing of payments for food products offered by the NFP. This statement will be displayed every time the customer initiates payment using a credit card as this requires disclosure of personal information to the financial institution. An example of a notice of personal information disclosure statement is:

By continuing, you understand and agree that your Name and Postal code will be disclosed to the financial institution for the purposes of processing the transaction.

7.4 PHIA Preliminary Privacy Impact Assessment

Health care professionals working at the Health Canada accredited health clinics will have access to study participant health information via the electronic medical record (EMR) which will be utilized to enrol and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information
Page 1103 of 1849

follow the study participants. The EMR utilized in the region is Accuro, which is one of the EMR system approved for use by Manitoba eHealth.

All health care data is protected by the PHIA legislation that governs personal health information.

Two health clinics will be utilized for the purpose of working with and supporting individuals who wish to be participants in the study group. One health clinic, Beatrice Wilson Health Centre, is operated by Opaskwayak Health Authority. The other clinic, The Pas Primary Care Clinic, is located within The Pas Health Complex in The Town of The Pas and is operated by the provincial Northern Regional Health Region. Both clinics follow the PHIA legislation and all staff have received PHIA training and have signed agreements of confidentiality under this legislation. All patient data is stored on an electronic medical record, Accuro, and the data is shared between the two sites. **The Northern Regional Health Authority is the trustee of this data.** Opaskwayak Health Authority has signed a Privacy Impact Agreement with the Northern Regional Health Authority (NRHA) which includes a Privacy Impact Assessment compliance document that was jointly signed at the time that Accuro was first shared by the NRHA with Opaskwayak Health Authority. Each of the clinics has a privacy officer, responsible for maintaining confidentiality, auditing, and to whom individuals may go to regarding concerns or any real or perceived breaches of their confidentiality that they wish to discuss.

The PHIA information flow map, shown below in Figure 14, outlines the collection, use and disclosure of personal health information, with the corresponding PHIA article numbers which govern the information's use.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

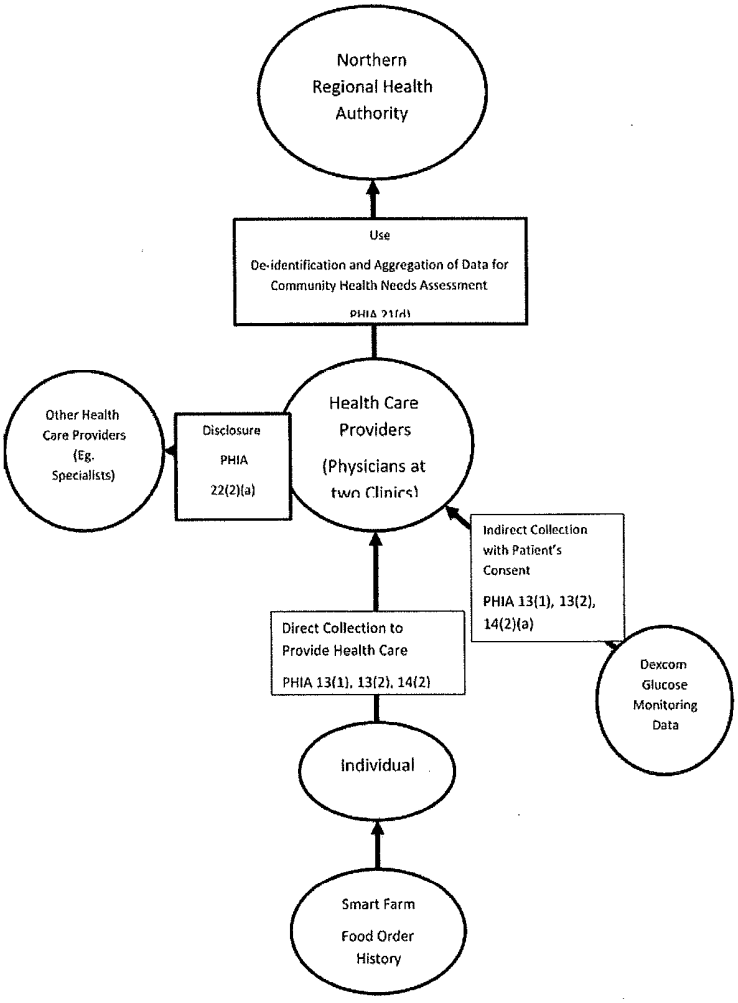

Figure 14 PHIA information flow map

7.4.1 Categories of personal (health) information to be collected, used and/or disclosed

Information collected by the healthcare clinics generally includes:

- name
- address
- contact information
- age
- sex
- allergies
- medications
- marital status
- medical history
- current health status
- other information as per current best practice in health care delivery

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Additionally, the biometric feedback study participants will provide data from their smart phone that has captured biometric data from their wearable device and their dietary choices. Any person in the community can healthcare without being participants in the study group. The intended use of the study is to demonstrate the connection between dietary choices and diabetes. It is our intention to respond to the growing diabetes epidemic in our community by demonstrating, through the use of data, that we can impact our health in a positive way through dietary choices.

Personal health information is collected and used for the individual's health as per PHIA and best practice standards of the nursing and medical professionals and their code of conduct within the primary care clinics.

7.4.2 Authority for the collection, use and disclosure of personal (health) information

For participation in the biometric feedback study group, customers will become patients of one of two clinics and their information will be kept secure through PHIA and the information sharing agreement for the electronic medical record (EMR). The researcher will have everyone in the study group sign a consent form which includes risk, benefits, all data collected and storage of data.

Data collected from the continuous glucose monitoring device, manufactured by Dexcom, will be sharable with the healthcare provider through Dexcom's proprietary Clarity software. Dexcom provides secure, cloud based, storage of user data using AES-256 encryption and data transmission encryption using a minimum of TLS 1.1. Dexcom operates under the U.S. Health Insurance Portability and Accountability Act (HIPPA) of 1996. Authorization for use of the Dexcom hardware and software has been provided by Health Canada as these devices are readily available to anyone in Canada.

PHIA defines **"personal health information"** as recorded information about an identifiable individual that relates to

a) the individual's health, or health care history, including genetic information about the individual,

b) the provision of health care to the individual, or

c) payment for health care provided to the individual, and includes

d) the PHIN and any other identifying number, symbol or particular assigned to an individual, and

e) any identifying information about the individual that is collected in the course of, and is incidental to, the provision of health care or payment for health care;

The project will involve personal health information (PHI), including:

- demographic information
- health information related to the provision of health care to the individual
- biometric data from diabetes glucose monitoring device
- order history of food from the smart farm

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

7.4.2.1 Trustee

Under PHIA **"trustee"** means a health professional, health care facility, public body, or health services agency that collects or maintains personal health information.

The Northern Health Region is identified as the trustee for the purposes of this project. The personal health information will be collected by physicians (health professional) at medical clinics (health care facility). The Pas Primary Care Clinic (health care facility) and the Northern Health Region (public body) are both trustees. The Pas Primary Care Clinic is operated by the Northern Health Region, and the Region would also be considered the "trustee" of the PHI collected at the Clinic as the Region would "maintain" the PHI. The physicians at Beatrice Wilson Health Centre, OCN (operated by the Opaskwayak Health Authority) are contracted by the Northern Health Region and may be considered employees of the Region.

7.4.2.2 Collection

Personal health information to be collected includes information about an individual's health status and diabetes management and information about their food order history and glucose monitoring information relating to management of diabetes. Collection of personal health information will be for the purpose of providing health care to the individuals. The following provisions of PHIA provide authority for the collection of personal health information in these circumstances:

> **Restrictions on collection**
>
> **13(1)** A trustee shall not collect personal health information about an individual unless
>
> (a) the information is collected for a lawful purpose connected with a function or activity of the trustee; and
>
> (b) the collection of the information is necessary for that purpose.
>
> **Limit on amount of information collected**
>
> **13(2)** A trustee shall collect only as much personal health information about an individual as is reasonably necessary to accomplish the purpose for which it is collected.

7.4.2.3 Use

Use of the personal health information by health care providers at the clinics will be for the purpose of providing health care to the individual including to monitor and manage the health and diabetes of the individual, which is the purpose for which it was collected (s. 21 of PHIA). Anonymized and aggregated health information will be used by the Northern Health Region to conduct its community health needs assessment (project participants' health information will be included with all community members' health information) (s. 21(d) of PHIA). The following provision of PHIA provides authority for the use of PHI in these circumstances:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

7.4.2.3.1 Restrictions on use of information

21 A trustee may use personal health information only for the purpose for which it was collected or received, and shall not use it for any other purpose, unless

(a) the other purpose is directly related to the purpose for which the personal health information was collected or received;

(d) the trustee is a public body, or a health care facility, and the personal health information is used

(i) to deliver, monitor or evaluate a program that relates to the provision of health care or payment for health care by the trustee, or

(ii) for research and planning that relates to the provision of health care or payment for health care by the trustee;

Limit on amount of information used or disclosed

20(2) Every use and disclosure by a trustee of personal health information must be limited to the minimum amount of information necessary to accomplish the purpose for which it is used or disclosed.

7.4.2.4 Disclosure

Disclosure of the personal health information would be authorized for the following purposes:

- Disclosure for a health care purpose to a person who is or will be providing or has provided health care to the individual (s. 22(2)(a) of PHIA)
- Disclosure with the consent of the individual (s. 22(1)(b) of PHIA)
- Disclosure to a researcher at University of Manitoba to conduct research with de-identified health information (s. 22(2)(f) and 24 of PHIA)

The disclosure of personal health information in the circumstances as noted above is authorized under the following provisions of PHIA:

Individual's consent to disclosure

22(1) Except as permitted by subsection (2), a trustee may disclose personal health information only if

(b) the individual the information is about has consented to the disclosure.

Disclosure without individual's consent

22(2) A trustee may disclose personal health information without the consent of the individual the information is about if the disclosure is

(a) to a person who is or will be providing or has provided health care to the individual, to the extent necessary to provide health care to the individual, unless the individual has instructed the trustee not to make the disclosure;

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

(f) in accordance with subsection 22(2.2) (disclosure to another government), section 23 (disclosure to patient's family), section 23.1 (disclosure to religious organization), section 23.2 (disclosure for fundraising), section 24 or 24.1 (disclosure for health research) or section 25 (disclosure to an information manager);

7.4.2.4.1 Disclosure for health research

24(1) A trustee may disclose personal health information to a person conducting health research if the research has been approved under this section.

Who may give an approval?

24(2) An approval may be given by

(a) the health information privacy committee established under section 59, if the personal health information is maintained by the government or a government agency; and

(b) an institutional research review committee, if the personal health information is maintained by a trustee other than the government or a government agency.

Conditions for approval

24(3) An approval may be given under this section only if the health information privacy committee or the institutional research review committee, as the case may be, has determined that

(a) the research is of sufficient importance to outweigh the intrusion into privacy that would result from the disclosure of personal health information;

(b) the research purpose cannot reasonably be accomplished unless the personal health information is provided in a form that identifies or may identify individuals;

(c) it is unreasonable or impractical for the person proposing the research to obtain consent from the individuals the personal health information is about; and

(d) the research proposal contains

(i) reasonable safeguards to protect the confidentiality and security of the personal health information, and

(ii) procedures to destroy or remove, at the earliest opportunity consistent with the purposes of the research, any information that, either by itself or when combined with other information available to the holder, allows individuals to be readily identified.

7.4.3 Agreement required

24(4) An approval under this section is conditional on the person proposing the research project entering into an agreement with the trustee, in accordance with the regulations, in which the person agrees

(a) not to publish the personal health information requested in a form that could reasonably be expected to identify the individuals concerned;

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

(b) to use the personal health information requested solely for the purposes of the approved research project; and

(c) to ensure that the research project complies with the safeguards and procedures described in clause (3)(d).

7.4.4 Source and accuracy of personal (health) information

Source of information

14(1) Whenever possible, a trustee shall collect personal health information directly from the individual the information is about.

Exceptions

14(2) Subsection (1) does not apply if

(a) the individual has authorized another method of collection;

For the purposes of our project, personal health information is obtained directly from the individual and not from a family member or another RHA or government department. Patients will provide their food order history data and their glucose monitoring information gathered by their wearable device that is stored on their smart phone to their health care provider (if glucose monitoring data is not collected directly from the patient, the collection from another source (Dexcom) may be authorized by the patient (s.14(2)(a) of PHIA).

7.4.5 Notification statements

Notice of collection is required under s. 15(1) and (2) of PHIA:

Notice of collection practices

15(1) A trustee who collects personal health information directly from the individual the information is about shall, before it is collected or as soon as practicable afterwards, take reasonable steps to inform the individual

(a) of the purpose for which the information is being collected; and

(b) if the trustee is not a health professional, how to contact an officer or employee of the trustee who can answer the individual's questions about the collection.

Exception if information already provided

15(2) A trustee need not comply with subsection (1) if the trustee has recently provided the individual with the information referred to in that subsection about the collection of the same or similar personal health information for the same or a related purpose.

Personal Health Information Disclosure Statement:

As part of receiving or providing health care services at a site within the Northern Health Region; we only collect, use and disclose your personal information and personal health information as permitted by The

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Personal Health Information Act (PHIA) and The Freedom of Information and Protection of Privacy Act (FIPPA). These Acts require Northern Health Region to protect the privacy of your information.

7.5 Risk Identification and Mitigation

One of the risks associated with the collection of any type of data is that it becomes compromised through a security breach. It is generally accepted that proper encryption techniques, both for the transmission and storage of this data, are suitable measures for mitigating this risk.

Inappropriate access to information, by employees of the organization that holds the information, is another mechanism whereby personal information security can be breached. This can take place with both personal information and personal health information. Implementation and enforcement of policies and procedures which outline the access to information on a need-to-know basis are understood to be the most effective methods for mitigating this risk.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

8 CHAPTER 8: FINANCIAL

We have created a budget that reflects the four milestones of our project as per our performance-based outcomes measurement plan discussed in Chapter 2 and the project management plan discussed in Chapter 3. As outlined in these Chapters, we propose four reporting periods over five years, in which all activities associated with that reporting period are met, as the framework for our outcomes-based contribution plan. Release of installment payments are anticipated to occur following the successful review by Infrastructure Canada of milestone reports; the reports outlined in Chapter 2. The budget reflects a comprehensive detailed breakdown of costs associated with implementation of the project.

The implementation process for this project breaks down the development of each of the three critical levers, identified in Chapter 1, and divides them into two stages of development: **building** and **operating**. The project budget breakdown reflects this approach; building costs and operating costs are assigned to each of the project lever categories.

8.2 Comprehensive Project Budget

8.2.1 Budget Timeline

The budget has been developed around an outcomes-based contribution model. As such, the each of the four financial installments identified in this chapter, are directly associated with completion of project milestones. Milestone reports will be submitted to Infrastructure Canada upon completion of the outcomes identified in Chapter 2. The estimated date of report submission are identified in the project financial schedule in *Figure 15* below with red diamonds. Ten weeks has been provided allotted for milestone report review by Infrastructure Canada, with the anticipated release of the subsequent funding installment following that review.

A complete Gantt chart, including the information below along with corresponding project activities and tasks can be found in Chapter 3.

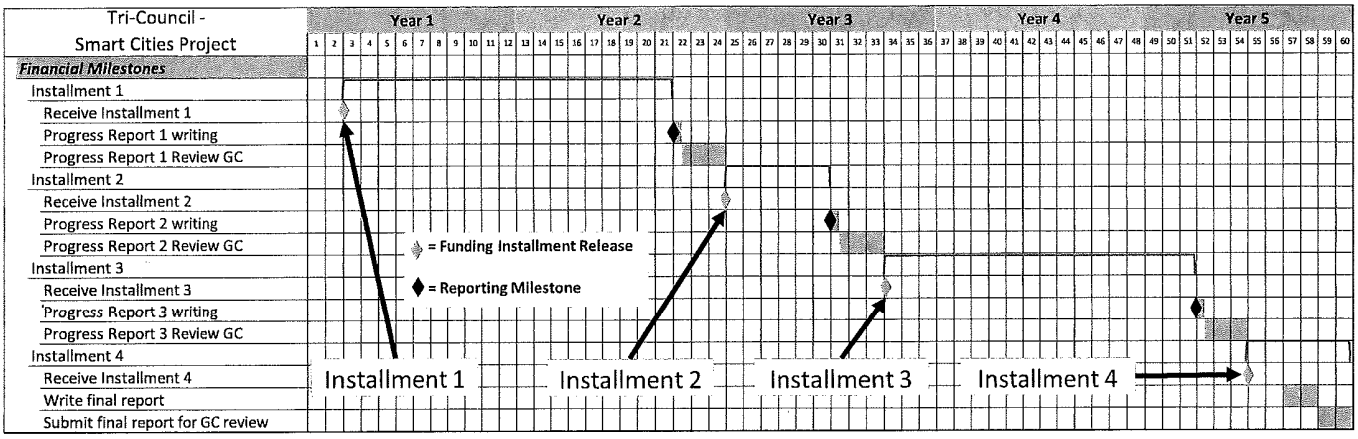

Figure 15 project funding timeline

The following sections present detailed budgets for each of the three main project activities; the Smart Farm, smartphone distribution system, and biometric feedback study. Each of these activities is then broken down into two stages; building and operating. Furthermore, each of these stages, within each activity, is broken down to a list of equipment expenses and labour expenses (hard expenses and soft expenses). There are several general costs that are associated with project management and overall project implementation and those are capture in the general operations section below.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

8.2.2 General Operations Budget

The general operating budget includes items that are associated with project management and overall project implementation. This portion of the budget is included below in *Figure 16*.

A general manager will be needed to act as a coordinator for all activities included in the project. This individual will be responsible for coordinating project tasks and procurement, hiring staff, and writing milestone reports for Infrastructure Canada. It is anticipated that this person will have to travel from time to time, and so a travel budget is additionally included in the budget to accommodate these expenses as they arrive.

A community engagement coordinator will be needed from time to time throughout the implementation of the project to coordinate community engagement activities. A budget to cover their time is also included here. Those activities will include those listed in Chapter 6 and will be pertinent to the successful implementation of the project.

A community health needs assessment report was produced by The Pas and OCN in 2017-2018. The cost of that report was covered by the provincial government for The Pas and Kelsey; however, given that OCN does not fall within provincial jurisdiction, the cost of developing that report for the population of OCN was covered by the OCN band. The cost of this report was roughly $100,000. In order to ensure that an equivalent report is produced upon completion of the implementation phase, this amount has been added to the budget as it is a necessary piece of data required to accurately assess the effectiveness of the project in decreasing diabetes rates in the region.

General

Budget Summary				*Installment 1*	*Installment 2*	*Installment 3*	*Installment 4*

8.2.3.1 General Budget

8.2.3.1.1 Energy Use Budget

Electricity is primarily used for operation of the Smart Farm and serves many functions, most notably it is the feedstock for light energy needed for food growth. The Smart Farm will use more than 3000 light units to drive photosynthesis. The conversion of electricity to light is accompanied by heat generation and so air conditioning system will be used to remove that heat from the grow area. The Smart Farm technology from KAST utilizes high efficiency LED lighting system to minimize heat production; however, some degree of heat production is unavoidable. Circulation of nutrients with pumps and mixers is another source of energy usage. General lighting, control system operation, air circulation, and dehumidification are also users of electricity in the Smart Farm. During the construction phase this will also include power tool operation, and other miscellaneous contractor equipment.

Figure 18 illustrates the relative contribution of each of these categories to the overall energy bill, based on KAST's recommended energy use numbers, and the projected cost of energy at each installment based on Manitoba Hydro commercial account rates and projected rate increases over the coming five years.

Energy Use

Category	Value	Units	Qty	Installment 1	Installment 2	Installment 3	Installment 4
Lights Energy Use (kw*h)				0	239,206	1,076,429	358,810
Air Conditioner (kw*h)				0	84,096	378,432	126,144
Nutrients (kw*h)				0	23,635	106,356	35,452
Misc (kw*h)				1,425,705	534,639	1,247,492	356,426
Total Energy Use (kw*h)				1,425,705	881,576	2,808,709	876,832
Electricity Cost							
Basic Electricity Cost ($)				$ 356.40	$ 388.48	$ 420.55	$ 452.63
First 11,000 kwh/month ($/kw*h)				$ 0.09	$ 0.10	$ 0.10	$ 0.11
Next 8,500 kwh/month ($/kw*h)				$ 0.06	$ 0.07	$ 0.07	$ 0.08
Additional kwh/month ($/kw*h)				$ 0.04	$ 0.04	$ 0.05	$ 0.05
Electricity Costs ($)				$ 79,873.05	$ 50,639.41	$ 172,579.21	$ 59,110.51

Figure 18 Smart Farm - energy use budget

8.2.3.1.2 Water Use Budget

Water is used extensively in the Smart Farm as it is the nutrient delivery medium, and a critical input in the cultivation of food products. Water usage is estimated based on KAST's recommended values of monthly consumption per month as well as the volume required to refill beds following a quarterly cleaning cycle. The cost of water is then calculated based on a quarterly service charge and cost per 1000 gallons delivered as per municipality rates. *Figure 19* below identifies these costs and rates in a tabular format.

Water Use

Category	Value	Units	Qty	Installment 1	Installment 2	Installment 3	Installment 4
Total water in beds (gallons)		250 L/bed		0	50,526	227,368	75,789
Water Use per harvest (gallons/harvest)		500% consumed / harvest		0	252,632	1,136,842	378,947
Water Use per month (gallons/month)		10 harvests/year (average)		0	210,526	947,368	315,789
Water Cost							
Service Charge (quarterly rate)				$ 34.27	$ 42.47	$ 52.63	$ 65.23
Service Charge (annual)				$ 137.08	$ 169.88	$ 210.53	$ 260.90
First 20,000 gallons ($/1,000 gallons)				$ 11.71	$ 11.75	$ 11.78	$ 11.82
Over 20,000 gallons ($/1,000 gallons)				$ 9.93	$ 11.74	$ 13.87	$ 16.40
Water Cost ($)				$ 306.96	$ 2,953.04	$ 15,977.48	$ 5,981.32

Figure 19 Smart Farm - water use budget

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

8.2.3.1.3 Rent Budget

Rent in the Otineka mall is payable monthly and has been quoted by administration. The current tenant of the space is departing in May of 2019, and so the 19,500 square foot space will be available for the implementation of this project. Rent rates have been quoted by mall administration. *Figure 20* illustrates this monthly expense by installment.

Rent								
Item	Value	Units	Qty	Installment 1	Installment 2	Installment 3	Installment 4
Rental of space in Otineka mall	$ 140,000.00	/year		$ 256,666.67	$ 105,000.00	$ 245,000.00	$ 70,000.00
Rent Cost ($)				$ 256,666.67	$ 105,000.00	$ 245,000.00	$ 70,000.00

Figure 20 Smart Farm - rent budget

8.2.3.2 Building Budget

8.2.3.2.1 Preparation Budget

In preparation for the Smart Farm system, the space in the Otineka mall will need to be renovated to provide partition walls and the electrical infrastructure for operation of the Smart Farm. A preliminary rendering of the space is attached at the end of this chapter for reference. An estimated $50/square foot has been used for calculation of construction costs given the minimal remodelling needed for the space; construction of a few walls, installation of basic electrical infrastructure within those walls, as well as some plumbing infrastructure.

Figure 21 identifies items within this budget, including completion of construction drawings, which will be done upon progression to the implementation phase, general construction materials and contract labour, as well as fixtures and appliances such as vacuums, lockers and shelving for employees, as well as coolers and tables for processing of plant factory products.

Preparation							
Category	Value	Units	Qty	Installment 1	Installment 2	Installment 3	Installment 4
Renovations							
Construction Drawings	$ 30,000.00			$ 30,000.00	$ -	$ -	$ -
Procurment (building supplies)	$ 400,000.00			$ 400,000.00	$ -	$ -	$ -

PST				*$ 83,200.00*	$ -	$ -	$ -
Preparation Costs ($)				$ 1,175,200.00	$ -	$ -	$ -

Figure 21 Smart Farm building - preparation budget

8.2.3.2.2 Equipment Budget

The equipment required for this project is identified in *Figure 22*. The largest item in this budget is the Smart Farm hardware, for which a quote has been provided by KAST, along with preliminary floorplan drawings outlining the intended equipment layout. Equipment will be received in shipping containers and system assembly and installation will take place following its receipt by technicians of the pilot OCN Smart Farm

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

project. Contracted support staff will be used to assist the technicians in assembling this equipment. Cost estimates have been made for assembly and installation costs based on the known assembly time of the pilot Smart Farm and the increased scale of this Smart Farm.

Prices for bagging stations, packaging stations, administrative office equipment, and server equipment is based on supplier list pricing for components.

Equipment

Category	Value	Units	Qty	Installment 1	Installment 2	Installment 3	Installment 4

Figure 22 Smart Farm building - equipment budget

8.2.3.3 Operating Budget

8.2.3.3.1 Consumables Budget

Operation of the Smart Farm includes the use of many consumables, identified in *Figure 23*. The items identified on the list below are derived from the operations budget of the pilot Smart Farm that has been running in OCN since 2015. By scaling the quantity of items used for the pilot Smart Farm, based on relative number of growing beds available, costs for seeding, cleaning, and nutrients have been assigned. The price of hygiene supplies, including lab coats, gloves, and hairnets are catalog prices from the supplier and quantities needed have been estimated based on the number of employees anticipated to be working at the Smart Farm through each installment stage. The pilot Smart Farm has experienced a significant number of visitors throughout the past 4 years, and so, visitor hygiene supplies have been estimated based on these known values.

The price of cleaning supplies and packaging supplies is established based on catalog price from suppliers. Quantities of cleaning supplies are estimated based on the known quantity needed for the pilot Smart Farm

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

and the proportional size of the Smart Farm facility in question. Quantities of packaging supplies are estimated based on projected production rates.

Consumables								
Category	Value	Units	Qty	Installment 1	Installment 2	Installment 3	Installment 4
Seeding							
Total plants				0	983,040	1,597,440	737,280
Seed cost	$ 0.0035	/ seed (avg)		$ -	$ 3,440.64	$ 5,591.04	$ 2,580.48
Grow medium sponges	$ 0.01	/ sponge		$ -	$ 9,830.40	$ 15,974.40	$ 7,372.80
Polystyrene rafts	$ 5.00	/raft	1 year/raft set	$ -	$ -	$ 10,240.00	$ -
Cleaning							
Vinegar	$ 2.98	/gallon	0.5 gallons/units/month	$ -	$ 643.68	$ 1,501.92	$ 429.12
Baking Soda	$ 1.98	/package	0.5 packages/unit/month	$ -	$ 427.68	$ 997.92	$ 285.12
Bleach	$ 2.99	/gallon	2 gallons/unit/year	$ -	$ 215.28	$ 502.32	$ 143.52
Others (sponges, bottle cleaners, etc)	$ 45.00	/package	0.5 packages/unit/year	$ -	$ 810.00	$ 1,890.00	$ 540.00
Fertilizer							
Nutrient Mixture A	$ 10.00	/pound	25 pounds/unit/year	$ -	$ 4,000.00	$ 18,000.00	$ 6,000.00

Figure 23 Smart Farm operations – consumables budget

8.2.3.3.2 Miscellaneous Budget

A list of miscellaneous operating costs is included in *Figure 24* below.

There are several ongoing operating costs, including internet, phone, community engagement costs (ex. printing, survey software subscriptions, community cooking class consumables, travel costs associated with visiting the school or similar activities) that are anticipated to occur on a monthly basis. The price of the internet and phone are based on list prices from local service providers. Community engagement costs are estimated based on projected activities. This cost is calculated as a monthly cost in the budget, however it is not anticipated to be recurring with the same consistency as phone and internet expenses.

Legal fees have been assigned based on the estimated cost for completion of the formation of the not-for-profit corporation identified in Chapter 2, as well as the creation of associated by-law documents. Annual accounting fees are assigned for the completion of year end financial documents required for the not-for-profit corporation. These will need to be completed on an annual basis. Bookkeeping software, such as Quickbooks, will be required to keep track of income and expenses on a month to month basis. The subscription for this software has been established based on a list price from the supplier's website.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Miscellaneous

Category	Value	Units	Qty	Installment 1	Installment 2	Installment 3	Installment 4
Operating / Administrative Costs							
Internet and phones	$ 250.00	/month		$ 1,750.00	$ 2,250.00	$ 5,250.00	$ 1,500.00
Legal fees	$ 7,500.00	/year		$ 15,000.00	$ 7,500.00	$ 15,000.00	$ -
Annual accountant fees	$ 5,000.00	/year		$ 5,000.00	$ 5,000.00	$ 10,000.00	$ -
Software (ex quickbooks)	$ 300.00	/year		$ 600.00	$ 300.00	$ 600.00	$ -
Community engagement	$ 500.00	/month		$ 12,000.00	$ 4,500.00	$ 10,500.00	$ 3,000.00
Employee perks (ex coffee)	$ 150.00	/month		$ 3,600.00	$ 1,350.00	$ 3,150.00	$ 900.00
Miscellaneous Costs ($)				$ 37,950.00	$ 20,900.00	$ 44,500.00	$ 5,400.00

Figure 24 Smart Farm operations - miscellaneous budget

8.2.3.3.3 Labour Budget

Operation of the Smart Farm will require the hiring of staff for the positions of Smart Farm manager, supervisor, planter/harvester, packager, and custodian. (Note, labour costs associated with operation of the smartphone distribution system are identified in a later section). All salary values are assigned based on values used for the pilot Plant Factory. The number of personnel assigned to the role of planter/harvester and packager are estimated by scaling the number of employees required to operate the pilot Smart Farm in OCN. It is assumed that a similar ratio of planters/harvesters and packagers to number of active beds is consistent between the pilot Smart Farm and this project's Smart Farm. Therefore, based on the number of active Smart Farm beds that will be operating throughout the ramp up process of this project, the number of required employees has been estimated. These values are all presented in *Figure 25* below.

The intended strategy for establishing the correct employee to active grow bed ratio will involve starting with a fewer number of employees and having them perform seeding, planting, and harvesting operations through several harvesting cycles. As they gain familiarity with their required tasks, the number of beds they are responsible for will be increased and further employees will be added as necessary.

Labour

Category	Value	Units	Qty	Installment 1	Installment 2	Installment 3	Installment 4
Number of employees							
Manager (book keeping, promotions, order supplies)				0	1	1	1
Supervisor (planting supervisor and packaging supervisor)				0	1	1	1
Planter/harvestor			3 units / harvestor	0	6	11	16
Packager			3 harvesters / packager	0	2	4	6
Custodian							
Total Employees				0	10	17	24
Cost of employees							
Manager Salary	$ 60,000.00	/year		$ -	$ 45,000.00	$ 105,000.00	$ 30,000.00
Supervisor Salary	$ 45,000.00	/year		$ -	$ 33,750.00	$ 78,750.00	$ 22,500.00
Planter/harvestor Salary	$ 34,000.00	/year		$ -	$ 195,500.00	$ 824,500.00	$ 272,000.00
Packager Salary	$ 34,000.00	/year		$ -	$ 68,000.00	$ 306,000.00	$ 102,000.00
Custodian Salary	$ 30,000.00	/year		$ 7,500.00	$ 22,500.00	$ 7,500.00	$ -
Labour Costs ($)				$ -	$ 342,250.00	$ 1,314,250.00	$ 426,500.00

Figure 25 Smart Farm operations - labour budget

8.2.3.4 Income Budget

Operation of the Smart Farm will commence following the release of installment 2. The food products created through operation of the Smart Farm will be sold to community members and so the income associated with projected sales is outlined below in *Figure 26*. The calculation is performed on a month to month basis and is based on the number of anticipated active beds, species specific planting density, spoilage rates, and the projected market bearable price per unit.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Species specific planting density is well-established knowledge in the hydroponic community and the Smart Farm manufacturer furthermore provides recommendations for planting densities for their equipment.

Spoilage rate considerations include anticipated crop failure while employees are establishing familiarity with the equipment and unpurchased product. Furthermore, during the ramp up stage following receipt of installment 2, no income is calculated. This is done to create a financially safe learning period where operations are not dependent on revenue for sustainability.

Price per unit of each product has been determined based on a market survey of same-species products at superstore in Winnipeg; generally considered an inexpensive produce supplier in the region. Those prices will be further refined with time, giving consideration both to market bearable prices and to cover operating costs. The intention is to establish a pricing model and product mix that decreases the cost of high-quality food within the community.

Active Beds					0	21	41	48
Product Spoilage Rates						50%	30%	15%
Local production								
Product	lbs (or bunches)/plant/l	Cycle Time		Density and Price	Installment 1	Installment 2	Installment 3	Installment 4

Total Income($)				$ 198.65	$ 553.50	$ 1,101.61	$ 1,916.76
Buffer		15%		$ 82,526.62	$ 13,917.45	$ 62,658.65	$ 13,114.61
TOTAL BUDGET - Smartphone Distribution System($)				$ 632,306.77	$ 105,593.46	$ 478,179.80	$ 96,711.83

Figure 27 smartphone distribution detailed budget

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

8.2.4.1 Building Budget

8.2.4.1.1 Equipment Budget

The smartphone distribution system requires acquisition of electric vehicles and their supporting charging infrastructure. Quotes have been secured for all components as well as estimates on installation of the charging infrastructure. Acquisition of vehicles and installation of their chargers will take place during the building stage of project implementation with monies from Installment 1. The need for two additional vehicles is anticipated at some point in year four with financing from installment 3. The costs associated with these items is outlined in *Figure 28*.

Equipment								
Product	**Value**	**Units**	**Qty**	**Installment 1**	**Installment 2**	**Installment 3**	**Installment 4**
Vehicles	$ 48,500.00			2	0	2	0
Chevy bolt	$ 47,000.00			$ 94,000.00	$ -	$ 94,000.00	$ -
Vehicle tablet and mounting	$ 1,000.00			$ 2,000.00	$ -	$ 2,000.00	$ -
Installation	$ 500.00			$ 1,000.00	$ -	$ 1,000.00	$ -

Equipment Subtotal ($)				**$ 238,820.36**	**$ -**	**$ 97,000.00**	**$ -**
GST				*$ 11,941.02*	*$ -*	*$ 4,850.00*	*$ -*
PST				*$ 16,717.43*	*$ -*	*$ 6,790.00*	*$ -*
Equipment Costs ($)				**$ 267,478.80**	**$ -**	**$ 108,640.00**	**$ -**

Figure 28 smartphone distribution system building - equipment budget

8.2.4.1.2 Software Development Budget

Development of specialized software will take place during the building stage of this project with financing from Installment 1. A preliminary requirements document was developed and provided to several software development firms in order to receive quotes. Further refinement of the requirements document will be performed in the first year in collaboration with the selected software developer, at which point a precise quote will be received. The allotted financial resources in Installment 1, presented in *Figure 29* below, are anticipated to adequately cover the required software feature development, as established by conversations with each of the contacted firms.

There may be a need, from time to time, to have updates performed on the software platform for a variety of reasons including:

- Maintaining compatibility with newer operating systems
- Increasing feature deployment
- Bug patching
- Other unforeseen issues

For this reason, an annual software maintenance budget has been assigned and is allotted for dispersion in Installment 2 and 3.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Software Development Costs

Category	Value	Units	Qty	Installment 1	Installment 2	Installment 3	Installment 4
Software Development							
Online marketplace, packaging and distributi	$ 250,000.00			$ 250,000.00	$ -	$ -	$ -
Maintenance

Software Development Total ($)				**$ 282,500.00**	**$ 28,250.00**	**$ 56,500.00**	**$ -**

Figure 29 smartphone distribution system building - software budget

8.2.4.2 Operating Budget

8.2.4.2.1 Vehicle Budget

As with any vehicle, electric vehicles have operating costs that must be accounted for. *Figure 30* outlines a budgetary list of these anticipated costs.

The electricity cost is calculated based on an assumed 200km travel per day per vehicle, operation of distribution services for 250 days of the year, and 0.16 kwh/km (the electric vehicle analogue for fuel economy; liters/100km or miles/gallon). Based on these numbers, and the anticipated number of vehicles on the road performing deliver activities, the costs are identified in the table below.

There are less maintenance activities with electric vehicles than with conventional vehicles because there are no oil changes, engine cooling systems, fuel filters, or emissions systems. As such, maintenance activities are anticipated to include brake pad changes, tire rotations, and wiper blade replacements, for which $500/year has been allotted. Tire changes are anticipated at the 100,000 km mark on each vehicle, and so this expense has been budgeted according to anticipated annual travel.

Miscellaneous consumables, such as wiper fluid and car washes have been assigned a value of $500/year for the duration of vehicle operation.

Given that each driver will utilize a tablet installed in the vehicle to provide delivery instruction, and those instructions will be dispatched over the internet, each vehicle will need an internet connected tablet. The carrier cost associated with this data plan is included below based on list prices and the anticipated data allotment.

Vehicles

Product		Value	Units	Qty	Installment 1	Installment 2	Installment 3	Installment 4
Total vehicles					0	2	4	4
Electricity	(200km/day, 250days/year)	0.16	kw*h/km	50,000 km/vehicle/year	$ -	$ 581.69	$ 2,544.77	$ 959.63
Maintenance	(brakes, tire rotation, wiper blade	$ 500.00	/vehicle/year		$ -	$ 750.00	$ 3,000.00	$ 1,000.00
Tires	(100,000km replacement interval)	$ 1,000.00	/vehicle		$ -	$ -	$ 2,000.00	$ -
Consumables	(wiper fluid, car washes, etc)	$ 500.00	/vehicle/year		$ -	$ 750.00	$ 2,916.67	$ 1,000.00
Cell phone plan for tablet		$ 80.00	/vehicle/month		$ -	$ 1,440.00	$ 5,600.00	$ 1,920.00
Vehicles Subtotal ($)					$ -	$ 3,521.69	$ 16,061.44	$ 4,879.63
GST					*$ -*	*$ 176.08*	*$ 803.07*	*$ 243.98*
PST					*$ -*	*$ 281.74*	*$ 1,284.91*	*$ 390.37*
Vehicles Costs ($)					$ -	$ 3,979.51	$ 18,149.42	$ 5,513.98

Figure 30 smartphone distribution system operation - vehicle budget

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

8.2.4.2.2 Labour Budget

Each vehicle will need a driver, and so, based on estimated salary requirements for this role, and the number of planned vehicles, the following budget has been assigned. *Figure 31* assigns a salary to this individual and identifies the number of employees that will be supported through each installment.

Labour						
Category	Value	Units	Installment 1	Installment 2	Installment 3	Installment 4
Drivers			0	2	4	4
Driver salary	$ 40,000.00	/driver/year	$ -	$ 60,000.00	$ 233,333.33	$ 80,000.00
Labour Costs ($)			$ -	$ 60,000.00	$ 233,333.33	$ 80,000.00

Figure 31 smartphone distribution system operation - labour budget

8.2.4.3 Income Budget

There is a small amount of revenue anticipated to come from the level 3 electric vehicle charging stations as outlined in *Figure 32*. For budgeting purposes, the number of customers has been estimated on a monthly basis. Income is calculated based on the difference between the cost of energy delivered and the selling price on an hourly basis. Refinement of this pricing model will take place as actual usership rates are established and infrastructure is operational. Is should be noted that the purpose of this piece of infrastructure is not principally to serve as a revenue source. Its purpose is primarily to enable the rapid re-energizing of distribution vehicles and secondarily to provide a value-add service, charging of future community vehicles, to the Smart Farm customers as well as other customers of the Otineka mall. The pricing structure will reflect these goals and so this revenue is critical to the sustained operation of the Smart Farm and smartphone distribution system.

Charging Stations						
Category	Value	Units	Installment 1	Installment 2	Installment 3	Installment 4
Customers/year			25	67	336	150
Energy / year (kwh/year)		50 kwh/customer (avg)	1,250	3,350	16,800	7,500
Energy price ($/kwh)			$ 0.04	$ 0.04	$ 0.05	$ 0.05
Energy Cost			$ 51.35	$ 150.50	$ 328.39	$ 657.24
Charge price ($/h)			$ 10.00	$ 11.00	$ 11.00	$ 11.00
Gross Income			$ 250.00	$ 704.00	$ 1,430.00	$ 2,574.00
Charging Station Income ($)			$ 198.65	$ 553.50	$ 1,101.61	$ 1,916.76

Figure 32 smartphone distribution system operation - income budget

8.2.5 Biometric Feedback Study

The following budget, *Figure 33*, is a complete budget for the smartphone distribution system. Unlike the other two activity budgets, the development stage of this study is not anticipated to incur any costs other than the labour of the project manager. Consequently, this budget only includes the implementation stage of the biometric feedback study by broking it down to a list of equipment expenses and operating expenses, including labour (hard expenses and soft expenses). Detailed descriptions follow.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Figure 33 biometric feedback study detailed budget

8.2.5.1 Implementation Budget

8.2.5.1.1 Equipment

Continuous Glucose Monitoring wearable technology is the sole equipment cost for the implementation of the biometric feedback study. At time of writing, Dexcom G5 is the only product available in the Canadian market that provides this functionality, although there are several additional equipment suppliers on the horizon. Therefore, the following prices are included in the budget based on a quote provided by Dexcom.

There are two components required for operation of this technology; a transmitter and an adhesive sensor patch that must be fastened to the torso of the subject. Adhesive sensor patches are priced at $340 per box and a box is anticipated to last for one month of operation. The transmitter, which physical attaches to the sensor and, via a Bluetooth connection, transmits data to the subject's smartphone, lasts three months before requiring replacement and costs $389. The total of these costs, along with the preliminary estimate of the total number of study participants that will be wearing these devices, is identified in *Figure 34* below.

The preliminary biometric feedback study design, developed during the finalist phase of this project, requires that participants wear the CGM system for six weeks. This is the minimum required interval for the collection of statistically significant data. However, in the interest of maximizing the value add to the community from each transmitter, a complete three-month supply of sensors has been budgeted for, so that study participants can be provided with an additional six weeks of real-time biometric feedback. This is done in the intention of further establishing knowledge of the connection between diet and diabetes among the study participants and with the hopes of spreading that message to the greater community.

Equipment Costs ($)					$ -	$ -	$ 331,171.36	$ -

Figure 34 biometric feedback study implementation - equipment budget

8.2.5.2 Operating Budget

The biometric feedback study will be conducted by University researchers in collaboration with healthcare providers at the local healthcare centers. This budget, outlined in *Figure 35* below, accounts for hiring two contract nurses to provide healthcare support to study participants, both during the study and for a six-month period following the study. A phlebotomist will be needed for collection of blood samples from study participants on a regular basis for laboratory analysis of diabetes markers beyond blood sugar. Budgeting for a phlebotomist, as well as laboratory fees and healthcare visit consumables (example: needles, Band-Aids, and sterilization supplies) is budgeted for to minimize the financial burden on local healthcare facilities and ensure successful implementation of the biometric feedback study.

Study participants will be required to carry a smartphone with a data connection throughout the study process, as well as drive themselves to and from their appointment. To cover these costs, as well as provide an incentive to the participants, $300 has been budgeted per person to cover these costs. Based on community engagement survey results, discussed in Chapter 6, those community members that were interested in participating in a biometric feedback study identified fresh food as the most desired incentive to compensate participation. The cost of this has been accounted for in the Smart Farm section.

Operating								
Category	**Value**	**Units**	**Qty**	**Installment 1**	**Installment 2**	**Installment 3**	**Installment 4**

8.3 Financial tools and methodologies

The Smart Farm will be utilizing Cash Basis Accounting: income is recorded when it's received, and expenses are reported when they're actually paid. We will record revenue when a customer pays for a product and will record a payable when it is paid.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Financial administration associated with building and operating the Smart Farms will be aided by the utilization of QuickBooks Pro. This is a financial accounting software program intended for a business of the size and scale we are considering. With features that are aimed at supporting accounting tasks such as accounts receivable, accounts payable, bank statement reconciliation, payroll and financial reporting, this software is suitable for our purposes. Specifically, this software allows us to complete the following tasks:

Money Management:

All recurring invoices and payments with their due dates and transaction detail can be keyed in. Cheques can be printed directly through QuickBooks and every transaction is documented, making future audit reports easily accessible. Additionally, the Smart Farm bank account can be connected directly to QuickBooks should we wish to utilize that option.

Sales Invoicing:

One of the sources of revenue, besides sales to community members, will be to service customer contracts for cash crops such as herbs, which are in growing demand. QuickBooks will allow us to track sales and generate receipts and invoices instantly. These invoices can be electronically delivered which saves on administrative time.

Financial Reporting:

QuickBooks will allow us to generate financial reports specific to the topic required including year-over-year income, expenditures, trends and forecasting documents. All reports can be exported to the Tri-Council membership and Board of Directors should they request these at any time, including for Board meeting preparation. These up to date reports impact the ability of the Board to make decisions based on real time facts.

Ease of Use:

QuickBooks has been selected as the accounting software of choice because it is user-friendly and uncomplicated.

SMART CITIES CHALLENGE BUDGET				
Expense Category	**Description**	**$ Amount**	**TOTAL**	**$ Balance**
				$250,000.00
Service Contracts	• Proposal development (2) • Videographer • Community Engagement • Communications • Legal Fees	$ 130,200.00 $ 10,500.00 $ 3,000.00 $ 3,840.00 $ 1,695.00	$149,235.00	$100,765.00
Travel & Accommodation	• Winnipeg – The Pas/OCN & Toronto Jury Check-in	$ 11,212.43	$ 11,212.43	$ 89,552.57
Hospitality and Meeting fees	• Tri-Council, Project Team meetings • Information Sharing, update meetings • Smart Cities Challenge team visit	$ 503.30		$ 89,049.27
Webpage Development	• Infrastructure Canada and public access to proposal and video	$ 500.00		$ 88,549.27
Administration	• Printing, financial, meeting space, staff hours	$ 10,000.00	$ 10,000.00	$ 78,549.27
Estimated Costs for Showcase Ottawa May 14, 2019	• Travel for project team • Display costs • Food/Accommodations • Taxis	$ 35,000.00	$ 35,000.00	$ 43,549.27
Project Wind-up Activities*	• Leadership to Determine	$ 43,549.27		

*unallotted funds at time of proposal submission

Tri-Council leadership jointly signed a Funding Authorization Process which detailed how spending of monies from the finalist contribution would proceed.

A project team was established consisting of a representative from each of the governments, as well as a project proposal manager and a project proposal coordinator. These five individuals carried the responsibility to ensure completion of the proposal and to ensure all criteria were met. All financial requirements were compiled by the proposal coordinator and forwarded to the three government representatives for approval. All service contracts were signed by these three individuals. An invoice was

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

created for each expense and forwarded to the Opaskwayak Health Authority finance department who have held the finalist contribution money on behalf of the Tri-Council. All cheques were processed by the finance committee and signed by two authorized personnel. Monies were maintained in a chequing account established solely for the purpose of housing the finalist contribution.

Details on the expense categories listed in the table above are as follows:

1. Service Contracts: all individuals requested to work on the development of this proposal, besides the government representatives who were not paid for this work, were hired on a contract basis.
    - Two individuals were the primary proposal writers. They travel between Winnipeg and the Tri-Council region on a regular basis and increased their travel for this project. Their roles included developing and coordinating all aspects of the proposal including the regular calls with the Smart Cities team and hosting the in-community visit of the team representatives, participating in all webinars hosted by the Smart Cities team, preparing for and travelling to Toronto for the jury check-in, writing all contracts for other service providers, preparing presentations to the government bodies and the Tri-Council, working with the videographer to complete the mandatory 5 minute video, working with the community engagement personnel in completing the preparation of surveys and other community engagement strategies, developing the plan and all aspects of the proposal, responding to media, and keeping everyone informed of communications, and working with the lawyer to develop the governance structure. These individuals will also be responsible to prepare for the showcase event in Ottawa in May 2019 and to travel to Ottawa with the project team at that time.
    - One individual was hired to produce the 5-minute video. The individual lives and works in the community and came highly recommended by the project team and community members. He photographed and interviewed a wide range of people; the inclusiveness and professionalism are noted in his final submission.
    - One individual was hired to complete community engagement activities on behalf of the project. She lives and works in the community and was able to complete extensive engagement activities during the initial proposal period as well as during the finalist period of this Challenge.
    - One individual has been hired for communications, including creating agendas and materials to present to the Tri-Council governments, and ongoing relationship development among communities.
    - A lawyer was hired to create the not for profit corporation as the form of governance structure that was agreed to by the Tri-Council as the best model for implementation of this project. Onekanew (Chief) Sinclair of OCN suggested the use of the lawyer preferred by OCN and it was this lawyer that was used for the development of the articles of incorporation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

2. Travel and Accommodation: This cost category included all travel and accommodation that was required by the project coordinator and project manager to complete the tasks requested of them as detailed in their description of services above. The amount is impacted by the northern remote location of the Tri-Council region.
3. Hospitality and Meeting fees: This cost category included costs associated with meetings of the project team, Tri-Council, hosting the Smart Cities Challenge team community visit and strategic planning meetings. Items included food, logo printing, and printed presentations.
4. Webpage Development: This cost category reflects the funds utilized to pay an individual to develop the webpage that contains the links to the final proposal submission and the finalist video.
5. Administration: Opaskwayak Health Authority incurred costs associated with staff time to establish and maintain the bank account, process invoices, prepare and deposit cheques, cover printing costs for materials, arrange for and provide meeting space, locate and provide documents pertaining to the existing OCN Smart Farm, provide staff time for interviews and expertise. A standard 10% administration fee has been allotted for these services.
6. Estimated Costs for Showcase Ottawa May 14, 2019: The project team has determined that five people will be attending the showcase in Ottawa. Costs associated with return travel from the Tri-Council region to Winnipeg and then on to Ottawa, as well as those required to set up the trade style display, are reflected in this cost category.
7. Project Wind-up activities: While currently unallotted, the remainder of the monies will be utilized for final legal fees and other costs associated with the completion of the proposal phase and moving into the implementation phase of the project.

8.5 Risk Identification and Mitigation

Risks and mitigating techniques are discussed within the narrative of the comprehensive budget review above.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9 CHAPTER 9: IMPLEMENTATION PHASE REQUIREMENTS

9.1 Duty to Consult and Modern Treaty Obligations

In Canada, we have recognized in the Constitution Act of 1982 that in affairs of the Crown, also known as the federal, provincial and territorial governments, that we have a duty to consult with Indigenous peoples when contemplating actions or decisions that may impact our Indigenous peoples. The Smart Cities Challenge is an initiative of the federal government and the Tri-Council within this proposal is contemplating a project that may be implemented in the event the Tri-Council is successful in the challenge.

The project we are proposing as a Tri-Council has a unique structure in that one of the three governments comprising the Tri-Council is Opaskwayak Cree Nation; a First Nation signatory to Treaty #5. The Friendship Accord among the three governments has been in effect since 2014. The governance structure identified in Chapter 5 of our proposal is the first formalized structure created by the Tri-council. This not for profit corporation will have equal representation from each of the three governments. While the articles of incorporation are standard, our unanimous member agreement outlines a list of items which require approval by Extraordinary Resolution. "Extraordinary" approval requires an 80% agreement threshold, so for all intents and purposes, the requirement is unanimity meaning no one voice can be silenced. Therefore, upon our success in this challenge and as our project proceeds, Opaskwayak Cree Nation, The Town of The Pas, and the RM of Kelsey will have equal voice at decisions made by the Board of Directors.

The national voice in Canada supports reconciliation with Indigenous peoples in Canada for the injustices of the past. We each carry a personal responsibility to move towards inclusiveness in our country. It is within the richness of inclusiveness, working together as we respectfully listen to the ideas and opinions of each other, that we can rise to greatness and achieve together what we could never achieve alone. The work of the Tri-Council demonstrates this move towards reconciliation at a local level. As we work together on issues that impact our communities, we are learning more about each other – our differences and our similarities. The Smart Cities Challenge project has provided another opportunity to know each other and to embrace our cultural diversity and the richness this brings to our communities.

9.2 Community Employment Benefit (CEB)

- The CEB is a federal initiative that requires implicated projects, such as that described in this proposal, to provide employment and/or procurement opportunities for at least three of the groups identified below. Tri-Council leadership publicly voices their intentions to continue to grow a stronger and more inclusive community by building on successes of the past. Our view is that providing diverse employment opportunities, as outlined in the CEB guidelines, are as innovative and important to our prosperity in the future as is the use of technological innovation. As the project unfolds, it is anticipated that the following groups will be included as our targeted community employment beneficiaries.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Indigenous peoples – the current vertical smart farm is located on Opaskwayak Cree Nation (OCN) and all current employees are Indigenous. Our expanded smart farm location is also on OCN land and all employment opportunities will be posted in OCN as well as the other partnering communities.
- Women – the current Manager of the smart farm and Chief Technician are women. They will be vital to the skills, training and procurement for the expansion of the smart farm. We anticipate that women will continue to seek employment and be strong leaders in this business as throughout this project.
- Veterans – veterans will be encouraged to apply just as all community members are
- Youth – dietary change begins with the youth. It is our plan that youth be integrated i operations of the smart farm, beginning with school tours and continuing into employ opportunities, particularly summer term positions while they are students and on to f they chose opportunity for employment at this location.
- Recent immigrants – there are increasing numbers of immigrants to the Tri-Council re submissions for employment will be met with the same enthusiasm as all other community members.
- Small/Medium enterprises – we have listed in Chapter 5 that our agricultural technology partnership and supplier is the OCN LED Smart Farm. Our smart farm expansion will bring direct financial gain to this enterprise. Others may follow as the project unfolds.

Upon success of our challenge and the funding decision, we will provide specific targets for each of these identified employment benefit groups.

9.3 Climate Lens Assessment (CLA)

As instructed by the Smart Cities Challenge team, we are asserting that the total cost of our project with a primary focus on climate change adaptation, resilience, disaster mitigation, or a reduction in GHG emissions is less than $10 million.

9.4 Risk Identification and Mitigation

1. Unequal voice at the governance table
   - Mitigation: Inclusive governance structure with legal items to ensure unanimity as detailed in Chapter 5.
2. Identified groups for CEB are uninterested in employment at the Smart Farm
   - Mitigation: widespread dissemination of job postings; provide adequate training; ensure salaries meet industry standards; ensure administrative protocols in place to foster a supportive work environment.

EXECUTIVE SUMMARY

As a group of four rural counties in Alberta, we are pleased to submit our proposal to Smart Cities Canada! We believe we have risen to your Challenge.

When awarded the Challenge prize, we aim to transform how rural Canada uses and accesses Information Communications Infrastructure for the common good. We will lever the benefits of connected technologies to improve rural lives, rural economies and rural environments. We will bridge the divide with urban Canada and better connect urban residents with their sustainable food supply. We seek to create a region where internet connectivity, smart technologies, and innovative data trust applications are developed and used to increase rural prosperity and will attract citizens to an innovative and prosperous way of life.

We are about to embark on a path to tackle one of Canada's most wicked of problems:

> *Deliver decision-making tools, informed by hyper-local data and connectivity solutions, that benefit residents that, in turn, improves Canada's food production and distribution system, enhances rural safety and security, incents young families to become life-long farm operators, and, when fully implemented, increases the prosperity of rural Canada.*

The challenge is large – our plan begins the process. It delivers upon the outline submitted in the Spring of 2018, and builds upon it in significant ways. A full strategic plan, with all the supporting details demanded through this rigorous application process, defines our way forward.

We propose a not-for-profit company reflecting our rural intent – ***AGora*** – be created to bring life to our strategy.

> ***AGora*:** an internet enabled meeting and marketplace, based on the original Greek agora where people meet, discuss, research, resolve, profit and prosper.

True to the intention of the Smart Cities Challenge, we are focussed on delivering value that can be adopted nationwide. We intend to use state of the art technologies to create *AGora* so it can be used by others. And it has not and will not be created in isolation. Collaboration underpins our achievements so far, and will be core to our long-term success. Community members and partners of all types will work with us to deliver value.

Our proposal defines a common purpose and shared approach to tackle our 'wicked problem' head on, and not wait for events to overtake rural Canada. We see a positive future for all rural regions in Canada, with connected technologies at the core.

We ask that you step forward in partnership with us to bring about a new future for Rural Canada. Something that perhaps was not contemplated when the Smart "Cities" Challenge was announced, but something that will deliver fundamental value to Canada's urban and rural residents alike.

We invite you to join us!

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

VISION

1. The Four-County Challenge

This proposal sustains the collective vision of Parkland, Brazeau, Lac Ste. Anne and Yellowhead counties in Alberta to create a smart rural region and describes how this will be achieved.

The proposal continues to focus on the collaborative Challenge that:

Our agricultural community will revitalize and grow through the connection of people to the land and food while attracting citizens to share in its prosperous, innovative and resilient way of life.

Our four counties envision a growing local populace that is positioned to succeed in the digital economy. Economic growth and population growth will require access to the Information and Communications Technology (ICT) economy and the decision tools required to prosper.

Our objective is to create a region where internet connectivity, smart technologies, and innovative data trust applications are developed and used to create a more prosperous agricultural economy, protect and improve the environment, enhance rural quality of life, increase safety and security, and provide leading-edge connectivity for our farms and citizens.

Rural Economy

The initiative will create a rural economy where opportunities expand, stronger links to urban markets support and diversify the economy, smaller farms are more viable, larger farms use precision agriculture to improve productivity and increase profitability, and increased opportunity and prosperity enable intergenerational farm transfer.

Rural Environment

The initiative will enable decisions that protect and improve the environment and husband the region's natural assets and land base. This includes identifying new end-uses for waste that is now being landfilled, efficient use of agricultural/residential by-products and green energy opportunities.

Rural Quality of Life

The initiative will enhance rural quality of life by creating communities with a more diverse age demographic, helping smaller farms to establish and prosper, increasing agricultural diversity, attracting residents with different social and economic interests, expanding the tax base to upgrade infrastructure, and increasing mental health as incomes grow and financial challenges are eased.

Rural Safety and Security

The initiative will make the region safer and more secure by improving road safety, reducing the incidence and severity of rural crime, and improving response times for law enforcement.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Rural Connectivity, Dataflow, and Data Trust

The initiative will provide leading-edge connectivity, where technology enables people to live further from urban centres, obtain equitable service, and derive more value from the agricultural data it produces, via a secure and fully auditable data exchange and trading platform.

Data protection has emerged as a factor critical to the long-term prosperity of communities. Data is the new enterprise currency – the ability to collect, analyze and lever it for the benefit of the data provider will distinguish one enterprise from another. This is no less so in the agricultural sector. Deriving value from this 'second crop' will be achieved by combining a single piece of data with other data and then generating more data – an evergreen crop. This virtuous cycle will help solve real-world farm management problems, provide new revenue sources and identify and solve community problems quickly and easily.

2. The Proposed *AGora*

We are proposing to incorporate a not-for-profit organization that will act as a rural innovation incubator, bringing together partners from all sectors to catalyze early adoption and use of high-speed internet communications, smart technologies, and innovative internet applications.

We are calling this new entity *AGora*.

AGora will establish the infrastructure required to provide a test platform for:

- Experimenting with new technologies and models for rural internet connectivity
- Supporting innovation in agricultural technology and agricultural practices
- Creating new applications that support rural citizens, communities, and businesses
- Protecting and monetizing data through new technologies on behalf of data producers

AGora will:

- Establish a data trust to ensure control and sovereignty of the data assets
- Deliver hyper-local data and analytics to provide value and incent participation
- Recruit an initial cohort of farmers, local businesses and rural farm-based businesses who wi provide their operations as a test bed for technology development and continuous improver will provide high-speed connectivity for these early adopters
- Recruit technology developers who will benefit from and are willing to pay for access to thes adopters help create new technologies on highly-connected farms
- Use revenues from this 'pay-to-play' model to extend connectivity to others in the region

Clear vision, app. est. if ors.

Through its activities, *AGora* will:

- Develop an affordable model for rural digital connectivity that can be replicated in other rural regions
- Develop made-in-Canada innovations in smart agricultural technology
- Accelerate adoption of new agricultural practices that improve farm productivity and profitability
- Catalyze development of internet-based applications that enrich rural life
- Improve urban Canada's understanding of its food production and security system
- Establish data as a 'second crop' for farmers that is renewable, expandable and profitable

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Data will be *AGora's* stock-in-trade. It is the critical focus of every product and service supported by *AGora*, which will provide content that is the most relevant, timely and valuable for regional agricultural producers and other clients. This focus on data will help *AGora* and its clients capitalize on these rich and comprehensive data resources that many commercial enterprises already exploit. Increasingly, agriculture producers and the broader population are coming to understand they have been supplying these and other private enterprises with useful and marketable data, with virtually no direct return. *AGora's* efforts to cultivate leadership in rural innovation will focus on improving digital and data literacy throughout the region and will build *AGora* and client capacities for data discovery, data science, data marketing, data brokering, and other profitable functions related to the lucrative and expanding global data economy.

3. Meeting Real Community Needs

3.1. Community Consultation and Engagement

This initiative will create outcomes that are highly relevant for the four-county region and its residents. These outcomes represent real community needs that have been refined through extensive consultation and engagement. The processes used to develop our vision and prepare this implementation plan are described in the ENGAGEMENT chapter.

3.2. Supporting Evidence

There is significant supporting evidence for the relevance of our key strategic objectives and the benefits of addressing this Challenge.

Rural Economy

Farms are getting larger, numbers are dwindling, and wealth is accumulating in the largest. In Alberta, the average age of farm operators increased from 48.2 years in 1996 to 55.7 in 2016. It is more difficult for young people to enter the agriculture business and to stay in business; farms are expanding instead of diversifying.

Where able, rural residents are enthusiastic adopters of new technology. Farmers always have had to figure out how best to market their products. Today, 12.7% of Canadian farms use direct marketing tools to access markets. This is more the case for small farms than large - 25.2% of farms with sales less than $10,000 use direct marketing, compared with 5.6% of farms with $1 million or more. Small farms rely on direct marketing, on-line presence, and ability to reach the 'farm-to-fork' audience.

Larger farms are becoming equally dependent on technology. Precision agriculture is data intensive and requires high-bandwidth connectivity. A futurefarming.com survey – "Internet speed hinders farm technology use in Canada" – found 93% of respondents felt precision agriculture was useful; three-quarters plan to expand their use of the technology in the future. However, according to the report, the biggest barrier to further technology adoption, after price, is internet infrastructure.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Rural Environment

Soil erosion is a significant challenge that is costing Canadian farmers more than $3 billion a year, notwithstanding the efforts that have been made in soil conservation. University of Manitoba professor David Lobb says in 1971 farmers lost $0.96 billion in 2016 dollars every year due to soil erosion. In 2011, he says, this had increased to $3.18 billion, resulting in cumulative losses of between $40 billion and $60 billion. ["Cost of soil erosion $3 billion annually in Canada." Chatham this Week. Tom Morrison. Feb 20, 2018.]

Continuous cropping and the use of agrochemicals have increased crop yields but also may impact long-term sustainability. Increased availability of hyper-local data coupled with improved data-mining and artificial intelligence will enhance each farmer's ability to make responsible decisions by better understanding of environmental processes at various scales, improving land stewardship.

Rural Community and Quality of Life

In its 2017 report titled Rural Broadband: *Policy Recommendations for Improving Broadband Access & Adoption in Rural Alberta*, the Alberta Centre for Sustainable Communities at the University of Alberta advocated that "broadband should be considered a priority for community development and an important space for interaction and innovation."

A paper published in American Behavioral Scientist in 2010 summarized research indicating that internet usage can increase voluntary participation and create social networks in rural communities, building social capital. ("Do Rural Residents Really Use the Internet to Build Social Capital? An Empirical Investigation." Michael J. Stern and Alison E. Adams. American Behavioral Scientist. 53(9) 1389–1422.)

The authors assessed how residents in an isolated rural region of the western United States used online connections to maintain local social networks and learn about community events and organizations. They concluded Internet usage can play an important role in strengthening rural communities. Residents used the Internet both to learn about local events and groups (bonding) and to connect to interests outside the local area (bridging).

Rural Safety and Security

Farms (and municipalities) are using larger and more advanced equipment. Their size and speed make them a hazard on public roads. As rural road traffic increases so does the accident rate. A 2016 study – "The effects of roadway characteristics on farm equipment crashes: a geographic information systems approach" – in the Journal of Epidemiology confirmed that "As traffic volume increased, the odds of a crash occurring also increased. Higher traffic volume, higher posted speed limits, road type, and smaller road widths were associated with the occurrence of farm equipment crashes."

Rural crime also is a growing problem. Western Canada has higher rural crime rates than tl average. Alberta, with 9,895 offenses per 100,000 residents, places third in the west. The Caucus on Crime Reduction in Saskatchewan (2017) reported that "there has been a reloc traditionally urban crime to increasingly rural areas. The result is that drugs, gangs and vio are more prevalent in rural parts of the Province." Rural residents feel criminals are becom brazen, better organized, and more brutal.

Continuing research

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Rural Connectivity

Canada has recognized the importance of nationally available broadband. The CRTC has confirmed that, notwithstanding significant improvements, "many Canadians, particularly in rural and remote areas, do not have access to broadband Internet access services that are comparable to those offered to the vast majority of Canadians in terms of speed, capacity, quality, and price." In its Telecom Policy 2016-496, the CRTC said it "expects fixed broadband Internet access services... to be available in 90% of Canadian premises by the end of 2021, and in the remaining 10% of Canadian premises within 10 to 15 years. In communities where distance, geography, and limitations to existing technologies present challenges, the Commission expects that intermediate steps will be taken to progress towards these goals."

Service in our four regions is currently spotty and irregular. In a survey conducted for this project 93% of respondents rated cellular coverage as average-to-poor; 77.3% rated internet coverage as average-to-poor. Moreover, as part of this project Taylor Warwick confirmed that fully $100.7M would be required to implement traditional connectivity across the four counties on par with urban Canada.

Meaningful Data Creation and Use

Smart farming relies on new technologies like the Internet of Things, cloud computing, robotics, and artificial intelligence. Massive volumes of data are captured, analyzed, and used for decision-making. The global data economy is pegged at $3 trillion - a rising trend that also is evident in agriculture.

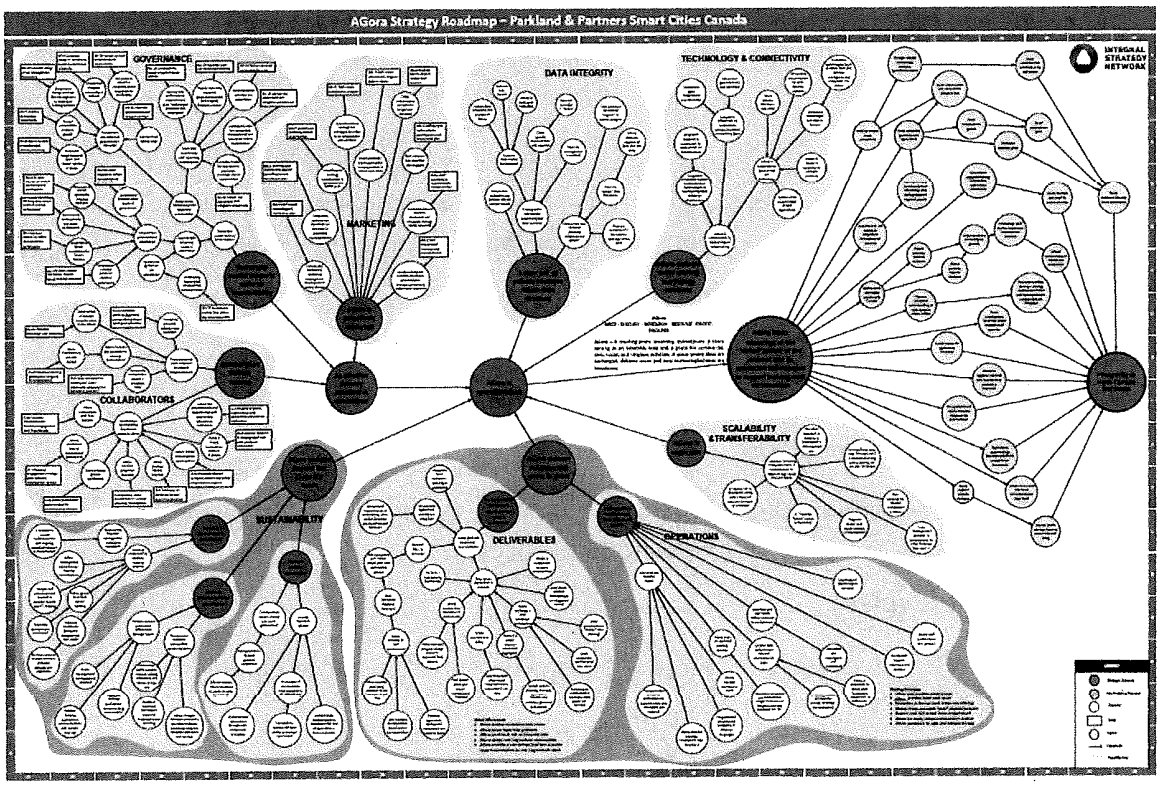
Climate Corporation's Chief Science Officer estimates 70% of agricultural yield is related to what to plant, how to fertilize, and how to protect the crop. According to equipment manufacturer John Deere, self-guided systems now farm approximately 60% to 70% of the crop acreage in North America, 30% to 50% in Europe, and more than 90% in Australia.

Monsanto paid nearly $1 billion dollars to acquire The Climate Corporation in 2013. There is a growing global market for tools that use Big Data to produce actionable insights.

In "A future internet collaboration platform for safe and healthy food from farm to fork" [Global Conference (SRII), 2014 Annual SRII, IEEE, San Jose, CA, USA (2014), pp. 266-273], Sjaak Wolfert and his co-authors identified five main challenges:

- Handling increasingly large amounts of data from all kinds of agricultural equipment
- Establishing interoperability between various systems at farm level and in the whole supply chain network surrounding the farm
- Standardizing data
- Going beyond the small scale and regional focus of farm software development
- Complying with national and regional differences in farming practices

Beside business players, many public institutions are promoting Big Data applications in farming by advocating for open data and data-driven innovation. Examples include the Big Data Coalition, Open Agriculture Data Alliance (OADA), and AgGateway. The US Department of Agriculture wants to use data created by connected farming equipment, drones, and satellites to enable precision agriculture for food security and sustainability.



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

4. Sustained Progress During the Finalist Phase

The region commissioned an assessment of current communications infrastructure in the four counties during this finalist phase. This provided additional detailed information describing the quality of service, gaps in service provided, and the investment required to meet CRTC service standards. This will provide essential baseline information for setting priorities and developing an infrastructure strategy that will evolve to support this initiative.

Substantial progress also has been made to secure community participation and support. The Integral Strategy™ Roadmap development process involved key community stakeholders who have committed their continuing involvement to move this initiative forward. It has received broad support from other key stakeholders and potential partners, including all cities and towns in the region.

The design process we used focused on results. Collective intentions are described in the Strategy Roadmap we created. The map defines a clear strategic goal, the actions and outcomes required to achieve it, and ensuing benefits. It provides an ongoing framework for disciplined implementation, including priority-setting, assignment of accountability, risk management and performance measurement linked to key outcomes.

Major themes describe requirements to establish *AGora* (governance, collaborators and marketing); creating user value (deliverables and operations); delivering leading technology solutions (technology and connectivity); stewarding data assets (data integrity); ensuring *AGora's* continuing viability (sustainability); and replicating the innovations in other rural regions (scalability and transferability). **The Roadmap delivered the framework used to develop the strategy described in this proposal. (http://integralstrategy.net/wp-content/uploads/2019/03/ParklandStrategyRoadmap.pdf)**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

5. An Ambitious and Achievable Challenge

This is an ambitious initiative aimed at:

- Providing a new and trusted Canadian platform for innovation
- Incenting technology development and commercialization
- Enlisting early adopters to test promising new technologies
- Identifying opportunities to increase productivity and profitability in agriculture
- Strengthening rural communities, farms and businesses
- Delivering new models and technologies to enable rural connectivity

The outcomes are well aligned with the objective of the Smart Cities Challenge to improve the lives of residents in Canadian communities through innovation, data and connected technology. The initiative will improve the quality of life in rural communities and will encourage the next generation of Canadian farmers to continue farming without being disadvantaged by this lifestyle choice.

Notwithstanding the scope of this Challenge, we are committed to achieving it, following a disciplined approach. Objectives will be achieved through strong partnerships, broad community collaboration, sustained commitment over time, and the use of artificial intelligence and distributed technologies to protect the intellectual property of participants.

6. Guiding Principles

AGora will adopt the following principles as the base for corporate operation and growth. They speak to the values of the organization and will guide decision making and setting business priorities.

Our conduct is honest, ethical, and responsible

AGora will not only meet all applicable legal and regulatory requirements, it will operate in a clear, open, and transparent manner in support of the rural and agricultural sector.

Value is created through partnerships

AGora will seek to create greater value through partnerships, recognizing that partners bring unique strengths to initiatives that increase their likelihood of success.

Data ownership delivers value

AGora recognizes that data has become the new enterprise currency and should deliver value for its creators, curators, and users.

Growth and innovation opportunities exist

AGora will pursue opportunities for growth and innovation, recognizing that rural economies and agriculture will benefit from capitalizing on these opportunities.

Successful development is based on knowledge, innovation and growth

AGora is committed to catalyzing innovation in Canada that meets the needs of a rural economy and agricultural base that seeks to remain competitive, diversify and grow.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Equitable access is fundamental to future opportunity

AGora will strive to deliver region-wide access to connectivity that is competitive with that in urban areas and transferrable to other rural communities across Canada.

First Nation involvement supports success

AGora recognizes that reconciliation and strong, sustainable communities will be achieved through long term engagement with First Nations and being respectful stewards of the lands we all reside on.

Customer service is key

AGora recognizes that its success depends on sustaining a culture that embraces excellence, integrity, accountability, and service to all clients in the four counties and beyond.

Data sovereignty and data trust are paramount

AGora recognizes the importance in the post-Cambridge Analytica era of deploying technology solutions that create a fair balance of power and control between those who produce the data (citizens and farmers) and those who manage the infrastructure or processes and use the data.

7. A Model that is Transferable, Replicable, and Scalable

It is a long-term objective of the Smart Cities Challenge that the investment Canada makes in this region can be replicated, modelled and transferred to other areas of the nation. Canada has advised that the funding provided should enable full national roll-out. *AGora* will demonstrate national scalability, transferability and replicability, anticipating that funding for implementation will come through other avenues.

The Organizational Model

The not-for-profit model used to establish and govern *AGora* will provide full financial accountability and transparency. Details of the model will be fully available to other rural regions that wish to participate with or emulate its services and design. In much the same way that this project leaned on the good works of existing entities like TECTERRA to help with key design elements, *AGora* will provide similar support to other interested parties.

Connectivity Solutions

Rural Canada is disadvantaged by poor internet access and speed compared to that enjoyed in urban areas. *AGora* will conduct pilot projects to determine how existing infrastructure can be twinned with new communications technologies to fundamentally re-structure ICT deployment and service delivery in rural areas and will assess the feasibility of achieving target service levels identified by the CRTC.

The 4 Counties have been broadband leaders since 2009, and have created some of the largest municipally owned infrastructure projects in Western Canada. They continually share best practices.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The *AGora* Platform

AGora's technology platform will be a web based, GIS enabled, Data Trust platform. It will be designed and architected to transfer, scale and extend to other geographic areas. The platform will enable data analytics, host applications and protect data through the Data Trust. *AGora* will create a feature rich library of products and services focused on solving hyper-local Agricultural problems.

Commercialization of Innovations

We contemplate a long-term and healthy relationship with the private sector. Private sector participation is critical to bring state-of-the-art technologies, broader skills and diverse applications to rural innovation. We expect many of the tools that are developed in *AGora* will be patented and commercialized through private sector participation. National and international replication and dissemination will take place through assertive profit-oriented companies.

An Innovation Transfer Program

AGora will establish a program to transfer innovations created in this region to other rural communities. This will include experience with its structure and governance model, values, operating principles, partnering approach, and community engagement processes. It will seek to establish relationships with other communities.

Extension to Other Rural Sectors

This proposal will create benefits for the agriculture sector and population in the four counties. The region also includes mining, oil and gas, tourism, and forestry. Implementation will improve connectivity and will create a model and technology enablement that can be extended to other sectors. Ultimately, this could include all sectors of Canada's rural economy throughout the country.

Ongoing Assessment

AGora will include ongoing assessment of the effectiveness of these approaches, to improve them and identify new opportunities to transfer findings from *AGora* to other regions. Its AI-backed and secure performance management systems will allow both project benefits and wider economic and social multipliers to be tracked and reported on.

8. Reasons to Select Our Proposal

Our proposal is strong in a number of essential respects – location, enabling conditions, technology design, and the rigor of our approach.

8.1. Location

The region represented by our four counties is ideally suited for this initiative. The site is a natural test bed to prove and develop solutions that can be deployed in other rural regions:

- There is a wide range of agricultural products, processing, and global marketing efforts in the region, and a small investment would deliver significant innovation, economic and public benefits
- Key rural economies are represented: forestry, oil and gas, mining and tourism

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- Agriculture is diverse, ranging in size from large to small, including farms and ranches, and profitable and less profitable operations
- Connectivity is highly varied, with many dark spots
- The terrain presents a variety of communication challenges

The region also is close to a major urban centre – Edmonton. This proximity offers:

- A connection point for high-speed internet access
- Recognized leaders in artificial intelligence (leading city for pan-Canadian artificial intelligence strategy)
- Opportunities to establish creative agri-food partnerships for technology innovation
- A test bed to develop new rural-urban connections and market opportunities

8.2. Enabling Conditions

The following conditions support delivery and adoption.

Local Farmers are Aware of the Need for Change

Farmers are increasingly aware of data-driven agriculture, and the impact this will have on their lives, their ability to make decisions, and the way in which they produce, transport, and sell their goods.

Some Connectivity Already is in Place

A base level of connectivity exists in some parts of the region. This provides a base to build from. In the first phase of implementation *AGora* will seek to connect early adopters.

There is a Global need for Innovation in Agriculture

In expert hands, data is intelligence. Hyper-local data is a valuable resource for planning and decision-making. It enables innovation in food production and security, transportation, and waste management. It supports applications that improve farm productivity and profitability.

Progress is Being Made in Data-Driven Farming

Agriculture focused companies are developing increasingly complex and data hungry systems to support farm/crop and livestock operations. Many are seeking the next generation of improvements based on hyper-local data that enables a site-specific response.

Partners Have Come Forward

We have sought and confirmed interest from potential private sector and academic partners. These partners will enable initiatives across the full research, development, and commercialization spectrum. More work will be done in the first phase of implementation to confirm roles, responsibiliti funding, but a base is already in place. Partners are willing to bring matching money to the

Early Adopters Have Been Identified

Early adopter farmers and businesses have been identified. Eighteen farmers and business from the four counties have agreed in principle to participate. More work will be done in th phase of implementation to select those who are most capable, best located, and most app the initial development projects.

imp stakeholders already on board

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Technology Design

Deployment of *AGora's* digital data trust platform will deliver a data exchange system that enables control and sovereignty of data assets. This will help data producers and consumers reap the rewards and value from these data assets, create a pipeline of next-generation products and services, broaden job opportunities, and accelerate economic prosperity and inclusion, while solving real-world farm management and community problems.

8.3. The Rigor of Our Approach

The stakeholder engagement, strategic design process, and definition of an outcome-focused roadmap for implementation, has been fundamental to our approach. This delivers a plan that can be implemented across organization, system, sector and community boundaries. Through the participation of key stakeholders, the strategic direction for collective action to address the following "wicked problem" has been developed:

> *Deliver decision-making tools, informed by hyper-local data and connectivity solutions, that benefit residents that, in turn, improves Canada's food production and distribution system, enhances rural safety and security, incents young families to become life-long farm operators, and, when fully implemented, increases the prosperity of rural Canada.*

Our proposal defines a common purpose, including contributions from diverse stakeholders, the corporate structure needed to deliver this strategy, a clear path forward based on specific deliverables and outcome, and a method to link costs to the desired outcomes. We undertook three parallel initiatives in this phase of work to confirm existing connectivity in the region and an infrastructure strategy to move forward; further detailing of the family of products, partnerships, and services to be established under *AGora's* innovation mandate; and ongoing public engagement to identify priority needs and public interest in the work to follow.

When brought together this delivered an integrated plan to create the structure, oversight, partnership, and innovation model required to meet the design expectations of the Smart Cities Challenge. We have not taken this lightly, as we understand both the challenges ahead for Canada's rural economies, and the huge impact that connectivity, data, and new tools for decision-making can have on its future.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9. Our Promise to Canada - What we will create

AGora is singularly focused on creating a rural innovation incubator that will design and deliver the three key elements to achieve the Vision it set for itself in the original Smart Cities Challenge. It will:

1. Define, establish and operationalize a number of Internet of Things based Farm Area Network pilots to take advantage of the interconnected technologies currently available. *AGora* will establish a Data Trust to collect, store, manage and add value to the data collected through these networks. This will enable farmers, and all rural residents, to improve their operations and to monetize data.
2. Research, define and establish a number of key agricultural-focused Innovation Labs to work with the private sector and academia to deliver new products and services to local farmers, producers and residents through the *AGora* Data Provider Network, the *AGora* Farm Area Network and the Geographic Information Systems (GIS), and other technologies, established within *AGora*.
3. Conduct a number of pilot projects to deliver a fundamentally different means to provide ubiquitous, competitively priced broadband service to rural residents. *AGora* will test a new Data Provider Model, working with other providers already servicing rural clients through electricity and natural gas distribution systems.

Accomplishing these initiatives will fulfill the goals we set for ourselves and support a growing and prosperous rural economy.

A bright future for rural Canada

"Newlyweds Steve and Julie and their growing family just moved back home to take over Julie's family farm. Several of AGora's programs are in place, and the future of farming looks bright. AGora's stable of products are capturing highly relevant data from the family farm, integrating it with specialized applications and are improving decision making. Profitability is up - both from improved farm operations and from the collection and use of the farm's data in ways that benefit the family farm.

Steve and Julie also have been able to relocate and expand the media business they built while living in the city. Agora pilots have proved out, and real time, state-of-the-art connectivity is available throughout the region.

These fundamental changes made farming a more attractive lifestyle choice for Steve and Julie. This vision of the future helped them decide that the time was right to buy out Julie's parents and enjoy living in a connected rural Alberta. "

10. Our Promise to Canada – How Value will Flow

We will create value in four streams of action (Value Streams):

1. We will establish and build *AGora*, as outlined in the "Building *AGora*" Value Stream.
2. The "Farm Focused Technology" Value Stream will deliver on-farm communication capabilities.
3. The "SMART Information Management & Technology" Value Stream identifies cross functional requirements to establish and maintain the systems that will underpin *AGora*, including Data Trust and data oversight, as well as architecture design requirements.
4. The final Value Stream – "Connecting People, Technologies and Farms" lays out specifics on how community engagement and understanding will be achieved.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ATIA - 21(1)(b)

ENGAGEMENT

Implementing change is difficult, and engaging residents and stakeholders is crucial in obtaining and maintaining their support. This plan describes how *AGora* has engaged communities and businesses to build the proposal and how it will sustain community engagement throughout implementation

1. Community Engagement To-Date

Parkland County held discussions with representatives from the neighboring three counties initially, to inform them of the Smart Cities Challenge, identify requirements, and confirm commitment to create a regional coalition representing nearly 62,000 people.

Farm and business leaders from the four counties were engaged from the start to develop this
se leaders reflected the diverse nature of the region, including farming, ranching,
s, and residential interests. A steering committee was established to oversee the
nity consultation process and provide input to develop our initial application.

ocus groups provided information on the adequacy key priorities, and next steps.
ere invited to contribute ideas used to define the challenge. This engagement included
velopment boards and members of the broader community. In-person interviews were
h local officials and other community members.

nes emerged that were used to articulate our Challenge and define the key outcomes
it will be achieved. All four counties formally endorsed the shared vision.

1.1. Preparing This Implementation Plan

Our commitment to community consultation has remained a key focus in this subsequent phase of work. The engagement process was expanded to inform preparation of this detailed implementation plan. The community steering committee provided continuing oversight.

The Design Team

A Design Team of 20 individuals – including steering committee members, other participants from the region, representatives of the provincial and federal government, and sector experts – participated in developing a comprehensive Strategy Roadmap. The Design Team also helped to answer the following fundamental questions:

- Attributes of *AGora* that will incent farmers to participate
- Key features of the innovation incubator that are most important for rural residents
- Pressing connectivity challenges that need be resolved to help maintain rural competitiveness and connection to the on-line economy
- High-level design of the incubator, including structure, staffing, relationship to sponsoring agencies, and the role of the private sector

The resulting Roadmap identifies the strategic goal, the outcomes necessary to achieve it, required actions, and resulting positive impacts and benefits for the region. The completed Roadmap was presented at a regional open house on February 5, 2019, where community members and civic leaders had the opportunity to review and provide feedback on the results.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Community Dialogue

A community engagement process was conducted in parallel with the work of the Design Team. Community members from across the four counties were consulted to obtain input on requirements and delivery priorities, and criteria for a future-focused marketing plan to build community understanding of *AGora* during implementation. This dialogue helped identify early adopter farmers and businesses that are prepared and well-suited to be first-to-market with this approach. This included the following activities:

- Communication through a website, social media, and email lists
- One-on-one meetings, phone calls and written correspondence with community stakeholders including primary producers and food makers
- Workshops using Lego Serious play method to gather community aspirations and concerns
- An online survey for agriculture and community stakeholders

Consultation with the Four Counties

Significant consultation took place with other municipalities that exist within the four counties. This recognized the intrinsic linkages between these communities and their adjacent rural constituents. Many producers and people with rural businesses live in these communities and work on the farm. *AGora* services and technologies will have to link to these communities.

Stony Plain, Spruce Grove, Drayton Valley, Hinton and Edson were briefed on the project and invited to support the initiative. Each has done so. This consultation ensured full commitment of the region to participate in achieving success.

First Nation Discussions

The proponents engaged Enoch Cree First Nation and Paul First Nation as future collaborative partners and have received letters of support from both Nations' Chiefs. *AGora* has several agriculture areas that will support goals of partnering with the Nations in areas such as food security, education, technology and connectivity and job creation.

2. Insights Gained That Have Shaped Our Final Proposal

Community outreach efforts involved focus groups, an online survey, on line postings and one-on-one meetings. Over 800 unique visits were made to our website to become informed on the project. 140 links were provided to the survey to gather input – 77 responses were received. Over two dozen meetings were held with individuals to discuss the final proposal that informed its final design. Outreach has been extensive and significant.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Insights from Community Consultation

An on-line survey was developed to invite participation and input. Respondents described success as (1) ensuring consumers, particularly Albertans, are aware that food produced by Alberta farmers is safe; (2) ensuring financial sustainability of farms; and (3) adopting technology to advance business.

Reasons for Participating

When participants were asked "What would you most like to achieve by participating in the activities of the Agriculture Innovation Living Lab?" the most important reasons for participating were to share input to help develop solutions, gain early access to innovations, and lever these innovations to strengthen their business. The least important reason for participating was to get reduced pricing for being an early adopter.

It appears that contributing and receiving information that will advance their business outweighs the cost associated with accessing that information. This will be important for the sales strategy and marketing material of *AGora* products in the future. The adjoining quotes provide context and are drawn from survey responses.

Connectors and Champions

Participants in the online survey were asked to list where they access expertise to improve their operations. They could choose from people pre-populated by others in the survey or they could list additional people.

Analysis of these relationships identified groups and key stakeholders in the social network. We asked participants to identify who they have collaborated with and who they want to collaborate with, to indicate cohesion; and who they think are experts and where they get innovative ideas from, and to indicate influence.

"Albertans are aware of how safe, responsible, available, and wonderful our home-grown ag products are. Further, Albertans with an interest in agriculture are able to connect directly to our producers, enabling communication, collaboration, and innovation."

"The consuming public accepts that the products we produce are safe and produced sustainably, not only environmental but also economic."

"Have our companies grown from start-up to the next level of their business growth and have the middle ones grown to their next level? Have they introduced new innovations in product development, technology and food safety? Have they gained access to market?"

"Less silos, more working together."

"I track all my expenses, making constant alterations to my plans. I am an entrepreneur I will never truly feel successful and do not want to, because if I did then I would stop driving ideas."

Nine groupings of people were identified who are connected to each other through people they feel are experts. Many of the respondents who answered this question listed one person or a few that they go to for expertise. These individuals in the community are already seen as experts and could be utilized as Community Champions in future work.

There is an opportunity for *AGora* to provide partnership connector services and broker collaborations that may not otherwise happen. A first step for quick wins will be to identify triads in the network map that can be closed. By closing an open triad, a closure with four points of connection is created, fostering network-building and innovation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3. Community Representation in *AGora*

Community input was fundamental to helping define ongoing community participation.

AGora Board of Directors and Committees

The Board of Directors will be drawn from the Design Team that delivered the strategic plan, municipal representatives and private sector, academic and other levels of government. It will include farm, business and municipal representatives, and others from the region. The role and structure of the Board is described in the GOVERNANCE chapter. Core members have already been recruited.

Partners from the Four Counties

The public engagement process confirmed the roles of existing service providers (agriculture service boards, local non-profits, three levels of government), and academic leaders. Core participants have been recruited. The nucleus for delivery across the four counties is in place. Further work will confirm levels of participation, define clear needs to be met through *AGora* delivery and establish any legal frameworks required to support system deployment.

Early Adopters

Farm and business leaders from the four counties have been engaged from the beginning. Early adopters have been identified from this group to lead implementation. A core group of early adopters will help deliver pilots to improve rural connectivity and be a test-bed for agricultural innovation.

Early adopters will help to identify new ways of connecting rural areas, collecting hyper-local data, and developing tools for on-farm decision making. They will provide access to their farm operations, and support for technology developers using the *AGora* platform. The "Connecting Peoples" Working Group is fully described in the GOVERNANCE chapter of the proposal.

4. Engagement with Community Stakeholders

Ongoing community engagement will enable the proponent to make sound decisions about the future of *AGora*; educate community members about the challenge; inspire confidence in local decision-making; maximize awareness and support for the project once it is launched; and facilitate wise and enlightened project development. One primary on-going activity of *AGora* will be to create opportunities for stakeholders to become better informed.

The "Connecting Peoples" Working Group described in the GOVERNANCE chapter will provide accountability and leadership to *AGora's* Board on stakeholder engagement, and will identify innovative and evidence-based strategies, techniques, or tools that could be used to sustain stakeholder engagement. The Stakeholder Engagement Plan that will be delivered will ensure two-way communications between *AGora* and stakeholders remains effective, relevant, and efficient.

AGora staff will be responsible for implementing the engagement tactics and activities, and for undertaking regular and on-going monitoring.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Engagement Activities

The implementation phase (Phase 1) will be important and intense, underpinned by significant consultation. We will not only educate community stakeholders about the project, we will develop excitement about the future of *AGora* and its goal of increasing prosperity in rural Canada. We will work directly with the community. Initial engagement will finalize the vision for *AGora*, expressed as a brand and brand promise, confirming the guiding principles for the *AGora* platform, and establishing partnerships to carry the initiative forward. We will involve the public and key stakeholders in:

- Sharing collective aspirations
- Gathering stakeholder input
- Ranking project opportunities
- Ongoing education and information sharing

Engagement will achieve the following outcomes:

- Stakeholders are satisfied with every interaction they have with *AGora*
- The Board of Directors is proactive in seeking information from stakeholders, and is well informed on stakeholder needs and wants
- There is consistency in how stakeholder engagement is conducted and how information is used and reported back
- Stakeholders are recognized for their contributions, and have a real and tangible influence in the direction of *AGora*
- Organizational succession planning is informed and intuitive with a pool of engaged stakeholders

Engagement Tools and Approaches

A variety of engagement tools will be used by *AGora*, including a dedicated website, social media, blogs, electronic newsletters, and traditional media.

The website will be intuitive and responsive, designed and written in plain language so it is easy to understand. It will be accessible in alternative formats and will enable feedback through online questionnaires. The site will link to reports, newsletters, event information, community contributed content, and project communication. An email sign-up function will collect user emails for future engagement and information sharing.

Social media accounts will be created on platforms like Twitter, Facebook and Instagram. These profiles will be regularly maintained, will be engaging, and will have analytics tracking. The goal will be to create an online community of users that can be converted to *AGora* customers using calls to action. Primary producers will be engaged on Twitter using hashtags like #agchat and #cdnpoli.

Use of traditional media will include radio, TV, and newspapers – with columns in newspapers and the *Western Producer*, and spots on the agriculture radio show *Call of the Land*.

AGora will establish extensive connections to people in the region. A community leader database and network mapping tool will help staff planning engagement initiatives to build relationships, invite input from, and engage with people to ensure diverse representation and ongoing inclusion. Team members will engage with stakeholders on an ongoing basis by phone, email, mail and at in-person meetings.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Monitoring and Reporting Results

Stakeholder engagement is only useful when it meets its objectives. Engagement activities, feedback, and the success of engagement efforts will be monitored against the objectives described above. Monitoring will be based on:

- Tracking engagement points, including who attends consultation events, contributes to content creation, identifies an early adopter, participates in prototype projects, visits the website, provides comments, and participates in surveys
- Asking participants to provide feedback on how they feel about being involved in *AGora's* design
- Using in-person and online surveys to determine which engagement activities are useful, fun, informative, and effective for participants
- Internal evaluation of engagement activities by staff and consulting teams, reflecting on the engagement activities at strategic checkpoints in a project: Did we meet our engagement objectives? What did we do well? What could have been better? What will we do differently next time?

Regular reporting of activities, successes, failures, and opportunities will be reported to the community to ensure *AGora* remains relevant and that new stakeholders have ways of knowing and engaging. Once *AGora* is operational, the benefits it enables will be seen by others, attracting wider participation. As other farmers and businesses join, a larger regional test-bed will be created. Deployment to new users will extend regional connectivity and enrich the hyper-local database. Expansion of the infrastructure and information base will be coordinated thorough *AGora*, attracting new private sector participants to its innovation platform.

5. Recruitment and Involvement of *AGora* Partners

A variety of partnerships will be established in *AGora*. The GOVERNANCE chapter describes the roles and contributions of each type. The Communications and Engagement Plan commissioned through this initiative (Kumpula Design, 2019) provides a plan of action for recruiting and training these partners.

Technology partners will be central to *AGora's* success. *AGora* will provide the infrastructure required to develop and deliver products designed to meet specific needs of the farm and business community. Each solution will be created in partnership with one or more private or academic partners. Letters of interest are included in an appendix to the proposal.

We have been successful in obtaining commitments from a large number of municipal, government, academic and technology providers through formal **Letters of Support**.

While relationships have not been concluded, they have all expressed their excitement about this proposal and the chance to work with us to realize its compelling vision.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Summary of Letters of Support and Expressions of Interest Received			
Mayor of Parkland County	Leteta Farms	Town of Edson	Connect Mobility
Service Alberta, Asst Deputy Minister	Brian Olafson	Town of Stony Plain	AB Centre for Sustainable Rural Communities
Minister of AB Agriculture and Forestry	Telus Communications	Village of Wabamun	Parkland Ag Services Board
Minister of AB Economic Development	University of Alberta - Faculty of Science	GROWTH, Regional Economic Dev.	Edmonton Metropolitan Region Board
Chief Morin, Enoch Cree Nation	Yellowhead County	Acheson Business Association	3C Information Systems Inc.
Chief Rain, Paul First Nation	Brazeau County	ATS Traffic	Cybera Inc.
Sightline Innovation Inc.	Lac Ste. Anne County	Stony Plain MLA	EQUS REA Ltd.
John Knapp	Parkland GIS	ISP Computers	ATCO Gas
Alberta Machine Intelligence Institute	West Central Forage Association	Brandon University, Rural Dev Institute	IBM Research & Development Centre
TECTERRA	Parkland Ag Services	Crop Pro Consulting	Ventus Development
ESRI Canada	City of Spruce Grove	FortisAlberta	Dell
Northern Alberta Institute of Technology	Spruce Grove Chamber of Commerce	Comtech Communications	Utility Network & Partners Inc.
Bell Mobility	Town of Hinton	Zayo Canada Inc.	Integral Strategy Network Inc.
ATB Financial	Town of Drayton Valley	Frank Robinson	

Most significantly, *AGora* has secured support from Sightline Innovation Inc., a Canadian IA solution and Data Trust provider. Sightline's support includes participation as a technology provider and manager of the data trust infrastructure. Sightline's suite of technologies and R&D activities will provide state-of-the-art data protection, data management, curation, and machine learning products to inform farm decision making, processing, and market entry. Equally important, its technologies will provide a means by which data collected from farm and business operations would be monetized and deliver value. Refer to the DATA AND PRIVACY and TECHNOLOGY chapters and the CONFIDENTIAL annex for full details.

6. Engagement Within Projects

Community involvement is designed into *AGora's* delivery process. *AGora* will establish and lever participation of local experts, partners and stakeholders. The following structure supports implementation of the four Value Streams, as described in the PROJECT MANAGEMENT chapter.

A core staff of *AGora* employees will provide the foundation for the implementation engine. They will take leadership roles to move *AGora's* Value Streams forward and work directly with community participants through defined Working Groups. These Working Groups will include local stakeholders, partner representatives, subject matter experts, and volunteers, and will help understand, focus, and identify near-term objectives and priority outcomes. See GOVERNANCE chapter for full details.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

One responsibility of the Working Groups will be to define work plans that will be reviewed, prioritized, and funded by the *AGora* Board. Once approved, teams will be established to implement the solutions. The Working Groups will oversee the progress of the projects they have submitted.

The intention is to encourage participation on project delivery and wide attendance at community events where *AGora* initiatives are discussed. The Community Engagement Value Stream will ensure people in the community are informed, can propose or champion initiatives, and contribute to any of the Value Streams based on their skills and interests. This will lever the collective intelligence of the community, build internal initiatives through the partner and vendor network, and ensure initiatives are grounded in community needs. External initiatives brought forth by the community, that deliver value and achieve outcomes, will be a testament to a successful change program.

7. First Nations Engagement

In forming this final application, the proponents engaged Enoch Cree First Nation and Paul First Nation as future partners and have received letters of support from both Nations' Chiefs. *AGora* has several agriculture areas that will support goals of partnering with all Nations in the region in areas such as food security, education, technology and connectivity and job creation.

AGora will be committed to meaningful indigenous engagement. It will seek to establish a strong relationship and build trust between the project and indigenous stakeholders, based on:

- Developing a wholistic understanding of the communities, by conducting or compiling research including the history of the community, environmental concerns, fishing, hunting, and gathering activities, spiritual practices, governance, tribal council affiliations, decision making structure, role of leaders and elders, identification of elders, community priorities, socio-economic situation, relationship with counties, and relationship with any previous project proponents.
- Respecting the ongoing impacts of colonialism, the history the community has with the land around them, and cultural differences.

Upon award of the Smart Cities Challenge prize, we will extend our engagement to all Indigenous communities in our region and the urban Indigenous community in neighbouring towns and cities.

8. Diversity, Equity and Inclusion

Significant effort has been made be inclusive and consider the diversity of residents, including identifying how specific groups can be involved in delivery. Ensuring equity requires understanding who is currently being engaged and developing strategies to engage other populations. Review and analysis of participation in engagement activities is critical. Historically, affluent white males tend to be the main participants in traditional engagement activities. Being aware of this and employing strategies such as those listed herein will ensure equity in stakeholder participation.

AGora will use human-centred design concepts such as place-based engagement, where the engagement team goes to stakeholders rather than expecting stakeholders to come to them. It is known that this type of engagement increases diversity and allows for engagement of different population groups that wouldn't traditionally participate in community engagement activities. Another

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

example is the use of prototypes and community design review workshops where stakeholders are asked to provide feedback. This will engage a broader population.

AGora will conduct community based participatory research on its own or in partnership with post-secondary institutions. This will engage with those most affected by a challenge or issue to support research and analysis and identify strategies to address the challenge.

Engaging Youth

Engaging youth in municipal activities is typically challenging and has seen limited success. Youth engagement initiatives proposed for *AGora* include:

- Working with 4H groups, local secondary and post-secondary schools and using existing makerspaces and hackathons to engage with students to create and collaborate on projects.
- Pairing students with partner companies in technology, media, or agri-food, as mentors, or sponsors of internships or work placements.
- Involving youth in video production to be used in *AGora* or for future consultation events.

Community Outreach Activities

To obtain community input from people who don't typically get involved in these types of consultations, we also will pursue other outreach activities:

- Engaging in conversations where project team members visit coffee shops where farmers and community members gather, randomly buying people coffee and sitting down to engage in a brief 5- to 10-minute conversation about *AGora*. This technique will be used at strategically selected times through implementation.
- Using network mapping to identify people in the community who have strengths and expertise to share, and others who are looking to improve their capacity in a particular area. By identifying and engaging these groups, *AGora* will help to establish peer networks that bring new ideas and engagement from people and organizations that may not typically engage with each other. This also will assist in obtaining input from the 'silent majority.'

In summary, it is critical to understand problems and opportunities by working directly with the affected population or stakeholder groups to develop options rather than working on solutions for them in isolation. Otherwise, it is difficult to fully understand the challenges these groups face and define the opportunities to overcome them. *AGora* will evaluate options based on the feedback received from diverse populations and will ensure consideration is given to how the plan will benefit other population groups, particularly the most vulnerable.

Workforce Training

Through the *"Connecting Peoples"* Working Group *AGora* will develop a training plan for users, operational staff, partners, and customers. This training will use the most appropriate and advanced technology for delivery. There are some excellent training firms in the region.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9. Risks and Mitigations

AGora's proposed corporate structure inherently manages risk – duties, structure, planning processes, policies, regulations and overall accountability processes both assign responsibility and contain risk. The GOVERNANCE chapter fully articulates roles relative to how public engagement will be managed, deployed and delivered.

Managing Community Expectations

Risk - Unrealistic expectations of residents that all ideas and suggestions will be implemented.

Mitigations - Communicate levels of ambition when planning and initiating stakeholder engagement. Ensure the process is fully explained and that stakeholders are clear about the decisions and approaches being taken. Inform and involve key community members in implementation.

Lack of Follow Through

Risk - The community does not see follow through related to outcomes of the engagement process and lose faith in the process or the project.

Mitigations - Ensure actions, even if small, are implemented in a timely manner after engagement with stakeholders. Before engaging, ensure that appropriate resources are allocated and that implementation plans are achievable. Communicate with stakeholders when decisions are made on what will be implemented.

Lack of Representation and Inclusiveness

Risk - Some people or groups may lack the time, confidence, mobility, language skills, or ability to contribute equitably. Vocal and organized groups may be more active, which leads to unrepresentative participation.

Mitigations - Determine the level of representation and input that is practical and achievable given the resources and timeframe. Use existing networks, and community champions to encourage participation. Use appropriate engagement methods at the right time and in the right place. Ensure engagement events are accessible and that they are culturally appropriate for a range of participants. Tailor engagement activities for different stakeholder groups.

Over-Engagement

Risk – Over-engagement is non-productive. This may lead to consultation fatigue and cause community members to become antagonistic or cynical.

Mitigations – Where relevant, use the results of previous engagement processes that have worked. Ensure engagement activities are meaningful and create clear outcomes. Focus engagement activities on stakeholder groups whose ideas, needs, and concerns are less understood than those whose perspective is already well known.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Negative Input

Risk - Community members may be overly negative toward the project due to other frustrations with the municipality, based on previous or current engagements.

Mitigations - Focus on future-forward conversations. Listen to stakeholders and acknowledge past experiences. Use engagement methods that are appropriate for the desired outcome. For example, avoid an open house when there is already known anger or extreme controversy.

Lack of Interest in Participating

Risk - Many municipalities have challenges getting participation and have become reluctant to spend resources on engagement processes.

Mitigations - Spend adequate time identifying stakeholders and ways of involving them that is appropriate for the desired outcome. Ask stakeholders how they would like to be engaged. Ensure activities are fun, social, and held at a time of day and location that is convenient. Identify Hubs in the community where people naturally gather and engage with them there. Be clear about the levels of ambition, ensure stakeholders know the influence they can have. Ensure feedback is provided to people about how their input is reflected in a project.

Managing Unintended Impacts

Risk – A project has unforeseen adverse consequences.

Mitigations - Clarify the challenge to ensure engagement efforts result in more sustainable solutions and avoid adding to the problem. Involve various population groups prior to developing solutions to understand the impact on each population group and identify the solution with the least negative impacts on stakeholders. Ensure transparency of communications so, when unintended impacts occur, stakeholders are informed and can participate in managing the outcome. Build and promote relationships with stakeholders to establish trust and reduce uncertainty among population groups. Ensure stakeholders including staff have access to resources and knowledge for project management and stakeholder relationship management.

Dealing with Unanticipated and Emergent Issues

Risk – Stakeholders react negatively to unanticipated and emergent issues.

Mitigations - Manage stakeholder expectations to assist in dealing with and overcoming issues. Build meaningful dialogue with stakeholders about the issues of interest in the project. Communicate with stakeholders early and often and create the opportunity for stakeholder engagement when issues arise to ensure community participation in solutions. Regularly monitor the stakeholder group against the project maturity, realizing that the group may change depending on project activities.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

TECHNOLOGY

Connected technologies and data sovereignty are the core of this Smart Cities proposal. The following sections outline key technologies that will be put in place to deliver hyper-local data collection needed to derive value from connected technologies, deliver the enabling pilots necessary to better link farms to the world, and enable software to be created to support focused decision making. Creation of the necessary technologies to collect, manage and monetize farm data – a new crop – delivers new revenues in support of increased rural prosperity. Deployment of rural-focused software 'labs' supports rural innovation and delivers superior decision-making tools to all.

1. A Catalyst for Innovation

The diagram on the following page broadly describes how access to hyper-local data will be enabled across the four-counties; how it will be managed, curated and monetized; and how the various elements will be delivered.

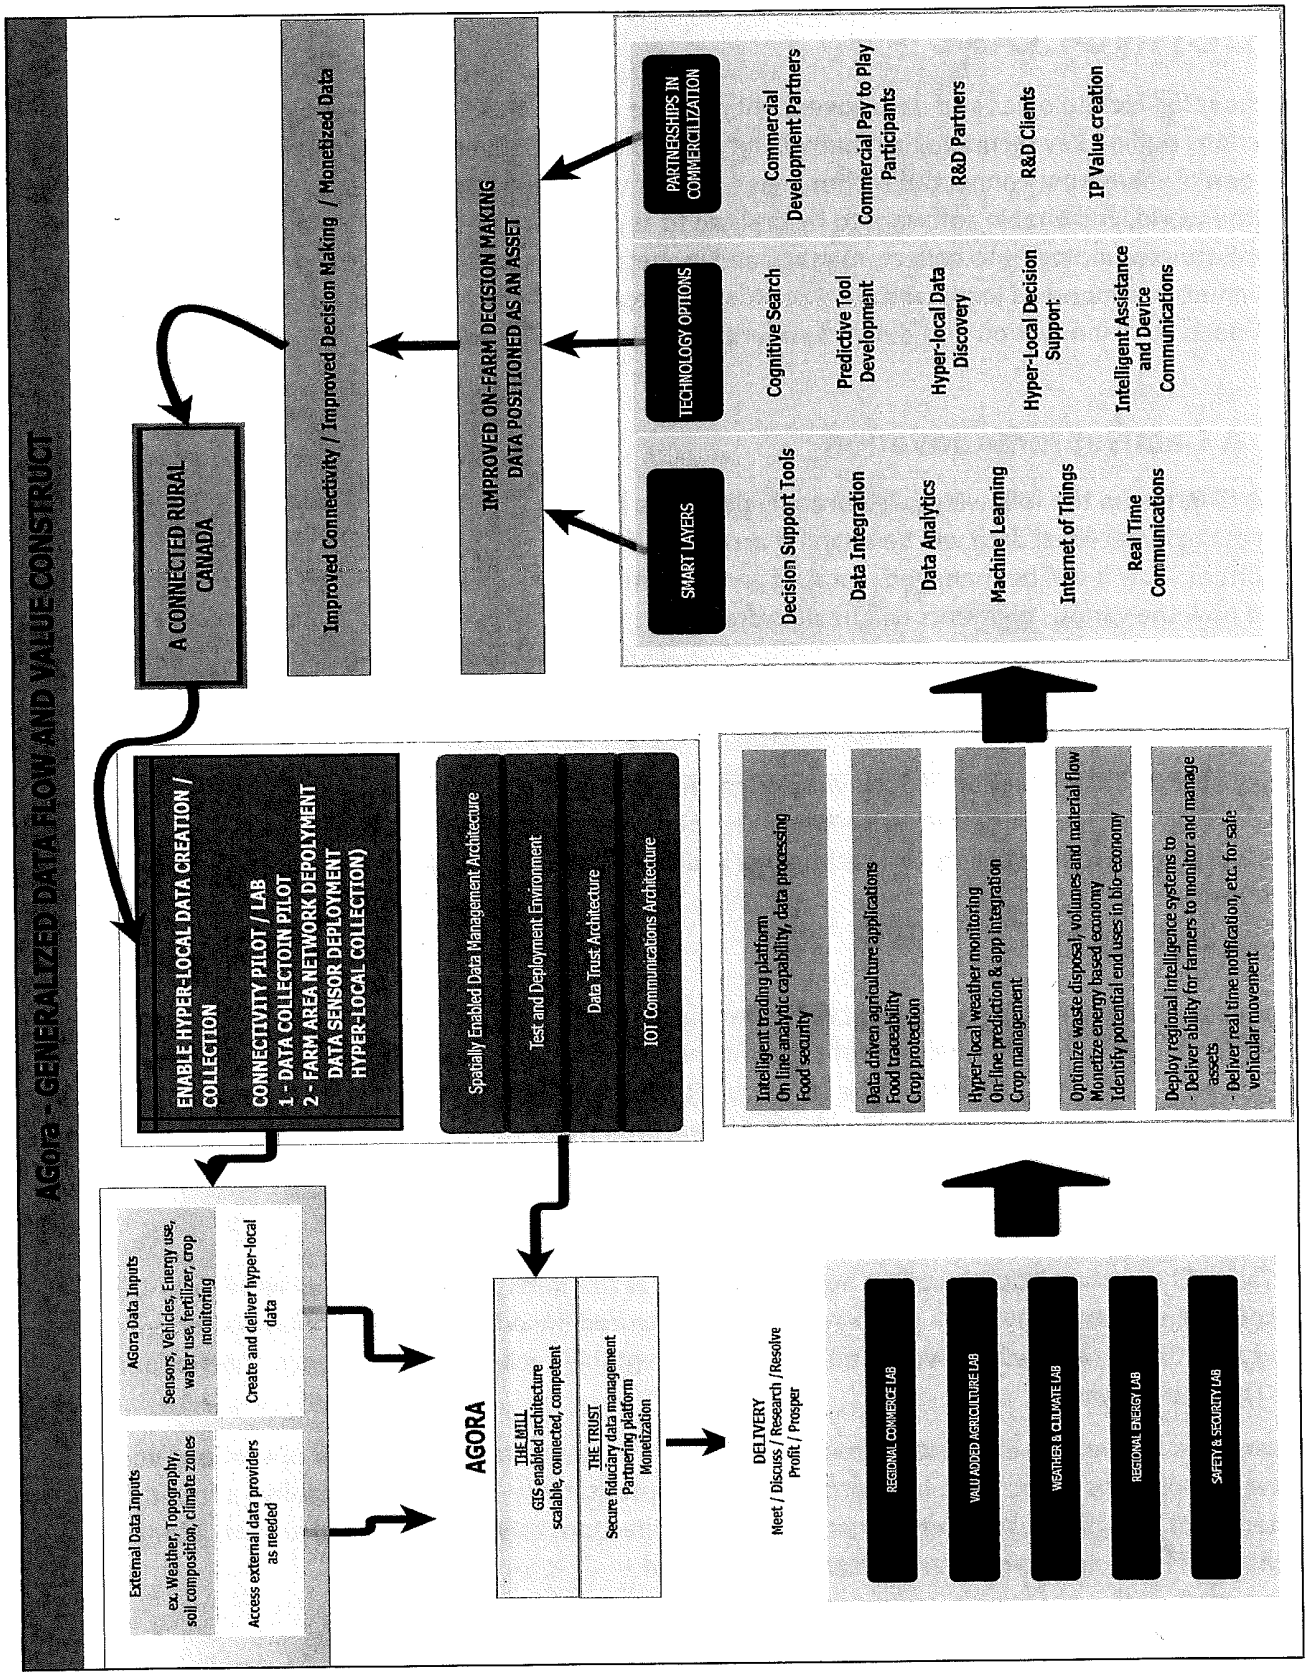
AGora will provide value to data providers, AGora itself, academia, and the private sector through a series of Innovation Labs dedicated to data analytics, software design and infrastructure development.

The Labs will pilot new communications technologies and will incent participation by partners to create new products and services and conduct focused research that supports rural and agricultural development.

2. The Technology Environment

To enable digital innovation, *AGora* will design and deploy technology that includes internet connectivity and farm area networks, underpinned by *AGora* technology and Data Trust platforms.

Internet Connectivity



Connectivity and capacity are significant communication barriers in the region due to the large geography and relatively small size of the rural market. This is a fundamental challenge that has predicated most of the activity in the four counties and much of this proposal. Traditional service providers have been reluctant to invest. *AGora* will undertake competitive pilots with non-traditional service providers to test and evaluate new connectivity solutions.

Farm Area Networks (FANs)

AGora will test the ability to collect hyper-local data at the farm level. Farm Area Networks will disperse connectivity over 10- to 20-acre plots, configured based on each farm's layout, orientation and structure. *AGora* will deliver pilots to define acceptable technical performance criteria for Internet of Things deployment.

Farm Area Networks will support agricultural sensors deployed to monitor farm operations and develop solutions to increase farm productivity and profitability. *AGora* will establish a foundational Internet of Things infrastructure for baseline data collection; this will be expanded with additional sensors, as new applications are tested and deployed.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

AGora Technology Platform

The *AGora* technology platform can be thought of as web-based services focused on data management – GIS enabled and connected to a suite of data analytics – that can be extended to host an application portfolio. The intention is that the model be completely cloud-based. It will be designed using a "software as a service" model to ensure scalability and transferability.

AGora will provide a minimum latency testing and development environment for partners and vendors to use for prototyping and development, generating an *AGora* revenue stream.

The farmer and vendor portals will be integrated with the data view and application portfolio. *AGora* will prove, develop and support this capability. Internet of Things deployment will deliver rivers of data for each farm, providing additional value to *AGora* partners, supported by appropriate technologies.

Data Trust Platform

AGora will work with partners who use data to create value. To ensure that the rights and privacy of data providers are protected, and those providers benefit from the use of their data, *AGora* will implement a Data Trust. Trust in the traditional sense of the word is a three-party relationship where an asset/value is transferred from a Grantor to a Beneficiary through a Trustee. A Data Trust takes this concept further and establishes a technology framework that enables control and sovereignty of data assets between data partners.

"Phil has completed another harvest, and now its time to plan for next year. All of the data collected from his farm for the past year (and before) have been collected into AGora, incorporated into its GIS and the Data Trust, and analyzed. He has at his fingertips information that links national and international corporate decision tools with his own. This software now is intelligent enough to tell him site specific information that he will use to make decisions about next year's crops.

Thanks to AGora's information services, he has access to the best available forecasting tools regarding future's prices and anticipated yields of the various crops that fit his site-specific characteristics best. He's looking forward to another profitable season."

3. The Technology Working Group

Further work will be required to assess and confirm the products, services, and pilot projects required to bring life to *AGora*. A select number will be necessary to establish operations, connectivity, and initial client value. They are defined in this proposal, along with the associated costs. As described in the GOVERNANCE chapter, one role of the Technology Working Group will be to conduct this assessment and confirm a delivery plan. Led by the Chief Technology Officer, teams will implement the framework, below, and champion the principles through the life cycle of the work ahead.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

4. Core Technology Architecture

The overall design will apply open technologies, standards, and policy based on an agnostic architecture. It will allow freedom for innovation and maximization of value. This architecture will rely on a framework that emphasizes:

- Understanding of and alignment with a Business Vision across the various services to be provided.
- Logical modelling, that pays attention to well-bound component models, and open, standardized component interoperability. This will address fundamental requirements and concerns like information and device security; and messaging, protocol, pattern, and content standards.
- Devotion to scalability, extensibility, interoperability, replicability, portability, and reusability. Strongly influenced by concerns for accessibility.
- Anytime, anywhere, any-device access.
- Application of established Best Practices, and definition of new Best Practices for use by other communities in their Smart City initiatives.
- Use of generalized models and standards related to the Internet of Things, assimilating and applying new ideas and standards as technology is developed.
- Continual monitoring of technology trends and vendor capabilities. The market for Smart City transformations will be large, leading to prosperity for both adopters and providers. Marketplace competition will drive increased value.
- Use of pilot projects to mitigate risk, maximize value, and establish Building Blocks, with an emphasis on re-use. The more re-use, the less that needs to be done, maintained, and operated (a smaller footprint).
- Use of cloud services as 'quick-to-market' platforms for delivering early value.
- Attention always to the cost of ownership, avoiding vendor monopolies.
- An evolutionary approach that avoids the big bang and provides benefits early and often.

5. Open Technologies

AGora will have a strong preference for open and open-source technologies. There are two general classes of services: (1) more traditional services like back-end analytics, collaboration, and resource pooling; and (2) innovative applications and data sharing. In the first case, technology is more mature and there is greater freedom of choice for standardizaton. In the second, there are fewer options; we don't want to limit innovators, but will require compliance with important things like the security framework, messaging standards, etc.

These demands drive creation of core partnerships with companies where security, standards and data integritywill be maintained and balanced with demands for cohesion across business, application, information, and technology domains. As described in this chapter, Sightline Innovation Inc delivers the only built-in Canada solution that enables data sovereignty without eroding control resulting from data owners being forced to move to a cloud provider or being subjected to vendor lock-in tactics.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Non-Proprietary

Services will be provided in a way that is open and non-proprietary. Logical boundaries will be established which facilitate the participation of partners with proprietary technologies. For example, Data Providers will be able to gather data in the manner they like, but security, transport, message construct, and delivery to Data Consumers will be standardized and based on Open concepts.

Multi-Vendor

A logical component model will drive provisioning of technologies through granular, well-defined requirements. The overall technology architecture will allow for multiple vendors to participate while *AGora* supports integrated and interoperable solutions. Vendors will seek to promote their own end-to-end offerings. These offerings will be evaluated in light of their implications for vendor lock, cost of ownership, and constraints on agility and extensibility.

6. Technology Standards and Policy

AGora's technology architecture will ensure business alignment. A Technology Standards and Policy Framework will be put in place that maps business services to application components, that are in turn mapped to technology platforms, standardized or optional technology, and policy. *AGora's* intent is to produce portable, replicable solutions that significantly reduce deployment cost to other locations.

International Standards Organization (ISO) and other certifications will be sought, as required, as confirmation of diligent engineering, and to enhance attractiveness to other communities.

Interoperability & Open Standards

Interoperability will be architected based on open standards defined through best practices. The industry has come a long way in the last 20 years. Patterns of interoperability will be selected that support other core objectives such as scalability and availability. Today, the preference is for asynchronous messaging that can behave like synchronous messaging, and is expected to mitigate a variety of issues related to unexpected downtime by participating systems. It also allows for incremental 'forwarding or streaming' of data from source to analytical stores, rather than dependence on potentially long batch cycles.

Replicability

Replicability will not be limited to reusable, portable solutions, but will include business processes and governance frameworks. *AGora* will architect so third-party innovation and intellectual property are uncoupled. This will allow for 'plug and play' of alternative solutions. We will protect third party Intellectual Property, and will endeavor to arrange for re-use by other consumers at reduced cost.

Our proposed open, standardized technology will be designed with scalability, replicability, and extensibility in mind. Open and standardized technologies, by themselves will ease the challenges of portability. Portability will be further enhanced through well-bound, uncoupled, cohesive solutions, so discrete 'portions' of the solution can be packaged and ported as sub-system modules or, at a minimum, re-usable frameworks. This also allows *AGora* to port easily to other hosting partners should we be dissatisfied with the service.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Scalability

Scalability will be tested in pilot projects or proven through prior application. Almost all scalability issues can be addressed by adopting patterns that have been proven to be scalable. If there are issues, they will be identified early, and appropriate expertise can be brought to bear. Scalability issues are typically a function of flawed architecture/design in a technology, information or application domain. Resources are readily available in the marketplace to deal with these issues.

7. Accessibility and Usability

Accessibility and usability of technologies and applications are planned to go beyond 'anytime, anywhere, any device' access. To the greatest extent possible *AGora* will design and implement tools and systems that are usable by all people. This will be enabled through negotiation of development agreements with private sector firms to ensure overall usability. This will expand the population of contributing participants and increase the value they receive. This includes designing for visual (blindness, color blindness), physical, and capability (oral, language) considerations. These requirements will be elaborated and ranked early, and throughout the initiatives so they can be addressed through the requirements, design, develop, and test iterations.

8. Future-Proofing

IT Architects have learned hard lessons from years of being trapped into forced, costly upgrades of proprietary technology. *AGora* will take all due care and diligence in making technology choices, and contracts with technology partners will be designed to provide appropriate protections.

Architects will research current and future trends. The growing Smart Cities community will increase the availability of resources. Initiatives by *AGora* itself should influence the local market. Partnerships with educational institutions, and employment of young graduates is one way to effectively future-proof the solutions. By embracing simplicity, isolating complexity, and committing to well-bound logical modelling, an adaptable and continually evolving solution can be implemented.

The Data Trust is designed to grow and accommodate the impending wave of massive Internet of Things (IoT) technologies and new data sources. It also is designed to meet the needs of future regulations around the governance of data. As data production becomes more ubiquitous, we anticipant governments in the coming years to update existing laws or enact new legislation around the use, governance, and sovereignty of data.

9. Compliance with Legislative and Regulatory Requirements

Compliance with Legislative and Regulatory Requirements will be articulated and designed into every part of the solution-building framework.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

10. Platform Technologies & Collaborators

Core capabilities within *AGora* will be supported by two underlying technologies. First is a fully secured data management solution – the *AGora* Data Trust. Second is a fully integrated Geographic Information System (GIS). *AGora* will deliver secure data management of IoT initiatives through its platform. Discussion is provided, below, with further details on how proposed technologies will protect and secure data in the DATA and PRIVACY chapter.

Through the development of this proposal significant effort has been invested in building corporate and academic interest in the work ahead. The following section outlines the enabling technologies that *AGora* will develop over its initial five years of operation. Those with appropriate technologies or having expressed interest in the technology opportunity are linked and identified, below.

10.1 The *AGora* Data Trust

The *AGora* Data Trust will collect, move, share and profit from the data that is provided to it. AGora's Data Trustee role will be legally defined and will clearly state the fiduciary responsibilities held by AGora and the respective parties. The Data Trust will be delivered through proprietary technology that is tested and deployed to protect, curate and monetize data on behalf of data providers. The structure for *AGora's* operations relative to equity, safety and security of operation will be established through the incorporation process. *AGora* also will confirm its fiduciary responsibilities:

- Accepting its responsibility to manage and provide honest-broker secure access to data on behalf of the farmers, businesses and others that maintain and provide data to it.
- Obliging its operations to provide long-term benefits to providers of the data.
- Confirming the technology framework to grant sovereignty over the data provided, grant control over the assets held in trust and establish pre-conditions for participation – a contract with each data provider and data user.

AGora assets will include data, curated datasets, analytic models, intellectual property, and machine learning technologies developed onsite. A Data Use Policy Framework will be developed to guide data use. *AGora* will work with data and technology providers to establish policies for this purpose.

The proponents have held significant discussions with technology solution providers to find potential partners with the same view of data, data ownership and monetization, in advance of committing to a specific vendor. Given that *AGora* is not yet a legal entity, no specific agreement has been established to provide the required architecture and

> *"Phil and Arne just left the last meeting of AGora's Technology Working Group. To say they were pleased is an understatement – they were ecstatic! While there, AGora transferred into their bank accounts the first payment from the Data Trust. As early adopters, they helped AGora set up the Trust, describe what data is most valuable to them, and what needs to be done to collect it and then use it to add value to their farm operations. They then helped design the system to collect all the hyper-local data going into the Trust.*
>
> *It was a long process, but now it is paying off handsomely. Companies are paying to access the data. And, as importantly, AGora is delivering to Phil and Arne huge amounts of information to help with on farm decisions. Decisions are becoming easier, and the time saved is being channelled into family, community and other farm activities."*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

technology solution. However, Sightline Innovation Inc., a leading Canadian technology provider, has provided a technology framework in anticipation of working with us to define their future participation in full deployment. Core elements of the solution are:

- Sightline's technology enables people, organizations, companies, and governments to control their data, derive value from data, and gain better insight from existing data sources in real-time across multiple business units and organizations. Its comprehensive Data Trust Platform is the only built-in Canada solution that enables data sovereignty without the erosion of control resulting from data owners being forced to move to a cloud provider or being subjected to vendor lock-in tactics.
- The company provides its services through two proprietary and patented Software as a Service (SaaS) based platforms: Sightline Innovation Data Trust ("SID") and Sightline Innovation Machine Learning for Optimal Networks ("SIMON").
    - SID is as a trusted alternative to centralized data lakes for Trust members to share data and perform advanced analytics at scale. The platform provides the ability to keep data in place, share data securely in a virtual data-exchange facility, and uses AI and distributed ledger technologies for network governance, membership onboarding, project evaluation and performance monitoring.
    - SIMON is Sightline's AI and machine learning platform. It provides AI capabilities through the integration of three distinct components: AI Domain, AI App, and AI Edge. SID and SIMON are currently delivering computational value in the Canadian agriculture, health, defense/biosecurity, and manufacturing sectors.

Refer to this proposal's CONFIDENTIAL Appendix for details on the Sightline family of technologies

10.2 Geographic Information Management

Data will be the critical focus and content of every product and service supported by *AGora*, which will be underpinned by a geographically-enabled data platform. A cloud-based scalable Geographic Information System will manage and access the growing array of geographically-referenced data. It will house diverse data related to the Region. Through this platform *AGora* will collect, curate and distribute data on behalf of participants and organizations looking to develop and commercialize new agricultural applications. ESRI Canada has offered their family of GIS technologies. Future discussion will fully define their roles.

11. Communications Technologies

The Regional Connectivity Lab will pilot and deliver the infrastructure required to collect hyper-local data and connectivity across the region on par with today's urban experience. This connectivity will be instrumental to enrich *AGora's* data assets and operationalize the innovations that *AGora* will develop with private sector partners. The Lab will be deployed as part of the early formation of *AGora*.

The Lab will accelerate expansion, improvement and utilization of wired and wireless connectivity throughout the region. Work will be based on a comprehensive geospatial map of all tele-communication infrastructure in the Region, including optical fibre, copper wireline networks, and terrestrial and satellite wireless networks. Maps will use data acquired from local governments, senior

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

governments, network operators and other external sources, and from field mapping projects to fill gaps in coverage. Geospatial co-ordinates are an essential dimension to all fact-based analytics.

The regional telecom infrastructure map will be used to devise strategies, solutions and plans for expanding and improving digital connectivity throughout the region. This will require cooperation between property owners, local governments, senior governments, telecom network operators and other partners including energy providers and Internet service providers. *AGora* will undertake and support development projects to expand and improve digital connectivity in the Region, starting with two pilot projects.

11.1 Pilot 1: Internet Connectivity via an Energy or Gas Provider

Most farms and residences in rural Alberta are connected to an electric network and a gas network. Most of this rural infrastructure was developed through collaboration with property owners, governments and the service provider.

This pilot will test the viability of using these providers to deliver rural fibre connectivity comparable to urban Canada – across this rural landscape.

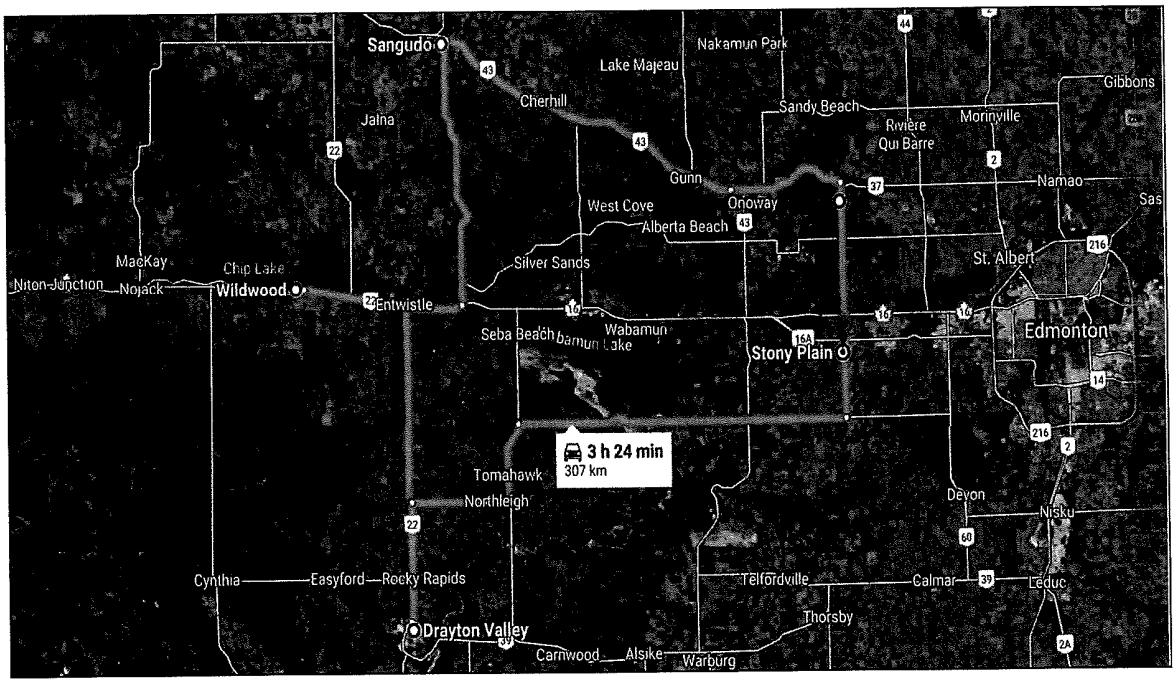
AGora will undertake a Data Provider Network (DPN) Pilot Project that supports the Farm Area Networks (FANs - detail following) with optical fibre connections managed as an open service. As with established rural energy networks, building rural data functionality will require collaboration between property owners, governments and operators. Electric utilities that incorporate data provision into their infrastructure can use it to mitigate growing risks posed by accelerating adoption of distributed power generation and storage systems by customers.

This pilot will include the following:

- Partnering with one or more electric and/or gas providers interested in incorporating optical fibre data provision into their existing infrastructure and operations: **four have expressed written interest**
- Collaborating with providers, governments and engineering and regulatory consultants to identify and eliminate technical and regulatory obstacles
- Collaborating with providers to choose footprints for one or more pilots
- Engaging, educating and organizing rural property owners within pilot footprints, and guiding them in developing connectivity co-ops to accelerate utilization and drive return on investment
- Collaborating with connectivity co-ops, service providers, providers and governments to develop sustainable and scalable models for financing, operating and using data infrastructure
- Managing the pilot for a period of 3-4 years, and developing a succession plan if needed
- Attracting multiple service providers interested in leasing capacity on the infrastructure developed to deliver digital services to rural communities, including competing service providers
- Defining, measuring and reporting on meaningful performance metrics

Expertise developed during deployment will be captured in a series of Best Practice Case Studies for future development by both *AGora* and others as Canada-wide scale-up takes place.

Technology providers have indicated interest and confirmed support. Most significant, four energy utilities will provide time and effort in support of proofs-of-concept through the Regional Connectivity Lab pilot projects. FortisAberta, EQUS REA Ltd., ATCO Gas and Zayo Group have all confirmed their interest in participating in pilot initiatives to assess how their existing infrastructure can be used to



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

support broad deployment of rural communications technologies. **This is considered a fundamental achievement**. The ability to collect and move information cost-effectively in a rural region is essential. *AGora* will determine how this will be achieved through the participation of these companies.

11.2 Pilot 2: Establishing Farm Area Networks (FANs)

AGora will undertake a Farm Area Network (FAN) Pilot Project to demonstrate the value of cheap, ubiquitous and unlimited on-farm connectivity for agricultural operators. The FAN Pilot will connect a diverse array of remote digital sensors and other devices to on-farm wireline and wireless networks, enabling remote monitoring of the environment and operating conditions, and remote operation and management of fixed and mobile equipment.

For efficiency of fibre optic access, the FAN Pilots will deploy close to County offices. *AGora* will use the FANs to collect data and deliver experiential understanding of digital on-farm innovation and hyper-local data collection

Each FAN will enable wireline connectivity within a farmstead, as well as wireless connectivity by way of a mesh network that serves a footprint at least one kilometre in diameter. Existing poles and buildings will be used where suitable to mount access points for the wireless mesh networks, but additional poles or towers may be required to provide connectivity into fields. The pilot will include:

- Building partnerships with technology and service vendors interested in leveraging the FAN
- Piloting to showcase their solutions, including network solution providers
- Selecting suitable early adopter farm operators to serve as venues for the pilot
- Designing the financing, technical, operating and business models for the pilot
- Coordinating and managing development of the FAN networks
- Procuring, installing, monitoring and maintaining the initial constellations of devices connected to each FAN, and adding to these constellations as needs and resources allow

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- Managing the pilot for a period of 3-4 years and developing a succession plan
- Engaging communities and local innovation leaders in experiential 'show me' learning relating digital innovation in agriculture and rural life
- Defining, measuring and reporting on meaningful performance metrics for the pilot, including impacts on rural innovation activity and leadership.

Optical fibre connectivity for all FANs will be essential to the effectiveness of the pilot. The proponents believe the performance of optical fibre connections can be vastly improved at marginal incremental cost, enabling the FANs to support the broadest range of digital innovations far into the future.

Today, fibre-connected homes and businesses in Olds, Alberta can buy Gigabit-per-second (Gbps) Internet service for $125 CAD/month. Fibre-connected homes and businesses in some U.S. markets can get 10 Gbps service for only $200 to $300 USD/month.

Bringing the same performance and pricing to homes and businesses throughout rural Alberta requires a fundamentally different paradigm for rural connectivity. The current paradigm forces service providers to build their own physical networks to deliver their services, but related costs are an insurmountable barrier to market entry for most would-be competitors. This is especially debilitating in low-density rural areas where competitive connectivity is needed most, but markets are too weak to support effective competition.

"Joseph's Farm Area Network is being expanded. Initially, a collection network was built to gather hyper-local data on farm operations at his immediate farm site. All machines, fixed assets, inventories and 'precision-farming' equipment were connected. Sensors were deployed to collect vehicular movement, moisture condition, and planting (variety, nutrient, chemical) and practices, etc.

Now, he is expanding the system to collect data from two new sources – full lifecycle tracking of his cattle herd, and to a newly purchased section of cropland 20 miles west. His current FAN has paid for itself, and has cost justified expansion to other parts of the business. An additional benefit he enjoys, thanks to AGora's Regional Security System is the comfort, and reduced insurance premiums, of knowing his valuable equipment is protected while he and his family sleep and even go on vacation."

12. Application Labs

AGora will establish a secure testing and development platform that provides internet enabled tools to enable residents to meet, discuss, research, resolve and ultimately prosper from the data access provided by the interactions generated and the data that will underpin *AGora*. This is where private sector partners, and perhaps even competitors, can work together to co-develop new innovations to benefit the farmer and other rural residents. These 'Labs' will be enabled in several ways. First is active definition of requirements with a specific vendor, in partnership, that delivers the requisite capabilities. Second is by making available the data housed at *AGora* to interested parties that, in turn, develop specific applications. Content, challenge and opportunity definition will confirm which approach is most viable given the 'Lab' in question.

12.1 Regional Commerce Lab

With a website in place, one of the first capabilities that will be established is an on-line tool for commerce. Developed and managed in partnership with a commercial vendor, the Regional Commerce Lab will deliver a marketplace/trading system that allows farmers to advertise their products and services within the region and beyond. Initial plans include land for rent or sale, new and used products for sale, and specialty items. This system also could be a vehicle for community associations, clubs, blogs, Do-It-Yourself groups, and a video library. This will enable many other community cross-connections.

"Jane poured herself a coffee and sat down to log into AGora to check if any of the chickens she had posted yesterday had sold. So far 6! She transfers her funds into her account and messages to make delivery arrangements. Not a bad start to a Saturday. She noticed she had a message on one of the message boards. It was a recent graduate for Olds College wondering if she still had the summer job available that she had posted a week ago? Maybe one more cup of coffee and watch a quick video – the one the research teams had sent her about new feed for her poultry."

The Regional Commerce Lab will be a vehicle to support 'buy local' initiatives. This will allow people in urban areas to source and purchase locally grown and made products and communicate directly with the producer. Using data provided by both buyers and sellers, it will enable research and analysis of regional markets and identify future growth opportunities.

Several products will support regional food security initiatives. The World Food Summit of 1996 defined food security as existing "when all people at all times have access to sufficient, safe, nutritious food to maintain a healthy and active life." *AGora* will provide the ability to encourage and facilitate food security for rural, urban and indigenous communities. The issue of food security will be addressed, and solutions discovered, through the partnership between community and technology.

This is a priority deliverable given the maturity of on-line market solutions, and the many partners that exist in the marketplace. Several have indicated a willingness to work with *AGora* to move forward.

Collaborators, Expressions of Interest and Technology Alignment

Expression of Interest / Technology Alignment	
Sightline Innovations	NAIT Industry Solutions
CropPro Consulting	Alberta Machine Intelligence Institute
University of Alberta	ATB Financial

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

12.2 Regional Value-Added Agriculture Lab

The Regional Ag and Food Lab will map, monitor and analyze agricultural production in the region. It will improve understanding of food production and food safety by rural and urban residents alike through delivery of data-driven agriculture that uses hyper-local data. Blockchain technology will secure and enable data collection and the analytics required to support ever-increasing demands for food traceability, much like how *Gem* is working in the USA with the Centre for Disease Control to put epidemics on blockchain to increase effectiveness of source identification and disaster response. Applications will prove provenance, inform production decisions and identify gaps in the supply and security chain of farm products as they move to market.

> *"The video Jane is watching is about the new process that will track her poultry from hatching to freezer using the new block chain technology. It will help take away consumer questions when she can track all that went into the birds and download it onto an FAQ sheet to go with delivery. When the video is over, she logs into the member area and sees how the other participants in the poultry study are doing. She makes a note that one other participant's birds are maturing much quicker than hers and enters her own weekly data."*

Key enabling features that have been identified by farmer participants process include mapping and monitoring agriculture and food operations and markets throughout the region, having the ability to conduct research, and analyze regional potential for agriculture and food production (gap and opportunity analysis). *AGora* will build regional capacity for data-driven agriculture and help deliver traceability of primary and value-added products, improving food safety overall.

Significant future partners have indicated a willingness to work with *AGora* in co-development. Farmers themselves are being required to provide ever more detailed information on point-of-origin food provenance and contact traceability as animals move through the feedlot system (point of contact detailing for disease tracking etc.). Canada is expecting and demanding greater proof of food safety to support expanded domestic and export markets.

Collaborators, Expressions of Interest and Technology Alignment

Expression of Interest / Technology Alignment		
Sightline Innovations	ATB Financial	University of Alberta
NAIT Industry Solutions	Alberta Agriculture	Crop Pro Consulting
Alberta Machine Intelligence Institute	Alberta AG and Food Council	Telus Communications

12.3 Regional Weather and Climate Lab

This Lab will link the collection of micro area weather information to land use, intelligent farm practices and crop selection and management. It will improve decision making on crops planted, nutrients required to optimize yields, inform management decisions (like when to spray/harvest, etc.) and better plan for daily farm activities. LoRa Sensors are already being deployed around the world for Agriculture purposes and would be assessed for use in the regional pilot.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Real time weather data will be collected at the farm level and linked to regional and national databases. Mapping and monitoring of weather systems will take place and be linked to on-farm support tools. A real time, micro-area weather service will be enabled.

Creation of a large data set that links farm-based decisions to climatic activities, predicting on a much more localized and specific basis short term weather events, and informing better farm decisions will result. *AGora* believes this linking of micro area weather data with existing data sets managed by existing research and commercial endeavors will provide value along the full value chain, as providers of national and regional farm data are interested in delivering greater farm management services and risk reduction to the end user. The end user, in turn will be enabled to benefit from the delivery, analysis and use of their information.

These data also are expected to help model and assess projected regional impacts of climate change and support development of regional strategies to adapt and mitigate the impacts of pending change. As such, *AGora* anticipates involvement by academic, research institutes and government institutions involved in climate response, building regional capacity for understanding, adapting to, and capitalizing on climate change.

"Harvest is in full swing, and it's time for John to head home for the night. His daughter meets him and takes over the combine, which she will run all night – not a problem since the software on the combine has linked the combine's GPS guidance system to satellite data and the hyper-local background moisture data the farm has collected. It tells her where the wet spots in the field are, and what weather may be coming, and ultimately how late she can combine. The system also has linked data from the family's land 20 miles west with information from the quarter she is harvesting, and told her what she needs to know – a specific forecast - to keep on harvesting."

Collaborators, Expressions of Interest and Technology Alignment

Expression of Interest / Technology Alignment		
Sightline Innovations	ATB Financial	University of Alberta
NAIT Industry Solutions	Bell Mobility	Crop Pro Consulting
Alberta Machine Intelligence Institute	SensorUp	3C Information Solutions

12.4 Regional Energy Lab

Evolving out of a question around proper disposition of regional waste will be the delivery of a Regional Energy Lab. Participants confirmed interest in delivering a system that integrates the region's waste management and recycling services into an efficient use of agricultural and residential by-products. Rapid improvements in energy production technologies and economics are steadily creating more profitable opportunities for consumers of fossil fuel energy to become more self-sufficient producers of their own clean energy, including energy from renewable sources such as sunlight, wind and industrial waste. These opportunities are driving an accelerating transition of energy economies from household to global scales, amplified by social and political responses to climate change.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Ag operators and rural communities can exploit these opportunities to improve self-sufficiency and profitability while reducing their dependency on grid power and fossil fuel, reducing their GHG emissions in the process. Solutions for energy are increasingly plentiful, accessible and affordable. The Energy Lab will work to accelerate energy transition throughout the Parkland region, helping regional innovators identify and exploit opportunities to profit from advances in energy technology.

The work of the Energy Lab will include:

- Mapping and analyzing the regional energy economy, including sources, quantities and qualities of industrial waste that can be gasified or incinerated to drive electrical power generation.
- Helping regional innovators build comprehension and competency around energy economics and solutions for community and on-farm energy production and management, by providing online tools for energy-related learning, analysis, modelling and planning; online and onsite learning tours and learning workshops relating to energy solutions and energy transition; and demonstration projects

"Dave just finished putting in a bio-fuel plant on his farm to serve his needs and the neighbouring farmers who invested in the business. By using AGora he identified all the local supplies of lower grade canola and other crops and 'carbon based' materials that could feed a facility like this, identified the most effective technology and confirmed local markets for the bio-fuel.

They found, through AGora, a local entrepreneur with the bio-fuel technology they needed to make their plant successful. Dave now can claim a federal carbon credit, as Canada's Clean Fuel standard provides a financial benefit to 'green energy' producers."

Collaborators, Expressions of Interest and Technology Alignment

Expression of Interest / Technology Alignment		
Sightline Innovations	ATB Financial	University of Alberta
NAIT Industry Solutions	Alberta Machine Intelligence Institute	

12.5 Regional Safety and Security Lab

Mapping, monitoring and mitigating risks to people, livestock and property throughout the region is a growing need. Today urban residents benefit from real time security monitoring and delivery of safety services. This has been enabled through advances in communications technologies not yet in place in rural regions. This Lab will work towards deploying a full network of IT enabled sensors, monitoring systems and integrated products that deliver real time ability to track, maintain and monitor on farm and rural assets.

The Lab also will improve safe vehicle movement across the counties, particularly with respect to large vehicle (farm, municipals and industrial) and significantly reduce the number of collisions between personal vehicles and large industrial vehicles which often move at slower speed and take up much more space on the road.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

It is recognized that several enabling actions are required to deliver upon this Lab – broad connectivity must be established to provide the base to monitor farm and rural assets; blanket coverage and data collection ability along major traffic routes needs to be enabled; and linkage to information systems deployed in vehicles must be enabled. Initial implementation will take place through data collection to be enabled through each FAN.

First order work is engagement with research and development institutions involved in issue definition and delivering proof of technology. They exist. The Applied Research Centre - Sensors & System Integration at NAIT, the Centre for Smart Transportation at UofA and Alberta Traffic Safety (corporate) have expressed interest in participating in the design and delivery of this Lab, and the use and development of the data that support the decision-making infrastructure. Significant work is envisaged to fully define the technical requirements, enabling software and partnerships to bring life to this Lab.

"Before heading home for the night John switched on the guidance systems for the grain carts that have been filled during the day. The autonomous vehicles begin their slow drive home, and should be at the granaries by morning. He is not worried since they are fully integrated with necessary road telemetry and traffic information. Crossing several grid roads and a major highway used to be a problem, but now that the county is fully networked and vehicles can receive real-time notification of big machines on the road, it's a safe and efficient process to get the crop home in off peak hours when it's safest."

13. Technologies Supporting Global Research Initiatives

The platform established through AGora will enable the collection and analytics of huge amounts of highly specific information related to rural and farm activities. Thee data will support significant research and development, be it through academia or the private sector.

Collecting hyper-local data in a rural farm context, with leadership from farmers willing to be involved delivers a new approach to research and vette technologies. Data will be created that fully informs how farms are being managed and operated. In addition, in between the lab and full commercial deployment there is the opportunity to deploy real-world trials, collect huge sums of data to inform design decisions, and see how new technologies actually are being used – by the farmers themselves.

"Today is the day that the crop development companies deliver their new seed varieties. Several early adopter farmers are ready to plant highly tailored varieties to see which perform best under "real-farm" conditions. Global research has matched soil type and climatic zone, predicted moisture needs and defined specific nutrient/micro-nutrient requirements in test conditions. Now it's time for farmers with the means to collect huge quantities of information to put these varieties to practical tests. The full sensor networks across the farms will collect data that will inform decisions on genetic improvement, crop support (nutrient, herbicide / pesticide) use and which perform best under what condition, to name a few.

Development companies that are recognized AGora partners benefit handsomely from access to these real-farm conditions and are willing financial partners / contributors to the farms' operations. Huge decisions now rest on the outcomes, as companies can determine which variety works best where, and which hold promise for long term improvement. Thanks to AGora's Data Trust, these companies also have access to the data needed to commercialize their new variety's in other parts of Canada, and the world, with similar characteristics.

14. Risks and Mitigations

AGora's proposed corporate structure inherently manages risk – duties, structure, planning processes, policies, regulations and overall accountability processes both assign responsibility and contain risk. The GOVERNANCE chapter fully articulates roles relative to how projects will be managed, deployed and delivered.

Privacy and cybersecurity breaches will be treated as a primary branch, especially as they relate to devices, network, and data ownership. We intend to partner with experts to address this concern.

Human Safety Related to Autonomous vehicles, and downstream utilization of robotics

Risk – 'Renegade' behavior rooted in the unavailability of sensor and/or component interoperability.

Mitigations – Exhaustive testing related to any, and all, scenarios regarding the dependency of autonomous vehicle 'losing contact' with governing related objects; example connectivity, vehicle/sensor mechanical failure. Continuous operational monitoring of network and exceptions.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Local device shutdown should be programmed on certain conditions; remote shut down should be available and applied. Apply other best practice remedies.

Risk – 'Renegade' behavior rooted in malevolent 'hack', or intrusion, related to vehicle or device.

Mitigations – Multi-factor authentication can be applied to 'control' devices (see Sightline). Detection of attempts to intrude should be logged, examined. 'White hat' hackers can be employed for testing/ongoing. Local device shutdown should be programmed on certain conditions; remote shut off should be available, and applied, on suspicion of takeover.

Reliance on signaling/alerting technologies that are less than 100% available

Risk – Signaling and alerting technologies become mainstream and will gain mainstream adoption. Citizens expect and are guided by their information. They may be sometimes unavailable.

Mitigations – Wherever possible apply a similar solution pattern that is applied to traffic lights. In the example of traffic lights, the red lights blink for all drivers; indicating outage and defining behavior (four way stop). In the example of notification of 'heavy machinery ahead', notify 'may be heavy machinery ahead', until systems are fully operable.

Privacy of Information – Impersonation and Identity Theft related to authentication/access

Mitigations – As described in the TECHNOLOGY chapter, we intend to partner with sector experts to address this fundamental rick. Best practice mechanisms will be implemented based on monitoring, and the detection of suspicious behavior, and emphasis on 'safety first'. 'White hat' hackers can be employed for testing/ongoing. We will define processes to mitigate security breaches that will identify the root cause, those harmed, level of harm, and 'resolution of root cause' actions.

Privacy of Information – Other

Mitigations – The data governance and data management model positions Data Providers to define what data will be available, to what consumers. Best practice mechanisms will be implemented based on monitoring, confirmation that solution is working as defined (no leaks), the detection of suspicious behavior, and emphasis on 'safety first'. 'White hat' hackers can be employed for testing/ongoing. Define process for Security Breach that identifies root cause, those harmed, level of harm, and 'resolution of root cause' actions.

Technology Project Execution – Quality/Time/Budget

Mitigations – Adherence to the architectural principles, and the following checklist are typical mitigation strategies:

- Employ Proof of Concept (PoC) and Building Block concepts.
- Define expertise required and provision the necessary people/partners.
- Define how expertise will work together and optimize the engineering process.
- Define small teams and make them accountable for outcomes within the overall architecture.
- Engage as many full-time, for a period, resources as possible as momentum reinforces persistence.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

GOVERNANCE

Different levels of involvement by different groups will unfold. Teams, partners, stakeholders and early adopters will help define success. This chapter describes how the project(s) will be governed. At the core is a new not-for-profit company with the responsibility to link those involved in the most effective way possible, provide operational transparency and align diverse interests in common purpose.

1. A Not-for-Profit Organization

AGora will be created as a not-for-profit corporation to establish clear lines of responsibility, provide operational transparency, incent diverse interests to participate for the common good, and mandate clear financial accountability. Materials supporting incorporation of *AGora* (bylaws, etc.) and the operational design of the organization will clarify its purpose and direction for staff, partners and funding entities alike.

> *AGora* will be created as a new not-for-profit corporation. This model has been chosen with deliberate care.

AGora's Strategy Roadmap defines initial outcomes to be achieved to create an effective GOVERNANCE structure. The key outcome is that its design supports national transferability, effective governance, monitoring and sustainability. The mandate of *AGora*, subject to Board input, is to:

> ***Take advantage of the 'virtual' nature of the internet and its connected technologies to support thriving rural communities.***

The not-for-profit structure delivers a practical framework to:

- Ensure equal representation by the four sponsoring counties: It was deemed impractical to house delivery inside any one of the four municipal structures.
- Establish means to attract corporate participation and financial support: This will create the ability to engage in legally binding development initiatives with private sector interests.
- Incent academic involvement: This will deliver a 'living lab' across significant geographies. *AGora* establishes more than a 'test plot' approach to support research and validate innovation – tested in real time – under highly variable conditions and deliver highly detailed data to support academic processes.
- Frame accountability in ways that are well-understood: The straightforward legal structure will be well-understood by external third-parties, with respect to both delivery and accountability (external audit).
- Provide a means to hire, service debt (if any), set contracts/agreements and receive revenues: This will be a legally enacted entity.

The Objects and Bylaws of *AGora* will reflect this and other key design criteria. *AGora's* legal structure will create a risk management and mitigation framework that provides responsible oversight to fund delivery and assign clear operational accountability.

To prepare this proposal a best-practice review of similar organizations was undertaken. A number of not-for-profit organizations provided materials. The applicants received significant support from TECTERRA (Calgary), a technology innovation support centre that has developed bylaws and operational guidelines that meet and exceed federal/provincial standards. The design of TECTERRA, founded in 2010, has helped to ensure long-term support from both the federal and provincial government. This has informed the proposed *AGora* model.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

2. *AGora* Board and Advisory Groups

Board Structure and Membership

It is envisaged that the *AGora* Board will be comprised of members representing each sponsoring county, local farm and rural interests, select for-profit firms, First Nations, communications providers, economic development interests, academia, and federal and provincial government representatives as deemed appropriate. A 13-member board is considered optimal.

The following members of the Design Team that created the Roadmap guiding full implementation have agreed to sit, initially in an advisory role to oversee establishment of the corporate entity, which they will then join as board members:

- John Knapp (retired) - Deputy Minister, Alberta Ministry of Agriculture
- Peter Laffin, Director of Business Development, NAIT Applied Research Centre - Sensors & System Integration, Office of Research and Innovation
- Sarah Leteta - Bison Rancher, Entrepreneur
- Brian Olafson (retired) - Vice-Chair Board of Directors, TECTERRA; Board Member, Cybera; Vice-President, Bell Canada

AGora bylaws will define membership structure in detail.

Board Committees & Working Groups

Initially, the following leadership groups will be created:

- The Finance and Audit Committee, responsible for providing support and advice to the Chief Financial Officer (CFO), monitoring and reviewing the financial performance and internal controls, developing the annual budget, and acting as a point of contact between the Board and the external auditor.

- The Technology Working Group, responsible for providing support and advice to the Chief Technology Officer (CTO) and *AGora* in the development of supporting infrastructure and applied technology initiatives that will deliver immediate benefit from new ICT capabilities for the agricultural sector.

  Major technology projects will require additional analysis prior to confirming investment. Drawing on best practices from similar not-for-profit organizations, the working group will be mandated to provide a rigorous review of development initiatives that includes monitoring and evaluating the strategic direction for programs and activities, selecting applied technology initiatives, placing emphasis on those that will create immediate benefits for the rural economy and assessing and recommending projects for approval by the Board, within the funding guidelines and budget constraints for these projects.

  The overriding consideration for approval of projects is: Does the proposed development have the potential to enhance the economic and social well-being of rural Albertans and Canadians through the improved use of connected technologies?

  The Technology Working Group will include members external to *AGora*. It will be comprised of well-respected, volunteer representatives from industry and the research community who have a background in issues related to *AGora's* mandate.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- A Connecting Peoples Working Group made up of early adopter participants that will focus on priority requirements of the initial group of farms and businesses. They will provide accountability and leadership on stakeholder engagement, and will identify innovative strategies, techniques, or tools that are evidence-based that could be used to sustain stakeholder engagement. This will confirm their interests, provide practical guidance on design of *AGora*, and help to define infrastructure and data requirements from a user perspective.

3. Management and Staff

The Executive Team

The Chief Executive Officer (CEO), reporting to the Board of Directors, will be responsible for translating strategic Board intent into corporate action. The CFO will deliver financial oversight, manage day-to-day financial operations, develop and oversee budgets and deliver audited statements following selection of an external accounting firm.

The CTO will be responsible for defining *AGora's* overall technology strategy and deploying and applying corporate technology assets in the rural / agricultural sector and beyond. Responsibilities also include design of the technology platform to manage *AGora* data, liaison with the Technology Working Group to recommend technology solutions for *AGora* and its partners, and oversight of system operations across the four-county region.

AGora Staff

AGora will be staffed to the minimum level required to ensure success. Full requirements will be defined in the implementation phase. Job descriptions will be created, and positions will be filled.

Staff will take leadership roles in moving four Value Streams forward. Each Value Stream will be supported by a Working Group made up of local stakeholders, partner representatives, subject matter experts and volunteers. The CEO, CFO and Office Manager will be focused on the "Building *AGora*" Value Stream. They will carry the vision and change program forward and report to the Board. They will be accountable for overall governance and operation of the organization.

A full-time CTO and a Solution Architect will focus on the "SMART Information Management and Technology" Value Stream. This will include design and implementation of *AGora's* architecture. They will enable the infrastructure through a series of Proofs of Concept and Pilots and focus on the flow of hyper-local data in response to agricultural challenges. They will work with the Technology Working Group to lever the capabilities and expertise of partners and subject matter experts, ensuring that scalability, privacy and security are primary concerns.

Agricultural Technologists will be responsible for providing front-line support to farmers, transferring technology, and a applying a deep understanding of agricultural challenges in each of the LABs. They will work with the Technology Working Group, hand-in-hand with farmers to gather requirements and a deep understanding of the challenges they face, in parallel with vendors and partners applying innovative technology, testing hypotheses, and measuring results. They will combine technological expertise with a hands-on farm work ethic.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

A Communications Specialist will apply their skills to marketing, communication and community engagement, focusing on the "Connecting People Technology and Farms" Value Stream and working with the "Connecting Peoples" Working Group. All staff will be supported by the Office Manager and a part-time Grant Writer who will identify opportunities for *AGora* growth and funding. This person also will work with partners to define required funding and funding sources for more innovation projects.

The intent is to create a 'virtual' organization as much as possible, but modest space will be established for administration and technical support. More may be secured as needed for meetings and for incubator space to support specific innovation projects.

4. Partnerships

Greater value is created in partnership than in isolation. *AGora* is committed to creating partnerships, and will seek to create close working relationships with local producers, the private sector, academia, First Nations, and other groups that share a common interest. The Service Provider Policy Framework will be developed to achieve the outcomes identified in the Strategy Roadmap.

Specific contracts will be established that define deliverables, costs, timelines, control points and oversight, to ensure timely, cost-effective delivery and ensure that the expected value is received. Among other things, this will include project objectives and deliverables, expected impacts, required funding, leveraged contributions, technical approach, plan and milestones, intellectual property ownership, and data ownership.

Infrastructure Partners

Infrastructure partners will include technology, connectivity and internet service providers. Letters of support are included. Infrastructure development partnerships will differ from service development partnerships given the very different revenue potentials associated with success, and the expected challenges in project design and delivery.

Service Development Partners

AGora will provide the enabling infrastructure required to develop and deliver a family of products designed to meet specific needs of the farm and business community. Each solution will be created in partnership with one or more private or academic partners. Partnership structures, revenue models, and risk sharing will be specific to each solution.

Early Adopters

Several groups of farmer and business partners are envisaged. As described previously, early adopters will agree to deploy new technologies across their land base or business. Partnership agreements will define responsibilities and benefits received (such as access to consolidated data and decision-making tools that improve farm practices), revenue potentials, site access, and the like.

Others

AGora will seek to form partnerships with the federal, provincial, and municipal levels of government, First Nations, and others. Financial support from these entities will create new partnerships based on a sharing of risks and rewards linked to success of *AGora*.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

5. Operating Principles

Financial Management Principles

AGora financial oversight will be delivered through combined accountabilities of the Chief Financial Officer, the Board of Directors, and the Finance and Audit Committee of the Board. An independent audit firm will be engaged to report on business operations.

Program Management Principles

Program Governance guides delivery of the transformation based on decentralized and distributed decision-making, clear roles and responsibilities, and coordinated systemic planning, problem-solving and learning at the program level. Collective intention will be sustained by *AGora's* organization and the Board. *AGora* will:

- Create high-functioning teams that are self-managed and empowered to make decisions. Employees will be identified with the relevant skills and experience; gaps will be filled where necessary; team commitments will be clearly articulated; and events, information and tools will support teamwork. *AGora* will focus teams on delivering results.
- Develop a high-level plan for strategic initiatives in a release planning process based on ranked outcomes. This blueprint, created by team members, will indicate the order in which initiatives will be addressed and when they will be completed. It also will serve as the baseline for measuring progress.
- Establish frameworks to track team achievement, assess risk, monitor outcomes and remove barriers to achieving results. As described elsewhere in the proposal, performance measures will be identified and aligned with the Strategy Roadmap.
- Sustain dialogue to resolve conflicting perspectives and ensure alignment. Working Groups, teams and stakeholders will create artefacts and events that support ongoing dialogue around the desired future, enabling outcomes, value delivery, actions, and work. This process will be continually monitored and refined, and the dialogue will respond to changing circumstances.
- Use a Lean/Agile structure to underpin the program budgeting process and plan for future work. Approvals will be linked to funding, priorities, expected results, and decision responsibilities. Program management will focus on balancing work-in-progress, team flow, alignment, dependencies, performance, and progress in achieving program goals.

Project Management Principles - the Lean/Agile Approach

Delivery will be enabled using the Lean/Agile implementation framework. Lean/Agile is widely adopted across the technology sector - requirements and solutions evolve through the collaborative effort of self-organizing and cross-functional teams and their customer/end user. In *AGora's* case, implementation teams will emerge from those who have been engaged to develop the Strategic Plan. Additional members, products, timelines structure and processes will develop from this core. Full articulation of the processes can be found in the PROJECT MANAGEMENT chapter.

AGora will coordinate execution based on active Lean/Agile stewardship of the Working Groups and teams, in cycles of acting, learning, and planning. Project management will be organized around the flow of value. Delivery will be achieved through the Agile teams, where all teams have a synchronized set of events, have an Outcome Owner and a Team Coordinator (see section following), and deliver work linked to a roster and a schedule. As the methodology describes, a regular process will be

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

established for program monitoring, communication, and progress that creates a rhythm for sustained performance. Through the Lean/Agile process *AGora* will:

- Create a culture of trust. Teams will be empowered to make decisions. Information will be shared openly and constructively, and team commitments will be honored.
- Be purposeful in value delivery. Innovating and learning as outcomes are achieved, and as impacts are created. Teams will become increasingly competent in working with complexity.
- Strive for agile delivery based on self-organizing, self-managing and cross-functional teams. Deliver value through prioritized outcomes and user stories. Teams will be synchronized through iterations and team events. Progress will be demonstrated at defined intervals and planning will happen just-in-time.

Risk Management Principles

Risk is exposure to a potentially negative outcome, with an associated level of uncertainty. Risk management seeks to identify the risk in detail, explore ways to address it and have the best approach prepared for possible use. Regardless work area, programs face several common categories of risk:

- Business risk related to a shift in business realities resulting from new market challenges or moves made by competitors.
- Technical risk resulting from evolving technology platforms, adoption of new technologies, and the combination of technologies in new ways.
- Operational risk related to suitability of the solution within the existing organizational ecosystem and the skills and knowledge required for the organization to run and support the solution.
- Process risk that occurs when a technique is used beyond its range of applicability or outside of the organization's comfort zone.
- Organizational risk resulting from changes in reporting structure, dysfunctional politics, competing visions, the social dynamics of transformational change, and other forces.

Performance Measurement Principles

AGora will use the Performance Measurement and Improvement System (PMIS) framework for lean-agile programs to measure, learn and achieve continuous improvement. The framework will be constructed based on the capabilities and outcomes in the Strategy Roadmap that describe the strategy and intention of the program. Appropriate metrics have been chosen that will assess progress that is being made to achieve critical outcomes, and to provide the feedback required for teams to learn and adjust. This is described in detail in the PERFORMANCE MEASUREMENT chapter.

Intellectual Property Management Principles

New intellectual property (IP) will be developed. It will be desirable to protect and commercialize this intellectual property. The Chief Technology Officer will be responsible for defining ownership and how value is realized from its development, either independently or through delivery partnerships.

AGora's Intellectual Property Policy framework will allow for timely, efficient dissemination of new IP, while allowing for its commercialization. *AGora* policy will recognize the respective interests of all funding participants in creating this intellectual property. Benefits are expected to accrue to the creators, *AGora* and other sponsors of the activities that reflect their respective contributions.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Data Privacy

By design, *AGora* will collect and manage data, and will be responsible and accountable for the data under its control. The Chief Technology Officer shall be assigned Privacy Officer responsibilities to ensure compliance. Technology compliance is fully detailed in the Sightline technology architecture; please refer to details provided in the TECHNOLOGY chapter and the CONFIDENTIAL appendix.

6. Letters of Support

We have received fifty-five Letters of Support from a substantial number of key constituents for this project. This demonstrated commitment to work with us has been received from all municipalities in the region (4 partners and 5 additional towns and cities); technology producers; connectivity companies; First Nations; government ministries; agricultural producers; technology accelerators; academic institutions; utility companies; and key volunteers (some of whom have agreed to serve on an inaugural Board as AGora is established). The complete set of letters received is provided as an appendix to this proposal.

7. Risks and Mitigations

AGora's proposed corporate structure inherently manages risk – duties, structure, planning processes, policies, regulations and overall accountability processes both assign responsibility and contain risk. All organizations need a structured and methodological approach to coordinate governance, risk mitigation, and compliance. Risks range from strategic risks in markets and value chains, day-to-day operational risks, and financial risk inside the firm (fraud, breach of contract, etc.) and external (interest rate impacts upon borrowing ability, etc.). Each risk requires an appropriate plan of action.

Compliance requires definition of a process and responsible follow up to ensure risks are minimized, the organization responds appropriately when they occur, and the duty to report is honored. Risk management strategies relevant to key elements of this proposal are defined in each chapter.

Corporate Strategy

Risk – Significant change in the client base, operating environment, markets or revenue may impact *AGora's* long-term ability to function.

Mitigations – Conduct periodic environmental scans with the Board and external stakeholders to re-assess and confirm *AGora's* strategic direction. Evaluate options for corporate renewal based on new realities when circumstances change.

Operational Risk

Risk – Loss resulting from failed processes and systems or from external events.

Mitigation: Identify and manage operational risks, with full monitoring and reporting. Assign oversight responsibility to the Board of Directors. Assign responsibility for compliance to the Chief Executive Officer.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Internal Fraud and Error

Risk – Corporate fraud and malfeasance.

Mitigations – Establish a full suite of financial accountabilities, with responsibility clearly assigned to qualified and capable staff, and with external audit to ensure proper fiscal management. Base policies on best-practice models, including financial governance, signing authorities, roles for audit/finance committees, and controls for financial approvals. Establish transparency for the Board, funding agencies, and the public at large.

Disaster Recovery

Risk – Failure of the technology and data management systems.

Mitigation – Establish and maintain an up to date disaster recovery plan. Define corporate and technology provider responsibilities and describe how operations will be continued in the face of loss of information or systems. Significant work to align data privacy, support providers and staff responsibilities will take place.

Staffing Overload

Risk – Workload exceeds staff compliment.

Mitigations – Seek Board approval and funding for additional resources. Scale back operational activities as required.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

PROJECT MANAGEMENT

AGora will deliver multiple projects. Initial work will focus on establishing the company, defining and initiating pilot projects, and building requisite delivery capabilities. Once established a full range of programs, community engagements and values will be delivered.

Full corporate accountability supports overall project management. Staff will manage projects in accordance with Executive and Board direction. The latest and most efficient project management system – Lean/Agile – will be used to deliver project success.

1. Lean/Agile Project Management

Delivery will be enabled using the well Lean/Agile implementation framework. This management approach is widely adopted in technology sectors - requirements and solutions evolve through the collaborative effort of self-organizing and cross-functional teams and their customer/end user. In *AGora's* case, Agile implementation teams will emerge from those who have been engaged to develop the Strategic Plan. Additional members will develop from this core.

Agile development methods break product development work into small increments that minimize the amount of up-front planning and design. Iterations (or sprints) are short time frames that typically last from one to four weeks that deliver that increment of work. Each iteration involves a cross-functional team working to deliver all project requirements. At the end of the iteration a working product is demonstrated to stakeholders. This minimizes overall risk and allows the product to adapt to changes quickly. See also https://www.scaledagileframework.com/agile-release-train for detail. Work within each Value Stream will be based on the following practices, or Agile Release Train:

- The schedule is fixed – The Value Stream will start at a known time and solutions will be delivered in set increments, aligned with other dependencies, on a reliable schedule.
- A new increment begins every four weeks – Each Value Stream will demonstrate its work to users, stakeholder and other teams at the end of each increment. This solution demo will provide a way to evaluate the working solution with all the teams.
- Priorities are revisited and synchronized across all teams every six to eight months – The next increment of work in each Value Stream will have common start and end dates for all teams within it.
- The Value Stream has a known velocity – Team and Value Stream velocity will be determined using estimation techniques and aggregated so the total capacity for work is understood.

AGora will use an iterative process to create a deep understanding of the desired outcomes identified in the Strategy Roadmap, to rank work activities, and to deliver value as the Value Streams are created. Each team will be led by a leader who is accountable for the team process, events, artefacts, and deliverables. Team members will learn and apply practices from recognized continuous improvement disciplines (Scrum, Kanban, etc.).

It will take some time for teams to become fully functional. *AGora* will initiate delivery by contracting a service provider who is familiar with *AGora's* work.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Value Streams

AGora's five-year plan is based on four Agile Value Streams (see FINANCIAL chapter) and associated delivery plans constructed from outcomes in the *AGora* Strategy Roadmap. Each Value Stream will develop solutions that benefit the end user. Work has been ranked and scoped in the five-year plan, attached. Priorities will be assessed further when six-month workplans are developed. Value Stream workplans will be developed through a face-to-face planning event every six to nine months. The status of work underway will be demonstrated and evaluated at that time. Teams and management will identify improvement backlog items in a structured, problem-solving process.

Each Value Stream will be resourced by at least one team, with team skills, experience and capability focused on a key value outcome. Each team will have an Outcome Owner and Team Leader. Each team will deliver solutions focused on ranked business cases approved in a large group workshop. They will be charged with meeting objectives and delivering outcomes in line with the business case.

Six-Month Workplans

Teams will work to achieve six-month workplans. Each team is responsible for its own plan. Dependencies, risks, performance, resources, and specific deliverables will be outlined in each plan. Each team – working with other stakeholders – will incrementally develop, deliver, and (where applicable) operate one or more solutions in a Value Stream. Where multiple teams are assigned to a Value Stream, they will be mandated to plan, commit, develop and deploy together. Teams will be cross-functional and will include all capabilities needed to define, implement, field test, and operationalize solutions.

Team Structure and Roles

Each Agile team will have five to nine people and will be anchored with permanent staff from *AGora* and members of the Design Team. Additional positions will be filled with contract resources, volunteers, or resources borrowed from other organizations. Volunteerism will be considered where appropriate. Recruiting the required skills, experience and expertise will be essential to create a capable delivery engine. Team training and orientation related to each challenge will take place to on-board team members and ensure they are effective.

In the first six months teams might include only two to three people. These people will work together to recruit and find others with the best mix of skills and availability to augment their capability. This recruitment process will be overseen and aided by the new Board and management team. Agile delivery will enable the following positions and responsibilities:

- The Team Leader is a unique Agile team member focused on helping other team members communicate, coordinate, and cooperate. This person will assist the team in meeting its delivery goals. They will act as a servant leader who helps teams self-organize, self-manage, and deliver results using effective Lean-Agile practices. The Team Leader will support and enforce Agile processes and other rules to which the team has agreed. They will coordinate with other teams and will communicate the status of their work to management as and when needed.
- The Outcome Owner will drive individual delivery. They will author each business case and will receive a go/no-go decision on the proposed work. After acceptance the Outcome Owner will work with the Agile Team to deliver all activities required to realize business value. After initiation, the Outcome Owner will

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

have the ongoing responsibility to steward and follow up with the team on the work. Once the work is completed, the Outcome Owner will turn their attention to the next high-priority action and outcome.

2. Investment Scope, Scheduling, Sequencing, and Dependencies

Project spending and investment decisions will be based upon a full delivery of Agile scoping, scheduling, sequencing and identification of dependencies. This will ensure that risks to project delivery are identified in advance, mitigations developed, and investments approved. *AGora's* Agile delivery and financial oversight methodology will rely upon constructive planning workshops to define work flow, investment requirements and scheduling and team synchronization. At the core will be effective use of funds to deliver the identified product in a timely, efficient and cost-effective way. Please refer to the FINANCIAL appendix for full details.

3. Managing Resources

Human Resources

AGora will seek commitment from community organizations and special interest groups to provide the human capital required to support its work. It has dedicated the Connecting Peoples, Technologies and Farms Value Stream to engaging with the community to recruit, attract and retain resources for Working Groups and Teams.

Infrastructure & Investments

Smart infrastructure projects will provide the foundation for *AGora's* program delivery. Components are connected and generate data that will be used intelligently to create value in the region. The following investments will be made with the smart cities funding:

- Infrastructure Connectivity: *AGora* will invest $1.5M to improve the infrastructure to connect farms through partnership and pilots with new service providers and seek to at least match these funds.
- Direct Economic impacts: *AGora* will spend $5.0M over five years within the communities it is working.
- Social license to Engage and Innovate: *AGora* will spend $0.75M over five years engaging the community in this challenge.
- Improving Farm efficiencies through Technology: *AGora* program will invest and leverage $1.25M to improve farming practices through the application and deployment of Technology solutions.
- Farming Data Investment *AGora* will invest $0.50M to build, analyze and curate the data flow from farms and turn it into an asset.

Financial Resources

AGora will employ a budgeting process that combines annual budget development for ongoing *AGora* operations (staff, overhead, support, pension, etc.) with a 'Lean' budget development approach that supports delivery of project value streams, pilots and specific development initiatives. This alignment will deliver necessary links to outcomes-based project implementation and necessary funding through the Smart Cities Challenge initiative. Full details are outlined in the FINANCIAL appendix.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Procurement Strategy

AGora's procurement strategy is modelled on Agile best practices and will be supported by full oversight provided by *AGora's* Chief Financial Officer. Full detailing of the process to procure materials, labour, etc., for agile delivered projects is identified in the attached FINANCIAL appendix.

4. Managing Stakeholder Engagement

As part of ongoing operation *AGora* will staff and deploy resources as part of the Value Stream – "Connecting People, Technology and Farms", as described herein.

5. Progress Monitoring and Course Correction

Monitoring, controlling, and reporting strategies and checkpoints for contingencies and any necessary course corrections are identified in PERFORMANCE MEASUREMENT chapter.

6. Related Initiatives Already Underway

We are aware of sustained, long term activities underway in the four Counties for some years regarding the installation and commissioning of numerous tower and mobility based broadband improvements. The continued commitment and funding of a Connected Communities Program Manager and the infrastructure they are deploying in Parkland Country is a demonstration of this on-going support. Investment over the past three years is estimated to be $7.6 million (to December 2019), with a combined four-county estimate exceeding $12 million.

We also know that the Province of Alberta is deeply interested in this subject and have announced the completion of a province-wide Broadband Strategy by sometime in 2019. Moreover, Alberta's SuperNet assets have been sold to Bell and they are in the process of determining their provincial wide strategy to capitalize on that purchase.

The proponents have demonstrated a large and encouraging interest in this initiative. They have a full complement of committed volunteer and municipal partners interested in pursuing these initiatives, alongside a substantial number of potential partner organizations – private companies, governments, academic institutions and community groups.

They will be the horse power we will engage with to deliver on the promise of AGora.

7. Sustainability

The proponents will develop methods to ensure, to the extent feasible, the long-term sustainability of *AGora*. This will be needed to ensure the on-going improvements in rural prosperity in the four Counties and will be necessary to effect scalability and transferability to other Canadian rural regions.

New Integral Strategy Labs™ are planned with the Technology Working Group to springboard from what's been learned to date and also to future proof the technology offerings available. We plan two additional Strategy Roadmap™ processes – first with the farmers, the community and the youth participants to build on and accelerate the Rural Culture of Innovation. A second Roadmap™ process is planned with the Board and *AGora's* corporate partners / participants to build on the evolving

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

business model and to consciously design a more robust "Pre-competitive co-design, co-development model" to accelerate innovation and commercialization opportunities.

Finally, while we are not yet able to estimate the scale of the following, we have identified a number of key on-going revenue streams that will be realized as *AGora* takes root and scales up:

- We have secured, via the Data Trust, the foundation for an on-going revenue stream from the data that will be collected, curated and made available – it is expected this revenue stream will grow substantially over time as the data set becomes larger, more comprehensive and more valuable;
- We will realize advertising revenues from appropriate Banner Advertising that will be sold on *AGora's* Regional Commerce Lab;
- We will, from the onset, negotiate with private companies, a pay-to-participate model to allow their access to our innovative testing environment for the purposes of their developing solutions to hyper-local challenges for *AGora* that also have wide-spread commercial application and value;
- We will negotiate shared Intellectual Property right fees from companies that use *AGora* data and its test bed to develop new products they then commercialize;
- We expect to have *AGora* deliver valuable services on behalf of its County partners which will enable them to avoid delivering duplicates services. We anticipate they will contribute funds to *AGora* for those joint, and more effective, delivery of services; and
- Finally, through the retention of an on-staff Grant Writer, *AGora* will be the recipient of numerous Innovation Grants from a number of governmental and philanthropic sources.

8. Risks and Mitigations

AGora's proposed corporate structure inherently manages risk – duties, structure, planning processes, policies, regulations and overall accountability processes both assign responsibility and contain risk. The GOVERNANCE chapter fully articulates roles relative to how projects will be managed, deployed and delivered. Specific to projects, risks will be identified and assessed, enabling decisions to be made about the extent and nature of appropriate interventions. This will be done with stakeholders.

Interventions

Project risks will be evaluated using a scoring system to assess their impact and likelihood of occurring. There are four possible responses:

- Elimination – Where possible, we will act to eliminate the risk.
- Acceptance – When the severity of a risk is lower than our threshold of risk tolerance, we may decide to do nothing about it unless it occurs.
- Mitigation – When the severity of a risk is above our level of risk tolerance, we will act to reduce its impact or the probability of it occurring. The objective is to reduce its severity below our threshold of risk tolerance.
- Transfer – We may decide to move responsibility for a risk with the potential to impact a project to someone outside of that project. The risk does not disappear, but another party becomes accountable for dealing with it.

Each Team will maintain a Risk Register. Accountability for ensuring risks are appropriately managed will be maintained at the overall program level.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

PERFORMANCE MEASUREMENT

Performance measurement is fundamental to understanding when/how/if success is being achieved. The following describes how progress will be measured and reported, and funding enabled.

The Strategy Roadmap underpinning this proposal defines in detail the full range of strategic outcomes to be met over the initial life (5 years) of the company. To deliver these outcomes, *AGora* will:

- Focus on delivering its strategic roadmap by creating long-term goals that define where it ought to go and how to get there
- Understand the environment in which it operates and anticipate how this is likely to change to ensure it continues to meet the needs of stakeholders
- Create a strategic agenda with a future orientation that promotes the long-term sustainability and performance of the organization, aligned with its strategic direction
- Develop business plans that ensure cross-organizational alignment
- Establish a community wellness index to capture the less quantifiable goals like mental health, aging in place and youth attraction.
- Focus on, and measure results and use those results for resource allocation and continual improvement

1. Why, What and How

Appropriate, relevant, aligned and linked performance measures have been established to create a comprehensive Performance Measurement Framework.

AGora's Performance Measures are consistent, integrated and aligned. They deliver clear accountability to achieve results, from senior management to the front-line.

Our approach is based on the fundamental premise that performance measurement, performance management, and the strategic intent of *AGora* must be aligned. The measurement system is simple, spare, and meaningful, and informed by knowledge of how the work of the organization is aligned with strategic intent – answering the questions WHY (what is our purpose?); WHAT (what outcomes need to be produced to achieve it?); and HOW (how will these outcomes be achieved?). From this, specific measures, milestones and payment schedules can be developed, implemented and monitored.

2. The Strategy Roadmap Foundation

The Strategy Roadmap developed by the Design Team is the foundation to the Performance Measurement Framework, and will be further refined in the first implementation phase. Visualizing strategy on a single page, the Roadmap map answers the three critical questions: WHY, WHAT and HOW, with the strategic goal located in the centre of the Roadmap. Impacts linked to achieving the goal are identified on the right. Outcomes that contribute to achieving the strategic goal, and actions required to create these outcomes, are located on the left. Once the Roadmap was done, performance milestones, schedules and payments were linked to the outcomes. They were defined by:

- Identifying outcomes in the map as leading and lagging indicators of performance
- Identifying candidate measures for these outcomes
- Choosing an appropriate metric for each measure

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Defining the process used to collect and report these metrics
- Defining accountabilities for measurement and reporting
- Documenting the chosen measures and their purpose and use
- Identifying requirements for ongoing maintenance including provisions for modifying the framework as strategic direction and business plans change

Accountability is assigned for every action, and implementation is actively managed by monitoring outcomes. Each stakeholder sees where their contributions complement the contributions of others to achieve the strategic goal. The Strategy Roadmap enables an ongoing focus on outcomes during implementation. By bringing clarity to strategic goals and identifying the actions and outcomes required to achieve them, the map define risks and increases the likelihood of delivering results.

3. Design Considerations

Six questions have been considered in designing the performance measurement framework.

1. Where Will We Measure?

Since the objective is to evaluate how well *AGora* is achieving its strategy, we will measure performance across the entire Strategy Roadmap, with metrics in every capability area. Information will be collected and used to assess progress and adjust the strategy to produce the intended results. If an expected outcome is not being achieved, additional actions or a modified approach will be assessed. If outcomes are delayed due to delays in project delivery, the appropriate response may be to add additional resources or adjust a project timeline.

It is not necessary or desirable to measure every outcome. Rather, a subset of outcomes will be measured that confirm progress – including early, middle and late outcomes in the Strategy Roadmap. Early outcomes — the immediate results of an action — will be monitored to see if actions are having the desired effect. Middle outcomes – representing the combined effect of multiple preceding outcomes – will be monitored to verify that *AGora* is on track to develop capabilities needed to achieve its strategy. Late outcomes will be monitored to verify that it is on track in achieving the strategic goal.

2. What Will We Measure?

When selecting metrics, rigor has been balanced with ease of measurement. The objective is to maximize utility while minimizing effort. By their nature, some outcomes are *verifiable*. That is, they are either achieved or not achieved (the intended product is produced or not produced). Other outcomes are *quantitative* in nature and are achieved by degrees. In this case, we can ask how much or to what degree an outcome has been achieved. Where an outcome is not easily measured, we will consider using a surrogate that can be more easily obtained.

3. How Will We Measure?

Measurement options include:

- A management checkpoint that verifies a project has been completed and the expected deliverables have been created successfully
- Quantitative measurement of a variable that specifies the degree to which the outcome has been increased or decreased, has been eliminated, or is being maintained at a specified level

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- Survey questions based on well-structured rubrics designed to gather external stakeholder input.

4. When Will We Measure?

Frequency of measurement has been considered. Measuring more frequently increases the effort and cost required to collect, manage and report performance. Measuring less often reduces visibility and introduces delays in taking corrective action where measurement identifies a problem.

5. How Will We Manage the Information?

Performance measurement is not a one-time activity. Systemic change is realized over time, and trends are significant. Measuring over time, we expect to see progress toward achieving early outcomes, then middle outcomes, and finally late outcomes. We will implement a repository that stores performance measurement data for *AGora* that allows us to track these trends.

6. How Will We Report the Results?

Information extracted from the performance database will be reported for different purposes and in a variety of ways. The Strategy Roadmap itself can be used as a communication tool and performance dashboard, highlighting progress and areas where intervention is needed.

4. Realizing Outcomes

To ensure delivery occurs on time, on budget and with competency, a complete financial plan and delivery program has been created. Refer to the FINANCIAL appendix for full details. Core to this is identifying the milestone and deliverables necessary to monitor progress. Summary detail follows, with full links to financial performance described in the appendix.

A full delivery plan is articulated in this proposal, specific to the development of internal capacity and the delivery of four 'value streams' that bring life to the company and deliver the large number of technology development initiatives identified herein.

Broadly, delivery is divided into two phases:

1. Phase 1 will establish the necessary corporate capabilities to house *AGora* and its services.
2. Phase 2 is delivery and operations, with initial focus on defining and delivering the requisite pilots to enable hyper-local data collection and rural connectivity, alongside data collection, community enablement, creation of the full spectrum of web-enabled services and ultimately monetization of the data and systems created.

   As the end of the five-year period approaches attention will expand to include positioning of the values developed in *AGora* for deployment and adoption on a Canada-wide scale. Refer to the PROJECT MANAGEMENT chapter and the FINANCIAL appendix for full detailing of the work plans, milestones, outcomes and specific phasing.

By way of example, the full set of outcomes, costs and performance measures are provided, below, for Phase 1. Detailing of how the four full value streams will be achieved is outlined in the FINANCIAL appendix, and linked to the phased delivery plan, funding requirements and the milestones/metrics proposed to monitor progress.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Measures: Phase1, The Readiness Phase

In order to move from the state of "Proposal Approval" to a working and functioning *AGora*, a six-month readiness phase is outlined. Its main focus is to launch the organization and establish the change program.

The following detailed plan outlines this program in four iterations. Included in the boxes are Action-Outcome deliverables needed to be delivered to prepare the Value Stream for the next 6 months of work. During Iteration 4 the next large group planning session for the following six-month will be conducted. Phase 1 establishment will be achieved through 4 Agile cycles, each delivering progressively more detail and product. (Larger graphics included in the FINANCIAL appendix)

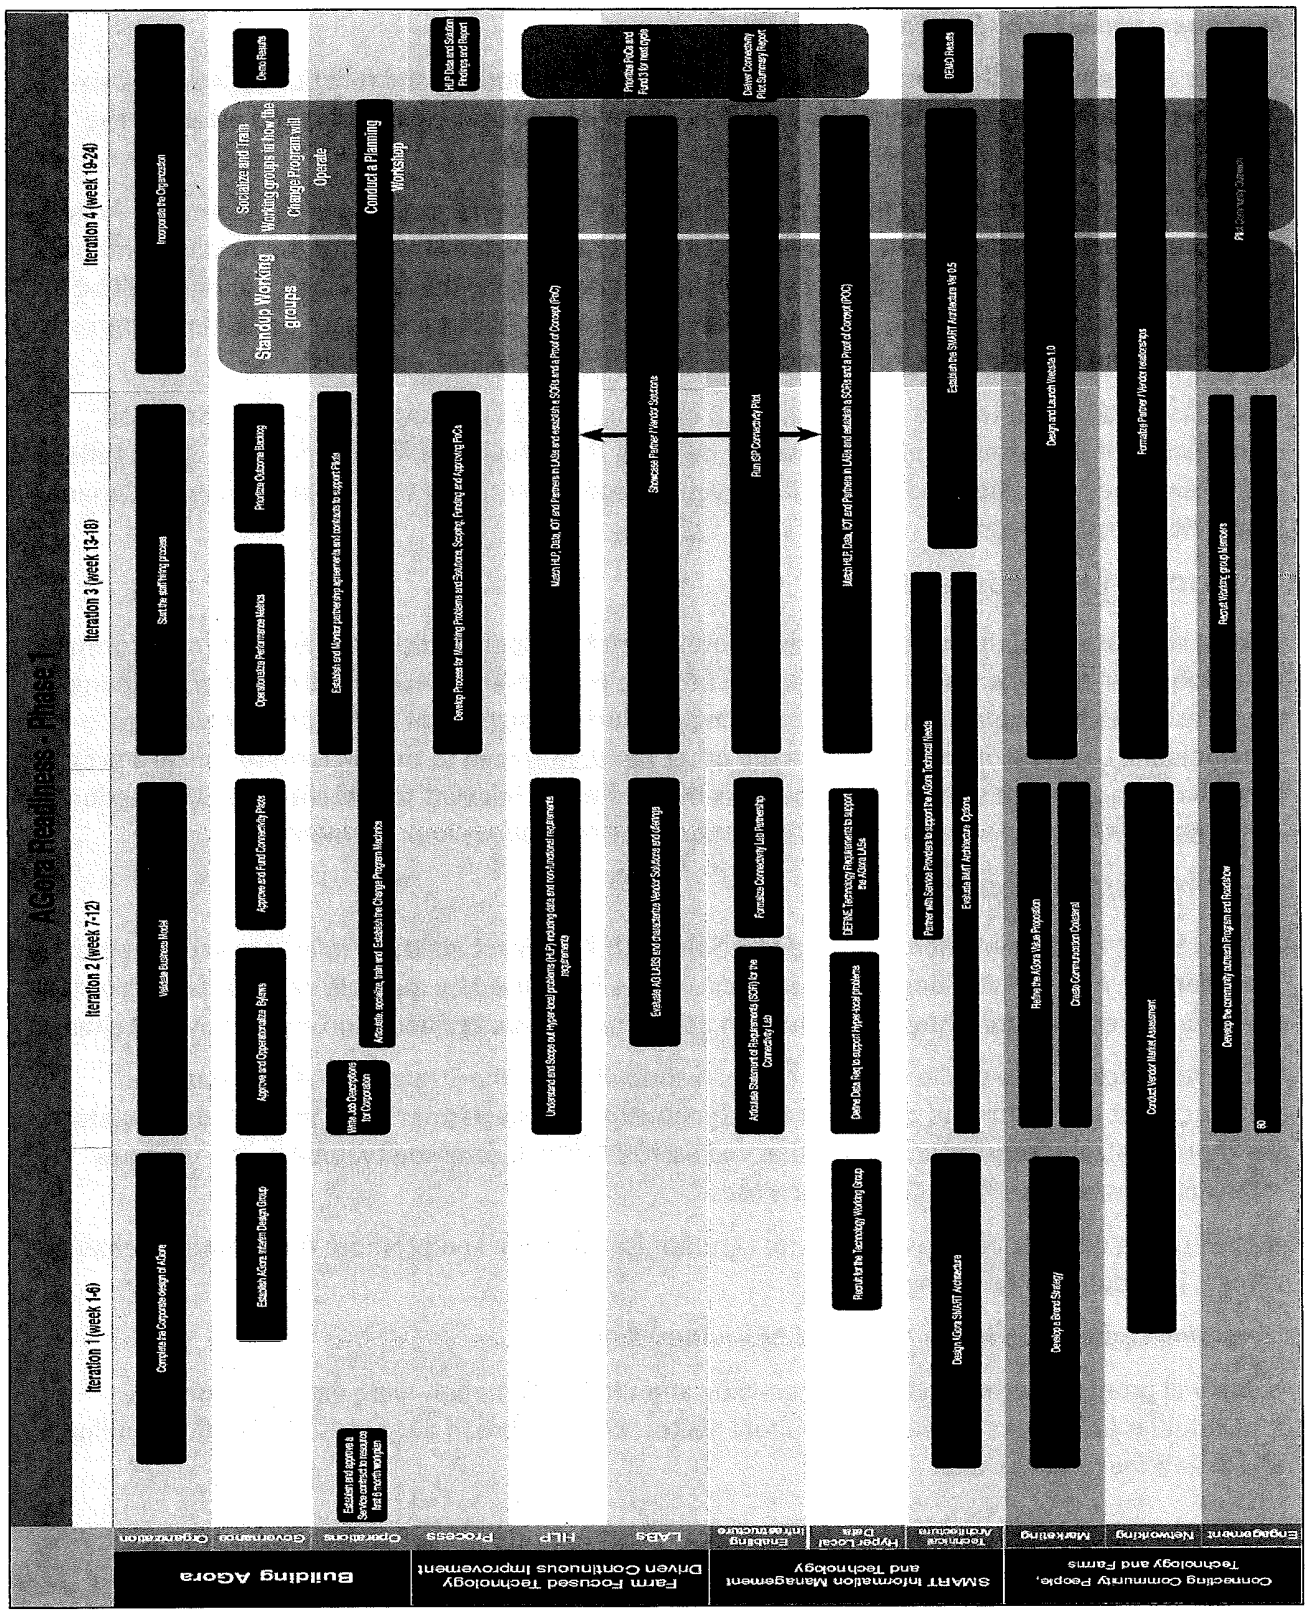
This phase is expected to take approximately 6 months, with all necessary and well-understood complexities of Agile-framed implementation defining the actual time for completion. This is reflected in the outcomes identified and the costing/revenue receipt processes to be negotiated with Canada that will underpin delivery.

5. Monitoring Progress

Using a measure-to-manage approach will allow *AGora* to respond quickly to results of a performance evaluation. For example, based on a report of positive performance, *AGora* will consider assigning more resources to programs that are generating products of significant and expressed value to stakeholders. Less favourable results, on the other hand, may lead to the decision to cancel a program, or to change a program so it produces outputs that are more relevant to stakeholders. The feedback loop supported by performance measurement enables continuous improvement.

6. Achieving Impact

While a $10M funding infusion will provide *AGora* with significant ability to influence actions across the four counties, many of the longer-term impacts will be influenced by multiple external factors outside of *AGora's* direct control. They will depend on achieving widespread adoption and behavioral change.



AGora recognizes these challenges and clearly distinguishes in the Strategy Roadmap between outcomes that are within the control of the organization and its partners, and much wider societal, environmental, and economic impacts that will accrue through community uptake. The ultimate impact is "*Prosperity in Rural Canada Increases*."

We will take a number of steps to increase community adoption and promote the required behavioral change, including the following:

Promoting Opportunities in a Renewed Agriculture Sector

AGora will promote region-wide, province-wide and ultimately nation-wide discussion of the opportunities linked to a renewed agriculture sector, creating broad awareness and understanding of a new future for rural Canada.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Supporting Early Adopters

Change will be led by those who see a new future. *AGora* will engage early-adopter farmers and business leaders and deliver value for them. They will become advocates for change based on their own experience, testifying how emerging communications technologies, data, and decision tools make farms more productive and profitable. This will broaden understanding and increase uptake.

Delivering Financial Benefits

AGora's business model envisages the collection, curation and monetization of data with and on behalf of the farmers and businesses involved. Direct financial benefits will be delivered in multiple forms (better farm practices, improved decision making, revenues from the use of data provided, etc.). In short, by participating in *AGora* farmers and local businesses will benefit financially.

This is expected to incent participation, enhance the value of the data collected, and increase revenue. A virtuous circle is created. Financial wealth should increase social resilience and collective investment in environmental sustainability – a much larger virtuous circle that underpins prosperity overall.

7. The Performance Measurement Framework

The measurement framework links the capabilities, outcomes and actions defined in *AGora's* Strategy Roadmap to performance measures. Data sources are identified. Key capabilities defined by the Design Team support outcome and measure. As capabilities are established and refined, greater certainty on how their linked outcomes are being achieved is defined through specific measures. In turn, these measures support payment through the outcomes-based approach being piloted by Smart Cities. *AGora* is pleased to be part of this leading-edge initiative to create a project delivery model based upon outcomes, and looks forward to establishing best practices that can be used Canada-wide.

8. Risks and Mitigations

AGora's proposed corporate structure inherently manages risk – duties, structure, planning processes, policies, regulations and overall accountability processes both assign responsibility and contain risk. The GOVERNANCE chapter fully articulates roles relative to how *AGora* will achieve results. While using the performance measurement system is not designed to be onerous, knowledgeable and skilled resources will be required to obtain the greatest benefit. From a business perspective, knowledge of the data structures and familiarity with the analytical and reporting tools will be most important. Competent technical support – particularly in database administration – will be essential.

Reporting performance measurements transparently will make a strong statement about accountability to stakeholders. Transparency will encourage dialogue with stakeholders about opportunities to make *AGora* more effective and will help to encourage a more collaborative effort among stakeholders to improve how it works.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

AGORA OUTCOMES
BUILDING AGORA

Roadmap Capability	Key Outcome	Source	Performance Measures
Governance	Independent governance is established	AGora checklist of governance requirements	Progress in implementing independent governance
Governance	The corporate structure and supporting practices are put in place	AGora checklist of structural elements and supporting practices	Progress in implementing structural elements and supporting practices
Governance	Corporate monitoring and reporting is implemented	AGora checklist of monitoring and reporting requirements	Progress in implementing monitoring and reporting requirements
Governance	Performance measurement tools, metrics and processes are established	AGora checklist of required measurement tools, metrics and processes	Progress in implementing measurement tools, metrics and processes
Operations	AGora staff and expertise support long term delivery and growth	AGora checklist of required staff positions and expertise	Progress in implementing staff positions and expertise
Sustainability	AGora is economically sustainable	AGora checklist of sustainability requirements	Progress in implementing sustainability requirements
Scalability and Transferability	AGora is replicable	AGora checklist of required standards, tools and processes to enable replicability	Progress in implementing standards, tools and processes to enable replicability

AGORA OUTCOMES
FARM-FOCUSED TECHNOLOGY-DRIVEN CONTINUOUS IMPROVEMENT

Capability	Key Outcome	Source	Performance Measures
Deliverables	New technologies for data-driven agriculture are used by farmers	AGora checklist of technologies for data-driven agriculture to be implemented	Progress in implementing technologies for data-driven agriculture
		AGora statistics	Adoption trends
		AGora survey	Structured feedback from users on their adoption of technologies for data-driven agriculture, satisfaction levels, and benefits received
Deliverables	Value added agriculture services are integrated	AGora checklist of value-added services to be integrated	Progress in integrating value-added services
		AGora statistics	Adoption trends
		AGora survey	Structured feedback from users on their adoption of value-added services, satisfaction levels, and benefits received
Deliverables	AGora initiatives solve hyper-local problems	AGora checklist of hyper-local problems to be addressed	Progress in defining and baselining the identified problems, matching them with solutions, and deploying solutions
		AGora statistics	Adoption trends
		AGora survey	Structured feedback from users on their adoption of solutions, satisfaction levels, and benefits received
Deliverables	Farms are more productive and profitable	AGora survey	Structured feedback from farmers on changes in productivity and profitability of their farm
		Third-party data	Statistics on farm productivity and profitability
Deliverables	The environmental footprint of farms is reduced	AGora statistics	Waste reduction data
		AGora survey	Structured feedback from farmers on progress in waste reduction
		Third-party data	Regional waste reduction

AGORA OUTCOMES
SMART INFORMATION MANAGEMENT AND TECHNOLOGY

Capability	Key Outcome	Source	Performance Measures
Technology	Infrastructure investments fill connectivity gaps in the region	AGora checklist of prioritized connectivity projects	Progress in completing prioritized connectivity projects
		AGora statistics	Visual map showing connected areas of the region and remaining gaps
Technology	AGora is underpinned by state-of-the-art infrastructure	AGora checklist of required infrastructure	Progress in completing required AGora infrastructure
		AGora statistics	Availability statistics
		AGora survey	Structured feedback from users on infrastructure performance, satisfaction levels, and benefits received
Data Integrity	Farm data is collected and used	AGora statistics	Volume of data captured and used, and the nature of use
Data Integrity	AGora data products are valuable	AGora checklist of required data products	Progress in implementing the data products
		AGora statistics	Use of data products by type
		AGora survey	Structured feedback from farmers, partner and vendors on the data products they use, satisfaction levels, and benefits received

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Data Integrity	AGora technology supports data-driven agriculture	AGora checklist of required technology	Progress in implementing technology
		AGora statistics	Use of technology by type
		AGora survey	Structured feedback from framers on the technology they use, satisfaction levels, and benefits received
Deliverables	AGora provides an R&D Environment	AGora checklist of required functionality	Progress in implementing the required functionality
		AGora statistics	Nature of R&D, number of R&D hours, and AGora capabilities used
		AGora survey	Structured feedback from researchers that they have the capabilities they need, satisfaction levels, and benefits received

AGORA OUTCOMES
CONNECTING PEOPLE, TECHNOLOGY AND FARMS

Capability	Key Outcome	Source	Performance Measures
Collaborators	AGora creates a network of collaborators that includes First Nations, environmental groups, Provincial and Federal Government, the private sector, social sector	AGora statistics	Number and type of collaborators, trends, and the nature and level of their collaboration
		AGora survey	Structured feedback from collaborators on their motivation to collaborate, the nature of their collaboration, satisfaction levels, and benefits received
Collaborators	AGora partners are recruited, trained and serve as Ambassadors	AGora statistics	Number and type of partners, trends, and the nature and level of their participation
		AGora survey	Structured feedback from partners on their motivation to partner, the nature of the partnership, satisfaction levels, and benefits received
Collaborators	AGora attracts champions and early adopters	AGora statistics	Number and type of champions and early adopters, trends, and the nature and level of their participation
		AGora survey	Structured feedback from champions and early adopters on their motivation to enroll, satisfaction levels, and benefits received
Marketing	AGora attracts new users to its programs	AGora statistics	Number and type of users by program, recruitment trends, volume of use
		AGora survey	Structured feedback from users on their motivation to connect with AGora, satisfaction levels, and benefits received
Marketing	The community engages with the AGora program and is involved in its implementation	AGora statistics	Human resources shared, physical resources shared, funds committed to initiatives
		AGora survey	Structured feedback from community members and organizations on the nature of their involvement and their intention to become involved
Marketing	Success stories are routinely communicated to the AGora network	AGora statistics	Communication materials developed, frequency, communication channels used
Marketing	There is broad awareness of AGora's mission and accomplishments	Web statistics	Website visits, product downloads, number of followers on social media
		AGora survey	Structured feedback from community members, partners and prospects on their level of awareness of the AGora and its accomplishments

AGORA IMPACTS
REGIONAL BENEFITS

Domain	Key Impact	Source	Performance Measures
Economy	The regional economy is strengthened	AGora survey	Structured feedback from farm operators and regional businesses
		Third-party data	Regional economic growth, employment statistics, new business creation
Community	Community is strengthened	AGora survey	Structured feedback from community members
		Third-party data	Community demographics, key social indicators
Environment	Environmental quality is improved	AGora database	Aggregated farm data
		Third-party data	Key environmental indicators
Food Security	Food security is increased	Third-party data	Annual cost of food for the average family in the region

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

DATA AND PRIVACY

AGora will create and securely manage data on behalf of all data providers. Significant effort has delivered what we believe to be the most effective means to protect these data. Protecting it in ways that build confidence by data providers that the data are, in fact, protected, and providing a fully secure means of supporting use of the data by multiple end users.

Key issues related to open data, sensitive data, data security and data monetization on behalf of the data providers, and others, are outlined in this chapter, the TECHNOLOGY chapter and the TECHNOLOGY confidential annex.

1. Integration of Security and Privacy Considerations in Project Design

AGora will become a Data Trust enabler, working with data producers and consumers to help them to reap the rewards and value from their data assets while contributing to regional and national understanding of Canadian agriculture. Deployment will position the four counties as global leaders in managing and using agriculture data. Further, this platform will deliver system security, control over assets and will assure privacy of materials held.

A Trust in the traditional sense of the word is a three-party relationship in which an asset or value is transferred from a Grantor to a Beneficiary through a Trustee. This "three-node" network creates a trusted relationship between the parties whereby assets can be shared or transferred based on the governance rules of the trust.

A Data Trust takes this concept further and establishes a governance framework – an architecture and supporting technology infrastructure to enable sovereignty and ensure trust related to the data and derivative data assets. It provides a framework for stewardship over these assets for the benefit of the people or organizations in the Trust. Members of the Trust have control and sovereignty over their data assets and relationships between data partners.

The Data Trust includes deployment of distributed software infrastructure that enables data partners to securely share and exchange data with proper equitable and transparent policies and governance structures, while creating a fair balance of power and control between those who produce the data (citizens and clients) and those managing the infrastructure, or processing and using the data.

Importantly, the technology deployed enables control and flexibility in rules and guidelines. It is not prescriptive in forcing specific governance methodologies, nor does it force any data localization methodologies. Members of the *AGora* Data Trust will establish the terms under which data will be used, shared, generated and monetized to meet their needs.

2. Guiding Principles for Data

Data governance is one of the most important public policy issues of our time. Data is the new enterprise currency. It is ubiquitous, and data stockpiles are proliferating. Data collected by the private sector and governments underpins decision-making and boosts economic productivity and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

competitiveness. Protection of this data is central to our long-term prosperity and the preservation of public trust across society.

Data Governance

When data is properly governed, a fair balance of power and control exists between data producers and those who manage technology infrastructure, processing, and/or deployment capabilities. More specifically, an open, transparent and robust Data Trust is required to reap the economic and social prosperity benefits from artificial intelligence – a game-changing invention in which Canada has played a leading role. On a national level, Canadian data should be governed by Canadians.

A Data Trust helps ensure data belongs to and is governed by those who create it. It establishes a governance framework, an architecture, and the supporting legal and technological infrastructure required to enable sovereignty and ensure trust over the data and derivative data assets. It provides a binding framework for stewardship over the data assets for the benefit of the people and/or organizations in the Trust.

Data Accessibility

The Sightline Innovation Data Trust (SID) is the only Canadian artificial intelligence software that creates a circle of trust for data. It enables flexible, transparent, and precise policy definition for all data shared among partners. Additionally, it will provide compliance assurance of policies for both data exchange and data usage. It manages membership changes and policy updates in a Trust while ensuring authenticity of messages and members within the Trust. Lastly, it manages remuneration and value transfer of data that is processed and exchanged between producers and consumers.

Data Security

Included in the governance structure of the Data Trust is the requirement to use industry best practices for data security. The Trust also ensures that all legislative requirements regarding data and privacy, both provincial and federal, are met.

Consent

Consent is integral to the Data Trust. All members, by virtue of being part of the Trust, consent to the terms and governance structure of the Trust. Furthermore, the Data Trust will provide distinctions in governance between data and personal information to provide additional layers of consent.

Data Minimization

Data minimization is typically practiced outside of a Data Trust to limit or reduce exposure to data misuse and/or theft. The Data Trust allows members to maximize their data production in a sovereign and secure manner for monetization purposes. Data is disseminated to consumers (researchers, the private sector, members of the Trust, etc.) to extract value through a secure channel that supports effective data standards, compliance, security and auditing.

Data De-Identification

The Data Trust technology creates synthetic datasets to ensure complete privacy. This creates anonymized features of the real data for analysis – not traceable to individuals or companies. This can

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

be done at the farm level and shared within the trust. Full audit trails and tracking of data usage and derivative data usage within the trust is possible through a distributed ledger and smart contracts.

3. Management of the Data Life Cycle

The Data Trust technology creates an agreed upon structure for management of the data life cycle (creation, storage, use, monetization, derivative data creation and use, derivative data monetization, etc.). Specific details governing the data life cycle will be established in conjunction with members of the Trust. This ensures the structure of the Data Trust meets the needs and goals of the members as well as addressing any local requirements. Industry best-practices will guide governance development and inform the processes used for data life cycle management.

The design architecture contemplates and addresses key concerns linked to data collection, analysis storage and transmission, to name a few.

4. Open and Big Data Strategies

Open data is important for innovation. It also is an important part of building trust with citizens. *AGora's* data trust does not force specific governance rules – it will build them with the data providers. Therefore, closed data, open data or hybrids of the two are all compatible with the trust architecture. In fact, Data Trusts enable open data to be executed properly and at scale. Additionally, Data Trusts enable data to be verified prior to being made open and allow the use of that data to be tracked. As a consequence, open data is stronger and more scalable.

5. Compliance with PIPEDA and Other Privacy Regimes

Jurisdictions like India and the European Union have sought to cement data and citizen's rights to privacy as a "fundamental human right." Data movement and control of data has been a leading public policy priority for Europe for nearly a decade, culminating in development of the General Data Protection Regulation (GDPR). Countries have recognized the growing conflict between the value of data and individual privacy and consent. According to the European Commission (EU), by 2020 the value of personalized data will be 1 trillion Euros – almost 8% of the European Union's GDP.

The Canadian Federal government is forming a National Data Strategy. Data use and privacy are defined in the Personal Information Protection and Electronic Documents Act (PIPEDA), the Canadian law relating to data privacy. This governs how private sector organizations collect, use and disclose personal information in the course of commercial business. The General Data Protection Regulation (GDPR) came into effect in Europe on May 25, 2018. This is viewed as a significant update to traditional data regulations, for it defines basic rights for an individual (the "data subject") over their personal data. This has put much greater control into the hands of users and more accountability on businesses that violate the legislation.

The Data Trust enables the participants to define access to data, whether it is personal or non-personal. It does not prescribe or presuppose any rules or regulations. The proposed technology-based solution will establish the means through which GDPR or other regulations are automatically enforced.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

6. Transferability and Replicability of Technologies and Projects

The Data Trust is readily scalable. Other groups in different geographies can be added as a node to *AGora's* Data Trust. Alternatively, the Data Trust can be replicated for other regions so there is alignment in terms of data sovereignty and the freedom to meet local and/or provincial requirements. Regulations around food inspection, for example, may differ between provinces. This could impact goals or user requirements of the Data Trust in other regions.

7. Risks and Mitigations

Of fundamental importance is the protection of data and related privacy of information. *AGora's* proposed corporate structure inherently manages risk – duties, structure, planning processes, policies, regulations and overall accountability processes both assign responsibility and contain risk. The GOVERNANCE chapter fully articulates roles relative to how data security will be managed, deployed and delivered. Central to this are the staff that will be employed – the CTO and others – and the several Policy Frameworks identified in this proposal that will be created in support.

This chapter describes in full both the technology providers proposed for partnership, their security structure and the technology base inherent that will protect data. Central to this is the Data Trust. Guiding Principles establish the foundation upon which risks will be identified, managed and mitigated. Disaster recovery plans, data security, and other will be built from this base, vetted by Executive and ultimately approved by the Board where appropriate.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

FINANCIAL

In line with the competition guidelines, a budget has been developed that will fully invest upwards of $10M to be made available over a five-year delivery period.

The following budget detail is provided by phase (establishment/operation), value stream, and year. Value streams are modelled on Lean/Agile methods, and key initiatives grouped thematically.

1. Project Budget

During the first five years, work will be delivered in two broad phases, with Phase 1 delivering necessary corporate capabilities to house *AGora* and its programs. Phase 2 is delivery and operations, with initial focus on defining and delivering the requisite pilots to enable hyper-local data collection and rural connectivity, alongside data collection, community enablement, creation of the full spectrum of web-enabled services and ultimately monetization of the data and systems created.

As the end of the five-year period approaches attention will expand to include positioning *AGora* for deployment and adoption on a Canada-wide scale. Refer to the PROJECT MANAGEMENT chapter and the FINANCIAL appendix for full detailing of the work plans, milestones, outcomes and specific phasing.

Approach

Delivery will be enabled using the well understood Agile implementation framework. This proven approach is widely adopted - requirements and solutions evolve through the collaborative effort of self-organizing and cross-functional teams and their customer/end user. In *AGora's* case, Agile implementation teams will emerge from those engaged to date, with the Strategic Plan, Strategic Design team and consultants involved establishing the core members that will create the company. Members, products, timelines structure and processes will develop from this core.

Significant financial detail is provided on Phase 1 - establish *AGora* corporate operations. This is intentional, as this is the first most critical phase. Moreover, once a Board of Directors and an Executive Team are in place, they will be expected to take an active role in defining how the following work will be achieved, in accordance with this initial plan.

Phase 1 establishment will be achieved through 4 Agile cycles, each delivering progressively more detail and product. This phase is expected to take approximately 6 months, with all necessary and well-understood complexities of Agile-framed implementation defining the actual time for completion. This is reflected in the outcomes identified and the costing/revenue receipt processes to be negotiated with Canada that will underpin delivery.

Phase 2 will maintain the Agile approach and philosophy. Delivery cycles will be defined and delivered to the newly constituted Board and Executive in advance of approvals to proceed.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

2. Financial Management

Fiscal oversight will be provided first through existing administrative support of Parkland County. Once *AGora* is established, a Chief Financial Officer will be employed and deliver Generally Accepted Accounting Principles (GAAP) processes to establish full financial accountability, including audited financial statements.

Budget Structure – Value Stream Summary

The following budget summarizes investment by delivery Phase and Value Stream.

Value Stream	Phase 1	Phase 2	Total
Building *AGora*	2.4%	54.0%	56.4%
Farm Focused Technologies	0.3%	5.7%	6.0%
SMART Information Management	4.3%	26.3%	30.6%
Connecting People with Technologies	1.1%	4.5%	5.6%
Sub-total	8.1%	90.5%	98.6%%
Total hardware (all phases/streams)			26.2%
Tax on hardware			1.3%
Total			100%

The FINANCIAL appendix attached provides full detailing on cost elements that are defined along the four Value Streams. These Value Streams consolidate functions into delivery requirements and deliver cross functional alignment.

1. Activities associated with establishing, staffing and running the company are grouped into "Building *AGora*" Value Stream.
2. Activities related to on-farm capabilities are housed in the "Farm Focused Technology" Value Stream,
3. The "SMART Information Management & Technology" Value Stream identifies all cross functional requirements to establish and maintain the systems that will underpin *AGora*, data trust and data oversight, as well as architecture design requirements.
4. The final Value Stream – "Connecting People, Technologies and Farms" lays out specifics on how community engagement and understanding will be achieved.

Building AGora

This Value Stream is the core of *AGora*. It will deliver the organization that will anchor, lead and oversee all *AGora* work, including corporate design, organization, governance and operations. Initial work focuses on creating the company, defining bylaw, operations, policies, etc., that set *AGora* on a positive course. Operational costing reflects what is expected of a new firm – Human Resource, governance and operational requirements to deliver, pursuing additional partnerships and revenue sources and the like.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Farm Focused Technology Driven Continuous Improvement

This Value Stream is the critical connection of *AGora* to the farms, farmers and communities that are volunteering as early adopters. It will establish the requisite capabilities for on-farm data collection and support software design and delivery through the first five years of *AGora* operations. Through discussion with early adopter farmers, the specific hyper-local challenges will be identified, appropriate data collection systems modelled and put in place, and a process to derive value from the data collected will be defined.

Fundamental to the success of this value stream is the participation of the early adopter farmers, proper framing of the problems to be addressed and the development of decision support tools that will flow back to the farmers to improve on farm decision making.

SMART Information Management & Technology

This Value Stream is *AGora's* technological backbone with three main themes: Connectivity infrastructure, hyper-local agricultural data and SMART architecture This value stream consolidates the technology requirements to both establish *AGora* (GIS systems, etc.), pilots that will determine how other infrastructure (electric/gas) can be effective delivery agents for connectivity, data cleanup and overall proofs of concept tied to software that will deliver value to the data providers and beyond.

Connecting People, Technology & Farms

This Value Stream is the key connection between *AGora* and the community at large. It will establish *AGora's* brand and key value statements. Networking, marketing and engagement underpin activities. Delivery of a community engagement, community outreach and leadership development process is framed in this section. Branding, web management and social media are costed into this stream. A full marketing plan has been developed that will underpin initial activities of this stream.

3. Budget Structure – Annual Investment Summary

Value Stream - Theme	Year 1	Year 2	Year 3	Year 4	Year 5	Total
Building *AGora*	$ 794,050	$1,188,100	$1,254,603	$1,216,643	$1,189,234	**$5,642,629**
Farm Focused Tech Continuous Improvement	$ 56,000	$ 100,000	$ 127,500	$ 155,000	$ 160,000	**$ 598,500**
SMART Information Management and Tech	$ 420,000	$ 630,000	$ 685,000	$ 675,000	$ 650,000	**$3,060,000**
Connecting People Technology and Farms	$ 159,000	$ 100,000	$ 100,000	$ 100,000	$ 100,000	**$ 559,000**
SUB-TOTAL	$1,429,050	$2,018,100	$2,167,103	$2,146,643	$2,099,234	**$9,860,129**
Hardware - All Streams	-	-	-	-	-	**$2,623,00**
Applicable taxes						**$ 131,150**
TOTAL	14%	20%	22%	21%	21%	**$9,991,279**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The above table describes the investment to be made in the first five years of activity. Overall, approximately $5.64M will be directed towards establishing human resource capacity across the four counties and to deliver programs. Fully defined on farm investments that will enable state of the art connectivity and data collection comprise approximately $0.60M. In addition, *AGora* will invest approximately $3.06M in technology design, proof of concept and technology development. Investment in community awareness, capacity development, and engagement accounts for an additional $0.56M. On balance, approximately 20-22% of total investment will occur each year, with relatively less required in Year 1. (Please note that summary detail in Section 5 details investment by infrastructure type, not Value Stream)

4. Methods, Sources and Assumptions to Deliver Confident Cost Estimates

Identification and compilation of required costs to deliver upon (1) the initial proposal; and (2) the strategy defined by *AGora's* Design Team was a core requirement of contracts tendered under the $250,000 grant to develop this proposal. Each contract included a costing exercise, ranging from delivery of a long-term marketing plan, infrastructure to enable connectivity across the four counties, the various pilots and labs, to staffing and operational support. Details of these contracts are provided in the following section, Reporting on Use of the Finalist Grant.

Specific contracts defined the organizational structure required to implement *AGora*, including human resource, operating and core infrastructure costs and additional policy/design requirements. Costs, implementation design, partnerships, and timelines were developed for the proposed pilots and labs. Overall, level 2 (at a minimum) cost estimates were provided through contract.

- Infrastructure Deployment & Requirements: Taylor Warwick Consulting Ltd. summarized broad costs for full connectivity and delivery.
- Initial Corporate Creation: Integral Strategy Network Inc. defined required elements to take the strategic design from concept to reality over the first delivery phase of the project. The strategic roadmap defined the core elements for *AGora* creation. Each element was costed in consultation with sector experts, both internal and external to the firm.
- Marketing and Community Engagement Plan: Kumpula Design Inc. delivered a full marketing and communications strategy for *AGora* creation and implementation.
- Annual HR, Operating and Deployment Costs: Integral Strategy Network Inc. defined the annual cost of operating *AGora*, based on design considerations identified by the Design Team. Core delivery requirements inside *AGora* were developed based upon outcomes defined in the Strategy Roadmap. Input from organizations of a similar scale, like TECTERRA, were benchmarked.
- *AGora* Technology Platform: Ventus Development Services Inc. confirmed GIS as a core component of the technology platform. Discussion with ESRI Canada and others confirmed that this platform could be implemented, and the cost of its implementation and operation. Costs were cross-verified by Ventus and ISN prior to our including them in the financial plan.
- *AGora* Data Trust Enablement: Integral Strategy Network Inc. discussed Smart Cities Challenge conditions related to privacy and security with technology experts and confirmed costs required to host, manage and support secure tracking and monetization of data in a data trust environment ensuring the appropriate protections are in place.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- Infrastructure Pilot & Implementation: Ventus Development Services Inc. defined technology requirements, development partners, costs, timing and risks associated with a series of pilot projects *AGora* will deliver. These initiatives have been included in *AGora's* roll-out plan.
- Consolidation and Alignment: All cost elements were brought together by Integral Strategy Network Inc. as part of this proposal development process. Key cost elements were vetted for consistency, accuracy and applicability and integrated into the budget and the workplan.

5. Contributions from Other Sources

Significant support for *AGora* has been obtained from external sources. Fifty-five letters endorsing the proposal gives confidence to the proponents of core viability, private sector interest in moving forward in alliance, academic support, and overall interest in cost sharing and participating in future activities.

Support is broadly aligned with the implementation process, with firm external support in place to establish *AGora*, to be confirmed once the company has been established.

Support to Establish and Maintain the Corporate Structure

Specific financial and non-financial contributions underpin initial establishment. Significant work is required to create the company, as identified in the GOVERNANCE chapter, to deliver the central outcome of "*An effective delivery structure is established*." To this end, a stakeholder group will be created, and they ultimately will form the core of the Board of Directors. Each has indicated interest and is willing to provide in kind time and effort in support. These efforts are estimated as follows:

- 2 Board meetings/month for 9 months and then 4 per year thereafter = $153,000;
- 1 Technology Working Group meeting/month for 9 months and then 6 per year thereafter = $148,500.

Parkland and participating counties have agreed to provide logistical and administrative support to establish *AGora*. This includes significant effort by Ms. Barb Scully, who will maintain her role of lead project coordinator, salaried through Parkland County. Administrative and accounting support also will be provided.

- These contributions are estimated at $130,000.

Integral Strategy Network Inc. (ISN) will deliver corporate establishment and work in partnership with the emergent Board of Directors, the respective counties, other consultants as required, and legal firms to 'stand up' *AGora*. ISN has been involved since inception, and discussions confirm ongoing interest in maintaining continuity in support. ISN has committed to providing support at a reduced cost (50% discount) that recognizes the future potential of *AGora*.

- This contribution is estimated at $441,500.

Technology Providers for AGora Operations and Infrastructure Pilots

Technology providers have indicated interest and confirmed support. Most significant, four energy utilities will provide time and effort in support of proofs-of-concept through the Regional Connectivity Lab pilot projects. FortisAlberta, EQUS REA Ltd., ATCO Gas and Zayo Group have all confirmed their interest in participating in pilot initiatives to assess how their existing infrastructure can be used to support broad deployment of rural communications technologies. **This is considered a fundamental**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

achievement. The ability to collect and move information cost-effectively in a rural region is essential. *AGora* will determine how this will be achieved through the participation of these companies.

Other technology providers have confirmed interest in helping to establish *AGora* core operations. Both ESRI Canada Inc. and Sightline Innovation Inc. have expressed interest. Sightline Innovation has offered their family of Data Trust platform technologies and has confirmed the participation of their Chief Technology Officer, Dr. Mark Alexiuk, in the Technology Working Group. ESRI Canada has offered their family of GIS technologies. Future discussion will fully define each of their respective roles. Niche vendors exist that offer translation from Latitude/Longitude co-ordinates to Premise ID, the foundation of location for Livestock and Poultry movement.

- Detailed discussion between the project proponents and Sightline Innovation Inc confirmed their support. They will provide $100,000 in kind contribution towards the project.

Technology providers/research interests; data access and software development

Numerous firms have confirmed interest in participating with *AGora* in design and delivery of software tailored to a rural agricultural clientele. A number of Application Labs will be initiated in partnership with private sector interests, academia and government. This will enable the Labs and deliver decision support and other tools necessary to take full advantage of the data to be managed by *AGora*. These Labs will be established later and, no fixed cost, fixed price, or fixed amount of external contribution has been assessed at this time.

- Detailed discussion between these companies and the Parkland Smart Connected Communities Program Manager in the development of this proposal has conservatively estimated the value of these contributions at an additional $10M.

6. Tools Utilized

AGora will receive accounting and administration support from Parkland County, as noted above. Its accounting systems and practices are compliant with Canada's Generally Accepted Accounting Principles. They have been vetted by Alberta Municipal Affairs. Furthermore, we have included in *AGora's* budget professional accounting services and Annual Audited Financial Statements.

We also will ensure we are fully compliant with any Contribution and Reporting agreements required by Infrastructure Canada and the Canada Revenue Agency, should our proposal be successful.

7. Reporting on Use of the Finalist Grant

To develop and deliver a successful proposal the Smart Cities Challenge provided $250,000 to Parkland and its partners. All funds were used directly in support of this proposal. Five contracts totaling $250,000 were released through an invitational tender process to secure the best proponent and link products to required outcomes that now drive the proposal itself. Proponents were selected in fall 2018, and contracts were developed to deliver specific project components, based on Smart Cities Challenge design criteria. Contract oversight was provided by Parkland County's Connected Communities Program Manager, Ms. Barb Scully, with contract administration provided by Parkland's financial administration office.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The following table summarizes the use of funds.

Tender Recipient	Select Deliverables
Integral Strategy Network Inc.- $50,000 - September 27, 2018 - Sustainability Strategy	Create a long-term strategy that would see the incubator be successful and expanded beyond our region after the initial development to include and be available to all areas of rural Canada. Look at opportunities that will create a financially sustainable future for the Incubator past the award dollars being used. Create a list of stakeholders and what their contribution could be towards the sustainability of the Incubator.
Ventus Development Services Inc. - $50,000 - September 28, 2018 - Virtual Ag Incubator	Develop a mandate and role for the organization. Review and assess similar global centres for Ag innovation. Define necessary conditions for success, organizational design, partnerships to be engaged, competitive advantages to be sought, staffing, applications and platforms required to be delivered and capital/operating requirements to bring life to the initiative. Define broad timelines for implementation.
Kumpula Design Ltd. - $50,000 - September 27, 2018 - Marketing and Communications Plan	Deliver a series of community events to continue and enhance the Smart Cities community engagement efforts accomplished to date. Further engage residents and businesses to gather input into the design of the Smart Cities Strategy, and components of the Living Lab. Build widespread understanding of what will be possible as the Parkland Smart Community plan continues to be fully implemented. Deliver an effective, long-term outreach plan to keep residents informed throughout the implementation phase will be needed.
Taylor Warwick Consulting Ltd. - $50,000 – September 27, 2018 - Infrastructure Assessment and Plan	Deliver a complete review and gap assessment on the installed broadband infrastructure in all participating Counties. Recommended approach to resolve gaps and recommendations regarding core technology choices to deliver equitable internet/cellular access for residents and businesses in the region. Summarize broad costs for implementation and delivery.
Integral Strategy Network Inc. - $50,000 - 27 September 27, 2018 - Strategy and Final Application	Form and brief Strategy Roadmap design team; build strategy. Conduct "information interviews" to obtain opinions from those influencers who need to be consulted (as required). Ensure regular input and communication with and from the other consultant teams and Parkland County's Project Manager. Develop, coordinate and consolidate information from other teams. Develop overall Smart Cities Challenge submission.

8. Risks and Mitigations

AGora's proposed corporate structure inherently manages risk – duties, structure, planning processes, policies, regulations and overall accountability processes both assign responsibility and contain risk. The GOVERNANCE chapter fully articulates roles relative to financial management and control will be delivered.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

IMPLEMENTATION PHASE REQUIREMENTS

This chapter describes plans to meet applicable municipal, provincial, and federal reporting and legislative and policy requirements. Much is formative, and will be actioned following selection.

1. Compliance with Reporting, Legislative and Policy Requirements

As AGora is not yet an incorporated entity it is not in violation of any municipal, provincial or federal laws, regulations or policies. As a matter of doing business, AGora will ensure the requirement for compliance with these rests with the Board along with a formal responsibility placed on the AGora CEO and CTO to ensure these are monitored and complied with over time. We have also established a relationship with Service Alberta to advise us and to assist in this regard. Once operational, AGora will identify and establish similar relationships with appropriate municipal and federal entities.

2. Duty to Consult with Indigenous Groups

Recognizing that the region's agricultural lands were originally those of the Indigenous people *AGora* will take extra care to ensure they have the opportunity to provide input and influence the initiative – during the proposal phase as well as moving forward. This will include recognition of rights, respect, co-operation, and partnership with our Indigenous neighbors.

In forming this final proposal, we engaged Enoch Cree First Nation and Paul First Nation as future collaborative partners and have received letters of support from both Nations' Chiefs. We have identified that *AGora* had several agriculture areas that will support goals of partnering with the Nations in areas such as food security, education, technology and connectivity. Upon awarding of the Smart Cities Challenge prize, we will extend our engagement to all Indigenous communities in our region as well as the urban Indigenous community in neighbouring towns and cities.

We also have created a collaborative relationship with the Metis technology business 3CIS. 3CIS specializes in rural connectivity with a history of working in rural municipalities and First Nations communities, as well as a background in software and technology solutions. We also have consulted with the Technical Services Advisory Group (TSAG), a not-for-profit provider of technical and advisory services for First Nations in Alberta. TSAG is mandated by the Chiefs of Alberta and takes direction from a Chiefs Steering Committee and Board of Directors, which include representatives from Treaty 6, Treaty 7, and Treaty 8.

Modern Treaty Obligations

We are not aware of any modern treaty rights applicable to this region.

Reconciliation and strong and sustainable communities have been discussed in outreach conversations with neighbouring First Nations. *AGora* is committed to these objectives as a basic principle and will works towards these ends in its delivery, in its full implementation and roll-out of initiatives.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3. Community Employment Benefit (Employment and Procurement Opportunities)

If awarded the $10 million, *AGora* will participate in the community employments benefit initiative. As a region we recognize that increasing employment opportunities is a win for all – including helping to employ the underemployed, creating a regional knowledge workforce that can become sustainable and successful, and creating more opportunities for small, medium and social enterprises. By creating a target and an implementation framework we have the means to grow the local economy while participating in the larger global economy.

According to the government of Alberta (https://investalberta.ca/industry-profiles/agri-foods/)

"Alberta offers a high-quality supply of primary products and is the third largest exporter of agri-food products in Canada. In 2017:

- *Alberta exports of primary and processed agricultural and food products totaled $11.2 billion.*
- *Alberta produced 33 percent of Canadian wheat, 32 percent of canola, nearly half of the nation's barley, and 16 percent of Canada's oats*
- *Alberta led the nation in cattle and calf inventory, accounting for more than 40 percent of Canada's total*
- *Alberta's agri-food industries employed 75,100 Albertans: 52,100 in primary agriculture and 23,000 in food and beverage*
- *Alberta's food and beverage processing industry was the second largest manufacturing employer in the province in 2017, employing 23,000 people, and accounting for $14.4 billion in manufacturing sales."*

Given these statistics we know *AGora* can increase employment opportunities for Indigenous peoples, women, and youth; and procurement opportunities for small-sized, medium-sized and social enterprises. We will establish an outreach program to make these opportunities known to these segments in the four counties.

In the phased approach we will take in developing *AGora* we know we will see an increase in training and employment opportunities for the listed groups. As *AGora* begins to grow in both scope and users, we expect it to attract new agri-food opportunities and larger private enterprises.

There is opportunity for under-employed people in the region from the cottage industry processor to larger facilities. Through *AGora* support we can grow agricultural production for women in agriculture and transfer agricultural opportunities to youth with succession planning. There also will be multiple procurement opportunities for goods and services provided by small, medium, and social enterprises.

AGora Innovation Labs are specifically geared to improving regional opportunities for these target populations. We have benchmark information collected in 2016 and propose not only to target improvements in these areas, as identified in the table below, but also will revisit these benchmarks and re-establish new targets annually.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

SECTOR	CURRENT SITUATION[1]	TARGET	SOLUTION
Indigenous Peoples	Known labour market gaps and underemployed workers in the region	2% increase annually	Through *AGora* supports and specific outreach programs we will grow agricultural production opportunities for Indigenous peoples in the Region, particularly in agriculture and food security
Women	Known labour market gaps and underemployed workers in the region	5% increase annually	Through *AGora* supports we will grow agricultural production opportunities for women in agriculture
Youth	Known labour market gaps and underemployed workers in the region	5% increase annually	We will expand agricultural opportunities to regional youth through a focus on improved succession planning
Small, Med and Social Enterprises	Unknown	10 new contracts awarded	We will target requests to these companies to supply goods and services to *AGora* and its participating partners

1. Sourced from "Parkland County – Labour Market Profile, December 2017". Completed by Applications Management Consulting Ltd. for Alberta Labour and partners.

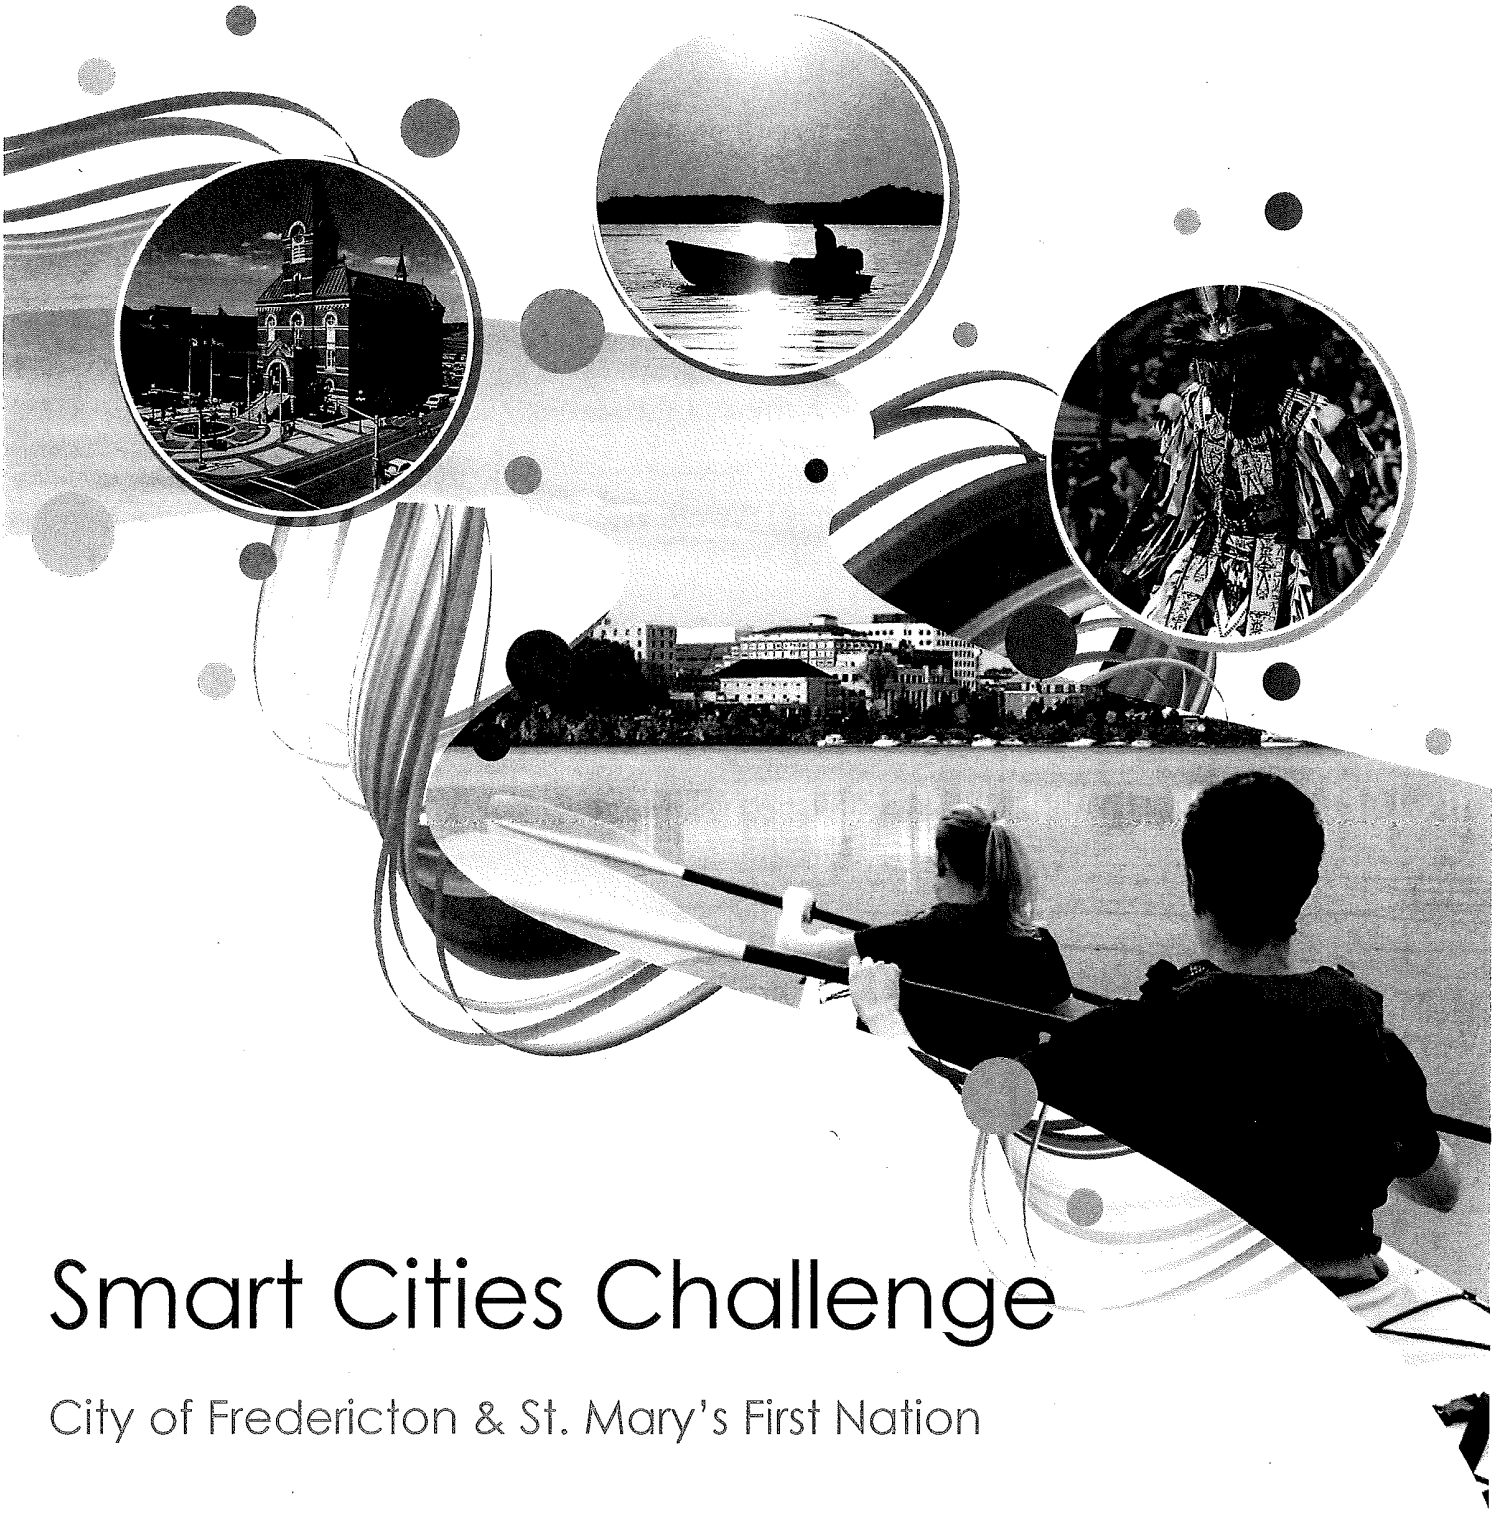
4. Climate Lens Assessment (Climate Impacts)

As a result of the projects outlined, we expect a number of positive impacts on climate change adaptation and mitigation as well as Canada's climate change-related goals. In particular, we foresee positive changes that will create an indirect reduction in greenhouse gas (GHG) emissions.

We foresee a positive and direct impact on climate change adaptation goals. In particular, *AGora* could develop a micro-climate monitoring system that would reduce the impact of flood and drought on local agricultural operations. Although these impacts are not expected to be significant at the national scale, our work to date believes they are significant at the community level.

Parkland County estimated an annual total of 453,860 tonnes of GHG emissions in 2010, with transportation being the highest contributor. A slow but steady increase was anticipated based on a 1.4% average annual population growth rate. This initiative could reduce these emissions.

In recent years, Parkland County has declared agricultural states of disaster due to both drought and high precipitation events. When local wildfire events are included, proposed development of a climate monitoring system will be significant for local agricultural producers. Innovations from *AGora* will support initiatives led by all counties to reduce the risk of climate change impacts in agriculture – including the Alternative Land Use Services Programs (ALUS) and the Modeste Natural Infrastructure



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project, both of which attempt to increase ecosystem service delivery regionally through beneficial management practices on agricultural land.

5. Other Applicable Laws and Regulations and Policies

Legislative and regulatory compliance rests with the Board; the CEO, CFO and CTO will be accountable for ensuring these requirements are monitored and complied with over time. We have already established a relationship with Service Alberta to advise and assist us in this regard. Once operational, *AGora* will identify and establish similar relationships with the appropriate municipal and federal entities.

Smart Cities Challenge

City of Fredericton & St. Mary's First Nation

March 2019

Fredericton

ST.MARY'S
WOLASTOQIYIK

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

A City to Like, Share and Follow

A poem written for the City of Fredericton & St. Mary's First Nation joint Smart Cities initiative (read at the joint Council briefing on January 30, 2019)

On the bus ride home, I watch a video of a Fredericton 5th grader who used her allowance to buy coffeeshop gift cards for the homeless in her neighbourhood. It's been a Shakespearean winter for those living rough, one of discontent and thin tents— a child can see that. I want a city as compassionate as that 10-year-old, chatting with strangers outside the community kitchen like she's with old friends; a city as warm as the hand-knit scarves tied around street poles and fences alongside the water treatment plant for those in need of heat, of comfort. I want a city that recognizes me in the same way that the vendors at the Boyce Farmer's Market do on a busy Saturday morning, knowing my name and what I do for a living, that the Guinness aged cheddar I buy pairs well with the sweet apple cider from the next stall over, that I live around the block and it's a short walk. I want a city that's a friend and an ally to St. Mary's First Nation; a city that connects with its residents like the Bill Thorpe marries the North and South sides. I want a city old as the Wolastoq River and as current so fewer friends leave to go out west and instead take root, I want to retain our youth. I want a city as smart as its population, as its university town reputation: UNB and STU, NBCC and the College of Craft and Design nourishing artists and scholars, blue-collars and doctors. I want a city that's accessible, easily navigable, multilingual, a city that is a home, a safe-haven, a welcome wagon. I want a city that's tech-savvy and customizable, a city to like, share, and follow.

Written by Jenna Lyn Albert, Poet Laureate for City of Fredericton

City of Fredericton & St. Mary's First Nation Partnership

St. Mary's First Nation Band Council and Fredericton City Council at their joint gathering on January 30, 2019.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Executive Summary

Our original **Challenge Statement** that we created for our application is:

> My city does not recognize me or connect me to what matters most; Fredericton will collaborate with First Nations to create an accessible, welcoming, supportive city for youth, newcomers, and an aging population, empowering everyone with a Personalized Inclusion Plan that connects people to create an exceptional quality of life.

Over the course of the finalist phase, we engaged further with stakeholder and residents, tested out concepts and ideas, and refined our **Vision** for our Smart Cities Proposal:

> Fredericton & St. Mary's First Nation are collaborating to create an accessible, welcoming, supportive community, starting with youth, newcomers, older adults, and persons with mobility-related disabilities; recognizing what is important to individuals and connecting them to what matters most, empowering residents with personalized digital tools, data & technology that enable them to create an exceptional quality of life.

To achieve this vision, we're proposing to carry forward the main initiatives that we set out in our original application, including the **Digital Fredericton** transformation initiative, the **Digital Community Hub** (formerly Smart City Dashboard/Real-Time Census), as well as three other community initiatives: **Doorable**, **Non-Profit Data Collaboration**, and **Road Home Digital Platform and Enablement.**

The initiatives we're proposing will offer more meaningful ways for community **Engagement**. We're using human-centred design to involve residents throughout the process of designing solutions, tailoring them to their unique needs. We've developed a unique model to discover who our residents are, gain deep insights about their aspirations and challenges, generate ideas for solutions, and co-create and test solutions with the community. We've piloted this approach with the key initiatives during the finalist phase, which generated key insights guiding this proposal and leading to the creation of four prototypes. We've also widely and deeply engaged community stakeholders throughout our Smart Cities Journey, developing partnerships and working relationships to deliver the initiatives in this proposal.

We've scoped out each of the key initiatives in **Project Management**, defining the goals and deliverables and resource requirements, while using an overall, coordinated approach for procurement, communications, risk management, and monitoring/managing issues.

We built our **Performance Measurement** plan across three strategic areas, aiming ultimately to achieve our vision to through three long-term outcomes:

- Developing a detailed community profile with richly defined segments and needs.
- Providing more efficient and targeted services that address needs, working in an end-to-end environment that puts resident engagement first.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- Connecting people to what matters, increasing inclusion through the uptake of personalized digital tools.

We've developed the deliverables and performance milestones that will trigger progress payments of the prize money. We've also outlined an approach to monitor, report and evaluate progress on performance at monthly and quarterly intervals

We have crafted a **Technology** architecture to achieve these outcomes, creating new user experiences and rich data sets and augmenting the workforce. We've designed the architecture across layers – from sensors and edge devices through to smart algorithms. Our technology selections are guided by principles to ensure interoperability, extensibility, scalability and replicability to achieve and sustain our technology vision. The technology architecture will be able to respond to rapidly changing technology environments. The proof of our technology is in the prototypes. We've demonstrated all layers of the technology architecture in action to provide sharply tailored personalized experiences using connected technology and data.

In terms of **Governance**, our Fredericton Smart Cities Task Force will oversee the implementation of our Smart Cities proposal. The Task Force includes representatives from City of Fredericton. St. Mary's First Nation, committee leads for the main initiatives and as well as stakeholders to provide academic, commercial and social oversight. The City and St. Mary's also intend to enter into a Friendship Accord, which will build on the governance structure to offer a framework for continued collaboration on this and other broader community issues of mutual interest. We have plans for program administration and implementation and have developed a number of partnerships with stakeholders to deliver our proposal outcomes.

We went through an intensive process to develop a plan for **Data and Privacy**, particularly as it relates to protecting personal information. We've completed a PPIA that examined each of the main initiatives in our proposal and outlines the risks related to privacy and planned measures to minimize those risks and comply with privacy legislation and standards. We've summarized those risks and plans to protect data and privacy in this proposal.

To meet the **Implementation Phase Requirements**, we've outlined the approach that we will use for consultation between St. Mary's First Nation and City of Fredericton, as well as our intention to provide employment and/or procurement opportunities for youth/ Indigenous peoples, small-to-medium-sized social enterprises, and women under the Community Employment Benefits initiative.

As part of the **Financial** plan, leveraging other sources of revenues and investment to increase the impact of the initiatives, including investments from the City of Fredericton, its wholly-owned subsidiary e-Novations Comnet Inc., and in-kind investments from technology partners. We used similar experiences, industry standards, estimates from vendors for specific items, agile development, and detailed cost breakdowns of project subcomponents to estimate costs and minimize finance risk.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Vision

> "Not everyone has the same needs & wants – but everyone has needs and wants."
>
> **City of Fredericton Mayor Mike O'Brien**
>
> "Everyone matters. The City of Fredericton and St. Mary's First Nation are thinking outside the box so that we can develop and plan for today, tomorrow and the future."
>
> **St. Mary's First Nation Chief Alan Polchies Jr.**

Imagine a *Smart City* where all residents are recognized and connected to digital services and resources they need 24/7 on a personal, interactive level.

Imagine an *Accessible City* where there are no barriers, doors wirelessly open, and you can easily find available, wheelchair accessible parking.

Imagine an *Inclusive City* where no one is left behind, and the most vulnerable are digitally enabled and expedited on a path for sustainable living.

Imagine a *Digital City* where free WiFi and open data access fuels new startups – enabling residents to create networks and design solutions addressing community problems.

Imagine a Caring City where non-profit organizations in the community are connected to provincial and municipal data infrastructure to influence policy development and drive evidence-based decision-making to improve the lives of residents.

Our Smart Community Vision

Fredericton & St. Mary's First Nation are collaborating to create an accessible, welcoming, supportive community, starting with youth, newcomers, older adults, and persons with mobility-related disabilities; recognizing what is important to individuals and connecting them to what matters most, empowering residents with personalized digital tools, data & technology that enable them to create an exceptional quality of life.

A Look Back at Our Smart Cities Journey

When the Smart Cities Challenge was first issued in November 2017, **Fredericton set out to determine through wide-ranging engagement what the biggest challenge facing our community was and how we could solve it using data and technology.** Through an extensive engagement process, we received hundreds of responses from the public through surveys (online and in paper copy), with a game app, using social media and emails to networks of community stakeholders.

What we found was that people had an incredible wide range of issues and solutions in mind. While we found **the biggest issue facing the community is different for each person,**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

the commonality is that everyone has desires and needs that could be better met. People expressed a desire for the City to better understand the needs of residents through improved data and targeted services to individuals based on their needs.

We saw a unique and historic opportunity for St. Mary's First Nation and Fredericton to partner together in this ambitious and important endeavour. Both communities remain committed to work together to develop innovative solutions to issues we share as well as the issues that are unique to our communities. We consider this the launching point for a future Friendship Accord.

We collaborated and consulted deeply with the community to create our application and our proposal through our Smart City Task Force and its committees. More than 40 people from 20+ organizations have been directly involved during the finalist phase in creating this proposal and moving forward its key initiatives, with additional stakeholders being engaged through individual projects. Residents have also been directly involved in the design and creation of the solutions proposed through the use of deep one-on-one conversations and observation, online survey responses, user-centred design workshops and focus groups, and testing the prototypes. (See *Engagement* for more detail.)

Before we entered the Smart Cities Challenge, we held a number of broader community engagement efforts that, together with the engagement efforts we undertook in the application and finalist phases, have helped inform our proposal:

- **Imagine Fredericton** – involving 2,800 people over 85 days to articulate the vision for the City as it grows, including the importance of being a welcoming and supportive community.
- **Digital Fredericton** – engaging more than 120 staff from across the City of Fredericton at every level on how the City can improve operations for better service.
- **Partnering for Impact** – 72 people from 30+ non-profit organizations coming together, identifying that to collaborate on shared concerns, there is a need to enable data collection, collaboration and measurement in the non-profit sector.
- **Age-Friendly Survey** – more than 900 older adult survey respondents identifying what they like about the community and what could be improved to make it more welcoming and safer for older adults.
- **Open Space Forum on Homelessness** – involving 40+ faith-based groups, highlighting the need to better coordinate efforts of these groups for those experiencing poverty and/or homelessness.
- **The Road Home: A Plan to End Homelessness** – consulting more than 130 community stakeholders including frontline workers at homeless serving agencies and people who have lived experience with homelessness, identifying that shared data management is a key feature to better serving people who experience homelessness in the community.

One of the key insights we had in the lead up to our original application was that we could not be a smart community if we left behind the people that are most likely to be under-engaged – those who often experience vulnerability, marginalization or exclusion. We decided that a smart community respects, values and facilitates the contributions and talents of all residents and accepts and embraces our diversity.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

We created our challenge statement to focus on community collaboration welcoming, supportive and accessible community for all by recognizing and people to what matters most to them. We set a bold aspiration in our applic primary outcome we wanted to achieve – to identify citizens' unique needs, c to personalized services and resources that meet those needs using enhance and to develop new collaborations and partnerships to achieve it.

Connecting culturally is important for a sense of inclusion and belonging. For F language and culture are core to identity; reconnecting with customs and la important in restoring a personal sense of inclusion and rebuilding natio Applying a cultural lens to our digital tools will result in services th sensitive to these needs and direct in address them.

outcome?

> "Our Smart Cities Challenge proposal addresses the issue of belonging. It's so important to foster communities where every citizen has the opportunity to belong; where barriers are broken down so that every person can access the benefits and advantages of their community. Working on this project has brought the community together and generated an awareness, sensitivity and motivation to design tools that enable and promote the inclusion of those who have not been adequately serviced and/or aware of services that exist. Through the Smart Cities Challenge, experts in every field are contributing their knowledge and skills to create a sense of belonging to make our city the best it can be for all its residents."
>
> **Kate Rogers | Executive Director, Fredericton Community Foundation**
> **City Councillor**

What we propose is a fundamental shift away from community leaders and service providers needing to rely on assumptions of what the needs and wants of the community are and how they serve them. This is a necessary shift.

For example, we saw through the Imagine Fredericton exercise in 2016-2017 that the city will change significantly over the next generation, with a likely 50% increase in population by 2041, largely growing through immigration (like the rest of Canada). This will massively increase demand for services. We've also seen over recent years that people expect immediate access to services – government services included – and that people expect services to be maintained, even improved, without necessarily paying more. We must have a continual pulse on who is in our community and be able to adapt to their needs and aspirations. This is also critical in terms of having talent to fuel our local businesses.

Looking Ahead – What We Propose

We will create modern Smart City digital infrastructure that will enable us to recognize who is in our community and what is important to them, connect them to what matters most, and enable collaboration to create a welcoming, accessible, inclusive, supportive community. Our overall guiding approach to achieving this is to:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- **Understand our resident landscape and define aspirations for the desired experience** to enable the development of prototype solutions for service improvement.
- **[redacted]dernize and integrate core digital infrastructure** and systems to enable more cient and targeted services and increased collaboration.
- **nnect aggregate and de-identified data** from a wide variety of sources to build a tailed community profile/census with richly defined segments and needs.
- **velop more accessible digital tools and connected technologies that are rsonalized and support the inclusion of residents,** enabling people to connect ore to what matters to them in the community.

osal demonstrates the advancement of and continued focus on the initiatives that sed in the original application to recognize and connect people to what matters, including:

- the **Digital Fredericton** transformation initiative
- the **Digital Community Hub**
- Connected Community initiatives (**Doorable, Non-Profit Data Collaboration, and Road Home Digital Platform and Enablement**)

Digital Fredericton

At the **epicenter of our Smart City aspiration** is the need to completely change and modernize how the City operates, serves residents, and collaborates with community. The Digital Fredericton transformation initiative represents a five-year journey to become a more flexible, efficient, responsive, and transparent government that works with community partners and focuses on what matters most to residents. This means a focus on delivering experiences to residents instead of services, establishing new collaborative working relationships, and engaging with our community in new and meaningful ways. There are three key layers to make this happen in a structured and integrated way:

- **Layer One: Core Foundation**
  (becoming a more efficient organization to better serve citizens)
  This is about transforming how the City runs its business with standardized and efficient processes through modernizing systems and IT infrastructures and establishing metrics that matter. As the City gains efficiencies inside the organization, it will reallocate human talent to improve or extend citizen services. Putting these digital core systems in place will provide more accurate and detailed data that will bolster the City's human resources with new insights and data-driven knowledge. It orchestrates an augmented workforce that is both efficient and customer-focused.

- **Layer Two: E-Government**
  (transforming services for citizens)
  This work involves enabling better digital citizen experiences through easy, intuitive access to technology-enabled services that are available 24/7. It's about putting systems in place to better understand and communicate with residents and businesses in real-time to address priorities and needs to make more effective, more resident-centric decisions.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- **Layer Three: Connected Community**
  (connecting community partners for innovation at the edge)
  This involves working collaboratively with partners in our knowledge ecosystem to continue to enhance services through innovation, becoming a living lab for solutions. It means making data easily accessible, enabling online collaboration and participation from the public and community stakeholders to develop improvements in the community that will help citizens experience life in extraordinary ways.

The transformational work undertaken through Digital Fredericton will make it possible to have both the human and foundational digital infrastructure resources necessary to make possible the other initiatives we feature as part of our Smart Cities Challenge proposal.

Much work has begun with the Core Foundation over the past year, with implementation of key internal systems. To set the stage for the work to be undertaken as part of the implementation phase for this Smart Cities proposal, a Citizen Experience Strategy will be undertaken to define segments and understand the overall aspirations of the customer.

Digital Community Hub

In order to enable new community collaborations, innovation and to get a picture of our community, we propose creating a City of Fredericton and St. Mary's First Nation Digital Community Hub. Currently, information and data about what's available and happening in our communities and the people in them is extremely fragmented and siloed, collected by a wide range of government, academic, non-profit and business sources. How can we connect people to what matters if organizations and individuals don't have a unified, complete, evidence-based picture to understand what is available and where gaps are?

The Digital Community Hub will combine aggregate data from shared data platforms and disparate data systems to create a multi-level hub – creating rich, open data on and for our community, opportunities for unique collaborations on issues that matter to residents, as well as personalized access to what matters most to people. This hub will bring together both existing data and applications as well as new ones developed through the work described in this proposal. The goal is to create a seamless, integrated resident experience, tailored based on the needs and preferences of the individual.

Components of the Digital Community Hub

Smart City Dashboard Allowing for transparent measurement of community performance based on established smart city indicators (e.g. livable community, mobility, safety, environmental stewardship)		**Personal Digital Inclusion** Enabling individuals self-serve and personalized access to resources, tools, people and services they need in the areas that matter most to them	**Resident Contribution** Enabling individuals to voice their need / report an issue and to contribute based on a community need (e.g. volunteer, develop an app, report a problem, add individual perspectives to community issues)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Connected Community Initiatives

Doorable (Developed by Appdigenous)

People with mobility-related accessibility challenges experience a number of barriers, even when something is purportedly designed for them. The existing "push buttons" on accessibility doors are often blocked, not functioning, awkwardly placed, or simply not easily used by people who have limited mobility in their arms and hands.

Doorable, developed by early-stage startup Appdigenous, is an Internet of Things solution featuring a multi-functional mobile app & custom designed hardware. It will help reduce barriers by wirelessly opening doors through a smartphone/tablet app. It will further help in identifying and reducing accessibility barriers by mapping the accessible city, creating a platform for app users to communicate directly with each other and facilities about accessibility barriers, and building data through interactions between citizens and infrastructure. The technology will integrate with the Digital Community Hub to help offer more robust information and data around accessibility and related challenges in our community. This project would make Fredericton and St. Mary's First Nation an early adopter test bed for the technology and a product development living lab for accessibility in Canada. Testing has already begun and is revealing insights on how the physical shape of our cities can profoundly hinder or enhance full participation in civic life. Appdigenous has, as part of this process, already developed concrete plans to expand into communities across the province and country with this next generation technology.

Non-Profit Data Collaboration

Many non-profit organizations (NPOs) lack expertise in data-driven outcome evaluation and measurement and miss out on the benefit of using data to best inform the decisions and policies they make. Government departments across Canada do not have robust access to data related to the frontline services of non-profits, which is a huge gap in information for policy development. NPOs want to go beyond siloed agency-specific data and be able to compare and link their data to other open data sources to gain a more holistic understanding of the impact of the services they provide on community.

Through this project, we will build the NPO community's capacity to collect data, establish measures and integrate with other public data. It will involve working with NPOs on establishing meaningful measurements, standardizing how to collect data, and how to link it with other data that is available to be able to measure efficiency and impact, improve access to funding, identify gaps and improve services. This project will allow agencies to collaborate and access data at a community level through the Digital Community Hub in cause-based hubs. Secondly, through the New Brunswick Institute of Research, Data and Training (NB-IRDT), one of the most secure data centres in Canada, it will allow government, non-profits, and researchers to secure aggregate/anonymous data on the impact of their services which can be cross-referenced with community demographics. You can see more about the process of how data is shared through NB-IRDT in this video:

https://www.youtube.com/watch?v=vUrkCUyFunM

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Road Home Digital Platform & Digital Enablement

Our homeless serving agencies are continually dealing with resource constraints to help their clients move along the continuum of care to achieve stable housing. These agencies lack the technology most organizations take for granted to operate efficiently and effectively. Clients often have to tell their story multiple times when they present themselves at homeless serving agencies that can and do work together to help them.

Adopting a shared digital platform through HIFIS4 (the latest version of the federal government's Homeless Individuals and Families Information System) will allow for shared case management and provide agencies with quick, accurate information to help better support clients, securely capture aggregate data, and generate useful reports to track performance and needs at an agency and community level. The plan is to expand HIFIS4 across the homeless-serving system to enable a coordinated approach to serving clients. For individuals, this system will reduce the need for them to re-tell their story to multiple service providers and help them connect to services along the continuum of care more effectively. To further enable this connection, we're also proposing to expand access to free, high-speed Internet in the shelters and in public places, as well as enhance and design new self-serve digital personalized inclusion resources for this segment as part of the Digital Community Hub.

Ongoing Development of Connected Community Applications

There are many more solutions that our focused iterative model will produce and refine. Connected Community applications will be based on the insights we gain from understanding residents more deeply and developing solutions to help recognize and connect them with what matters personally.

Through the finalist phase, we continued to uncover new opportunities using the model of dialogue with a segment to learn about the needs of people in that segment and then involving them in user-centred design to co-create a prototype. In one example, we partnered with a local startup to prototype an app for newcomers to connect them with a personalized tool designed to help facilitate their inclusion.

Our vision includes ongoing mutual learning about the data and technology opportunities within First Nations. This proposal recognizes Indigenous rights to self-determination. Under Indigenous control and directed by staff hired from Saint Mary's First Nation, the team will develop technologies and applications that match the aspirations of Indigenous people and are culturally sensitive to First Nations' needs.

Smart City Internet of Things (IoT) Telemetry

- Resident experiences can be personalized in real-time with data about the status of services that impact them.

Cities deliver many common services to residents using infrastructure, public spaces and assets that are spread across a large geographic area. Telemetry is an automated communications process by which measurements and data about infrastructure and public

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

services are collected at remote geographic or inaccessible points and transmitted to equipment for monitoring.

[redacted]

can be optimized and personalized using real-time and historical data. Real-time ut the availability of a parking space, the status of a transit bus, the current river ring a flood, soil condition at sports fields after rain, air quality, noise level, current aring and garbage routes and road conditions will be pushed from our LoRaWAN ork to our open data portal and accessible through application program interfaces r consumption by Connected Community applications, third party developers, and ity operations.

Our Repeatable Community Model

With the Digital Fredericton transformation initiative and Digital Community Hub providing the foundation, we have developed a repeatable community model to recognize and connect residents with what matters to create an accessible, welcoming and supportive community through the use of personalized digital tools and data, achieving the transformation we envision. First, to get an overall picture, we will undertake the Citizen Experience Strategy to identify and learn more about resident segments in our community. Once we have the overall experience defined, we will conduct in-depth learning on each segment and develop solutions in response to the unique needs and aspirations of residents. Below is an outline of the process (see *Engagement* for more details).

- We will **deeply get to know each segment** (beginning with those who are most likely to have experienced marginalization or exclusion) **and their experiences through direct interaction** using ethnography. Ethnography means having deep one-on-one conversations and interactions with people to understand day-to-day experiences of residents, what's important to them, and what barriers/challenges prevent them from having a great day in the community. We will supplement this approach with engagement through the resident contribution feature on the Digital Community Hub to confirm insights and offer broader opportunities for people to identify barriers they face to their quality of life.
- Based on the research, we will use **journey and empathy mapping** to develop insights about what matters to people in that segment. We also use the research to develop distinct "personas" within the segment (a resident profile that brings together specific types of similar experiences and behaviours within a segment).
- We will then engage and connect with community partners (e.g. NPOs, entrepreneurs, tech businesses, etc.) to **ideate potential solutions** based on the insights using connected data and technology.
- We will **co-design the solutions with residents** from the segment and work with community partners to **develop prototypes** of personalized digital tools, data and technology using user-centred design workshops.
- We will bring the applications and data from the developed tools and technology into the **Digital Community Hub**, which will feed back into the cycle by further giving us insight into the challenges and aspirations of our community. This will contribute to the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

metrics that enable better policy and decision making and offer richer, personalized information tailored to each individual's unique set of needs and preferences.

This model isn't a straight line – it's an iterative cycle. We will continually go through the process of taking what we learn from each segment through the engagement, ideate on solutions, prototype, test and build more data and insights to improve on those ideas and develop new ones.

Outcomes

Through the initiatives we propose, we will achieve our **primary outcome** of identifying residents' unique needs and connecting them to personalized services and resources that meet those needs using enhanced data tools. We will do that through the following key related outcomes (see more detail in *Performance Measurement*).

- Improve the quality of life by making it easier for citizens to access all services provided by the City and for the City to push out information that is meaningful to citizens.
- Use customer relationship management (CRM) systems and move more staff to customer-facing roles to create a more personal, welcoming city, enabled by efficient, technology-driven processes.
- Create a multi-level hub to create a channel for interactive government, personalized access to services and activities available in the community, and a place where the community can collaborate on key quality of life issues, bringing together both traditional & non-traditional partners to deliver on common objectives.
- Increased economic vitality and job creation through the development of new technologies resulting in the creation of new startups and new opportunities for existing businesses, as well as increased participation of underrepresented groups in the job market due to increased accessibility and connection to needed supports.
- Recognizing that language and culture is identity and the importance of these for Indigenous people, enable an Indigenous cultural resurgence through digital technologies that youth and elders can use to connect with their language and heritage.

> "Indigenous community members of all ages use digital technologies – in particular social media. A holistic approach to digital technology can support Indigenous language and cultural resurgence."
>
> **David Perley | Director of the Mi'kmaq-Wolastoqey Centre**

> "Language is identity. It's the foundation. This is the International Year of Indigenous Languages. We have a prime opportunity to remove barriers to learning our language."
>
> **Chief Alan Polchies Jr. | St. Mary's First Nation**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Empower the City's non-profit agencies to make data-based decisions that will help them to better serve their clients and our community and be able to contribute to the community-level data.

> "Shared data within and from the non-profit community will enable a full conversation with all social sector stakeholders who are working with the most vulnerable members of our community day-in, day-out. The greatest benefit of this project will be how shared data enables government, business, and community partners to collaborate on the solutions to the most pressing problems facing our community. As a community, we are striving to achieve bold targets to address deeply entrenched social issues; without shared data, we cannot really know if our efforts are amounting to the change we desire, or why they may not be working. You can't manage what you don't measure. Data and results are essential in making sound social and public policy decisions, and so often we are limited to making important decisions based on hunches or anecdotes."
>
> **Jeff Richardson | Executive Director, United Way**

- Enable a more accurate assessment of the housing and support needs of people experiencing homelessness in our community and reduce their need to tell their story multiple times through enabling shared case management and resource allocation between homeless-serving agencies.

- Making the physical infrastructure of the city more accessible, and movement through the public space more fluid, making it easier for people with mobility-related accessibility challenges to live and get around their community with fewer barriers.

> "AbilityNB applauds the leadership of the City in seeking solutions to accessibility challenges with our City to ensure everyone can live work and play in our community. Universally designed communities and programs are essential so all residents of a community can actively participate. More than 73,000 New Brunswickers live with a mobility disability – the most common disability type in NB. At 26.7% of the population, New Brunswick has the second highest rate of disability in Canada. A disability lens on policy, infrastructure and program development is critical."
>
> **Haley Flaro | Executive Director, Ability NB**

Progress Towards Outcomes During Finalist Phase

During the finalist phase, we focused on further developing this final proposal while also making significant progress towards these outcomes and testing our approach. Over six months, we put systems in place and tested out the ideas and concepts we're proposing, conducted research on some of our priority segments and accelerated the development of key prototypes of solutions for them.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Building core foundation	• Engaging more than 120 City staff to select, test and configure technology tools to assist in streamlining business operations. Modernizing our approach to internal systems has driven results for staff and gained efficiencies that are being re-invested in delivering value to citizens. • Built most of the City of Fredericton's core digital foundation through implementing an enterprise resource planning cloud solution (Canada's first cloud-based municipal core), enabling staff with modern technology and corporate standard processes to be more efficient in their operations. • Freeing up staff capacity and reallocating staff toward customer-facing roles to improve services for citizens.
Uncovering insights on resident aspirations & challenges	• Focusing on three of the priority segments – older adults, people experiencing accessibility challenges, and newcomers: o One-on-one conversations with older adults to uncover insights that removed assumptions and highlighted opportunities to help older adults in our community. o Co-design workshops with older adults and persons with mobility-related accessibility challenges for the Digital Community Hub. o Conducting a day-in-the life tour with a person in a wheelchair to understand challenges. o Broader online survey to uncover more about the barriers people with mobility-related accessibility challenges face with entering buildings and getting around the community. o Conducting a co-design workshop and journey mapping with newcomers of diverse backgrounds. • Conducting an environmental scan of NPO best practices of data privacy, use and collaboration.
Stakeholder relationship/ partnership development	• Developing relationships and in-kind and other partnerships (see *Governance*). • Building stronger relationships with other municipal governments and levels of government to ensure a repeatable model is designed for resident-centric communities. • Onboarding 11 non-profits for the Non-Profit Data Collaboration, mapping out their current data collection, use and disclosure practices and privacy standards and delivering education on the benefits of data collaboration with other non-profits through a video and workshop. • Onboarding 5 homeless-serving agencies for Road Home Digital Platform & Enablement, identifying the most meaningful outcomes achievable through digital enablement to help better serve those who experience homelessness and begin data transfer to HIFIS4 (shared digital platform). • Engaging with the Mi'kmaq-Wolastoqey Centre to uncover potential ways to support Indigenous resurgence with digital technologies. • Engaging with Mayor, Chief, City Council & Band Council on progress and goals of proposal.
Data and Privacy	• Completing comprehensive preliminary privacy impact assessment (PPIA). • Mapping out data flow for projects.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

	• Conducting extensive workshops with project leads, led by a privacy expert with more than 25 years of experience to create a detailed plan with clear principles to ensure all projects comply with legislation and meet the standards of Privacy by Design and the 10 Canadian Standards Association (CSA) Privacy Principles.
Ideating and Prototyping	• Running an ideation workshop to generate and prioritize ideas for prototypes based on insights gained from older adult ethnographic research. • Rapidly prototyping a check-in companion app (developed by a local startup) that can be used by older adults so they feel connected and safer in our community. • Running the two co-design workshops with individuals that identified as older adults and persons with mobility-related accessibility challenges to identify the best design for the Digital Community Hub prototype. • Creating a prototype of the Hub with a focus on mobility, accessibility, and older adults. • Accelerating the development of the Doorable hardware and first version of app software. • Developed Hullo app MVP (minimum viable product) for newcomers to connect with settlement organizations.
Testing Prototypes	• Usability testing of Digital Community Hub, Hullo App, Companion Check-In, and Doorable (see *Engagement*)

Why This is a Winning Proposal

Our proposal thoroughly embodies a smart cities approach. We will bring together diverse sources of data to break down silos between government, organizations and residents so that we can address issues of importance to the community in a holistic way, with a complete picture of what matters and a more accurate measure of our performance in addressing the needs of our residents. It's about coming together as a community, bringing together partners and stakeholders – from the City and St. Mary's First Nation, to businesses, non-profit organizations, academia, and individuals – to collaborate in creating a more welcoming, accessible and supportive community. First by getting a more accurate and deep assessment of what the experiences, aspirations and challenges of our residents are, then developing innovative approaches to improve services and break down barriers to inclusion and full participation for all.

We have developed a unique approach to understand and better serve residents:

- using ethnography and a continuous dialogue with residents to gain a deep and ongoing understanding of our residents, their aspirations and challenges
- interconnecting data from a wide variety of disparate sources to build a complete community profile and enable effective analysis & insight-driven decision-making to make services more effective for residents
- intensely collaborating with community partners from all sectors
- involving residents directly in the design of solutions using human-centred design

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- enabling a more personalized experience for each resident, tailoring services, information and tools to their unique needs and preferences

We have the momentum to make this proposal a success. The initiatives that we propose build on work that has been ongoing in the community. We have made further significant progress during the finalist phase – creating several prototypes in addition to creating this final proposal. **We have demonstrated our ability to make significant progress in a short amount of time and to make investment dollars go far.**

We have a demonstrated ability to build and implement smart solutions that will be a model for the country. As part of the Digital Fredericton transformation, the City of Fredericton has launched Canada's first cloud-hosted enterprise resource planning solution for a municipality, which was implemented using agile development in just eight months and was completed on time and within budget.

Other initiatives we are undertaking further demonstrate how we are able to lead the country in building smart communities. The Non-Profit Data Collaboration project is a game-changer, as it is the first time that NPOs are working together to collect and bring together data on their services on this scale, connecting them with provincial and municipal data infrastructure.

The Connected Community apps developed through the implementation of this proposal, such as Doorable, will be developed with the view of being adoptable by other communities across the country. We're also building technology that is enabling a likely unprecedented amount of collaboration among community partners of all types, as well as an ongoing dialogue with citizens.

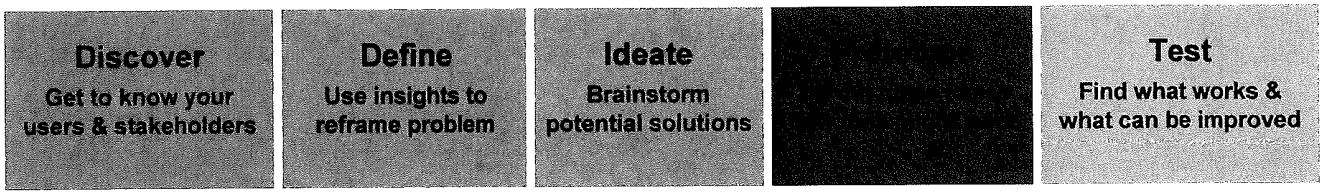
The initiatives in this proposal will not only lead to an improvement in the quality of life for Fredericton and St. Mary's First Nation; the transformative solutions we develop will also be able to benefit communities of all sizes across the country. Any community will be able to replicate our approach to recognizing and connecting residents to what matters and building personalized digital tools that respond to their community needs.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Engagement

Engagement is the Cornerstone of Our Proposal

Traditional community engagement includes broadcasting information (through news releases, web and social media updates), public meetings and open-houses, online surveys, stakeholder meetings and emails, sometimes more unique activities like an "ideation bus", etc. These methods of engagement are useful, but there are ways to more deeply and meaningfully engage with residents.



The initiatives and projects that are part of this proposal will offer ways for the City of Fredericton and St. Mary's First Nation, as well as other organizations within our communities, to engage with approaches and tools that put our residents at the center and allows for better understanding of their needs, desires and challenges. Residents will have an improved ability to voice their needs and contribute back to our community.

We are also deeply involving residents and stakeholders in the design of these solutions that we will use to be able to engage and better understand residents and connect them to services and resources that meet their unique needs.

Using Human-Centred Design

We're using human-centred design (or user-centred design) to involve the people we are designing for and facilitating citizen co-creation throughout our Smart Cities projects – from concept to design, implementation, and evaluation. This will ensure that the solutions are tailored and adjusted along the way to meet their needs and achieve meaningful outcomes.

Human-centred design informs better decision making by understanding not only what works or doesn't work, but also why. It allows us to more deeply understand the pain points and ambitions of the community's residents to be able to build the most effective and appropriate solutions to connect them with what matters. Here are the elements of the human-centred design process we're using:

Source: Jules Maitland, Human Centred R&D

The process doesn't end with testing the solution – there's a continuous loop as we brainstorm solutions for improvements based on feedback we get in the testing phase, prototype those improvements, and test them again with people. It's an iterative and ongoing cycle within a living lab environment.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Discovering Who Our Residents Are, Defining Aspirations & Challenges

It's easy to get lost in demographics and data. We want to go beyond the data to gain a more holistic understanding of our residents.

Ethnography is the primary method we will use to understand what residents want in terms of their experience in the community and the barriers and challenges that might prevent them from achieving that experience. Ethnography involves interacting with and observing people directly through one-on-one interviews and other interaction and observation in places where the person spends their time.

It leads to uncovering much better information about people's motivations and aspirations than self-reported information through a survey. We get a better understanding of how residents think, what they see, how they feel, what they hope for, what they fear, what goes well in their day, and where their pain points are. We can then map those insights using empathy and journey mapping to gain an understanding of what the end-to-end experience is for the resident.

Example of empathy mapping (Source: GNB Silobusters)

A foundational piece of the work through Digital Fredericton is the Citizen Experience Strategy. We will use ethnography, which we piloted during the finalist phase, to gain deep learning of different segments of the population in both the Fredericton and St. Mary's First Nation communities. As part of the ethnographic process for each segment, we will:

- ***Have in-depth one-on-one conversations/interviews with residents, representing a wide range of segments.*** The hour-long conversations occur at the participant's home or other familiar place.
- ***Do "walkabouts"/"day-in-the-life tours"*** with 1-2 participants in each segment in order to observe and learn more about the challenges identified in interviews.
- Use ***empathy and journey mapping*** to be able to visualize where the high and low points of the resident's experience is and map out the moments that matter.
- Based on the information uncovered as part of these exercises, ***develop distinct empathy-based personas*** within each segment and document their current experience, aspirations and pain points.
- To test our findings, we will supplement ethnography with broader traditional engagement tools.
- Document the "moments that matter", we will analyze our efforts to ***develop new and unique insights*** to understand the future experience desired by residents to be able

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

to both ideate and prototype segment-specific solutions and make overall improvements to common, digital infrastructure used by all residents.

This process is a very effective way to test and challenge existing assumptions and uncover new and unique insights.

Piloting our "Discover and Design" Approach

During the finalist phase, we piloted these engagement methods to test their effectiveness and suitability in our Smart Cities operating model. It proved to be very effective in discovering more about specific resident segments and define the unique challenges they face. During the pilot activities many existing assumptions were tested and broken. This collection of field research ultimately leads to real evidence-based decision making.

As a **very early pilot of the ethnography**, and to secure long-term support for this method, nearly all the City of Fredericton's senior leadership participated in a workshop exercise – interviewing citizens from different customer segments, developing personas, mapping out what a typical day looks like for that persona, and identifying the key challenges that persona faces. They then designed concepts that might help solve some of the challenges. As a result of this engagement, the senior leadership of the City is energized by this approach because the level of engagement is much deeper than normal methods of public engagement and resulted in new insights that would have previously not been considered in service delivery, public policies and setting government priorities.

We then did a **full pilot for one segment, conducting ethnographic interviews with 13 older adults**. As a result of hour-long, in-depth conversations, we got a clear sense of what the participants' current experience is, what the "moments that matter" are in their day, what challenges they face and what they would like to see improved to make their experience in Fredericton a better one. We used the information to develop three distinct personas based on analysis of the information.

We piloted a **"day-in-the-life-tour"** as part of the work to uncover challenges for another key segment – persons with mobility-related accessibility challenges. Appdigenous Founder and CEO Melissa Lunney accompanied Zack, a young man who uses a wheelchair, as he went around the City. We filmed the experience and attached a Go-Pro camera to Zack's wheelchair to gain perspective of a person with accessibility challenges and experience a day in their life as a tool to develop insights. Through his interactions with people and the environment and conversation with Melissa, Zach revealed several accessibility barriers he faces in Fredericton.

Appdigenous Founder and CEO Melissa Lunney accompanies Zach on a day-in-the-life tour.

also the opportunity to spread the technology elsewhere.

Key Insights Informing Prototypes

Without a network, older adults seek to build their own. Those who live alone, don't have family close by, or are more vulnerable have created their own support networks through friends and neighbours. We found an extraordinary example of this in talking with Sharon (last name held upon request).

Sharon is in her 70s and she and a group of her female friends who live alone in the city use a crossword app on their phones as a way to check in on each other each morning. If one of them hasn't played a word by 9 a.m., the others will arrange for someone to visit their house to make sure their friend is okay. One of the friends didn't play her word. When they went to check on her, they found she had fallen into a diabetic coma. They called 911 and emergency responders saved her life. Without connection to this network, this woman would not be alive today. But not everyone has access to these networks. Social isolation is a real demonstrated issue across the country that needs to be addressed.

Volunteering is limited by mobility. When older adults are unable to drive, their participation in volunteering decreases. Older adults are actively looking for ways to give back their time and energy in Fredericton, but are prohibited by limitations in their mobility.

Accessibility challenges prevent people from participating in the community. 88% of people with accessibility challenges that responded to the Doorable survey found that lack of accessibility prevented them from going to public places that they'd like to/need to go (83% for Fredericton). Respondents reported that buttons or accessible doors themselves are often broken and that the buttons too hard to push (whether due to an issue with the button itself or the user's limited strength) or were in an awkward location or height.

77% of respondents felt that a solution that would open "push button" accessibility doors from a smart phone or table would or might make a difference whether they would enter a building (83% of Fredericton). Respondents also overwhelmingly valued a platform to communicate about accessibility barriers (87% for all respondents; 84% Fredericton only),

> "I think that [Doorable] is an excellent idea because I am in a wheelchair and I find it hard to go places when there is no one with me. I can't use my arms, so I am not able

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

[redacted]ch the button. Also, often times the button are in places that no one in a chair could reach unless they have full mobility in their arms. [...] I am very ed, and I think this is something that would be great and that people with lities would benefit from. [...] I would really like for this new invention to come to that people with disabilities can live independently and don't have to rely on one to open the door every time they want to go somewhere."

Erica (last name held upon request)

Use of technology is more common among certain segments than we might think. We came up against an assumption during the finalist phase that perhaps technology use is not common among the segments we focused on in our finalist phase due to either unfamiliarity or unaffordability. We found that assumption was flawed.

The ethnographic interviews revealed that email, Facebook, and Skype, among other online applications are all commonly used by older adults. Although technology literacy may not be the barrier, affordability can be. Those with financial limitations tend to rely on public access or choose to live without it entirely. This creates a level of unfamiliarity not from being disinterested in technology but rather out of circumstance. In a similar vein, conversations with homeless serving agencies have revealed that many people experiencing homelessness do have a smartphone – either their own or through sharing one with another person, but with limited means, they generally can't afford a regular phone or data plan, so they rely on free WiFi to use them. Early indicators are smartphone and tablet use is widespread among people with mobility-related accessibility challenges – nearly every respondent in the survey noting that they use one or the other.

This shows how effective this approach can be in challenging and confirming or debunking assumptions.

Living Lab – Ideating, Prototyping & Testing Solutions

Co-creating with community to develop tailored digital solutions for residents

With much clearer insights on the aspirations and challenges our residents face, we will continue our Citizen Experience Strategy work that will be undertaken early in the implementation phase, sharing the findings and **partnering with entrepreneurs, residents and community organizations** to brainstorm ideas/solutions to address problems, and create prototypes of those solutions to test them with residents they are designed to help.

- We will conduct ***brainstorming/ideation sessions*** with frontline staff and managers from the City of Fredericton and St. Mary's First Nation, entrepreneurs from the local technology community, as well as NPOs that provide frontline services to the residents in the segment we're designing for. We will tap into their creativity to ***generate exploratory concepts guided by the resident insights*** for data and connected technology solutions that will solve a specific issue for each of the resident personas to help them achieve their ambitions and overcome the barriers they identified. The ideas will be prioritized for implementation by the participants in the session based on feasibility and impact.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- As part of our Digital Fredericton Connected Community layer, we will work with businesses/startups and others to create prototype solutions using ***rapid prototyping & co-design workshops*** to see how ideas might work. Prototypes could include creating mock-ups and wireframes or a small minimally functioning product to be able to better show the capability.

- We will continue to directly involve residents in the design of solutions through ***co-design workshops,*** involving them in the prioritization of features and what should be included in the design.

- Once a concept has been prototyped, we will move to ***testing and refining solutions***. We will hold usability testing with residents, finding out what works and what doesn't about the product so the design can be iterated and improved upon. Based on the feedback received, the idea will be refined and launched to the public. The community will continue to act as a living lab for new technologies and solutions.

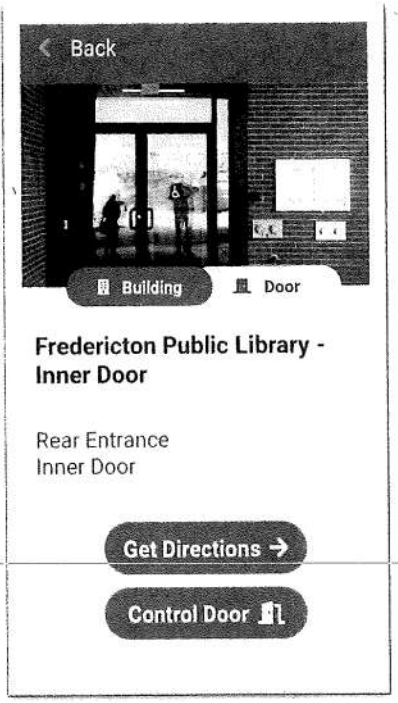
- In the design and testing stages, we will also ***engage with accessibility and other experts*** that work with the people we're designing for (e.g. people with expertise in accessibility standards) to ensure we design with diversity and inclusion in mind, taking into account how certain population groups may have different abilities to access, use the technology, and benefit from the solutions we design.

Piloting our Approach for Ideating, Prototyping and Testing

Over the course of the finalist phase, we have piloted the core elements of this approach. After the "discover and define" efforts we piloted with older adults and persons with accessibility challenges, we worked with community partners to ideate, prototype and test new digital solutions to the challenges and ambitions identified and refined the Community Digital Hub to personalize it for the target segments. At the end of the finalist phase, the solutions are at various stages of design, development and idea testing.

The progress completed in the development of this proposal demonstrates our Smart Cities Model in action: connecting people to what matters most to them, creating an assessible welcoming community, and taking strides towards personalized digital inclusion.

Doorable for Improving Accessibility



Over the finalist period, Doorable has moved from concept to early stage production. Hardware was developed and installed in test sites and more advanced user-centred design was used to build the software application. These were field tested with the target audience.

Appdigenous created prototype hardware and a plan for prioritized features based on the challenges and other insights identified by people with mobility-related accessibility challenges in the design and discover stages. Guided by human-centred design principles, usability testing was conducted with the participation of a person who uses both a wheelchair and a walker to inform the most intuitive and useful app development.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

During this phase, consultations were also held with Stan Cassidy Centre for Rehabilitation occupational therapists specializing in assistive technology and an assistive technology specialist from CNIB (Canadian National Institute for the Blind) to identify ways to make the technology most accessible and inclusive. Consultations are also being undertaken with owners-operators of public spaces to understand their needs as secondary users of the technology.

[redacted] the insights gained during this phase, a first version ıp was developed. Hardware was deployed at six (including City Hall, Fredericton Public Library, ı and Productivity Council, Brookside Mall, Grant :entre and Willie O'Ree Centre). As of February, the ɣy is being tested in-the-field with a group of users ɛ mobility-related accessibility challenges and those :ialized knowledge associated with the technology or own buildings. Already, the app is available publicly load in Google Play and Apple's App Store.

Screenshot of Doorable app

Companion Check-In App for Older Adults

The ethnographic research revealed that one of the personas of older adults include individuals who live alone, have no family in the community, and are therefore potentially vulnerable. Without a family network, being able to connect with friends to check in on their wellbeing is important to this group. We also saw that giving back to the community is important to this persona, although their ability to do so through volunteering is hampered by difficulties getting around the city without access to a vehicle of their own. These older adults are very familiar with Facebook.

Screenshot of the Companion Check-in App

We held an ideation session to come up with solutions for some of the insights uncovered. Inspired by the story of the women who check on each other by playing a crossword game app, we came up with the idea of an app that would allow people to interact and check in on friends by playing simple games while also earning points to give back to the non-profit organization of their choice. In just a few weeks, we partnered with a local startup (Mav Synergetic) to rapidly prototype and test a Facebook-based companion check-in app.

The prototype was tested for user feedback with a user-centred design test with an older adult, and a broader market acceptance test using Facebook's demographic and geographic targeting capabilities. Over a period of just four days, 574 older adults in Fredericton (between 3-4% of the city's older adult population) responded to the test promotion and accessed the app. An in-app survey was administered to present the concept of the check-in companion function of the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

app, to which 86% of users responded positively. Two non-profit organizations were also interviewed about the value of the app, one of them specializing in supporting people with intellectual disabilities, noted that the check-in function would be incredibly helpful to many of the people it serves, not just older adults.

The testing confirmed the app's value proposition, with an overwhelmingly positive response in a short time. Primary feedback from the older adult during the user-centred design test was that app seemed to be designed for a much younger demographic and its purpose was unclear. This demonstrates the value the iterative user testing approach. The next step will be working on the app's design to respond to the concerns.

Recognizing that a game may not appeal to everyone, the City developed secor application that tested advanced technology features of voice command and I The prototype supports four types of simple and non-intrusive check-in interfac a simple responsive browser-based web interface, Amazon's Alexa family of d voice command, a simple IoT connected button that is uniquely registered to a s a traditional telephone-based Interactive Voice Response (IVR) system that us The City will conduct further user-testing to get feedback on these new interfac

[redacted]

Hullo App for Newcomers

Newcomers are important to the growth of Canada's communities, including Fredericton. Connecting newcomers to what matters most to them will help them to integrate into their communities more quickly, feel welcomed, and build new lives in our Cities. Ali Allauddin is a newcomer to Fredericton and an entrepreneur. He says, "When I came to Canada, I struggled to find connections that could help me navigate everyday life and I realized there was an opportunity to make it better." Based on his and other newcomers' experiences, Ali came up with the idea of creating an app called Hullo that would help with the inclusion of newcomers in the community.

Using the approach, we have adopted for all our Smart Cities projects, Ali conducted a user-centred design workshop to test two assumptions:

- Newcomers want to integrate and belong to a community with quick access to services, and that an app can help with that.
- Newcomers who first arrive can be, for a time, invisible to the groups and individuals that exist to help them.

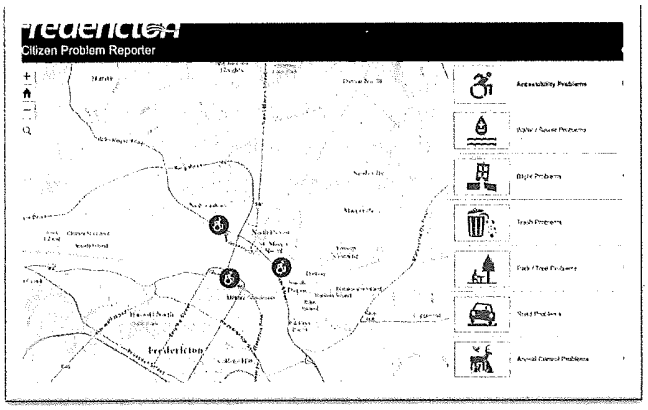
Journey mapping with newcomers during a user-centred design workshop.

A minimum viable product of the app was developed to test with users, including a simple sign-in/registration and steps to create a profile, a Google Map integration with language

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

preference and chat interface for newcomers to interact with settlement organizations/agencies (such as the Multicultural Association of Fredericton). Further development will allow Hullo to present users with a map filled with local resources, including location-tracked transit and shuttle services, geographically-indexed calendar events, and job postings. Newcomers will be able to be automatically added to their own language and cultural communities upon registration.

Finding meaningful employment opportunities was identified in the user-centr one of the most important aspects of settlement. The MVP prototype is developed with this feature set first.



Like the Check-in Companion, Doorable and other Connected Community app Hullo will be connected into the Digital Community Hub.

existing tech, pre-selected prototype

Digital Community Hub

To design the initial prototype of the Digital Community Hub, we held co-design workshops with two segments – older adults and people who have mobility challenges – to find out what information was most important and how they preferred to see it curated for them. We partnered with Esri Canada Limited to build a prototype through which users can access the shared information of our database in an easily accessible and personalized way.

The prototype includes: a Smart City Dashboard feature using existing and prototype data from the City and other sources; segment-specific curated personalized digital inclusion resources (events, information, services) most relevant for older adults, people with mobility-related accessibility challenges and people who are at risk of/experiencing homelessness; and a citizen reporter feature where users can report problems and upvote/comment on problems others have reported, providing a living database of issues in the city. Other key features of the Hub, including cause-based hubs for like-minded organizations to collaborate on issues of common interest will be developed in the implementation phase.

Screenshot of the Citizen Reporter feature of the Digital Community Hub prototype.

GIS mapping is embedded in most of the features so users can easily see where resources and where issues are reported. Users can create a personalized profile, in order to earmark the information most relevant to them and to follow progress on issues / items of interest (e.g. if they report a problem, they can receive a notification when it's been addressed).

To see results of the ethnography, the prototypes completed, the user-centred workshops and our video content, along with links to downloadable prototype applications, please visit www.fredericton.ca/smartcity.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Stakeholder Partnership and Collaboration

One of the key opportunities of this proposal has been our stakeholder collaboration. From the very start, we've relied heavily and intentionally on working with a broad cross-section of community partners and thought leaders in technical innovation, entrepreneurship and social innovation through our Smart City Task Force. **In addition to the 40+ representatives from more than 20 organizations** that have worked to collaboratively design this proposal, other stakeholders have been and will continue to be engaged through the projects. Ongoing stakeholder engagement includes:

- Holding **education/Q&A workshops** for non-profit organizations on the benefits and concerns surrounding data collaboration.
- Engaging **11 early adopter NPOs** for Non-Profit Data Collaboration, beginning with mapping out their current data collection, privacy and use practices and policies (see *Governance* for list of organizations).
- Engaging **five homeless-serving agencies** on their challenges and the benefits of adopting a shared platform. Some of the homeless serving agencies have already begun or completed data transfer to HIFIS4, with plans to bring on other agencies in subsequent years (outreach to the other agencies has already begun)
- Consulting with **owners-operators of public spaces** to better understand how to get the highest participation in installing Doorable technology, including bringing on Brookside Mall as a partner organization. Doorable plans to conduct a research study summer 2019 to determine the number of wheelchair push button doors rand then rolling out the technology starting with public and institutional access, and then private sector.
- Meeting with organizations to **understand the availability of data sets and what's missing to build out the Digital Community Hub** concept.
- Holding **workshops with City of Fredericton staff** at all levels to understand business processes and opportunities to improve, to select the right technology to implement to streamline operations, and to establish the roadmap forward.
- **Briefings** with the Mayor and Council for City of Fredericton and Chief and Council for St. Mary's First Nation on the progress of our Smart Cities Challenge.

We also have and will continue to establish **stakeholder partnerships and use stakeholder networks** to identify participants for and get word out about engagement opportunities.

Additional Insights That Helped Shape the Proposal

Demographics alone are not a good identifier of challenges. In the case of older adults, we discovered factors that affected the challenges they face including whether or not they live alone, their income status (e.g. stable, fixed, limited), their access to a car/transportation, and their state of health. Instead of looking at older adults as one big segment, we're better

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

able to contextualize the unique situations and develop a more nuanced understanding of the realities that exist within the segment to identify and address challenges when we break it down on these levels. This shows us the importance of getting to know our residents in a deeper and more comprehensive way through the engagement methods in this proposal.

We need to engage with residents directly to learn how they identify themselves and about their lives instead of making assumptions. There is a perception that older people are lonely and feeble. As we confirmed in the pilot ethnography exercise, "seniors" covers a very large age group, and many people within it live active and independent lives. In fact, we discovered that even if some may use it to describe themselves, the term 'senior' can carry subtle ageism. As one 69-year-old participant said, "I don't like the term senior. I'm an adult, I don't think of myself as anything else."

People enjoy the opportunity to be included in the early stages of design of innovative concepts. Here's what one participant in our older adult co-design workshop had to say about the opportunity to participate in a co-design workshop for Digital Community Hub:

> "It is heartening indeed that seniors are being afforded the opportunity of involvement in a workshop of this nature. I would be most grateful to be included."
>
> **Meris K Brookland**

Engagement Risks and Planned Mitigations

Risk	Mitigation
Not getting a true representation of the community in engagement efforts (not fully reflecting diversity or those that don't traditionally participate in engagement)	• Reaching out widely through community networks for user-centred design efforts, including non-profits that serve those who are often underrepresented in engagement efforts. • Rewarding people for their time (e.g. using grocery cards or other incentives) to reduce the barriers to participation.
Failing to get perspectives of important stakeholders that are tight on resources and failure to communicate benefits of participating	• Minimize off-site training/consultations to save time. • Use regular social media, email updates to share progress, opportunities for feedback, and success stories of how stakeholders benefit from projects.
Confusion/speculation from staff and stakeholders around what's happening, how things will change with the Transformation	• Establish a Transformation Office to coordinate Digital Fredericton effort in a structured way, including integrated stakeholder engagement/change management plan that aligns all projects. • Develop a robust Transformation Hub (e.g. SharePoint site) to host timely and accurate project details for staff and use multiple modes of communication. • Use tools, such as ChangeScout, to identify communications based on change impacts and schedule distribution for targeted messages to end-users based on unique impacts.
Leaders are silent and "invisible"	• Build / refine Sponsorship Cascade to expand the engagement of key leaders across the business.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project Management

Road Home Digital Enablement

Scope

This project will build digital infrastructure to support people who are experiencing homelessness and modernize the core systems that homeless serving agencies require to more accurately assess needs and increase service coordination.

- Connect all homeless serving agencies in Fredericton and St. Mary's First Nation with a shared data platform (HIFIS4) (deployment, data transfer to HIFIS4, and staff training for the system and create a consistent triage model).
- Feed de-identified/aggregate data to the Digital Community Hub.
- Deploy free, high-speed internet access at all homeless shelters as well as computers/kiosks for resident use.
- Deploy and upgrade free high-speed internet access in public places in the City center and on transit.
- Enhance and design new self-serve digital personalized inclusion resources as part of the Digital Community Hub.
- Provide first responders with digital resources so they can more effectively help people in the field.

Goals

These activities are designed to reduce barriers for people experiencing homelessness to reconnect / remain connected to community. They will:

- Help homeless serving agencies connect residents with what they need most in a continuum of care more quickly, with a more coordinated approach.
- Reduce the need for individuals to re-tell their story to multiple service providers.
- Allow for more efficient operations for shelter staff.
- Offer a necessary, easily accessible, high-quality internet connection.
- Offer a one-stop for enhanced, relevant online resources for shelter residents and first responders (e.g. places for a free meal, laundry service, crisis support, etc.).
- Take a more proactive, preventative approach in addressing chronic or episodic homelessness and help intercept those at risk.

Project Committee

The committee is comprised of subject matter experts and community stakeholders including: Community Action Group on Homelessness, City of Fredericton, St. Mary's First Nation, Fredericton Homeless Shelters Inc, John Howard Society of Fredericton, Capital Region Mental Health & Addictions, Youth in Transition, and Ignite Fredericton to lead the project.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Sustainability Beyond Project Lifecyle

At the end of the five-year project, the homeless serving agencies will have a shared client management system and coordinated intake and assessment system to better serve clients. It is anticipated there will be operational efficiencies due to reduced redundancies in the homeless serving system. This time can be reallocated to other priority areas. It is also anticipated that where HIFIS4 is a federal platform, that there will be a renewal agreement between adopters and the government for the sustainability of the system.

Non-Profit Data Collaboration

Scope

This project will connect NPOs with provincial and municipal data infrastructure and will build community capacity to collect data, establish measures and integrate with government and community data.

- Work with NPOs to establish data-sharing agreements.
- Develop consistent data collection standards based on academic research and security/privacy protocols.
- Develop data entry collection tools, templates and DIY data toolkit for NPOs.
- Transfer, de-identify and link data with provincial data infrastructure at NB-IRDT.
- Aggregate and anonymize data to the community level and make it accessible via the Digital Community Hub and provincial open-data portals.
- Run custom analysis of data in-house and in context of community.

Goal / Expected Results

By enabling community-wide engagement in the use of data and improving how our non-profits collect and use data, the project will enable NPOs to more accurately measure efficiency and impact, community needs and recognize gaps and overlaps in service. They will be able to create greater community impact through effective and targeted service design, delivery and evaluation, increased partnerships, and have more outcome-oriented funding in order to more effectively address community problems and influence policy development.

Project Committee

The committee is comprised of subject matter experts and community stakeholders including: Greater Fredericton Social Innovation, City of Fredericton, St. Mary's First Nation, NB-IRDT, NB-Social Policy Research Network, United Way, Fredericton Community Foundation, Fredericton Public Library, Civic Tech and Saint Thomas University to lead the project.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Sustainability Beyond Project Lifecyle

At the end of the five-year project, the NPOs will have 20% of Fredericton's non-profit agencies with the ability to make data-based decisions that will help them to better serve their clients and our community. Greater Fredericton Social Innovation will continue to support the NPOs in data collaboration and lead post-project activity that maintains growth and development. It will host regular gatherings to develop more advanced uses of data.

Digital Fredericton

Project Scope

The project scope includes work across three areas, which will be informed by the desired citizen experience, as defined by the Citizen Engagement Strategy.

1. **Core operational systems**
   This involves implementing modern cloud applications for **streamlined utility and customer billing, work order management, and field service delivery**, which will:
   - Enable self-serve customer access to billing accounts with real-time balance and transaction information systems to enable a transition to smart meters.
   - Provide a centralized view and point of control for monitoring field service activities to increase productivity and reduce costs.
   - Ensure adequate staffing and on-time arrival of field service personnel and more accurately predict a window for customer service delivery for improved service.
   - Diagnose symptoms and potential resolution for service calls before dispatching field service resources to prevent unnecessary service calls.

2. **Implement core HR/Talent strategies & systems**
   - Develop **a digital talent strategy** to align human resources, recruiting, training and development to this vision.
   - **Automate staff scheduling**, auto-selecting the best employees for the work based on rules, history and future schedule needs, and transforming how the City prioritizes, assigns and delivers work assignments.
   - Modernize **talent and performance management** and make it an ongoing activity through continuous conversations on goals, alignment, frequent checkpoints to review progress, and coaching to enhance performance.

3. **Customer facing strategies & systems**
   - Developing a **comprehensive citizen experience strategy** using ethnography and user-centred design to understand and enable desired resident experiences.
   - Implement **CRM systems for 311 services** to understand customer needs and develop operational strategies & technologies that close the gap between the current service delivery approach and the digital experience desired by residents.
   - Deploy a **self-service citizen portal** that empowers residents to help themselves to services and information, making it more convenient and faster for residents.
   - Create technology interfaces and an innovation lab space to enable the development of **connected community applications.**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Goals / Expected Results

1. **Operational efficiencies** achieved by streamlining processes and offering self-serve options, freeing up internal staff to focus on more analytical and strategic tasks.

   - Faster and more convenient billing and collections for citizens.
   - Repurpose 50% of account billing work to more relevant citizen-facing roles.
   - Improve customer service delivery.
   - Increase internal operating efficiencies and generate operational savings.

2. A **nimble, agile, innovative workforce** that can apply digital solutions to citizen issues.

   - Clear view of the talent requirements to deliver a new service experience.
   - Engage employees and help them be more strategic and productive in their work.
   - Track resources to increase productivity and improve service delivery to citizens.
   - Efficiencies and cost savings through reduced overtime costs.

3. Provide citizens with **highly personalized, interactive services, access to open data,** and provide the City with **better analytics about what matters to residents**.

   - Convenient and intuitive access to information and services.
   - Better understand and communicate with residents and businesses in real-time.
   - Capturing real-time data to address priorities and needs to make more effective, more resident-centric decisions.
   - Facilitating the environment for potential and existing businesses to innovate through open data access, which will lead to economic development.

Project Committee

The committee is comprised of subject matter experts to lead the digital transformation. Please refer to *Governance* for an organizational approach to project oversight of this area.

Sustainability Beyond Project Lifecycle:

This initiative will generate operational efficiencies, which will be transitioned to sustain ongoing customer service roles and initiatives.

Digital Community Hub

Scope

We will fully build out a multi-level platform that will bring data sets & digital resources from diverse community sources to measure progress on key smart city/quality of life areas, create communities of interest for collaboration on issues, and offer a personalized curation of resources, tools, information and services that matter most to users.

- Establishing data sets to feed into census aspect of the Digital Community Hub and creating process for data identification and refinement.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Developing partnerships with organizations to provide data and tools to include on the Hub, and identify alternative ways for people to connect non-digitally.
- Fully developing a platform for each of the Hub levels.
- Developing an opt-in profile for people who want to provide personal info to personalize the information, resources, and services displayed on their Hub.
- Conducting user testing of the platform.
- Creating an engagement survey mechanism to be conducted at regular intervals.
- Monitor our progress towards becoming a Smart City and identify indicators for mobilizing to continue improving the quality of life for all our residents.

Goal / Expected Results

The goal is to give a complete and detailed profile of our community with rich data on who is in our community and their challenges and priorities.

- Increase the sense of citizen inclusion and participation.
- Allow for better informed and proactive decision-making by the City, St. Mary's, organizations, and entrepreneurs, supported by citizens' core needs.
- Improve the ability for citizens and organizations to effect change and have a voice in decisions in their community (participatory democracy).
- Enable open data access so residents and businesses can design solutions to address community problems, which leads to new innovations and economic development.
- Enable more innovative responses to service delivery.

Project Committee

The committee is comprised of subject matter experts and stakeholders including: City of Fredericton, St. Mary's First Nation, WSP Canada, the University of New Brunswick, and the Fredericton Community Foundation to lead the project.

Sustainability Beyond Project Lifecyle

By year five, it is anticipated that the Digital Community Hub platform will be complete and operational. As we generate efficiencies in internal processes, the City will redeploy staff for the sustainability of the Digital Community Hub. As we develop the hub, organizations will have a space to specifically evaluate their direct and indirect impact on our community's well-being. Alternative funding sources will be explored through subscribing partners.

Doorable (Developed By Appdigenous)

Scope

Appdigenous will fully develop hardware and software to make built physical infrastructure more accessible, available free of charge to users (residents). With the wide-spread adoption of Doorable technology that this project will enable, Fredericton and St. Mary's will become Canada's living lab for accessibility.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Map the current inventory of push button doors across the City.
- Produce and deploy hardware on doors where there currently is a "push button" throughout Fredericton and St. Mary's First Nation.
- Further develop the core user app to allow users to communicate directly with each other and with facilities about accessibility barriers.
- Develop a next version of existing Doorable hardware (Bluetooth-based), that will enable Doorable to be web-based; significantly enhancing the range of services available through the app.
- Build data through interactions between citizens and infrastructure (e.g. count of door opens, use geo-location features for those that opt-in to specialized research to identify barriers/gaps in accessibility in the community, and help better inform municipal decisions with respect to accessibility).
- Build an application that will assist installers in rolling out the technology in diverse facilities and configurations.
- Build a revenue stream through subscribing facilities, that will allow those facilities to push information on services, programs, events and goods to (opting in) individuals who use Doorable to access their space(s).
- Expand the technology throughout Fredericton and St. Mary's and to other communities in the province and across Canada.

Goal / Expected Results

The goal is to make it easier for people with mobility-related challenges to live and get around their community with improved accessibility, allowing them to be more independent & fully participate in education, jobs, services, the community. This will be done by making it easier for people with accessibility challenges to get into buildings and to access better information about options available to them as well as by giving decision makers better information on gaps in accessibility, so that they can address them. Doorable will also contribute to the Internet of Things ecosystem as a catalyst for other infrastructure changing advances and become Canada's product development living lab for accessibility.

Project Committee

The committee is comprised of subject matter experts and community stakeholders including: private sector lead-Doorable, City of Fredericton, New Brunswick Community College, Stan Cassidy Rehabilitation Centre, St. Mary's First Nation, Research and Productivity Council, AbilityNB, and Hotspot Parking (private sector) to lead the project.

Sustainability Beyond Project Lifecyle:

Appdigenous has developed a commercial business plan for Doorable. The Smart Cities funding will seed the preliminary market testing. With a proven revenue model, Doorable will access investor and government funding to sustain business development.

Budget, Timelines and Milestones

Please see detailed project timelines and budget shown in *Financial* and milestones and progress payments shown in *Performance Measurement.*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Overall Project Management

Resource Assessment Management Plan

The following criteria will be used to manage the resources, both human and equipment, for project implementation.

Authority/responsibility	• Smart Cities Manager
Timing for resource management	• Monthly meetings
Methods of acquiring resources	• Job posting competition to acquire HR • Secondments of City Staff to this program • Procurement process to acquire materials/services
Training requirements for resources	• Training resources will be engaged as need be based on technical requirements for project implementation.
Tools for managing resources	• Resource performance progress reports • Committee meetings – resource performance • Schedule baseline & cost baseline – resource assignments
Tools for resources measurement	• Resource performance review
Authority/responsibility for accepting resource changes	• Smart Cities Manager • Project Committee Leads

Human Resource Requirements

Resource Role	Timeframe	Responsibilities
Digital Fredericton		
Manager of Corporate Systems Renewal	Existing and ongoing	Leads the Digital Fredericton Transformation, provides visionary leadership on renewal of corporate systems and alignment to the Digital Fredericton Vision. Manages the strategic partnerships and oversee the project implementation, milestones and Digital Fredericton outcomes.
City Subject Matter Experts	Secondments as required	Provides subject matter expertise on City service delivery, and is seconded to agile project teams with technology partners to develop core systems and CRM projects throughout the project lifecycle.
Redeployed internal staff		Staff time gained through efficiencies generated in modernizing core systems will be redeployed to digital customer relationship management.
Digital Community Hub		
Digital Community Hub Coordinator	5 years/ongoing	Developing a structured five-year Digital Community Hub Plan in consultation with the Smart Cities Manager; data discovery and establishing/negotiating data sharing agreements, maintaining data sharing partnerships with organizations; liaising with Digital Fredericton team/St. Mary's ethnographer in terms of receiving ethnography inputs (segments & personas and insights); coordinating user-centred design as it relates to the Hub and feeding this into the design; developing data maintenance/renewal plan and long-term data strategy for future sustainability.
Data Analyst	5 years/ongoing	Modelling data; conducting analyses; liaising with data contacts with partner organizations to obtain aggregate data transfer; inputting data, facilitating the creation of required data; and assisting with data discovery.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Content Creator	5 years/ongoing	Creating content and assisting with the implementation of the Smart Cities marketing/communications plan includes: advertising/promotions for public engagement; hub/segment releases; social media and website content generation; building the brand, etc. This position also assists with the data entry and supports the overall Fredericton/St. Mary's Smart Cities Program.
Appdigenous		
CEO	Ongoing	Overall business leadership and development.
President	Ongoing	Operational management of Doorable.
Technology lead	Ongoing	Updating of Application(s). Leadership role with outside developers.
Finance Lead	Ongoing	Management of Financial plan, budgets, payroll, billing and costing systems.
CRM	Ongoing	Technical support for users, installers and subscribers, social media promotion.
Installers/Service	Ongoing	To install Doorable hardware on subscribing facilities, capturing information required to populate the User App (maps, etc.). Service existing installs.
6 Researchers	Jun-Aug/19	To undertake the inventory project of all accessible doors in Fredericton and research strategy.
Data Entry Specialist	July 1-Sept/19	To input data from inventory project.
Data Analytics Expert	Sept/19	To analyze data from inventory project.
Research coordinator	May – Oct/19	To coordinate research for inventory project.
Non-Profit Data Collaboration		
Project Manager		Resourced through GFSI.
Process Design Consultant		Resourced through GFSI.
Data Analyst		Resourced through NB-IRDT.
Road Home Digital Platform		
Resourced through participating agencies and in-kind partnerships.		

Smart Cities Program Management		
Smart Cities Manager	5 years/ongoing	• Managing the Digital Community Hub administration. • Liaising with project committees to facilitate the successful implementation of projects. • Managing budget oversight, and funding disbursements to the five projects. • Reporting to Infrastructure Canada. • Coordinating quarterly Fredericton Smart Cities Task Force meetings including report generation (quarterly progress reports, budget, issue management). • Managing strategic marketing and communications for the Smart Cities Program as it relates to Fredericton's brand. This includes the development of an integrated marketing communications plan (encompasses public awareness element/storytelling, leveraging partnerships with respect to marketing, public relations, refreshing GoFred brand, elevating Digital Fredericton brand, etc.). • Cultivating and fostering stakeholder relations/partnerships. • Managing Smart Cities Innovation Lab and liaising with potential and existing entrepreneurs as it relates to Smart Cities app development – connecting them with partners/staff and funding.
First Nations Lead	5 years	• Lead ethnographic research initiatives.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

		• Oversee technology development and implementation. • Advocate and monitor OCAP principles for First Nations data. • Liaison for Digital Community hub and NPO data teams.
Privacy Officer	5 years	• Sub-contract consultants for annual privacy audit
Chief Information Security Officer	5 years	• Sub-contract consultants for quarterly security review and ongoing development of policy and security practices

With the University of New Brunswick and New Brunswick Community College both located in Fredericton and other post-secondary educational institutions, it is assumed that talent acquisition will be viable.

Procurement Management Strategy

The following criteria will be used to manage the procurement components of this project.

Authority/responsibility	• Smart Cities Manager • City Purchasing
Timing for procurement management	• As required as per procurement list pertaining to requisitions
Procurement management approach steps	1. Determine procurement items required (planning) 2. Determine lead time required & timeframe needed 3. Complete procurement documents (as required) 4. Determine & document decision criteria 5. Engage Purchasing 6. Conduct procurements (source vendor) 7. Award & approve contracts 8. Administer & manage contracts 9. Verify & contact deliverables 10. Close contracts 11. Complete procurement evaluations
Procurement documents required	• RFP (Source selection criteria and pricing forms) • Statement of work • Terms & conditions • Non-disclosure agreement • Letter of intent • Firm fixed price contract • Procurement audit form • Procurement performance evaluation form
Tools for managing procurement	• RFP/RFI • Statement of Work (SOW)/Contract • Standard contracts • Purchase Orders • Historical information – vendor performance evaluations
Measurement tools for procurement	• Procurement baseline • Approved SOW/Contract
Contracts approval steps	• Procurements for standard contracts - approved by project management
Authority & responsibility for contract approval	• Smart Cities Manager • City Purchasing (as required for RFPs over certain amount)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Communications Strategies / Management Plan

A full-scale integrated marketing/communications plan will be developed for the Smart Cities initiative, including approaches to ensure the public and many stakeholders are kept informed on progress and given opportunities to participate in engagement activities. The following criteria will be used to manage the communication for this project.

Authority & responsibility	• Smart Cities Manager • Project Committee Leads
Timing for communications	• Public update on progress every two months • Project Committee meetings • Ad-hoc (as required)
Tools for managing communication	• Quarterly project status reports • Project committee presentations if required • Committee meeting agendas • Project committee meeting minutes
Authority & responsibility for accepting communication changes	• Smart Cities Manager • Project Committee Lead

Stakeholders

See *Governance* section for list of stakeholders and roles/responsibilities.

Risk Management Strategy

The following criteria will be used to manage the risk components for project implementation.

Authority & responsibility	• Smart Cities Manager • Project Committee Leads
Risk management approach steps	1. Do a quarterly risk assessment 2. Identify & capture risk in register 3. Qualify & prioritize risk 4. Determine risk owner, approach and assignment 5. Update risk & action (communicate as required) 6. Close risk in register
Timing for risk management	• Monthly – during project committee meetings • Initiated by change control process (as required)
Tools for risk identification	• Committee meetings • Workshops • Brainstorming • Historical information from similar projects • SWOT analysis • Stakeholder engagement • Corporate risk register • Project risk register
Tools for risk qualification & prioritization	• Risk register criteria (defined below) • Decision trees • Monte Carlo analysis/what if scenario planning
Approach for risk monitoring & control	• Monthly review of open, prioritized risks • Communication of impact of triggered risks (meetings, status reports)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

	• Closing of completed risks
Authority & responsibility for accepting risk plan changes	• Smart Cities Manager • Project Committee Leads

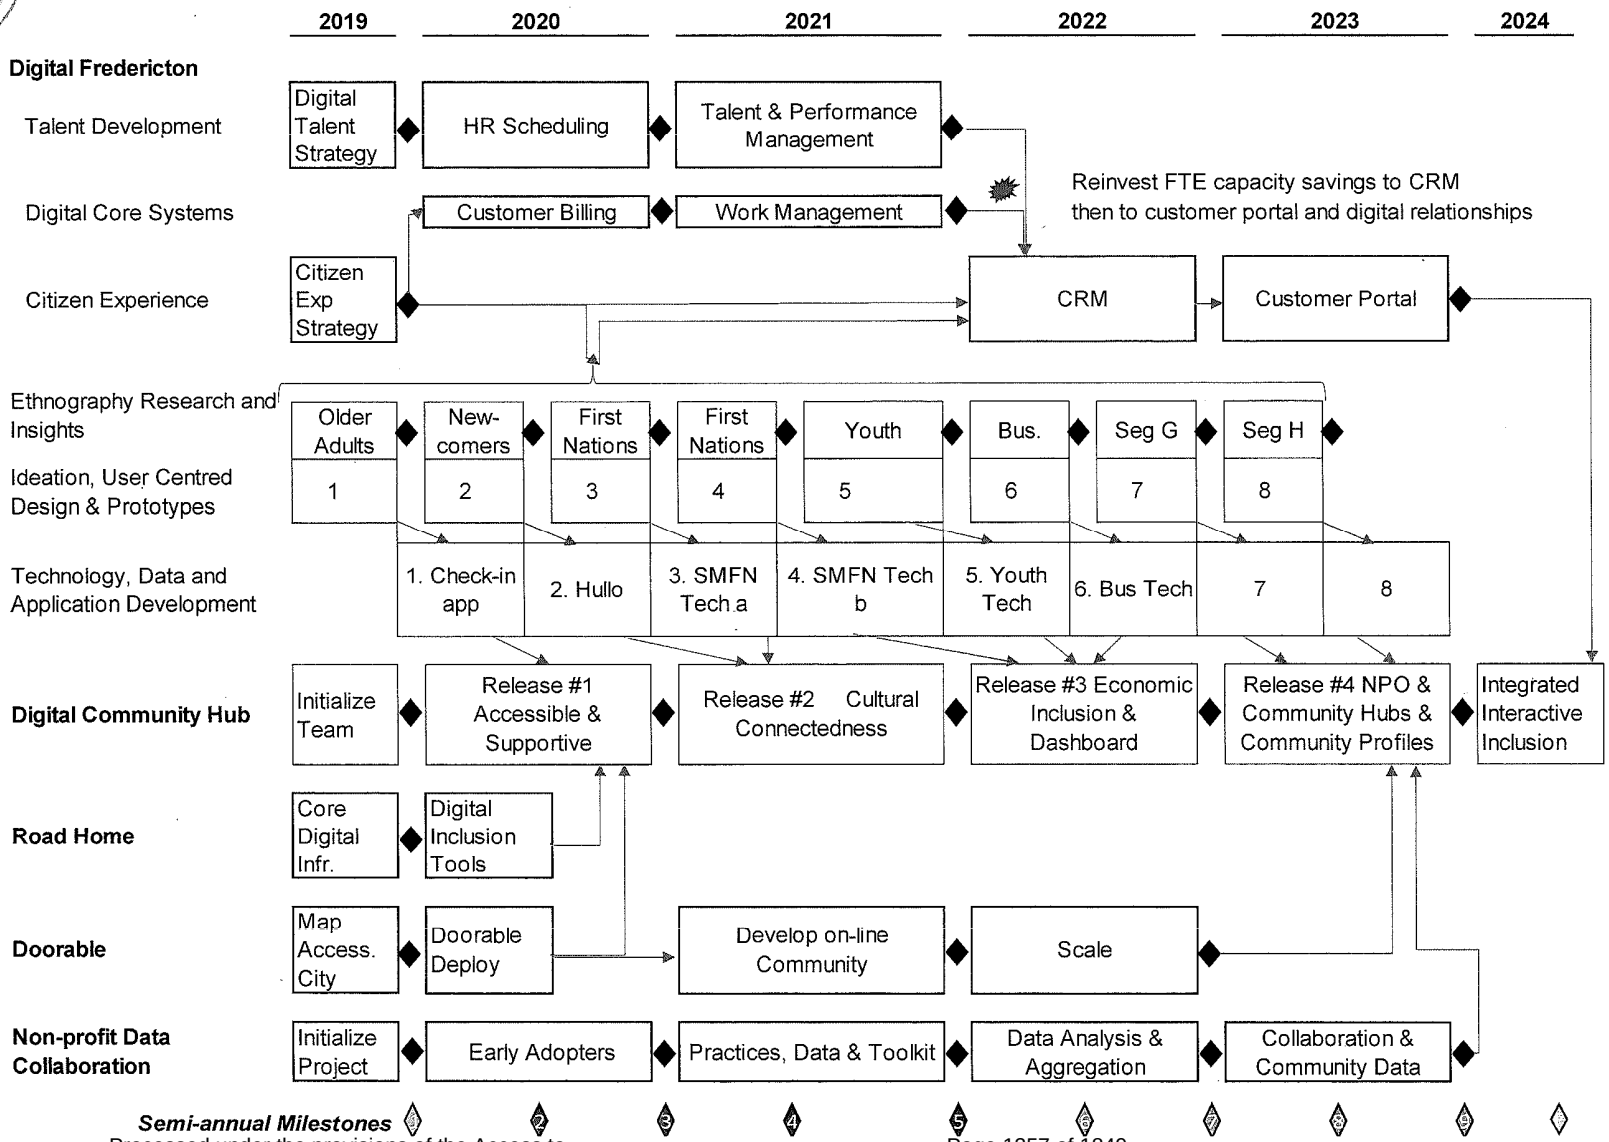
Monitoring, Controlling, and Checkpoints for Project Management

The following framework will be used to monitor and manage the issues of project implementation.

Authority & responsibility	• Smart Cities Manager • Issue owner
Issue management approach steps	1. Identify & capture issue 2. Categorize/prioritize issue (communicate as required) 3. Assign action owner 4. Determine issue resolution plan & due date 5. Close issue (communicate as required)
Timing for issue management	• Monthly - during committee meetings • As required for high priority issues
Tools for issue identification	• Committee meetings • Risk triggers • Escalation to Task Force • Stakeholder interviews
Tools for measurements & management	• Project issues log
Project issue categories	• Technology • Business • Political/Legislative • Resource • Project • Process • Departmental • Security /Privacy

High level summary of project checkpoints and contingency measures will be brought forward in the quarterly progress report to the Task Force.

Project Management Risks and Planned Mitigations



Risk	Mitigation
Risk of building too many one-off Connected Community solutions without the full Customer Experience Strategy and necessary core & talent development systems to be sustainable and efficient (e.g. if an app is built to report a problem to the City, need to connect with automated work management system)	• Build a detailed the citizen experience strategy that outlines the required digital talent strategy and citizen experience and the expected connections to back-end systems in the first six months. • Build core systems in the first 2.5 years of implementation, which will support the sustainability and efficiency of CRM, Customer Portal, and Connected Community apps.
Poor cost management & over-runs	Develop full cost management plan, conduct monthly budget checks for each project to highlight need for adjustments/course corrections as necessary; communicate to Smart Cities Manager monthly.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Cashflow beyond lifecycle of project	Seek alternative funding sources and revenue generation models (e.g. subscription base, etc.).
Inability to meet milestones	• Strong, organized leadership. • Maintaining well defined scope & project schedule.
Talent acquisition/personnel loss	Good recruitment strategies and relationships with educational institutions, coop programs, summer internships, cross-training, advancement planning.
Lack of operational efficiency/redundancies	Ensure quality plan/process training is in place to ensure projects are completed on time and on budget.
Low morale or change fatigue leading to delays and low-quality work	Kick-off and planned subsequent pulse checks and working sessions to be tailored to equip leaders and team members with knowledge, skills and tools for success in their role on the Transformation and to fuel team effectiveness.
Failure to plan and communicate need for sustained behaviour change /change management support	• Use change impacts to identify where behavior change is needed and establish integrated approach across all work streams and business units. • Identify resources responsible for sustainment of learning content and nurturing the change agent network to include them in the design of the initial products and approaches to establish alignment. • Implement robust knowledge transfer program.
Team members, key stakeholders and business leaders work in silos and fail to harness the interconnectedness of the Transformation, resulting in wasted efforts	Use training to kick-off the project and support staff in onboarding and continuous learning throughout the course of the Transformation.
Adoption risks are not meaningfully communicated for targeted action	Leverage Transformational Risk Framework to proactively identify and manage risks to adoption in collaboration with project and organization leaders.
Stakeholders are not clear about what they need to do to prepare for change	Work with the Transformation teams to develop Personas for key roles.
Business leaders do not take ownership for their stake in the change journey	Use digital change tool (e.g. ChangeScout) as the repository for stakeholder and change impact assessment and readiness dashboards that can integrate across the Transformation for a holistic view.
Losing relationships with community organizations due to lack of time/changing players	Hiring a community digital hub coordinator to establish and maintain relationships, ensure continuity of relationships when there is a change in personnel.
Failure to get/keep NPOs and homeless serving agencies onboard with the projects that rely on them sharing data because they don't see the benefit of participating	• Start with a small number of NPO early adopters for projects, engaging closely/maintaining relationships to identify what's working, what's of benefit, and what could be improved to make it easier or yield more benefits for them, addressing any issues. • Be transparent about the progress made, successes/benefits/ROI achieved, and how we're addressing issues that have surfaced.
Increased workload for NPOs, inconsistent/invalid data, competency for data mine analysis for ROI	Staff training, train the trainers, standardized system and data standards.
Boxing out NPOs that provide important services but don't know how to use the data, then receive less funding in outcomes-based grants	• Skills training and education on how to use data. • Civic Tech Fredericton team will partner with NPOs to help them link and analyze their data in-house and when linked with other open data sources. Each member of Civic Tech Fredericton will "adopt" a Caused-Based Hub and be the go-to person for data analysis.

Performance Measurement

Strategic Themes

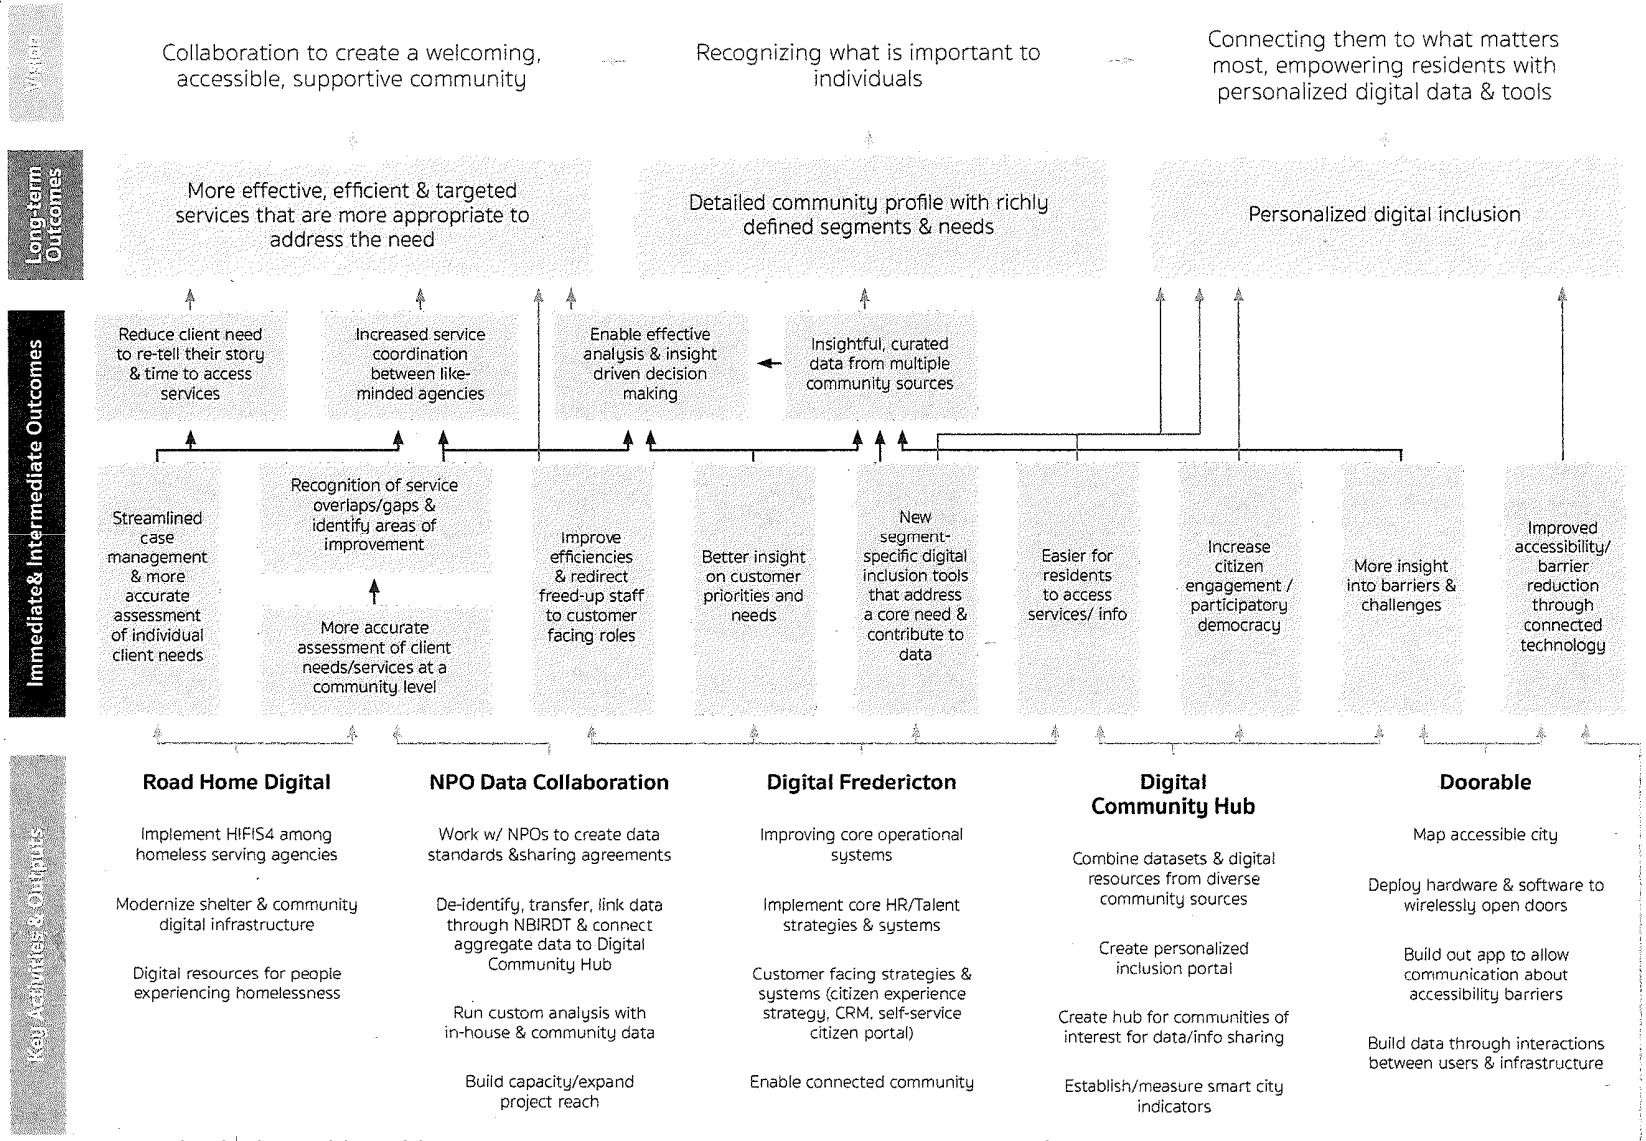
Our plan is focused on measuring performance across three key strategic themes to achieve our vision.

Collaborating to Create a Welcoming, Accessible, Supportive Community

We need to create more efficient, effective and targeted services that appropriately address resident needs to achieve increased inclusion for all residents. Modernizing our community's core technology infrastructure is a fundamental step to achieving the efficiencies we need to create the capacity to offer value-added, targeted, resident-focused services. With improvements in core systems, we will be able to conduct far more effective analysis and make evidence-based and insight-driven decisions to be able best address resident service expectations. This will also allow us to offer a higher level of tailored and more resident-friendly service.

Recognizing What is Important to Individuals

This requires a deep understanding of who our residents are and the challenges they face to enjoying a high quality of life in their community. By collecting and curating detailed data and information from diverse sources – including data from community organizations, the City's CRM, ethnographic research, and connected community apps – into the Digital Community Hub, we will be able to develop much richer information on our community needs. We will use that to develop deep insights about the issues that matter to people in our community and what impact addressing them will have, developing a much more complete profile of the people we serve and the issues that matter to them. This insight will feed into the activities under the other two strategic themes.



Connecting Residents to What Matters Most Using Personalized Digital Tools

Upon recognizing resident needs, we will use connected technology & digital tools to connect them to what is important. The meaningful insights we gain will inspire new solutions for under-addressed core needs and provide opportunities to further tailor how we connect people to resources they need most. By involving residents at every step of solution design, the tools created will be truly effective in both helping people find personally relevant resources to connect with their community and reducing barriers to that connection. The result will be an increase in inclusion.

There are several interconnections across project activities/outputs and outcomes. To manage performance over five years, we will monitor the three themes with metrics to track progress in achieving outcomes at each level. Following are the logical links between activities and outcomes and a balanced scorecard for each theme.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Activities, Outputs and Links to Outcomes and Strategic Vision

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Measuring Outcomes and Performance Indicators

STRATEGIC THEME

Collaboration to create a welcoming, accessible, supportive community

LOGIC MODEL | BALANCED SCORECARD

		OBJECTIVE	MEASURE	TARGET	BASELINE	DATA SOURCE
Long-term Outcomes	Services Address Needs	Increase inclusion by providing targeted services that address needs, working in an end to end environment that puts citizen engagement first	Increased percentage of citizens who are satisfied with the supports and services to help them participate fully in the community	95%	TBD	Citizen Attitude Survey; Digital Community Hub
Immediate and Intermediate Outcomes	Increased Collaboration	Increased service coordination between like-minded agencies	Number of new service collaborations between NPOs	10	TBD	Greater Fredericton Social Innovation (GFSI)-self report
		Recognition of service overlaps/gaps & identify areas of improvement	Agencies reporting use of data to improve services	10	TBD	GFSI - self report
Immediate and Intermediate Outcomes	Streamlined Service Delivery	Streamlined case management	Clients connected to appropriate services quickly	TBD	Unknown	Shelters
			Reduction in duplicate files	0	Unknown	HIFIS4
		More accurate assessment of needs using shared data	Granting agencies using data/outcomes as a criteria for funds	2	0	United Way and Fredericton Community Foundation
		Faster more convenient City services	Increase in customer satisfaction	40%		Citizen Attitude Survey
Project Activities and Outputs	Modernize Core Systems	Implement HIFIS 4 Core	Number of agencies	9	0	Homeless agencies
		Modernize core City systems for efficient service delivery and operations	Reallocating talent from admin to customer service	4000 hrs	0	Lean 6 Sigma process reviews
			Realized operational efficiencies	38%	0	
		Develop core data tools for NPOs	Number of orgs who contribute and share data	40	0	GFSI - self report

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

STRATEGIC THEME

Recognizing what is important to individuals

LOGIC MODEL		BALANCED SCORECARD				
		OBJECTIVE	**MEASURE**	**TARGET**	**BASELINE**	**DATA SOURCE**
Long-term Outcomes	**Detailed Community Profile**	Develop a detailed community profile with richly defined segments & needs	% of population captured in a one or more personas	100%	0	Ethnographic Research compared to Stats Can data
Immediate and Intermediate Outcomes	**Develop Rich Insights**	Develop rich insights into community needs through thorough analysis of diverse data inputs connected technology and people	Number of issues that have comprehensive analysis using community input	14	Unknown	Digital Community Hub Data Analyst
			Diversity of inputs used on issue analysis (organizations, individuals, research, connected technology)	>3 per issue	Unknown	Digital Community Hub Data Analyst
Immediate and Intermediate Outcomes	**Strong Community Voice**	High-level on-going engagement from community organizations, interest groups and individuals contributing to caused based hubs, identifying issues, and voicing perspectives	Number of organizations contributing data and participating in cause-based hubs	10	0	Digital Community Hub Coordinator
			Number of individual monthly users participating in the Digital Community Hub	500	0	Digital Community Hub Coordinator
Project Activities and Outputs	**Diverse Collection of Digital Input**	ID segments and develop insights, and ideas through ethnography	# of detailed segment aspirations and experience analysis	8	0	Ethnographic Researchers Completed Reports
			# of personas	24	0	
			# moments that matter	100	0	
		Develop cause based hubs for diverse community issues	# of cause-based hubs created	8	0	Digital Community Hub Coordinator
		Connect data from connected community applications to drive insights	# of segment-specific applications providing data to the dashboard	8	0	Digital Community Hub Coordinator
		Drive insights from CRM/311	Annual analysis of top 5 issues	25	0	Service Fredericton

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

STRATEGIC THEME

Connecting residents to what matters, empowering them with personalized digital tools

LOGIC MODEL — BALANCED SCORECARD

		OBJECTIVE	MEASURE	TARGET	BASELINE	DATA SOURCE
Long-term Outcomes	Personalized Digital Inclusion	Increased inclusion through uptake of personalized digital inclusion tools and citizen portals	% of population using personalized digital inclusion tools	10%	Unknown	Sum of DCH users, CRM users, and users of connected community apps.
Immediate and Intermediate Outcomes	Segment Specific Tools	Create self service tools that are intuitive and help people find resources relevant to their needs and reduce barriers	Customers who rate the digital tools as highly satisfactory in connecting to what matters and reducing barriers	75%	0	Develop customer feedback areas within tools
			# of tailored tools per segment	1		Smart City Manager
Immediate and Intermediate Outcomes	Citizen Co-creation	Incorporate user-centred design iterations to improve and deploy technology that reduces barriers and improves access	Customers who provide on-going feedback on the digital tools (CRM portal, connected apps and DCH)	10%	0	Develop customer feedback areas within tools
			End user participation in user-centered design workshops	300	0	User-centred design consultants' reporting
			# of user-centered design iterations	>2/app	0	User-centred design consultants' reporting
Project Activities and Outputs	Connect Data, Ideas and Technology	Deploy technologies for user adoption	User uptake on each new tool	8%	0	Application userbase
			Market penetration for Doorable	50%	0.7%	Doorable
		Improve basic digital access	# of agencies and public spaces with digital access for clients	50	15	Fred-e Zone reporting
		Create personalized inclusion spaces	Number of unique visitors to Digital Community Hub and CRM portals	5000	0	Develop analytics on Digital Community Hub userbase
		Create rich data sets and resources for users and innovators	# of datasets in the hub	TBD	TBD	Digital Community Hub Coordinator reporting
			# of services and programs listed/linked in the hub	TBD	TBD	

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Progress Timelines, Deliverables, Milestones and Payment Schedule

The schedule of deliverables and performance milestones with a proposed payment schedule are shown on the following pages. The rightmost column shows the **progress for each performance milestone anticipated at each stage relative to the end-target**. For example, we will develop three empathy-based personas by December 2019, showing progress towards a total target of developing 24 before the end of the five-year period.

Certain deliverables have immediate performance measures within the same timeframe, while others have resulting performance measured in the subsequent period.

Deliverable Milestones	Performance Milestones	Progress and Payment
Complete Citizen Experience Strategy	Empathy based personas	3/24
Complete Digital Talent Strategy	Insightful moments that matter	12/100
Community Digital Hub team established	Segment aspirations and experience analysis	1/8
NPO team operational	Number of installations of Doorable hardware	200/200
Ethnographic research older adults	Number of agencies onboarded to HIFIS4	5/9
Map of the Accessible City Doorable initial deployment Road Home Core Infrastructure Installed	Number of users of digital access at homeless agencies per month	100
1 December 2019		**$ 1,925,000**
Complete Newcomer ethnography	Empathy based personas	6/24
Check-in companion app V1	Insightful moments that matter	24/100
Technology inclusion tools for homelessness	Segment aspirations and experience analysis	2/8
Doorable deployment & dev	Number of user centered design iterations	2
	User uptake as a percentage of segment	8%
	Number of agencies on HIFIS4	8/9
2 June 2020		**$ 620,000**
Implemented core Customer Billing	% of customers transitioned to self-serve online accounts	50%
Implement core HR Scheduling	Number of FTE hours efficiency gained	2000
Complete 1 First Nations ethnography	Empathy based personas	9/24
Develop Newcomer technology V1	Insightful moments that matter	36/100
10 NPOs on-board data project	Segment aspirations and experience analysis	3/8
	Number of user centered design iterations	2
	User uptake as a percentage of segment	8%
	Number of user-centered design iterations	2
	First 10 out of 40 NPOs	10/40
	Number of cause based hubs created	3/8
	Number of monthly contributors to the DCH	100/500
	Number of unique visitors to DCH & CRM portals	500/5000
	Market penetration of Doorable on public facilities	50%
3 December 2020		**$ 2,700,000**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Deliverable Milestones	Performance Milestones	Progress and Payment
Complete 2nd First Nations ethnography Develop First Nations technology (a)	Empathy based persona	12/24
	Insightful moments that matter	50/100
	Segment aspirations and experience analysis	4/8
	Number of user centered design iterations	2
	User uptake as a percentage of segment	8%
	9 agencies on HIFIS	9/9
	Reduction in number of duplicate files	TBD
	Speed to connect clients to appropriate services	TBD
4 June 2021		**$ 200,000**
Implement Talent & Performance Management Implement Work Management & Field Service Complete ethnography for youth segment Develop First Nations technology (b) Create Doorable online community Create NPO data and practices toolkit DCH Release #2 Cultural Connectedness	Increase in customer satisfaction with billing	40% increase
	Number of FTE hours efficiency gained	6000
	Empathy based persona	15/24
	Insightful moments that matter	62/100
	Segment aspirations and experience analysis	5/8
	Number of user centered design iterations	2
	User uptake as a percentage of segment	8%
	Number of users on the Doorable application	2000
	Next 10 of 40 NPOs	20/40
	Number of caused based hubs created	5/8
	Number of monthly contributors to the DCH	200/500
	Number of issues that have comprehensive analysis using community input	4/14
	Number of unique visitors to DCH & CRM portals	1000/5000
5 December 2021		**$ 1,695,000**
Complete ethnography business Develop technology for youth	Empathy based persona	18/24
	Insightful moments that matter	75/100
	Segment aspirations and experience analysis	6/8
	Number of user centered design iterations	2
	User uptake as a percentage of segment	8%
6 June 2022		**$ 195,000**
Implement CRM Complete ethnography Seg G Develop business technology NPO Data analysis and aggregation Doorable scale business DCH Release #3 Economic Inclusion and dashboard	First 2000 hours reallocated to customer relationships	2000/4000
	Analysis of top CRM issues in 311 data	10/25
	Segment aspirations and experience analysis	7/8
	Empathy based persona	21/24
	Insightful moments that matter	87/100
	Number of visitors to the Digital Community Hub and CRM portals	5000/5000
	Number of user centered design iterations	2
	User uptake as a percentage of segment	8%
	Next 10 NPOs on board	30/40
	NPO testimonial reporting using data effectively	10
	Number of caused based hubs created	7/8
	Number of issues that have comprehensive analysis using community input	9/14
	Number of monthly contributors to the DCH	300/500
	Number of unique visitors to DCH & CRM portals	2000/5000
7 December 2022		**$ 1,275,000**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Deliverable Milestones	Performance Milestones	Progress and Payment
Complete ethnography Seg H Develop technology for seg G	Empathy based persona	24/24
	Insightful moments that matter	100/100
	Segment aspirations and experience analysis	8/8
	Number of segment specific tools deployed	8/8
	Users who rate the digital tools as highly satisfactory in connecting them to what matters	75%
	User uptake as a percentage of segment	8%
8 June 2023		$ 197,000
Implement Customer Portal Develop technology for Seg H NPO data collaboration & community data DCH Release # 4 NPO Community Hub & Community Profile	Next 2000 FTE hours reallocated to customer relationship	4000/4000
	Analysis of top CRM issues	25/25
	Number of user centered design iterations	2
	User uptake as a percentage of segment	8%
	Next 10 NPOs on board	40/40
	Funding grants supported by data using outcomes as a criteria	2
	Number of organizations contributing data to the DCH	10
	Number of service collaborations between NPOS	10
	Number of cause based hubs created	8/8
	Number of monthly contributors to the DCH	400/500
	Number of issues that have comprehensive analysis using community input	14/14
	Diversity of inputs used in analysis per issue (organizational input, individual input, ethnography, connected technology)	<3
	Number of unique visitors to DCH & CRM portals	5000/5000
9 December 2023		$ 1,190,000
Interactive Integrated Personalized Inclusion	Number of monthly contributors to the DCH	500/500
	% of residents who are satisfied with services to help them participate fully	95%
	% of residents captured in 1 or more empathy based personas	100%
	% of population using personalized digital inclusion tools, DCH and Customer portal	10%
F June 2024		$ 3,000
		$ 10,000,000

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Performance Monitoring, Reporting & Evaluation Strategies and Checkpoints

Each project team will report on outcome measures, milestones and payments for the respective project. The Digital Community Hub administration, led by the Smart Cities Manager, will compile and monitor performance indicators monthly and/or quarterly (whichever is more appropriate for the measure), establishing reporting with both internal and external sources of data and sharing the information directly with all projects. Monthly cashflow variance reporting will occur as outlined the financial tools and accounting methods section.

The Smart Cities Manager will bring forward a high-level summary of project performance checkpoints and contingency measures from project monitoring as part of the quarterly progress report to the Task Force (as outlined in *Governance*). The Task Force would suggest course corrections for the project committees if not meeting objectives and a change control process if there are major project deviations.

Performance Measurement Risks and Planned Mitigations

Below are risks and mitigations identified for performance measurement.

Risk	Mitigation
Disproportionately focusing on a few select groups (not representing whole community), preventing a complete community profile	• Selecting a relatively high number of distinct segments (12), ensuring segmentation represents the entire population so each individual will be able to see themselves represented in at least one segment. • Conduct annual surveys to ensure proper capture; ongoing ethnography to identify changing needs, new customer segment profiles/personas, etc.
Lack of people using personalized digital inclusion tools due to privacy concerns and/or of real or perceived value by residents	• Being clear and upfront about how the data is collected, used, disclosed and protected through a simple consent form and in communications efforts. • Using user-centred design principles and stakeholder collaboration to directly involve users/stakeholders at each step (including post-launch) and understand their concerns related to ease of use, privacy, etc. as well as what they value. • Develop & regularly update full marketing/communication plan for all projects, with wide range of communication mediums to address concerns about value/privacy. • Conduct regular surveys to determine satisfaction, solicit feedback, and identify new and changing needs.
Lack of participation in cause-based hubs, or lack of cause-based hubs	Marketing and awareness efforts; stakeholder engagement via Digital Community Hub Coordinator working with organizations.
Lack of data sets, services, programs to include in the Hub	Research to identify data sets, and stakeholder engagement to onboard new agencies.
Inaccurate data sets to feed into Digital Community Hub	• Ensure data quality via analyst & hub coordinator. • Work with NPOs to establish data standards. • Community Hub Coordinator to work with stakeholders to identify issues and recommended fixes.
Lack of citizen engagement in co-creation process	Marketing and awareness and more targeted outreach re: user-centred design.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

No measurable change or citizen dissatisfaction with support and services created to increase inclusion	More targeted engagement to increase awareness and/or more in-depth research to better understand needs and gather insights.
Choosing inappropriate metrics to measure improvement	Segmentation research & workshops.
Transformation effort of Digital Fredericton does not make a material impact on organizational behaviours	Launch Transformation Academy to develop leadership skills and gather key feedback and insights about how they can best be supported in their role to be visible and accountable change leaders (e.g. coaching, key messages).
Digital Fredericton stakeholders have not adopted new behaviours, processes, policies, and / or tools	Embracing/adopting new learning modes: micro-learning, self-service, "in the moment", engagement as learning, etc.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Technology

Technology Vision

Fredericton and St. Mary's First Nation will create a modern Smart Cities digital infrastructure capable of responding to an increasingly fast pace of change, providing innovative new user experiences to residents while augmenting our workforces and community service organizations to elevate our human and social capital to new heights.

We will use agile human-centred design practices and a digital mesh of platforms to create a smart city that is open, secure, interoperable and extensible. Putting digital ethics at the core of all we do, our network of interconnected personalized digital inclusion tools and services will be safe, cyber secure, with privacy and transparency built in by design. It will be governed in the public trust with data owned by the public domain.

> "It has been an honour to work with the City of Fredericton team over the past two years, as an early client of our pioneering cybersecurity engagement and risk management platform. I have experienced firsthand the skill, vision and passion the City will employ to successfully execute on their proposal. I can also attest to their commitment to cybersecurity, privacy, data and connected technology. As we strive to build the smart cities of tomorrow, ensuring they are secure and respect the privacy rights of citizens is fundamental. Fredericton's commitment to empowerment and engagement for its employees and to continuous improvement in its people, processes, culture and technology is a powerful example for other Canadian municipalities. I can think of no better Canadian city, town or village that embodies both the spirit of innovation and collaboration than the City of Fredericton."
>
> **David Shipley | CEO, Beauceron Security**

Technology Architecture Guidelines and Principles

The many technology selections, and approaches to development and integration available in the market presents a challenge in reaching and sustaining our vision. The following principles will guide our approach to mitigate the risk of selecting technologies, designs and integration methods in an ad hoc fashion that do not support our vision.

Accessibility and Usability Principles to Support the Uptake and Acceptance of Diverse Users, Residents, and Other Stakeholders

New User Experiences

There is a plethora of smart technologies being released to the market. These allow for new user experiences to be developed. New user experiences will be powered by artificial intelligence (AI) and natural language processing. More specifically Machine Learning to allow for voice enablement of services, as well as using new data sets from embedded sensors, video, and imagery to allow for an increased level of cognitive

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

computing. Mobile apps will be supplemented with chatbots, conversational user interfaces and intelligent assistants.

We will use insightful moments to deliver more meaningful and personalized experiences. This connection of data, smart algorithms, and insights will lead to deeper and more meaningful interactions sharply tailored to the individual and their situation.

Design Ops

We will combine agile development, dev-ops and design thinking to create design driven engineering or "Design Ops". We will use rapid prototyping to re-engineer outcomes.

Design thinking visualizes the end experience first, then synthesizes the pieces together to achieve, augment and build toward that vision. It is human-centric and iterative.

Design-ops will fundamentally shift user experiences to interfaces that are more intuitive. Design thinking is about adopting a deeply human-centric viewpoint to redefine why and what should be built in the first place. It will refine and then perfect user experiences to create better, more enjoyable productivity – for both residents and service providers.

Augmented Workforce

Technology will not replace the expert. Instead, it will bolster the expert with new insights and data driven knowledge to serve customers better.

To be digital on the customer service side, we must first have digital process inside. We will transform and modernize our workforce including non-profits and service organizations. We will use technology to drive an efficient internal process and use digital talent management to drive customer focus. Technology will achieve new outcomes while simultaneously optimizing core operations.

Rich Data Sets

We will leverage existing, widespread data to gain exponential value from new ecosystems, to generate even more value than the sum of the different pieces, advancing the entire system of service delivery, rather than individual agencies.

This will lead to new learning about how to partner and crowdsourcing innovation to solve problems by going beyond traditional organizational and digital borders to benefit from the knowledge of people who would not normally interact.

Guidelines for Future-Proofing the Technologies

Interoperability

Interoperability is imperative in sustaining a smart city solution that will be very heterogeneous in environment, both in terms of present and future state.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

These systems encompass many layers from communications, data interfaces, service interfaces, and user interfaces like voice and IoT devices. Interoperability of systems ensures they can exchange and make use of information.

We will create a dynamic mesh that seamlessly connects people with things, algorithms, data, and future innovations, with digital personal assistants, automated agents, and other entities. Application and data interfaces will connect many systems and data sources to leverage the power of multiple platforms.

Extensibility

A key component of any smart city solution is to ensure the solution developed and implemented takes future growth into consideration. While this may seem like trying to predict the unknown, we will follow best practices to "Future Proof" the solution. Those include using loose coupling of solutions in a service-oriented manner so continued development can occur even of not all requirements are known at the onset. Taking an Agile approach to solution development will also facilitate extensibility.

Interoperable and extensible platforms create opportunities for multiple meaningful engagements for residents and enable partners to take advantage of a "mesh of interactions" and future technologies that connect to legacy data.

Access to shared data and access to add on to systems and add new features using service-oriented architecture will create solutions that are flexible enough to use in new ways that are not yet know. This will allow others to extend existing solutions in innovative new ways we have not thought of.

Scalability

In the spirit of future proofing a solution, we must ensure it will scale in many different ways including volume of data, number of users, and types of usage. Cloud based computing will be a key resource to assist with this in that it supports auto scaling of resources. We realize that might not come automatically, but wherever possible we will look for solutions that are delivered in a secure Software as a Service model (SaaS). Any solution developed will utilize cloud native resources and tools that support auto scaling.

Legislative, Regulatory and Ethical Principals

Digital Ethics

Ethics is more than just what is legally required for compliance; given what is possible through technology, it is creating that which is morally desirable. With AI and big data, the digitization of everything, and our extended ecosystem, the potential impact of secondary and unintended consequences is greater and harder to predict than ever before.

Every digital action can have an equal and potentially unintended secondary consequence and decisions we make about our digital experiences are particularly

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

significant. From personal data and privacy protection, to compliance, trust and responsibility, ethics has never been so important.

We will address issues like data security, trust and privacy with guidelines of how data should be obtained and used. We will demand digital ethics from all participants who must adopt digital ethics and act with responsibility, transparency, compliance and privacy.

We will educate stakeholders on what is possible, how data is being used, and on threats and security considerations. We will manage data interactions from other repositories, establishing data sharing agreements and secure technologies to share data between platforms.

Security and Privacy by Design

Given the ever-increasing threat of cybercrimes, and the legislative requirements within the New Brunswick Right to Information and Protection of Privacy Act, we will ensure all solutions are designed with security and privacy as a foundation. This includes securing data at rest and in transit, least privilege access as well as robust monitoring and auditing. It also includes leveraging cloud native development platforms where the traditional security vulnerabilities do not exist.

Systems will be designed for privacy and security using upfront analysis, and designs that facilitate regular privacy and security assessments, reviews and audits. Designs should include audit logs that can be routinely monitored and analyzed.

Technology Standards, Architectures, and Initiatives

Developing a Smart Cities technology that seamlessly connects people to what matters most requires definition of elements at every layer of the data collection and information management process. Definition of the specific standards used for integration allows for the interoperability principle to be achieved. Each element shown in the following technology architecture is commercially available and easily deployable. Following this architecture and the guiding principles will allow for replicability and scalability.

An overall architecture is defined that includes sensors and edge devices, networks of WiFi, low powered radio, cellular, and fibre networks connecting to secure data storage platforms and linking to advance computing algorithms within a service-oriented architecture to create smart user experiences.

This Smart Cities proposal builds on a multi-cloud approach using hosted applications, on-demand infrastructure, and micro-services. In 2018, the City of Fredericton successfully launched SaaS applications for core Financial and Human Resources Management on the Oracle cloud with authentication and application interfaces using ADFS services and SOAP webservices hosted in the Microsoft Azure cloud.

The City of Fredericton has an extensive geographical information system (GIS) and open data portal already built on Esri ArcGIS. The Digital Community Hub will extend these existing resources to deploy new community-based features and services.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Fredericton was one of the first municipalities in North America to build a community fibre network and offer free Public WiFi. Several hundred kilometers of fibre connect the city.

The City recently partnered with technology company eleven-X to pilot a new LoRaWAN IoT sensor network which is now operational and available to the community.

Our ecosystem has grown substantially over the past year and has attracted both technology partners with specialized skills, academic researches, and social innovators building technology solutions that are important and useful to people who live in our City.

Interoperable Open Architecture for a Smart City

Layer	Object	Technology
Intelligent Adaptive User Applications	Enterprise core applications	Oracle ERP, Human Capital, and Work Management
		MS Dynamics 365 CRM
		HIFIS 4
		ESRI Geographic IS
	Digital Community HUB	ESRI ArcGIS Community Hub
	Connected community applications	Doorable
		LiveKool Check-in
		Hullo & Future Development
Smart Algorithms and Microservices	Serverless computing	Amazon S3, AWS Lambda
	Identity management	AD B2C, Cognito
	Access and authentication	MS ADFS
	Recommendation engines	Amazon Personalize
	Chatbot and voice recognition	AWS Lex
	Machine learning	SageMaker on AWS
	Computer vision	Amazon Rekognition
Service Oriented Architecture	Web Services	SOAP
	Application Programming Interfaces	JSON REST APIs
	IoT device data brokering	MQTT
Infrastructure and Storage	Database storage	AWS RDS and S3
	Open Data	ESRI Open Data Hub
	Secure data storage and analytics	NBIRDT
	Cloud backup	MS Azure Blob
	Infrastructure and servers	MS Azure, AWS EC2
Network	Municipal fibre network	F6 Networks
	Public WIFI	e-Novations
	Cellular 4G, 5G	Rogers
	Telemetry IoT network	LoRaWAN by eleven-X
	Security monitoring	IBM Q-Radar
Edge Devices	WIFI Access Points	Fortinet
	Cameras	Cisco
	Smart water meters	eleven-X
	Digital displays	Samsung
	Urban telemetry sensors	LoRaWAN IoT protocol

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Technology Partnerships and Collaboration

Open integrated architecture creating a digital mesh of interactions requires an open and integrated collaboration of technology partners.

One key partner, Deloitte, started with us on our journey, supporting our vision to digitally transform. Our strategic relationship with Deloitte includes a combination of project support, in-kind contributions, and general transformation management activities that will span core, e-government (customer experience) and connected community strategies, with designs and implementations. The relationship is likely to evolve over that timeframe, given the rapid pace of technological and other change that will occur.

A strong partnership, with a unified team focused on delivering value to our community through innovation, is able to build and sustain a strong innovation ecosystem and community.

> "We are proud of the milestones that the City and Deloitte have achieved together thus far. We are also thrilled to have the opportunity to continue to collaborate, along with community groups, Oracle and other private companies, and others to achieve the Digital Fredericton aspirations of improving quality of life and driving economic prosperity. We are confident that together, an ecosystem will mature to fundamentally change the way the City works and interacts with its citizens."
>
> **Greg MacQuarrie | Partner, Deloitte**

Roles and Responsibilities of Technology Partners

Deloitte – Transformation leadership and visionary support; Core systems implementation Oracle Cloud Integration; global perspectives and Smart Cities insights

Blue Spurs – Technology Innovation leadership; Adaptive Smart Application extensibility to other digital systems; serverless application development for connected applications; technology support for Civic Tech Fredericton; adoption and implementation of AWS smart algorithms; innovative edge devices with smart algorithms

Bulletproof – Cybersecurity monitoring using IBM Q-Radar and security operations centre; threat hunting and risk assessment; training and development of cybersecurity workforce

Civic Tech Fredericton[1] – Technical learning, volunteer and collaboration opportunities for developers and social innovators; analyze and visualize data and develop applications and microservices to provide technical solutions to social issues for non-profit agencies;

[1] The City of Fredericton works together with Blue Spurs to provide AWS cloud infrastructure and microservices to Civic Tech Fredericton. Volunteers from Blue Spurs provide training and leadership in building advanced applications based on AWS cloud technology. www.civictechfredericton.com

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

develop social applications on the AWS platform, using low cost and scalable infrastructure.

eleven-X – Engineering, support and delivery of public IoT network using LoRaWAN; supply urban sensors and build out smart city telemetry devices and data; provide smart city sensor data through Open Data Portals and APIs.

Esri Canada Ltd. – Expertise in geographic information systems; in-kind support and development of the Digital Community Hub.

F6 Networks – Maintain and extend Fredericton's metro fibre infrastructure; provide gigaburst, high bandwidth internet connectivity.

NBCC-NSERC Industrial Research Chair in Mobile First Computing – Provide applied academic research in immerging UX design.

Rogers – Innovation investments in Fredericton; provide LTE networks for IoT extensions; provide data connections on municipal transit to enable public WiFi.

Results of Testing and/or Piloting in Finalist Phase

To prove out development methods, guiding principles and technologies, many of the technology architectures have been used by the City in production environments or prototyped with pilot projects during the finalist phase. The links below are to working prototypes or minimum viable products. Please visit www.fredericton.ca/smartcity for more information about these prototypes with video content and latest developments.

Doorable (minimum viable product, version 1.0):
https://play.google.com/store/apps/details?id=com.appdigenous.doorable
(also available on the Apple App Store)

Digital Community Hub (prototype of features and functions):
http://fredericton-dashboard-fredericton.hub.arcgis.com/

Velocity CRM Portal (functioning pilot, integrated with back-end systems, not publicly launched): https://cof.microsoftcrmportals.com/en-US/submit-a-service-request

Hullo (prototype setup for android device):
https://drive.google.com/drive/folders/11EvGboyBSSwi08f-RxlLmKaJFLrnQVAo?usp=sharing

LoRaWAN Telemetry IoT network (pilot project using parking sensors):
https://demoapp.eleven-x.com;
User Name: fredericton.parking@eleven-x.com , Password: parking

Companion Check-In and Online Community Support Tool (prototype used for market testing): http://livekool.com/nonprofit

Real-time Data integration of IoT LoRaWAN network with Digital Community Hub (MQTT and JSON APIs protocols for interoperable application and data integration):
http://how-are-we-doing-fredericton.hub.arcgis.com/

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

"Shortly after we started working with the City of Fredericton, it became apparent that this is not your average city. First, they already had an impressive amount of Smart City infrastructure in place. Specifically, they had their own fiber network, city-wide Wi-Fi, and an impressive operational open data platform. In addition, they were already working with a local company to develop a smartphone app to help people with accessibility issues. Impressive for any city of any size, in my humble opinion. Second, they move at lightning speed compared to any other city we have encountered. For example, the RFP was issued in September and awarded in October, our network was deployed several weeks after that and the in-ground parking sensors were installed shortly after that. In around three months they went from initiating the RFP to getting real-time parking data. Third, they listened to their community to find out what is important to them, structured their Smart City Challenge Statement around that, and found an innovative way to address the challenge with technology. The first parking spots that Fredericton choose to monitor are the accessible parking spots. The data is being fed into their existing open data platform and from there into the accessibility parking app I mentioned earlier. Fourth, in case it is not obvious, Fredericton is willing to take risks and be early adopters. I can tell you this is very uncommon for cities, but it is a fundamental and often overlooked ingredient required to truly achieve innovation."

Ryan Hickey | COO, eleven-X

Technology Risks and Planned Mitigations

Risk	Mitigation
Digital tools/platforms/apps are not user-friendly	Employing user-centred design workshops/usability testing throughout ideation/prototyping/development stages as well as post-launch.
Personal Privacy	Annual privacy audit, PIA and guidance, governance subcommittee.
Cybersecurity	Monitoring, threat assessments and threat risk assessments from Bulletproof Security Operations Centre using IBM Q-Radar appliance.
User acceptance and usability	Iterative user-centred design, reporting on monthly users.
Workforce efficiency	Lean 6 Sigma reporting to performance subcommittee.
Interoperability	• Develop and document an integration strategy that defines the service-oriented architecture and interface protocols to be used, and the application service end-points. Publish the documentation on the Open Data portal. • Maintain a central library of documented system interfaces and with subscriber list.
Knowledge gaps	Create networks of systems experts through Civic Tech and business partners, hire staff with existing skills, train internal staff on new protocols.
System architecture – the current infrastructure is not ready to build out a project of this magnitude.	Review and update internal architecture in parallel. Understand the implications of lack of infrastructure readiness on organizational success and team adoption.
Abandoned platforms HIFIS-Feds; NB-IRDT, NPOs	• Federal housing agreement renewal, NBIRDT agreement renewal. • Maintaining relationships among adopters.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Governance

Governance Frameworks and Strategies

The Smart Cities Program and the initiatives and projects in this proposal will be governed by the Fredericton Smart Cities Task Force comprising 15 members outlined below representing a broad community of interests. Meetings will be held quarterly. The Task Force's primary role is an advisory one with respect to the overall progress of the Smart Cities Challenge and its five projects. Reporting will be by way of quarterly progress reports furnished by the Smart Cities Manager, which will include projects' progress, marketing/communications/engagement and budget. The Task Force will provide input with respect to issue management, mitigation strategies, change control process if there are major project/cost deviations, and ensuring data, security and legislative compliance requirements are executed (including an annual privacy audit).

Fredericton Smart Cities Task Force Composition:

1. Fredericton Smart Cities Task Force Chair
2. St. Mary's First Nation designate (ex-officio)
3. Smart Cities Manager (ex-officio)
4. Fredericton City Clerk / Privacy Sub-Committee Chair (ex-officio)

Five Project Committee Leads representing:

5. Non-Profit Data Collaboration (Greater Fredericton Social Innovation)
6. Road Home Digital Platform (Community Action Group on Homelessness)
7. Digital Community Hub (WSP)
8. Doorable (Appdigenous)
9. Digital Fredericton (City of Fredericton)

Academic, Commercial and Social Oversight:

10. University of New Brunswick
11. New Brunswick Community College
12. Fredericton Public Library
13. Rogers
14. Blue Spurs
15. Deloitte
16. Fredericton Community Foundation
17. Stan Cassidy Centre for Rehabilitation
18. Hotspot Inc.
19. Ignite Fredericton
20. United Way

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Friendship Accord

This governance structure has representation from City of Fredericton and St. Mary's First Nation. Building on this governance structure, the two communities intend to enter a Friendship Accord. The Friendship Accord is a framework for mutual governance of broader community issues of mutual interest.

A Friendship Accord "creates the opportunity to outline why and how two (or more) communities would like to build and sustain their relationship over the long term [...] to:

- strengthen the relationship and provide a framework to undertake joint work
- provide structure, although this not a legal document or a business agreement
- inspire and guide the long-term relationship
- celebrate with the broader communities and regional partners
- formalize the spirit, intent and cooperative agreement of the partnership."[2]

Program Administration

The Fredericton/St. Mary's Smart Cities Challenge initiative will be managed by the **Smart Cities Manager**, who is responsible for:

- Managing the Digital Community Hub administration and staff (including the Digital Community Hub Coordinator, Data Analyst, and Hub Content Creator; see "Human Resource Requirements in *Project Management*).
- Liaising with project committees to facilitate the successful implementation of projects.
- Managing budget oversight, and funding disbursements to the five projects.
- Reporting to Infrastructure Canada.
- Coordinating quarterly Fredericton Smart Cities Task Force meetings including report generation (quarterly progress reports, budget, issue management).
- Managing strategic marketing and communications for the Smart Cities Program as it relates to Fredericton's brand. This includes the development of an integrated marketing communications plan (encompasses the public awareness element/storytelling, leveraging partnerships with respect to marketing, public relations, refreshing GoFred brand, elevating Digital Fredericton brand, etc.).
- Cultivating and fostering stakeholder relations/partnerships.
- Managing Smart Cities Innovation Lab, and liaising with potential and existing entrepreneurs as it relates to Smart Cities app development – connecting them with partners/staff and funding.

Privacy

There will be a Smart City Task Force Privacy Sub-Committee – chaired by the CoF Chief Privacy Officer (City Clerk) or his/her designate and will be comprised of representatives

[2] "Relationship/Friendship Accords." *CEDI.* Cando. http://www.edo.ca/cedi/relationship-friendship-accords

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

from each of the five project committees, plus a representative from St. Mary's First Nation, a privacy subject matter expert, Virtual Chief Information Security Officer/Bulletproof Security Operations Centre, and a representative each from NB-IRDT and Service Canada. The Committee will be responsible for developing privacy frameworks and their privacy policies, procedures, protocols, consent forms and data sharing agreements as necessary and submitting them for approval to the Task Force. The Privacy Sub-Committee would ensure an annual privacy audit.

Financial Oversight

Funding received from Infrastructure Canada will be disbursed by the City of Fredericton. The Smart Cities Manager will be responsible for maintaining the budget and funding disbursements based on allocations as per the Smart Cities Challenge submission. Quarterly reports – or prescribed reporting format as per Infrastructure Canada requirements – will be presented to the Task Force by the Smart Cities Manager to inform of progress and deviations which could result in change control.

Digital Fredericton Program & Project Governance

Due to the magnitude of the Digital Fredericton initiative, a **Program Level Leadership Team** will be assigned to the Digital Fredericton Transformation. The Leadership Team is made up of leaders across the City of Fredericton's lines of service and relevant Deloitte service lines and responsible for planning, priority setting, overseeing and delivering against the commitments inherent to achieving the Digital Fredericton vision. Each Digital Fredericton project will be governed by a project charter and statement of work when it involves partnering with external partners. Each Digital Fredericton project will have its own project team, with projects of significant size and scale including the following elements: Project Steering Committee; Executive Sponsor; Project Manager; Project Subject Matter Experts; Project Team Members; Change Management Team; Technical Leads (where appropriate); other roles defined as appropriate.

Project Committees

The five project committees (Digital Fredericton, Digital Community Hub, Doorable, Road Home Digital Platform and Non-Profit Data Collaboration) will comprise:

- **Project Lead** – Setting and managing direction and overall project deliverables.
- **Subject Matter Experts** – Providing insight and subject matter expertise and support.
- **Team/Project Resource Support** – Providing team support, assistance and resources to support the project including administration, maintaining budget, reporting, etc.
- **Creative Lead** – Innovating and pushing the team to advance outcomes through creative thinking.
- **Additional Resources** – as deemed appropriate by the project lead.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The committees will be responsible for setting their meetings and their project plan deployment (including maintaining project schedule, budget), monitoring/controlling outcomes as per set performance measurements to receive funding disbursements, managing risks, partnerships, recording minutes and providing quarterly report inputs to the Smart Cities Manager regarding project progress and budget.

Role, Capacity and Partner/Stakeholder Readiness

Role	Organization & Contact		Impact/Influence & Capacity/Readiness
Co-Applicant	Mike O'Brien *Mayor, City of Fredericton*		Municipal decision-making on behalf of City Council Fully committed to the success of this initiative providing significant human and financial resources.
Co-Applicant	Alan Polchies *Chief, St. Mary's First Nation*		SMFN decision-making on behalf of Band Council Fully committed to the success of this initiative providing First Nations oversight.
Digital Fredericton Transformation Partner	Greg MacQuarrie *Partner, Deloitte*		Long-term strategic partner investing $1 M to date in helping to achieve the Digital Fredericton vision.
Technology provider	Alex Miller *President, Esri Canada Limited*		Provided over $50,000 in technology and supporting services to develop the Digital Community Hub prototype. Committed to provide $20,000/year in professional services to further support the development of the Digital Community Hub.
Digital Community Hub Research & Data	Dr. Jeff Rankin *Dean of Engineering* *University of New Brunswick*		Provided comprehensive research on smart city indicators and data sets to include in Digital Community Hub.
Digital Community Hub Project Management	Dr. Anna Robak *Research Manager, Innovation & Future Ready, WSP Canada*		Provided in-kind project management services for the development of the Digital Community Hub.
Innovation Partner	Troy Harnish *Rogers*		Providing in-kind services to support Fredericton's innovation/Smart Cities agenda.
Innovation Partner	Ryan Hickey *eleven-X*		Supporting Fredericton's smart cities agenda to deploy/operate LoRaWAN wireless IoT network to enable future application development. Eleven-X is contributing half the cost of the next 1000 network connections – valued at $12,000.
Innovation Partner	Mike LeBlanc *CEO, Blue Spurs*		Providing strategic innovation oversight with respect to the Smart Cities Challenge projects.
Smart City Task Force / Project Committee Members	***Project Leads*** Digital Fredericton – Valerie Kelly Digital Community Hub – Anna Robak Appdigenous – Melissa Lunney Non-Profit Data Collaboration – Sandi MacKinnon Road Home Digital Platform – Faith McFarland		These organizations/ representatives have been selected based on their unique contributions, capacity and subject matter expertise to impact the success of projects.
User-centred design provider	Greg Phillips & Chelsea Wilson *Accreon*		Providing in-kind user-centred design valued at $1500 for the Digital Community Hub.
Road Home Platform Early	Warren Maddox *Fredericton Homeless Shelters*	Julia Galant Daigle *Youth in Transition*	Partnering to pilot/adopt new HIFIS4 shared client management platform.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Adopters of HIFIS4	John Barrow *John Howard Society of Fredericton*	Lisa Edwards *Capital Region Mental Health & Addictions*		
Doorable Early Adopters	James Blanchard, *City of Fredericton*	Sally Brooks *St. Mary's First Nation*		The City of Fredericton and St. Mary's have committed their readiness as an early adopter of the technology, and to conduct user testing. Two for-profit organizations have come on board as private sector adopters.
	Tim Woods *Brookside Mall*	Larry Shaw *Knowledge Park*		
Non-Profit Data Collaboration Early Adopters	Sandi MacKinnon *GFSI*	Alex Boyd *Greener Village Food Centre*	Betty Daniels *Meals on Wheels*	Led by GFSI, 11 NPOs are participating as early adopters in the NPO Data Collaboration Project.
	Jess Baxter *Alzheimer Society of New Brunswick*	Fiona Williams *Liberty Lane*	Julia Gallant Daigle *Youth in Transition*	
	Christin Swim *Skigin-Elnoog Housing Corporation*	Erica Young *Opal Family Services*	Jan Wambolt *Wil-Doo Cycle*	
	Karen MacAlpine *Fredericton Boys & Girls Club*	Fiona Williams *Partners for Youth*	Julia Stewart *Fredericton Library*	
Non-Profit Data Collaboration Support Partners	Karina LeBlanc *NB Social Policy Research Network* *Pond-Deshpande Centre*			Strategic support partner.
NPO Data Infrastructure	Dr. Ted McDonald *Director, NB-IRDT*			Key partner of the NPO Data project equipping NPOs with tools, enabling the transfer of aggregate data to connect with provincial data infrastructure.
NPO Data Support	Dr. Jules Maitland *Co-Founder, Civic Tech Fredericton*			Supporting the NPOs on how to link data sets, utilize visualizations tech, perform analysis for better decision making, and design tech solutions to address social issues.
NPO Data Standards Coordination	Sarah Campbell *Research Manager, NB Social Development* (Social Pediatrics)			Funding $80,000 Data Standard Specialist to develop standardization for NPO project.
HIFIS4 support	Randy Hatfield *Saint John Human Development Council*			Funding part-time HIFIS Coordinator to onboard and coordinate HIFIS4 deployment valued at $35,000.
AbilityNB	Haley Flaro *Executive Director*			Provincial organizations for persons with accessibility challenges/Appdigenous partner.
NBCC	Dr. Marilyn Luscombe *NB Community College*			Provincial community college network and integral Appdigenous partner.

Please refer to attached supporting documentation for the aforementioned partnerships and other letters of support. Please see the proforma budget in *Financial* outlining the value of in-kind contributions/financial arrangements.

Retaining Community Control Over Sensitive & Personal Data

Individuals of the community will be the rightful owners of their own personal information. (See *Data and Privacy* for more detail.) Community ownership of aggregate or de-

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

identified personal information through the Digital Community Hub will be the hallmark of the partnerships between the City of Fredericton's initiatives and others undertaken as part of the Smart Cities program. Decisions about community aggregate data availability will flow through the Fredericton Smart Cities Task Force. As well, the OCAP principle (Ownership, Control, Access, and Possession) will be the guiding principle of all personal and aggregate data obtained through the partnership with St. Mary's First Nation.

Governance Risks and Planned Mitigations

Risk	**Mitigation**
Breakdown in collaboration between the City of Fredericton and St. Mary's First Nation due to diverging priorities	• Continue to focus on developing the Friendship Accord • Regular joint briefings between City and St. Mary's elected officials and staff
Keeping stakeholders engaged in the governance process and fulfilling their oversight responsibilities	• Set expectations with Task Force members through written roles, responsibilities and expectations of task force members • Semi-annual survey of Task Force and committee members on their satisfaction and effectives of the governance process.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Data and Privacy

The personal privacy issues for the initiatives and projects in this proposal are as complex and challenging as the overall endeavour is ambitious, innovative, and entrepreneurial. An in-depth focus on cybersecurity and privacy will be incorporated across all layers of the Digital Fredericton transformation.

Principles

The Fredericton Smart Cities Task Force's Privacy Committee has committed to the following 10 principles to serve as signposts as it moves to ensure privacy compliance for each project: **Respect; Anonymization; Control; Necessity; Consent; Community Ownership; Consultation; Access; Transparency, Accountability, and Open Government; Security.** See a complete description of the 10 Privacy Principles at www.fredericton.ca/smartcity.

Preliminary Privacy Impact Assessment

To address the privacy issues, a preliminary privacy impact assessment (PPIA) was completed by Robert P. Doherty Access and Privacy Services (RPDAPS). Mr. Doherty has almost 25 years' experience in information access and privacy including ten years as an information access and privacy consultant and lawyer. His approach to developing and preparing a privacy impact assessment is one of common sense and attention to detail in rooting out the privacy risks of any project according to the Canadian Standards Association (CSA) ten fair information/privacy principles and relevant legislation and to provide realistic mitigation strategies that address the privacy compliance risks. As part of the development of the PPIA, the Office of New Brunswick's Integrity Commissioner was also consulted and was provided with a copy of the draft PPIA with a request for comment. Adjustments were made to the PPIA and its related materials based on the feedback received from the Office.

The PPIA examined each of the initiatives/projects according whether at this point they were compliant with each of the ten CSA privacy principles and relevant privacy legislation.

Privacy Compliance

Our ambitious proposal creates privacy challenges for each of the projects it encompasses as they not only encounter four applicable privacy laws, but also involve organizations with varying degrees of familiarity with privacy principles and use of privacy management tools. The relevant privacy legislative obligations for the main initiatives/projects are:

- Digital Fredericton & Digital Community Hub – New Brunswick Right to Information and Protection of Privacy Act (RTIPPA)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Doorable (Appdigenous) – Personal Information Protection and Electronic Documents Act (PIPEDA)
- Non-Profit Data Collaboration – RTIPPA and the Personal Health Information Protection and Access Act (PHIPA)
- Road Home Digital Platform – PHIPA and the Federal Privacy Act

The PPIA has taken into account the privacy obligations of the relevant legislation on each project, **reviewing and assessing the privacy compliance requirements of the ten Canadian Standards Association Fair Information/Privacy Principles each project** as well as the projects overall with respect to:

- the seven principles of Privacy by Design developed by Dr. Ann Cavoukian, former Ontario Information and Privacy Commissioner
- the letter sent to the Minister of Infrastructure Canada from the Information Commissioner of Canada and the information and privacy commissioners or their counterparts across jurisdictions in Canada.
- input from the Office of the New Brunswick Integrity Commissioner responsible for the New Brunswick Right to Information and Protection of Privacy Act (RTIPPA) and the New Brunswick Personal Health Information Protection and Access (PHIPA) Act.

The PPIA also sets out the ten privacy principles set out by the Fredericton Smart Cities Task Force's Privacy Sub-Committee.

Applicable provisions in the relevant legislation are expressed in each of the 10 privacy principles and are assessed in the privacy impact assessment.

Essentially the proposed data management plan is comprised of two major components:

- a privacy management framework for each project
- an information technology infrastructure and security plan and/or policy for each project

The PPIA indicates that for most projects, with the exception of Non-Profit Data Collaboration and Road Home Digital Platform, the security plan for the IT infrastructure that will be used to facilitate is in its formative stages. The exceptions are the IT infrastructure that is already in place at NB-IRDT and the Department of Health for Non-Profit Collaboration and the HIFIS4 System developed by Service Canada. The data provided to both of these organizations by non-profit organizations and homeless serving agencies will be collected securely through the IT infrastructure of these organizations, and will be housed on secure platforms there as well.

As well, there is little in the way of privacy management frameworks and the organizational tools, policies, procedures, and protocols for all projects and participating agencies. The exceptions are Non-Profit Data Collaboration and Road Home Digital Platform. Although non-profit organizations and homeless serving agencies participating in these projects appear to have limited familiarity with the need for such frameworks, their project partners (NB-IRDT, N.B. Department of Health for the Non-Profit Data Collaboration Project and Service Canada with its HIFIS4 System for the Road Home Digital Platform project) appear to have robust privacy frameworks for protecting the personal data they will receive as part of the project.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The full data management plan for all projects will be created in accordance generally with the ten CSA privacy principles' requirements, and specifically in compliance with the provisions of the relevant legislation for each project. Thus, the requirements of the following pieces of legislation are the basis of the privacy assessment for each principle, and the mitigation strategy recommended alleviating and minimizing privacy risks:

- the Right to Information and Protection of Privacy Act (RTIPPA) for each principle for Digital Fredericton, Digital Community Hub, and Non-Profit Collaboration;
- the Personal Information Protection and Electronic Documents Act (PIPEDA) for Doorable;
- the Privacy Act for Road Home Digital Platform; and
- the Personal Health Information Protection and Access (PHIPA) Act as well for Non-Profit Collaboration and Road Home Digital Platform.

The need for such a data management plan is reflected in the legislative obligations that apply to each project. The provisions that apply to determine the specific privacy compliance obligations under each principle in each piece of legislation are not identical. However, there is enough similarity among the different provisions in each relevant privacy law and the CSA privacy principles, except areas such as data matching and common or integrated service delivery, to base the obligations on the applicable principle. Because the obligation in each CSA principle is reflective of the similar legislated obligations for each principle, this was the basis, with the exception noted, of the privacy assessment and will be the basis of the data management plans developed for each project in implementing the mitigation strategies for each project. In short, the data management plans will be compliant not only with each CSA principle, but also to the specific legislative requirements of the relevant privacy laws. The only differences will be in the degree of detail that is required in each law.

Types & Methods of Data Collection, Use, Retention and Disclosure

Personal information will primarily be collected from residents through online engagement, service use (e.g. Doorable), and dialogue. The ethnographic research will collect personal information through online one-on-one video recording and notes made by session facilitators. Other personal information collected by other projects will be done through data entry, either by project representatives or citizens engaging in online dialogue with project representatives.

The personal information will, where possible, be aggregated and de-identified and provided to the City of Fredericton for analysis, policy development and assessing service performance and determining overall service delivery needs or approaches for citizens. Personal information will be, according to the legislative authority relevant to each project, retained according to retention and destruction schedules consistent with the Municipal Records Authority (MRA), NB-IRDT, the New Brunswick Department of Health, and the federal government, and future record retention polices that are expected to be developed by the Government of New Brunswick.

The total life cycle of the personal information collected on all projects will be consistent with these policies, but as noted above, apart from the City of Fredericton and the data

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

life cycle policies that are part and parcel of NB-IRDT and Service Canada, there will be a need to provide resources for the development of such policies.

Security and Privacy Considerations

From the beginning, privacy and security considerations, particularly those of the seven principles of Privacy by Design, have been and will be dominant in the development of IT infrastructure that will serve each of the projects. The City of Fredericton, in particular has already in place robust privacy and security protections built into its existing infrastructure. Plans for additional IT infrastructure, as noted in Appendices D & E of the PPIA also will include industry standard privacy and security features to protect personal information. In the initial engagements with citizens, there was little if any privacy and security concerns raised as the focus was initially on designing a vision for the future of a city that epitomized a future digital Fredericton that connected and provided services that meet the needs of the citizens of the city most effectively.

Adhering to Principles

Governance

A proposed governance structure has been developed for this initiative that recognizes the homogeneous participation in each project at all levels. Thus, project leads, technical, academic, social innovation, and privacy expertise will be part and parcel of the decision-making process as projects roll out their programs. As well, there will be a privacy checkpoint for all projects that will review progress in the development of the various mitigation strategies designed to ensure privacy compliance with the ten CSA Privacy principles and relevant legislation. A commitment has also been made to engage with residents about the plans for each project prior to each project becoming fully operational, including how their personal information that they provide in the implementation of each will be protected.

Ownership and Control

The concept of community ownership of aggregate data and individual control of personal data through the use of well-structure informed consent forms, and audits of collection, use, and disclosure of personal information on each project is important. It has been and will be dominant through the planning and implementation process for the overall initiative. It is also the intent and goal to provide as much relevant open aggregate data through the Digital Community Hub open online portal. This will not only allow reporting on the progress of each project attaining its goals, but also in providing aggregate data and analysis that encourages economic development in the community. As well, the project recognizes and will implement the First Nations Information Governance Centre Principles of Ownership, Control, Access, and Possession (OCAP) in dealing with personal and community based aggregate information of St. Mary's First Nation, a full partner in the Smart Cities initiative.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Consent

Consent will be the hallmark of each project in requesting citizens to provide their personal information in identifying their service needs and to engage in dialogue with the City. While at this point, there is a variety of consent forms, or no consent form at all for some projects, the future will be marked by use of a solid informed consent form that provides specific information about the purpose of collection, the limits on future use and disclosure, and the retention periods and security protecting personal information they provide. Residents will have the option to opt-out of consent at any time, in accordance with the consent principle developed. For more information, refer to the PPIA, section 8c "Consent" on page 38.

A solid consent form guidance document with a template that can be adjusted to the uniqueness of each project has been prepared for use by each project. As well, to encourage projects to limit their collection of personal information only to that information that is necessary for the effective delivery of the project, a draft data collection template has been developed for use by each project.

Data Minimization and De-Identification

All Smart Cities Challenge projects will retain personal information only within their IT infrastructures for use to deliver services to client or user base. Some de-identification will be possible (and would be done at the earliest opportunity where appropriate) through the use of unique numerical identifiers for this data. However, on the whole, the identifying information will continue to be needed for providing effective services, or confirming identity. For disclosure outside of the individual projects, all personal information will be aggregated or de-identified. This will provide snapshots of the effectiveness of particular services as well their progress in meeting service delivery goals and where appropriate will enhance the data sets on the Digital Community Hub. Other uses would include being able to map an "accessible" city in the use of the Doorable app for the accessibility community, particular research projects through NB-IRDT through data obtained through the "Crosswalk" process, and service delivery analysis for the Road Home Digital Platform. This will all be done by developing appropriate software or approaches to aggregating or de-identifying data with appropriate privacy protections within each application.

Accessibility

At the heart of the initiative is the Digital Community Hub, which will be used as a conduit to providing meaningful data on an open government online portal. This should encourage development of improved service delivery options, real time census data, and economic development and entrepreneurial innovation. This goal will be achieved through open source data gathered by City of Fredericton researchers, and aggregated data from most of the Smart Cities projects. In particular ethnographic research, feedback from accessible app users of Doorable, and aggregate data from the Road Home Digital Platform with respect to homeless individuals will also be used. The Digital Community Hub is the portal and the community engagement sessions that will encourage dialogue

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

about different approaches and economic development opportunities will be one of the key mechanisms. These mechanisms will take the informational seeds on the Digital Community Hub and provide opportunities for them to grow in fertile environments.

Security

As noted earlier, the information technology infrastructure for the majority or projects (Digital Fredericton, Digital Community Hub, and Doorable) is still in the conceptual or early development stage. However, in the course of providing information for assessment in the PPIA, these projects have discussed or provided evidence of concrete plans to incorporate industry standard privacy and security features in the development of information technology infrastructure for the project. The test ultimately will come when a final privacy impact assessment examines the degree to which these features have been included. Non-Profit Data Collaboration and Road Home Digital Platform, based upon documentation reviewed for these projects, have acceptable privacy and security features in their information technology infrastructure resident in NB-IRDT and the HIFIS4 Platform.

Open and Big Data Strategies

At the heart of this proposal is the objective of capturing a real-time snapshot of the city and its citizens and determining their program and service needs, and the current capacity to address those needs physically and socially. Existing data sets from national counts or surveys, or no data sets at all, are inadequate to provide that determination either because of time lags, privacy, or no data at all because marrying needs with physical, social, and geographic access has been difficult.

While each of the projects will collect and retain personal information of residents to improve personal experiences with programs and services, that personal data will be de-identified or aggregated as well. There are privacy risks and challenges in that overall process that require mitigation strategies as noted in the PPIA. But there are also tremendous opportunities to address that data deficit. Policy and decision makers using analytical tools with the aggregate and de-identified personal information should be able to improve service choices for residents.

Data and Privacy Risks and Planned Mitigations

The PPIA developed for this proposal used a common-sense approach to identifying privacy risks for its main initiatives. It identifies privacy risks based on the ten CSA privacy principles and proposes practical mitigation strategies for projects where, although guided in the past by confidentiality approaches to personal information, would have limited privacy and security data management frameworks. The strategies identified are realistic relative to the current privacy expertise of the organizations and individuals guiding these projects, and to the required development of frameworks. Resources will be made available to guide these projects to achieve their privacy objectives.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The need for such frameworks has not only been readily recognized by the project proponents, but embraced in the expressed desire to ensure that the projects will be "doing it right" when it comes to establishing a privacy culture within not only the project, but within their organization.

The privacy risk assessment for the 10 CSA principles involves also a variety of existing compliance by projects. There are mitigating strategies suggested relative to compliance with all of these principles, but for some, mitigation will only involve using preparatory work already done to mitigate the risk (e.g. consent guidance, data element template to determine the "necessity"). See the table below for identified risks and their mitigations. The scoring for each of these risks is available in the PPIA.

Risk	**Mitigation**
Lack of accountability	• Putting in place overall governance structure for the initiative and formally/publicly identify individual/position responsible for privacy on each project.
Lack of clear identified purpose of data collection/use, etc.	• Develop and use a consent form that clearly identifies the specific purpose(s) for the collection, use and disclosure of personal information.
Lack of meaningful consent	• Develop and use a consent form that clearly identifies the specific purpose(s) for the collection, use and disclosure of personal information, as well as the length of time it will be retained and what security there will be around it; review this annually by an independent third party; for NPO and Road Home develop/use a specific informed consent form for future collections of personal information by clients.
Failing to ensure appropriate respect for First Nations data and community privacy	• All stakeholders will collaborate closely with St. Mary's First Nation • Projects follow OCAP principles
Collecting more personal information than is necessary to achieve project goals	• Modify and use a data element collection template that requires explanation of why each data element is necessary for Digital Fredericton, Digital Community Hub and "Doorable"; review by a third party annually.
Failure to limit use, disclosure to what is necessary	• Develop and use a thorough informed consent form for clients interacting with the project that specifically limits further use and disclosure other than for the identified purposes of collection "except as authorized or required by law"; third party monitoring on an annual basis.
Failure to limit retention	• Put the resources in place and develop an overall records retention policy for the FSC Program that is consistent with the Municipal Records Authority.
Incomplete/data/inaccurate information	• Ensure that from a policy/protocol perspective that staff involved in project are reminded to verify and update client information; scheduled reminders for users to confirm information.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Data breach/inadequate safeguards leading to identification of residents and related risks including lack/loss of trust	• Follow Privacy by Design Principles. • Establish privacy and security infrastructure that incorporates what privacy and security features are required to ensure that personal information is protected relative to its sensitivity and vulnerability (+ server integrity/data back-ups). • Establish and follow privacy framework including all protocols & policies noted in PPIA; security audits; conduct full privacy impact assessment.
Failure to be open and transparent about management of personal information	• Continue the openness and transparency philosophy adopted for this initiative by ensuring that privacy features of the program are promulgated successfully through websites and open forums.
Failure to provide individuals access to their own information	• Establish and promulgate procedures on web sites and other communication venues whereby individual citizens are informed of how they may obtain their own personal information that the organization holds on them.
Failure to communicate clearly about how to challenge compliance	• Publish openly to whom and how individuals may complain about their privacy rights being compromised.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Implementation Phase Requirements

We have identified that the primary legislative requirements that relate to our projects relate to privacy (detailed in *Data and Privacy.*)

We recognize the **Duty to Consult** with First Nations on a broad range of issues. A key motivator for the City of Fredericton and St. Mary's First Nation to submit a joint proposal was to develop a closer relationship between our neighbouring communities. This process is the launching point for pursuing a Friendship Accord that will set a framework of governance and collaboration and establish processes for consultation for this and other initiatives of shared interest. The projects in this proposal are governed by the Smart Cities Task Force, which includes representatives from both the City of Fredericton and St. Mary's First Nation.

We recognize the **Community Employment Benefits (CEB)** initiative is designed to provide employment and/or procurement opportunities for: apprentices; Indigenous peoples; women; persons with disabilities; veterans; youth; recent immigrants; and small-medium-sized social enterprises.

As part of our vision to become a more inclusive, connected community supporting diversity, we will be participating in the CEB with respect to the following target groups:

- **Youth / Indigenous Peoples** – Appdigenous has committed to giving preference to qualified candidates who are chronically economically disadvantaged including, in particular, young indigenous individuals. Through this project – starting the summer of 2019 – six indigenous students and one project coordinator will be hired to undertake a research study to determine the number of wheelchair push button doors in Fredericton. Doorable will also partner with the Joint Economic Development Initiative (JEDI) to hire indigenous students for the programming and product development.
- **Small to Medium-Sized Social Enterprises** – Through Digital Fredericton's 'Connected Community' layer and the Digital Community Hub, citizens and entrepreneurs will be able to access open data to designs solutions to address community problems. As part of the Digital Fredericton project funding, we intend to procure and invest in new apps / startup companies to fuel procurement and more products from startups like Doorable, which will lead to job creation.
- **Women** – As part of our efforts to support social SMEs, an emphasis will be put on targeting and supporting female entrepreneurs. Already, Fredericton and St. Mary's First Nation have set the stage by supporting Melissa Lunney, Doorable Founder.

As part of the Smart Cities Challenge requirements, it is understood that specific CEB targets and a community employment benefits approach will need to be established when project funding is awarded.

Although the nature of the projects included in this proposal would suggest that a **Climate Lens Assessment** is not necessarily applicable, we have identified a potential for environmental issues to be addressed through future potential projects based on the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

insights we develop on what matters most to residents. Some digital tools may be developed to have a positive environmental impact (e.g. to increase renewable energy use, recycling, reduce greenhouse gas emissions, etc.) In developing the IoT network, we are deploying urban sensors to monitor environmental conditions, such as flooding, air quality and localized weather conditions. Generating this data will allow us to engage the community in environmental solutions and identify how we can adapt to climate change and minimize our environmental footprint.

Implementation Phase Risks and Planned Mitigations

Risk	**Mitigation**
Traditional procurement processes used do not consider the opportunities presented by the Community Employment Benefits initiative.	The governance structure provides direct control over initiatives that impact procurement and the task force will be advised of the objectives of the CEB and provide governance over its implementation.
Failure to adequately consult First Nations	Implement Friendship accord to provide a governance structure for systematic oversight of issues of mutual interest.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Financial

Comprehensive Project Budget

Revenue Including Own-Source and Partner Contributions

Contributions from Other Sources

As outlined above in the comprehensive budget, the City of Fredericton will directly contribute $3.1 million in capital funding, along with $1.25 million in operating funds for dedicated staff salaries and increased operating investments in cybersecurity.

The City's wholly owned subsidiary, e-Novations Comnet Inc. plans to contribute $375,000 towards community digital infrastructure that will directly benefit this Smart Cities journey.

Our technology partners have also committed to in-kind investments of services and expertise:

- Confidential partner, $100,000 per year in-kind investment in innovation
- Eleven-X Inc., half of the cost for the next 1000 connections on our IoT network for the next two years as in-kind contributions. This will total up to $12,000 in connectivity fees.
- Esri Canada Inc., $20,000 per year professional services support of the development of the Digital Community Hub.

Leverage Other Financial Sources

Many of the connected community applications will be developed by third parties as a repeatable business model. Doorable, Hullo and LiveKool each have a planned commercial business model supporting their social technology products. The Smart Cities funding will help seed the ideation, prototyping and preliminary market testing and development of these products.

Having validated the business use case with proven user adoption, many of the third parties will seek investor funding and access other government investment initiatives for technology innovation and business development including:

- The New Brunswick Innovation Foundation (NBIF)
- Atlantic Canada Opportunities Agency (ACAO)
- Opportunities New Brunswick (ONB)
- Business Development Bank of Canada (BDC)

This is not the first time the City of Fredericton has acted in the capacity as early adopter to bring technology innovations to market. The City has partnered with many start-ups including HotSpot Parking and Beauceron Security.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Working with the City of Fredericton as a first customer, HotSpot Parking was able to understand the problem and test solutions to build a repeatable business process. HotSpot then leveraged their experience and track record with the City to secure private equity funding including investments from NBIF and BDC. HotSpot has also leveraged funding from ACOA to develop and grow a sustainable business model. HotSpot now has over 30 major customers throughout Atlantic Canada and Ontario with 10 full time staff.

> "It would not have been possible to attract funding and investment without the City of Fredericton as our first customer. The City shared their expertise to help us understand the problem and allowed us to test our prototypes and build a repeatable business model. This in-kind investment and direct access allowed us create a business from which to attract significant public and private investment"
>
> **Phillip Curley | CEO, HotSpot Parking**

Financial Tools and Accounting Methodologies

The project will use traditional job cost reporting with monthly cashflow management to monitor and control project revenues and expenditures.

Accounting for the project will be handled within the City's financial accounting system and by the City's finance department and accounting staff. The overall project will be assigned a unique cost centre within the City's financial system and each of the project streams will be assigned a project job code within that cost centre.

All expenditures related to the project will be coded to the cost centre and project job code. The comprehensive budget will be further broken down into planned monthly cash-flows. As part of the City's regular reporting process, the actual expenditures by job will be compared with the planned cashflow monthly. Any variance greater than $1,000 or 5% will be investigated as to the cause, and planned spending remaining to year end will be re-evaluated.

These two methods follow established processes on existing systems with experienced personnel and allow for detailed tracking and proactive course adjustments. The process is controlled within existing internal controls and has Council oversight.

Procurement will be subject to the New Brunswick Public Purchasing Act. Procurement will use the City's purchasing agents and established policies and financial systems.

Because Smart Cities funding is outcome-based using predetermined milestones, the City will provide upfront cash-flow requirements using own source revenues committed to this project. Early milestones have been set that allow for the project to be cashflow positive using this combination of City annual funding commitments and outcome-based payments.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Where funding is allocated specifically for staffing through St. Mary's First Nation and other activities under the direction and control of St. Mary's, these payments will be made semi-annually in advance to St. Mary's for disbursement within those established management systems.

Methods, Sources, and Assumptions Used for Estimating Costs

We use several sources and methods to estimate costs:

1. **Wherever possible we used experience from similar recent projects to estimate the cost of initiatives in this project plan.**

   Our estimates for Customer Experience Strategy, ethnographic research, and user-centred design are based on the cost of our finalist phase pilots of ethnographic research and user-centred design workshops. Each were conducted by professional consultants and costs for the scope of these activities are proven.

   Throughout the finalist phase, we have also worked with Doorable to develop a complete functional version of the software application. The application was created by our ecosystem partner at BlueSpurs on the AWS serverless development platform as outlined in our technology strategy. Through this process of development, we can reasonably estimate the costs to develop other version 1 Digital Inclusion Tools.

   We also worked with Esri to develop several features and functions of the Digital Community Hub. Our estimates for future development are provided by Esri and based on their clear understanding of our goals, and the amount of in-kind professional services taken to develop the prototypes.

   We have experience delivering other key elements of our proposal including core government systems as outlined below.

2. **Industry standard cost estimates, primarily for human resource costs.**

   Several of the estimated costs are for additional human resources to fill strategic roles in the development of Smart Cities data, digital content creation, analysis and administration. The costs of these positions are estimated from industry standard salary scales for these types of human resources.

3. **Cost estimates from vendors for specific items contained in this proposal.**

   In building our cost estimates for core e-government services we have received cost estimates from our strategic partners at Deloitte and Oracle. These cost estimates are based on both on our recent experience implementing core financial and HR systems at the City of Fredericton, and also from their knowledge base of similar projects deployed by their teams.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

4. **We use agile development to minimize financial risks, fix total costs upfront and manage project to budget.**

   In order to minimize financial risk, we will use an agile approach to projects. This method helps to establish project estimates and resources first then work progresses in short sprints to develop, test, and implement solutions iteratively.

   Using an agile approach involves focusing on shorter "sprints" with targeted functionality, allowing teams to develop prototypes to confirm requirements when needed. Consistent reviews by management are conducted at the end of each Sprint. This means issues will surface early and can be addressed immediately. When functionality is accepted by users it can be deployed. Because agile involves a process focus, it removes silos between teams and brings together all groups involved.

   We chose an agile approach because:

   - It allows **quicker delivery**, which can decrease the cost and accelerate the achievement of desired outcomes.
   - It helps **build strong relationships** to fully understand current pain points to ensure both the technology and the people are ready for the digital transformation.
   - It enables **accelerated delivery of high-priority features** and opportunities at regular intervals throughout the engagement for leaders and stakeholders to view demonstrations of key processes in the system.
   - It enables **faster adoption** with increased knowledge transfer throughout engagement delivery.
   - It enables **increased transparency and feedback**, offering opportunities for leaders and stakeholders to give input to the solution and identify issues as they arise.
   - It allows for more **predictable costs** and allows for course corrections early.

5. **We use detailed cost breakdowns of project subcomponents to estimate total cost and match them with milestones.**

   The detailed breakdowns of smaller project sub-components and intermediate steps allow for much more accurate costing of the overall project plan.

   The following pages contain the detailed breakdown of costs by project area. These detailed breakdowns are the basis for cost estimations and used for preparing monthly cash-flow projections by project.

   Together these techniques provide effective and consistent controls over budget and scope and provide routine opportunities for evaluation and course correction.

Financial Risks and Planned Mitigations

Risk	Mitigation
Cost and budget overruns	Use detailed cost breakdowns with monthly monitoring against planned annual cashflows for budget control. Use agile development to set project cost and build most important features first using iterative development to control project costs.
Procurement delays and red tape	Engage purchasing agents early in the process to advertise expression of interest calls to establish a pool of preselected partners.
Additional cost of administrative overhead	Use existing process and procedures and existing accounting systems to minimize creation of new reporting, controlling and administrative functions.
Lack of internal controls over external organizations	Where possible, have all expenditures paid through existing City finance and administrative controls. Where external agencies disburse funding directly, provide payments in installments and report on payments and monitor outcomes of projects through the Task Force Governance structure.
Cash-flow requirements due to outcomes-based payments	Seed projects with own source revenues enough to generate early proven deliverables, and track performance measures using progress to ultimate outcomes with earlier stage gates.
Financial burden of expenditures that fail to produce outcomes and trigger payments	Use performance measure that are broken down into early indicators of success to reduce the time between costs and evaluation of success. Provide written roles and responsibilities of the Task Force that outline their role to detect early failures and advise course corrections. Ensure that the Task Force is functioning effectively to receive and evaluate quarterly reports and has clear mandate to seek remediation and course correction.
Financial impact of cybersecurity or privacy breach	Use routine threat risk assessment, threat hunting and cyber security monitoring to reduce risks, and use annual privacy review to identify potential problems before they occur. Assess the need for cyber and privacy insurance to insurance against the financial risks from breaches.
Escalating pace of technology change that results in investments in outdated solutions	Use loosely coupled solutions in a service-oriented manner so continued development can occur even of not all requirements are known at the onset. Taking an Agile approach to solution development will also facilitate extensibility among technologies both current and future.

Project Costs with Timelines

Road Home

Phase	Phase Duration	Milestone	Milestone Date	Cost Breakdown
HIFIS4 Deployment	Ongoing	HIFIS Coordinator		In-Kind
	Sept-Nov/19	Onboard 5 agencies: (Fredericton Homeless Shelters Inc., John Howard Society of Fredericton, Capital Region Mental Health & Addictions, Youth in Transition, Liberty Lane)	Dec 1/18	
	Jan1-Mar 1/19	Complete data transfer from HIFIS3 to HIFIS4	Mar 1/19	grant
Training	Feb1-July 1/19	Create training capacity for HIFIS, SPDAT (train the trainers) & develop user manual	July 1/19?	grant
Technology	July 1-Nov 1/19	Deploy digital infrastructure/user tech to agencies above (fibre, hardware/software, licensing)	July 1/19	$60,000
	2019	Upgrade free public WiFi	2019	$150,000
Service Coordination	July1/19-July1/20	Onboard 3 additional agencies & coordinate services (St. Mary's First Nation shelter, Gignoo, Women in Transition)	July 1/20	
Technology	July 1-Nov 1/20	Deploy digital infrastructure (fibre, hardware, licensing) – First Nations shelter	July 1/20	$30,000
	2020	Upgrade free public WiFi	2020	$150,000
Service Coordination	July1/20-July1/21	Onboard 1 additional agency & coordinate services: - Fredericton Downtown Health Clinic	July 1/21	
	Feb 1/19-July1/21	Coordinate intake & assessment & triage model among 9 agencies, identify opportunities for improvement (OFIs)	July 1/21	
Technology		Digital inclusion infrastructure & tech resources (First Nations)	July 2/21	$4,000 $1,000
App Development	July 1/19-April1/21	Create personalized digital inclusion applications/tools (i.e. digitized street survival guide)	April 1/21	$125,000
Digital Community Hub	Aug 1/20-April 1/21	Coordinate high level aggregate data based on indicators to 'city performance dashboard' and personal level resources	April 1/21	
Technology		Digital inclusion infrastructure & tech resources (First Nations)	July 1/22	$4,000 $1,000
Sustainability Plan		Coordinate plan among agencies.	2023	
Total				$525,000

Digital Fredericton

Agile approach with Sprint outline.

#	Phase	Phase Duration	Milestone	Milestone Date	Cost Breakdown
1	Work Management & Field Service Delivery				
	July 1/19-Feb 7/20 (30 wks)	Prework (2 wks)	• Product selection finalized • Product licensing (annual) • Internal team identification		$50,000
		(4 wks)	• Develop workplan • Create status report templates • Develop instance & integration strategy • Develop test strategy • Develop high level change management plan • Confirm user stories		$150,000
		Sprint 1 Sprint 1 Spring 2 (4 wks)	• Project financials • Project costing • Inventory		$200,000
		Sprint 3 (4 wks)	• Field service core manage cloud & field service mobility cloud • Maintenance management		$150,000
		Sprint 4 (4 wks)	• Field service customer communication & field service routing • Smart location cloud		$150,000
		Testing (4 wks)	• Systems integration testing & user acceptance testing		$150,000
		Deploy (4 wks)	• Process redesign & capability development		$150,000
		Deploy (4 wks)	• Product cutover/support & transition		$100,000
	Phase 1 Sub-total				$1,200,000
2	Utilities & Customer Billing				
	July 1-Dec 20/19 (25 wks)	Prework (2 wks)	• Product selection finalized • Product licensing (annual) • Internal team identification		$100,000
		Sprint 0 (2 wks)	• Develop workplan • Create status report templates • Develop instance & integration strategy • Develop test strategy • Develop high level change management plan • Confirm user stories		$50,000
		Sprint 1 (3 wks)	• Accounts receivable • Contracts cloud service • Development		$300,000
		Sprint 2 (3 wks)	• Order management cloud		$125,000
		Sprint 3 (3 wks)	• Advanced collections		$125,000

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

		Testing (4 wks)	• Systems integration testing • User acceptance testing		$100,000
		Deploy (4 wks)	• Process redesign & capability development		$150,000
		Deploy (4 wks)	• Product cutover/support/ transition		$50,000
	Phase 2 Sub-total:				$1,000,000
3	Talent & Performance Management				
	July 1/21-Feb 11/22 approx. (30 wks)	Prework (4 wks)	• Product selection finalized • Product licensing (annual) • Internal team identification		$50,000
		Sprint 0 (2 wks)	• Develop workplan • Create status report templates • Develop instance & integration strategy • Develop test strategy • Develop high level change management plan • Confirm user stories		$100,000
		Sprint 1 (4 wks)	• Talent acquisition • Succession management		$250,000
		Sprint 2 (4 wks)	• Learning cloud service		$250,000
		Sprint 3 (4 wks)	• Performance management		$250,000
		Testing (4 wks)	• Systems Integration testing • User acceptance testing		$250,000
		Deploy (4 wks)	• Process redesign & capability development		$150,000
		Deploy (4 wks)	• Product cutover/support/ transition		$125,000
	Phase 3 Sub-total				$1,425,000
4	CRM/Portal				
	July 1/20-Aug/21 (56 wks)	Prework (4 wks)	• Product selection finalized • Product licensing (annual) • Internal team identification		$400,000
		Sprint 0 (8 wks)	• Develop workplan • Create status report templates • Develop instance & integration strategy • Develop test strategy • Develop high level change management plan • Confirm user stories		$400,000
		9 sprints (4 wks/sprint x9 sprints=36 wks)	• Citizen portal • Enterprise contact center • Interface cloud service		$900,000 $100,000/sprint)
		Testing (4 wks)	• Systems Integration testing • User acceptance testing		$200,000
		Deploy (4 wks)	• Product cutover/support/ transition		$100,000
	Phase 4 Sub-total				$2,000,000

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

5	Customer Experience Strategy (cycle repeated annual: ethnography, insights, ideation, prototyping, tools)				
	July 1/19-July 1/23	2019	• Citizen experience strategy		$ 240,000
		2021 2022 2023	• Ethnography research (2 segments per year)		$100,000 $100,000 $100,000
		2019 2020	• First Nations specific ethnographic research (2 segments directed by SMFN)		$50,000 $50,000
		annually	• Ideation & prototyping based on insights		$20,000/year =$100,000
		2019 2020 2021 2022 2023	• Digital inclusion tools, application/tech development and innovation		$125,000 $250,000 $125,000 $125,000 $125,000
		2021 2022	• First Nations specific digital tools resulting from ethnography		$125,000 $125,000
	Phase 5 Sub-total:				$1,740,000
6	Digital Talent Strategy				
	July 1-Sept 18/20 (12 wks)	Sprint 1 (8 wks)	• Digital employee talent proposition • Define • Skills identification • Skills gap		$100,000
		Sprint 2 (4 wks)	• Talent modelling • Governance		$50,000
	Phase 7 Sub-total:				$150,000
7	HR Scheduling				
	July 1-Dec 24/20 (26 wks)	Prework (2 wks)	• Product selection finalized • Product licensing (annual) • Internal team identification		$150,000
		Sprint 0 (2 wks)	• Develop workplan • Create status report templates • Develop instance & integration strategy • Develop test strategy • Develop high level change management plan • Confirm user stories		$50,000
		Sprint 1-3 (6 wks)	Scheduling		$375,000
		Testing (4 wks)	• Systems Integration testing • User acceptance testing		$100,000
		Deploy (4 wks)	• Process redesign & capability development		$150,000
		Deploy (4 wks)	• Product cutover/support/ transition		$50,000
	Phase 8 Sub-total:				$875,000

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Transformation Management

	Smart Cities Program				
	Digital Fredericton TMO Marketing/communications, & Consulting	2019 2020 2021 2022 2023			$325,000 $125,000 $125,000 $125,000 $125,000
		annual	• Virtual Privacy officer		$20,000 $15,000 $15,000 $15,000 $15,000
		2019 2020 2021 2022 2023	• Smart cities collaboration space		$10,000 $20,000 $20,000 $20,000 $20,000
		annual	• SMFN lead for ethnography and tech initiatives		$375,000 ($75,000/year)
		annual	• Smart Cities project management – dedicated staff		$750,000 ($150,000/year)
			• Cybersecurity (virtual Chief Information Security Officer & security operations monitoring)		$500,000 ($100,000/year)
	Sub-total				$2,620,000

Digital Community Hub

#	Phase	Phase Duration	Milestone	Milestone Date	Cost Breakdown
1	Project Mobilization Admin-HR	July 1-Aug 1/19 Aug 1-31	Develop skill requirements and advertise posting (2 weeks) for data analyst, digital community hub coordinator, content creator Screen, interview candidates, select/sign contracts and set start dates (Oct 1 latest).	Aug 1/19	$345,000
	Admin-Technology Procurement	July 1-Sept 1/19	Develop RFP package, tender/award project for platform development.	Sept 1/19	$60,000
2	Platform Development	Sept 15/19-Feb 15/20	Develop Digital Community Hub platform ensuring compliance with data & security requirements (conduct user testing where required) for: 1. Smart City Dashboard 3. Personal Digital Inclusion	Feb 15/19	
3	Data Sharing Agreements	Oct 1-Nov 1	Sign 5 partnership agreements (Ability NB, Age Friendly Committee, CAGH, Appdigenous, NB-IRDT)	Nov 1/19	
4	Ethnography, Data Input & Testing	Aug 1-Oct 1/19	Via Digital Fredericton – conduct ethnographic research for 2 segments	Oct 1/19	
		Oct 1-Dec 1/19	Collect & input segment baseline data for dashboards	Dec 1/19	
		Early Feb/20	Pilot /user-centred design testing for 3 segments	Feb 19/20	
3	Data Sharing Agreements	Nov 1/19-Feb 1/20	Sign 5 data sharing agreements: TBA	Feb 1/20	
5	Release #1	Feb 19-Mar 31/20	Develop/deploy communications campaign / launch dashboard. Personal/2 segments +performance: • older adults community hub + integrate LiveKool • accessibility challenged (accessible community hub w/ data & map) • Smart City Performance Level • First Nations segment	April 1/20	$245,000
6	Data Renewal Process	April 1-June1/20	Create process for data refinement and identification	June 1/20	
2	Platform Development	Feb 19-Sept 1/20	Develop dashboard platform for Personal Interactive Level	Sept 1/20	$60,000
7	Census 1		Establish 1,000 users / annual survey / produce community census	Nov 1/20	
4	Ethnography, Design Testing & Data Input	Aug 1/20-Feb 19/21	2 segments + 1 SMFN segment	Feb 19/21	
5	Release #2	Feb 19-Mar 31/21	Personal/3 segments + interactive: • Road home community hub (homeless segment including digital street guide) • Cultural /Newcomers community hub + integrate Hullo	April 1/21	$245,000

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

			• SMFN • +Personal interactive level		
2	Platform Development	Feb 19—Sept 1/21	Develop dashboard platform for Organizational Level	Sept 1/21	$60,000
4	Ethnography, Design Testing & Data Input	Aug 1/21-Feb 19/22	2 segments + SMFN	Feb 19/22	
2	Platform Development	Feb 19-Sept 1/22	Develop dashboard platform for Organizational Level	Sept 1/22	$15,000
7	Census 2		Establish 2,000 users / annual survey for community census	Nov 1/21	
5	Release #3	Feb 19-Mar 31/22	Personal/3 segments (TBA) +community hub of interest and integrate user experience tech, applications and data	April 1/22	$245,000
4	Ethnography, Design Testing & Data Input	Aug 1/22-Feb 19/23	2 segments + SMFN	Feb 19/23	
7	Census 3		Establish 5,000 users / annual survey / produce community census	Nov 1/22	
5	Release #4	Feb 19-Mar 31/23	Personal Level – 3 segments + organizational level	April 1/23	
4	Ethnography, Design testing & Data Input	Aug 1-Dec 1/23	2 segments + SMFN	Dec 1/23	
7	Census 4		Establish 10,000 users / annual survey / produce community census	Nov 1/23	$245,000
2	Platform Development		Continued dashboard development for sustainability	Sept 1/23	$10,000
8	Sustainability		Create project sustainability plan		
					$1,530,000

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Doorable

Phase	Phase Duration	Milestone	Cost Breakdown	Milestone Date
Mgt Team & Talent Acquisition	Feb 15-July 15/19	*Mgt team currently in place. Recruit technical staff, installers, CRM staff		July 15/19
Testbed of Users Created	Feb 15-June 30/19	250 downloads of Doorable app. Ver1.0		June 30/19
Sustainability Plan (See Attachment)	Feb 15-Dec 31/19	The Smart Cities funding, which in effect subsidizes 1000 installs of Doorable tech, generates sufficient revenue to undertake the development and growth of the technology as described in the budget. Costs unmet by the launch project are met by install purchases from organizations and businesses as well as through services offered to subscribers.		Dec 31/19 ("Sold" installs and subscriber services)
Research Strategy: Baseline Fredericton	May 6-Oct 11/19	Conduct inventory of all button accessible doors in Fredericton, and make available via Hub	$135,000	Oct 11/19
Commercial Subscribers Testbed (subsidized installs)	May 19-Sept30/19	Sign 5 commercial customers and install hardware (testers) Private sector subscriber consultative group established		June 30/19
Intellectual Property	June 1-Aug 30/19	Develop patentable design schematics on DOORABLE hardware (Release 2)		Aug 30/19
Hardware Development: Web-based Black Box (Version 2) & Testing	June 1-Aug 30/19	Develop Version 2 of Doorable hardware with both wireless and internet connectivity allowing Doorable Release 2 of the User App to be a web capable (future proofing the hardware)	$92,000	Aug 30/19
Mobile application design and implementation: Installer application version 1	July 1-Aug 30,19	Develop Installer App to populate Data base of "Doorable" accessible doors on the "back end" and initialize device	$35,000	Aug 30/19
Advisory Board	July 3-Aug 3/19	Constitute advisory board		Aug 3/19
SaaS Model	Aug 1-Dec 31/19	Create pricing structure for basic level of content management associated with Subscriber app.		Dec 31/19
Public Building Retrofits (Phase 1)	Sept 1-July 1/19	Fit all public buildings owned/ operated by Fredericton/St. Mary's with Doorable technology (HW Release 2)	$150,000	July 1/20
Non-Profits-Retrofit Installations (Phase 2)	Sept 1-Oct 15/19	Fit NPOs participating in Smart Cities Proposal with Doorable (HW Release 2)		Oct 15/19
Hardware Upgrades in Test Sites	Sept 1-Oct 30/19	Conduct testing at Bluetooth enabled door (by Aug/19, the future proofed web capable units will be ready)	$150,000	Oct 30/19
Commercialization/ Market Entry Strategy		(See Appendix - Business Model)		
User Education & Awareness Campaign	Ongoing	Enable online support of user community		July 15/19

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Software (backend cloud server-data storage)	Sept 1-Nov 1/19	Develop back end software to support User App and Version 2 of Firmware	$38,000	Nov 1, 2019
Mobile Application Design & Implementation: User Application Version 1.1	Sept 1-Nov 30/19	Release Version 1.1 (release 2) to User group.	$40,000	Dec 13/19 Release date
Research Strategy: User Experience	Sept 1 – Nov 30/19	Create set of revisions driven by user experience		Nov 30/19
Mobile Application Design & Implementation: Subscriber Application Version 1	Sept1/19-Jan 24/20	Release #1 Subscriber App including content management and push features.	$85,000	Jan 24/20
User Feedback System	Nov 16-Dec 13/19	Build integrated feedback system into User App and Subscriber App.		Dec 13/19
Doorable Community: Online user-user dialogue/community building	Mar31/20-Mar 1/21	Fully develop platform for user-user, user-subscriber dialogue on issues, projects, specific issue-based initiatives, project building.	$172,500	Mar 1/21
Market Research – Subscriber Community	June1-Sept 1/20		$80,000	Sept 1 /20
Mobile Application Design & Implementation: Subscriber Application Version 2	June 1-Dec 1/20	Fully develop platform for services to subscribers, including a fee for service model for content management, push services for interested users and a range of content offerings. Licensing options may be available and developed for large subscribers (i.e. GNB)	$60,000	Dec 1/20
Mobile Application Design & Implementation: User Application Version 2.0	Nov 1/20-Mar 1/21	Major release of the User app synchronized with the release of Doorable Community.	$55,000	Mar 1/21
Data storage and processing	Sept 1/20	Data storage and processing of subscriber data, Open data and User special research data	$42,500	Sept 1/20
10,000 Users	Nov30/20	10% of Greater Fredericton residents		Nov 30/20
MRR SaaS: Fully featured Subscriber services	Dec 1/20-Ongoing	Develop subscriber app features, test/price/deploy		Dec 31/20
20,000 Users	Mar31/21	20% of Greater Fredericton residents		Mar 31/21
New Market Entries: - 2 new NB cities - 2nd province	Mar31/21-Mar31/22			Mar 31/22
60,000 users		Definable percentage of population market in 2 NB cities		Mar 31/22
120,000 users		Definable percentage of population market in 2nd province adopting the technology		Mar 31/23
National Reach	Mar31/22-Mar 31/23	Distribute/sell fully deployed and tested Doorable technology		Mar 31/23
Total			**$1,135,000**

AKWESASNE MOHAWK COUNCIL RESOLUTION

File Reference:

MCR #: 2018/2019 #346

THE	MOHAWK COUNCIL OF AKWESASNE
AGENCY	SOUTHERN ONTARIO DISTRICT
PROVINCE	ONTARIO/QUEBEC
PLACE	Administration 1 Building
DATE	4 (Day) March (Month) 2019 (Year)

THIS MEETING TOOK PLACE IN THE TERRITORY OF AKWESASNE WITH THE FOLLOWING MEMBERS OF THE AKWESASNE MOHAWK COUNCIL PRESIDING

RECORDED VOTE

For: 9

Against: 0

Abstention:

☒ Carried ☐ Denied

DO HEREBY RESOLVE:

Moved: Tim Thompson

Seconded: Theresa Jacobs

WHEREAS, *the Mohawks of Akwesasne have the existing and inherent right of* ***self-determination,*** *which includes the inherent jurisdiction over their lands, peoples and territory;*

AND WHEREAS, *the Mohawks of Akwesasne have the aboriginal and treaty rights, and other rights and freedoms that are recognized and affirmed in the Constitution of Canada, which include the inherent right of* ***self-determination*** *and jurisdiction over their lands, peoples and territory;*

AND WHEREAS, *the Mohawk Council of Akwesasne is the community government within the territory of Akwesasne and has* ***inherent jurisdiction*** *to make laws, regulations and policies to meet the needs and concerns of the Mohawks of Akwesasne;*

AND WHEREAS, *the Mohawk Council of Akwesasne intends to preserve the cultural, political and economic integrity of the Mohawk territory and community of Akwesasne;*

WHEREAS, Infrastructure Canada announced Canada's Smart Cities Challenge in the fall of 2017, which is a competition open to municipalities, local or regional government, and indigenous communities (First Nations, Inuit and Metis) across Canada; and

WHEREAS, the Mohawk Council of Akwesasne (MCA) staff, leadership and technicians discussed the Smart Cities Challenge and worked with a digital consultant on framing the Challenge Statement for submission; and

WHEREAS, Mohawk Council of Akwesasne submitted the finalized challenge statement was selected as a finalist for the Infrastructure Canada Smart Cities Challenge; and

WHEREAS, The Smart Akwesasne Team worked diligently on collecting community input and formulated the criteria for the compilation of the final proposal submission; and

WHEREAS, The final proposal is now complete and has been prepared for submission;

THEREFORE BE IT RESOLVED THAT, The Mohawk Council of Akwesasne approves the final proposal and supports it's submission to Infrastructure Canada for consideration in the Smart Cities Challenge.

CARRIED.

Executive Summary

Our Smart Cities Challenge: To reduce the prevalence of new cases of diabetes at Akwesasne to the rate of the Canadian average. Our goal looks rather humble, to only be as bad off as the rest of the Canadian population. With this statement, however, the people of Akwesasne draw a line in the sand against the existential threat of diabetes. And our work maybe beneficial to others: Recent research reviewing 111 studies worldwide confirmed a disproportionate burden of diabetic disease complications among all Indigenous peoples regardless of their geographic location.

(From: Global complication rates of type 2 diabetes in Indigenous peoples: A comprehensive review)

We recognize that the situation Akwesasne folks now face was ultimately caused by our loss of traditional ways. A steamroller of westernization disrupted our traditional lifestyles, polluted our natural food sources, and dropped on top of the Akwesasne territory three complicating political jurisdictions, not of our making. Our skills and competencies in the old ways lost relevance. Our elders' ability to provide guidance using traditional teachings and ceremonies was derailed. The temptation of western consumptive habits and modern food, that is, frankly disease causing exacerbated our genetic susceptibility for diabetes, as did our now overly sedentary lifestyles. Our traditions sought to preserve our unique relationship with the environment, to make us a sustainable society. This has been replaced by our acceptance of living in a negatively altered state, and of accepting the need for modern medicine, which does not bring us back to health. It does not cure but keeps us in a state of perpetual decreased vitality.

But how to reverse this trend towards ever worsening health? How can we address this problem in a new way?

We became aware of how organizations and industries were re-inventing themselves and disrupting their existing situation for the better through the use of Design Thinking. With our partners, we learned how to get to the root of our problem, and how to come up with ideas to solve the problem.

We wanted to have all of our community involved. We wanted to make our work transparent so our residents' relationships with our public organizations and with each other would be stronger. We wanted our people involved so the solutions that are

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

designed will work for our people because they were part of developing where we are going at every step.

We started by looking over everything we had previously studied. We brought together our people singly, in groups, and remotely through surveys and phone calls. We discussed and identified problems. We thought of over 100 causes and solutions and then arrived at key insights regarding our predicament. We determined that the precursors leading to high levels of diabetes are related to these rather straightforward factors:

- Food Accessibility
- Network Accessibility
- Transportation Accessibility
- Westernization
- Checkup Frequency in Health and Dental
- Healthcare System Disconnection
- Loss of target demographic following primary school.

(These will be explained in detail later in our proposal).

We learned that the way forward for the health of Akwesasne must be a multipronged approach, working on many battle fronts at the same time. In our own traditions of health we remember from a Haudenosaunee perspective Goodmindedness, Peacefulness, and Strength are synonymous with a unified mind, body, and spirit concept. Similarly, our ability to achieve a healthy state will focus on four pillars that summarize our insights: Wellness, Tradition, Access, and Measurement. These Pillars will become themes for our actions in our Smart Cities approach, and take the form of new tools, and a new way of communicating, remembering and teaching. With the help of technology, the way forward is for us to accurately understand our own condition, organize ourselves for change and then make change happen in measurable, adjustable ways.

In the big picture we are where we are because we could not adapt when westernization and industrial technology changed our environment. This is the same story for Indigenous people the world over and is also a story of misused power. While it is regrettable our current environment offers us much less in many ways then it once did, it also has new things in it. Our elders could walk into the bush and point to dozens of things that had nutritional, medicinal or cultural uses. Now our environment has technologies and machines that we need to recognize as useful and use. And not just use, but develop our own skills in their use.

In the years since we were forced to abandon traditional ways and lost our self-sufficiency, the spirit of our community was also damaged. The disruption to Kanikonhriio or Goodmindedness, and Sken:nen or Peacefulness, led to the loss of our strength in looking after ourselves and each other. It weakened our self-worth, our contribution of shared effort, our access to teachings; all were made difficult. Even food in our own territory can no longer be

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

drawn from the river or grown safely.

Yet the strength of our community can be reinvigorated, especially if we tackle the issue of diabetes. We can make use of new technologies such as mobile communication to help us function like a community again. Systems can be introduced that will make us strong together by keeping us in touch, by responding to each others requests for help or to learn; we can share our learnings and join one another in healthy activities, and get to know one another.

Our health challenges are made harder because we don't know one another. Not in the causal sense of knowing but in the sense that our health services don't have proper information on our individual health. The fracturing of our community across jurisdictions and health districts means we can hardly even know ourselves in the sense of having an accurate medical history, often spread across provinces and countries. So how can we understand the health status of our community or plan to improve it? A mobile application, designed for the purposes of organizing us and our information can give us back this glue that can make us a community again. Modern tools can make our problems understandable, and allow us to find insights into our condition so we can develop ways to reverse our maladaptation to this still relatively newly imposed environment.

Now, in thinking about how technology can help Akwesasne, and what the Smart Cities challenge may permit us to accomplish, we started with a new way of thinking as a group. Design Thinking helps organizations innovate, which is really just a word for adapting. And this approach allowed us make up time for those years when we weren't adapting; we wanted to move ahead but had trouble deciding what needed to be done. Now we have gone over what we know, focussed on a challenge, engaged our community, developed some momentum and made a plan that uses smart technologies as an antidote for the issues caused by previous modernization.

Akwesasne has recognized the Smart Cities Challenge as an opportunity to face our hardest challenge. It has brought our community together and we have found a way to organize ourselves to move forward. While much of the world's technology had caused problems for us in the past, we will now use technology as a raw material to regain our vitality.

Our plan for adoption of technology will be on our terms. Our project probably does not seem earth shattering, which is a rate of change we find disconcerting, anyway. Through the use of about a dozen electric vehicles, the construction of 3 greenhouses adopted by the school curriculum, and a mobile application we can put in everyone's hand we plan to attack the 4 pillars of our challenge. With this limited investment in machines and software we will address the insights about our predicament.

Key to organizing the strength of our community will be the mobile and administrative coordination tool we are calling the Akwesasne Community

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Application. This brings everything together by providing communication amongst our people, coordination of services, access to food and community programs, measurement of service efficiency, and tracking of individual health. With these tools and oversight, we will make progress on our challenge, and reduce the rate of new disease to the rate of other Canadians. It would be nice to target the rate of diabetes in our people of 200 years ago, but for now it will be a major goal to achieve the health of other Canadians.

Our success will represent a watershed in our history. This will be where we began to defeat the most significant health risk for our people. This is where we began to improve the most significant factor for achieving a happy life, that being good health. Our elders knew how to make the most of what the environment offered; we can use that approach again. Tech is like a new herb, we must understand and use it. We will put it to use without obliterating the traditions that are our identity. We will use it while maintaining harmony with the environment.

We can use new things like e-cars and e-buses to get where it is important to go, without adding to the toxic load by burning oil. We can use greenhouses to replace our polluted food sources and gain back a measure of self-sufficiency. Mobile and computer programming can bring back the sharing and helping on which our strength as a nation was based. Digital tools will give us access to our collective memory and to the wisdom of our traditions, from which we regain pride necessary for our progress as a people. Our traditional teachings shows how strength is based on things working together. We will use that approach to work on many things at once to reverse the main threat to our health.

We believe this solution is extensible. Our package of ideas, with its mobile technology, databases, integration of health devices, location sensing, health diagnostics, statistics, transportation logistics, electric vehicles — these are all details to be adjusted for each case. At the center, however, will be the open-source system that is the hub of the services, and this is a non-proprietary system suitable for hosting anywhere. What we have learned, the approaches we take, the way we integrate the very new with the old will surely be helpful to aboriginal nations across Canada and the world over.

We are not the only people whose nation has been knocked out of harmony with the environment because of colonialism. We are not the only aboriginals whose communities were disfigured by imposed change and 'progress'. Regardless of cause, other indigenous people around the world are vulnerable to developing diabetes at the rates we are. They would surely benefit from our experience with this project. They would be welcome to our technology.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Vision

The goal of our Akwesasne Smart Cities Challenge is to leverage smart technologies to reduce new cases of diabetes in Akwesasne to the Canadian national average. Six months ago our preliminary proposal laid out four pillars of focus, and we hold true to that vision in both our process and outcomes. These four pillars are improving approaches to community wellness, incorporation of holistic Indigenous practices, improved access to community services, and finally, tracking of health diagnostics for a measurable approach.

Community Wellness

The approach to our first pillar, community wellness, calls for making existing opportunities more accessible, increasing the number of people taking advantage of these initiatives, while simultaneously improving the existing systems supporting them. The Mohawk Council of Akwesasne, Community Health and numerous individuals in the community provide a number of opportunities for the improvement of physical, mental, spiritual and emotional wellness in their community. These programs include The Green Food Bag, a service offered by the Department of Health, which provides fresh fruit and vegetables to households at a low cost on a monthly basis; daily yoga, pilates and fitness classes at the recreational center, free cooking, knitting, art, and taekwondo classes. Also provided is an adventure club that takes groups of individuals outdoors to experience nature through hiking, bike rides, fishing, and other activities. These are just a few of the many programs and opportunities available to the people of Akwesasne. Unfortunately, participation rates are rather low with stagnant growth uptake. Many individuals are restricted to the programs in their own district or are unaware of when and where things are happening. Our proposed solution will address these impediments in a multi-faceted approach, through improved intrinsic motivators of awareness; ease of scheduling and community connection; by improving accessibility via more affordable transportation, and through measuring the effects of our efforts to further improve existing services.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Adding to the lack of community wellness is the barriers to healthy food sources within the community, including long drives to grocery stores, and high levels of mercury in both the Saint Lawrence River and surrounding soil, stealing our traditional practices of gardening. To address the issue of food insecurity and inaccessibility, we will implement three Smart Greenhouses through a phased roll-out approach at each of the Akwesasne Mohawk Board of Education (AMBE) Schools locating one in each district. The intention of this project is to first create a curriculum based on agricultural education teaching years 6 through 13 on how to grow fruits and vegetables with the importance of a healthy diet. The second goal of this project is to help address the transportational barriers by using students as a vehicle to get healthier options onto young families tables. Lastly, gardening promotes physical health, mental health through stress relief, exercise, brain health, nutrition, and healing, which is not only a contributor to reducing pre-diabetes, but also following the teachings of our Indigenous and Mohawk practices.

Our Greenhouse implementation is planned to be fully automated including temperature control, the amount of light saturation, humidity levels, soil moisture as well as other factors. Smart greenhouses can be controlled remotely over the cloud through an application, eliminating the need for a person to be present for most operational needs. By using IoT, sensors and actuators, factors such as temperature and humidity can be monitored remotely, and changed based on needs to create the most viable growing environment for the products. Although fully automated, connecting children with the natural world and allowing them to explore the outdoors, including our school gardens, will be an integral part of our integrated curriculum. Students work in the garden, weeding, watering and tending to the beds. Classes utilize the space for lessons in science, social studies, math, reading, writing, and painting. A living laboratory, children are growing, experimenting, observing, measuring, comparing, and learning to care for something that is important to the Akwesasne Mohawk Board of Education and to sustainability efforts around the world. A garden is as much a story about the people who create it as it is about the garden itself. School Greenhouse Gardens are spaces for "hands-on" education, incorporating the full cycle of learning associated with healthy food - from growing to nutrition to cooking and eating. This will provide hands-on learning experience and a living classroom for Akwesasne.

Incorporation of Indigenous Community Practices

Many of the issues we face, and particularly the challenge we are experiencing with diabetes, can be attributed to the loss of the traditional ways of diet, activity levels and mindset. To tap into the strength of our traditions we will be integrating these cultural beliefs that served us well for centuries. These practices, even if put to use in combination with modern

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

technologies, will once again help us regain our vitality.

Our intention to incorporate Indigenous Community Practices means we will approach health and wellbeing from more than just the modern clinical perspective. Akwesasne is part of the Haudenosaunee Confederacy and remains connected to our traditional roots. Holistic Indigenous practices encompass three principles that were introduced to our people as the Peacemaker traveled the land: Kankonhriio or Goodmindedness, Sken:nen or Peacefulness, and Kasastensera or Strength. This teaching became known as the Great Law of Peace. Essentially, what the Peacemaker taught throughout the territory was that the practice of Kanikonhriio or Goodmindedness would bring Peace or Skennenkowa to the people in the land. When the Peacefulness was pervasive through the territory, the people would gain a Strength or Kasastensera that could not be overcome by negative forces. From a Haudenosaunee perspective Goodmindedness, Peacefulness, and Strength are synonymous with the concept of mind, body, and spirit. This holistic approach to wellness has gained significant traction in alternative healing practices. The popularity of respecting the interrelationship of mind, body, and spirit is undoubtedly due to its effectiveness, especially in combination with modern medicine or as an alternate. In the Haudenosaunee Wellness Model, the 'health' of Haudenosaunee individuals, families, clans, communities, nations and overall confederacy can be measured using indicators strictly from our teachings and cultural mores. Likewise, an individual can receive guidance on a process to return to a state of 'health' using our traditional teachings and ceremonies.

The Haudenosaunee Environmental Task Force has proceeded with a project to develop an environmental protection process based on their Indigenous world view and relationship with the natural world. Such a process enables individual nations and communities of the Haudenosaunee to protect and restore the natural world, while helping to preserve their unique relationship with it, as a sustainable society. The process devised criteria and indicators for health of the natural world including people, which has a foundation in Haudenosaunee culture and traditions.

Through our Smart Cities Challenge proposal we keep these teachings and values at the center of all solutions, smart or otherwise. The Akwesasne Community Application will embrace holistic Indigenous practices through the teachings it contains the insights it provides to users, and the accessibility of these resources. The application will simply provide the means for the people of Akwesasne to achieve and maintain Good Mindedness, Peacefulness and Strength.

Improved Access to Community Services

The geographical footprint of Akwesasne is unique and includes jurisdictions in Ontario, Quebec and the state of New York. For many citizens, significant distances, travel

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

times and border delays both ways impact accessibility to major services. This limits our access to facilities and infrastructure where physical health, fitness activities and training are provided as well as accessibility to fresh, healthy food.

Without personal vehicles, getting between major public hubs or to a grocery store, fitness and recreation centers, or healthcare providers is unfortunately challenging, and a real impediment to these trips occurring. Right now Akwesasne relies solely on taxi-cab. These companies — based out of surrounding cities Cornwall, Ontario and Massena, New York — charge high rates to travel into the districts of Cornwall Island, St. Regis, and St. Snye. Additional charges accrue due to the extremely sparsely populated community and additional drive time to come into the reservation. Our plan in overcoming this challenge is to bring affordable and accessible public transportation to the community of Akwesasne. To do this we will organize a Mohawk Council of Akwesasne (MCA) subsidized taxi-cab service, as well as designing and beta testing a project for on-demand electric public transit bus services. Through these two transportation initiative we will facilitate the important movement of our citizens between our districts and to needed services including fitness and recreation centers, healthcare providers in various locations and to purchase food at grocery stores. Through a phased roll-out approach we will begin by purchasing an electric vehicle per district in order to gain feedback on the program and truly understand our capacity requirements. Based on the preliminary research this will lead to four cars per district, a total of twelve cars as allotted in our budget.

Tracking of Health Diagnostics for a Measurable Approach

The prevalence of Diabetes in First Nation communities is disturbing. Diabetes Canada states the rate of diabetes for First Nations individuals living on a reserve is 3-5 times higher than other Canadians. The Canadian national average is 9%. The rate in Akwesasne is 33%. While we plan to include many measurements in the Smart Cities system — to help us understand and influence patterns of behaviour, optimize services and logistics, to provide feedback to help in the iteration of ideas — one measure is preeminent in our challenge: the number of new cases of diabetes in Akwesasne. This one number must be reduced to that of the Canadian national average. This is the goal which all the other pillars and tactics will be organized to achieve.

Consistent with research on diabetes in First Nations populations, the Akwesasne rate is more than three times the Canadian average. Through the aggregated data received from the Akwesasne application, CANRisk surveys completed within the application, individuals referred to the diabetes prevention and management team as well as the number of new cases of diabetes in Akwesasne, we can measure the relation between our efforts and the Smart Cities Challenge initiatives with a real change of diabetes in Akwesasne.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

(CANRisk surveys provide questions that help individuals determine if they are at higher risk of having pre-diabetes or type 2 diabetes.)

Apart from the measuring of health outcomes and diagnostics indicative of medical issues, our work with the Mohawk Council of Akwesasne Executive team also narrowed in on Key Performance Indicators that would indicate if our solution was having a positive effect on the factors contributing to health outcomes; for example, were our chosen tactics shown in the behaviors of the community? Were our solutions achieving key objectives? The Akwesasne Community Application and digital ecosystem through which transportation and participation rates can be collected and analyzed is central to the measurement and understanding of these contributing KPI's.

To address this pillar, and the key performance indicators contributing to your Challenge statement we will collect and aggregate all of the data gathered from the application including CANRisk survey results, usage rates of programs and services, and progress of health metrics in aggregated form and display it in a dashboard view for the Mohawk Council of Akwesasne. This will allow us to understand both baseline data within our community and understand how our efforts are relating to decreasing the new cases of diabetes.

With these four pillars — Wellness, Tradition, Access, and Measurement — at the center of our Smart Cities Challenge, we will improve community wellness by developing better services while creating more affordable access to them. We will incorporate Indigenous Mohawk culture to tap the wisdom held in our traditional teachings and approach all issues with a more holistic mindset respectful of nature. All the while measuring movement towards targets, to show proven results or highlighting a need to adapt to better serve our people.

Reflective of the true needs of the community; as demonstrated through a compelling body of data and evidence and extensive resident engagement. Ambitious, achievable, and meaningful for the community and it's residents.

A human centered-design approach is based on delivering solutions that meet the true needs of the community, that are meaningful, that are aligned through initial and ongoing engagement with the end users. Consequently, our Smart Cities team has kept Community Engagement at the forefront of our Smart Cities Challenge solution. Over the past seven months, we have implemented the Design Thinking methodology in its many forms, facilitating workshops with important user groups, surveying and interviewing internal and external stakeholders. And, as this information provided direction and formed into ideas, prototypes and application interfaces, we gained feedback from Akwesasne community members on our solutions and how they should iterate via rounds of user testing. Our partners,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

zu, knows from experience that it is best to "measure twice and cut once" in designing solutions, which means keep users in the loop until things are completed, or one is likely to complete the wrong thing.

Using the Design Thinking process our outcomes and approach ensures the true needs of the community are served. Community members are the ones who both identified the problems and helped ideate the solutions. They were and are conferred with every step of the way providing feedback on solutions, voting on the best implementation strategies, and user testing our prototypes. In the past consultants sought to implement their own "expert" ideas in prescriptive ways; in Design Thinking, however, users are encouraged to critique things and provide their ideas on what would be a better implementation for the community.

In addressing the question of whether our identified challenge is meaningful to the community, we put forward this data point. During our community engagement events, we surveyed all individuals in attendance and found that 82% of respondents had either suffered from Diabetes themselves or had a family member who did.

Ambitious, achievable and meaningful for the community and its residents

When we look at our Smart Cities Challenge Solution, we believe our challenge statement defines ambition. Despite advancements in medical treatments and technology, diabetes remains a prevalent chronic disease that afflicts a huge number of Canadians and more specifically, Indigenous people. We recognize that reversing the prevalence of diabetes in Akwesasne requires a strong desire, determination, and hard work. This will mean, first, work to be done by the community and the vendor partners in determining what tools will come into existence, followed by commitment by our community members in engaging in the new systems and supporting these new approaches to health, fitness, and traditional mindsets. It is an ambitious undertaking to address a problem affecting so many individuals in the community, across Canada and around the world. We are excited and driven by the opportunity to create a healthier Akwesasne, as well as creating an approach that is intended to be extensible and actually extended to a much wider population.

Although our challenge is ambitious and potentially far-reaching, we have taken a very practical, grassroots approach to solving it. In looking at the many software project debacles over the past years, we observe the common problem that these systems were designed by experts for the many — but failed for the individual users — and so failed for the many, too. We started with individuals as we believe if our approach can be confirmed to work for one it has a much greater chance of working for the many.

The community is telling us our solution, the one they have helped us to develop is

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

achievable. While there are more science-fiction oriented tech in existence, our choices, though less appealing, are based on proven technologies with the basic goal of providing our people with better access to the essentials of life.

- Smart Greenhouses Agriculture solutions account for 6% of all IoT projects, giving us confidence in a successful implementation with capable partners in order to cut operating costs and make the most of the available arable land in Akwesasne.
- The use of electric vehicles (EV) continues to grow with nearly 50,000 plug-in vehicles in Canada and the growth of 68% in 2017. Our Smart Cities Challenge will implement this proven technology as an economic and environmentally sustainable approach, which also meets the practical challenges of transportation for people, and the delivery of quality food and services.
- Design Thinking is reshaping service delivery and product design in industries from tech to banking and everything in between. Business consultancies are buying up Design Thinking shops as they have recognized the importance of Design Thinking to organizational strategy and success. We have chosen to use this approach to identify opportunities and problems and to produce solutions always in touch with our citizen users.
- In partnering with zu we are tapping both their expertise in Design Thinking, but also in their high success rate of creating digital products that centralize an array of components and capabilities. We will create an integrated technological solution that combines mobile applications with an administrative back-end while integrating third-party services and information feeds from other systems associated with services, greenhouse inventories, event scheduling and so forth. Our solution requires us to bring services, educational components, scheduling, information collection, and other capabilities together through a hyper-localized web-application to achieve success through a holistic system of seamlessly flowing parts. The Akwesasne Community Application will be used as an education tool, management software, expediter of services, and a collector of information.

Well-suited to a smart cities approach

Being a Smart City can mean many things. It can look very different depending on where you are and what is your pre-eminent challenge or opportunity. But the objective is always the same – using technology to create a sustainable future and improve the quality of life for people. As we come closer the end of our finalist phase, we are confident our solution takes on both this Smart City approach to technology, but also its approach to openness, integration, transferability, and collaboration.

Openness derives from our commitment to

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

building this project with the community, and not for the community. Unlike many technology projects, we are not using a team of experts working in secret to produce something without their input, which our citizens will then be trained to use. Openness is embodied in what this is for and how it will work. Openness is also driving our planned collection and sharing of data and results, which are used to motivate improvement at an individual and group level, so progress can be celebrated as we move towards improved health. And openness also requires transparently communicating data collecting, use and disclosure with our users, always respecting privacy best practices.

Integration is embodied in the development of tools that fit into the lifestyles and activities of community members, rather than requiring our folks change to fit the system. Integration is represented in the interaction and interdependence of the capabilities we plan to develop in the Akwesasne Community Application. Each capacity — education, transportation, access to services and better food — enables or relies on the next, supporting our recognition of the interplay of curasitive and curative elements associated with our challenge. This dependence of factors is supported by our traditions, where mind, body, and spirit are supportive of a combined single strength. Our traditional teachings tell us there is a wholistic state of balance where maximum strength is attained. Our people can receive guidance on a process to return to a state of 'health' using our traditional teachings and ceremonies. In this case, technology will help us organize and integrate an additional combination of knowledge, tools, accessibility, transportation, measurement, feedback, health services and nutrition. All facets will be integrated in a virtuous circle to achieve more than the sum of the parts.

From the beginning, the approach has been about engaging our community, being open to ideas and feedback, and relying on even the most basic direction of identifying: What do we want this to be about? We believe that a human-centered design and co-design approach consistently produces a collaborative solution for the people and by the people. When one looks at our Smart Cities Challenge integration is a pivotal piece of it, we bring together Healthcare, Education, Public Transportation, Community Initiatives including recreation Integration is a large piece of our project, bringing together many essential services from nutrition, healthcare, education, executive council, public transportation services, data management, traditional practices, and more into one silo and system to provide seamless and high quality service to the community of Akwesasne. This is what integration means to our Smart Cities Proposal, it means bringing people, business and essential community services together to make them more accessible and affordable through collaboration.

Our strategy to solve the challenge that addresses root causes; it targets opportunities for improvement that also exist for many Indigenous communities the world over. As success is realized our

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

approach should be shared. Our system ideas and components can be reused, whether as open-source software or as open-source ideas, all non-proprietary. The technologies will be able to be redeployed in other jurisdictions, incorporating modifications for changes in detail relating to specific communities, health measures, locations, educational elements, transportation challenges, targeted medical conditions and so forth.

National survey data has consistently shown that the national age-adjusted prevalence of diabetes is 3 to 5 times higher in First Nations than in the general population. Diabetes within Indigenous communities The higher rate of adverse health outcomes in Aboriginal peoples is associated with a number of factors, including lifestyle (diet and physical activity), genetic susceptibility, and historic political and psychosocial factors, stemming from a history of colonization that severely undermined Aboriginal values, culture, and spiritual practices. Barriers to care that are unique to Aboriginal settings also exacerbate the problem with fragmented healthcare, poor chronic disease management, high healthcare staff turnover, and limited or non-existent surveillance. In addition, social determinants of health, including low income, lack of education, high unemployment, poor living conditions, lack of social support, negative stereotyping and stigmatization, and poor access to health services compound the problem. This is common across Indigenous communities, and we believe the barrier facing the community of Akwesasne is common across all Indigenous communities big and small throughout Canada. We believe our Smart Cities approach, built with open source tools, solving problems people across Canada are facing makes transferability opportunities endless.

The Mohawk Council of Akwesasne and our digital consultancy zu have come together to build something greater than the sum of its parts. We at MCA bring a wealth of knowledge to the table about the barriers our people face, but also about the capabilities we have, and the strength of our teachings rooted in our culture. zu brings an ability to plan and deploy digital strategy, to build digital tools, and a proven knack for driving digital transformation at municipal, provincial, and federal levels. In combination, we bring an incredible amount of insight and opportunity identification to the Akwesasne Smart Cities Challenge. Our partnership to date has resulted in highly satisfying progress. Because this will be an ongoing battle against the challenge of diabetes and for the pillars of health, and given that technology is a rapidly adapting toolset, we expect this collaboration will span more than the timeline of this Challenge. Together, and with other partners, Akwesasne will foster a sustainable future for our people. And if we are successful, we will seek to share our learnings to improve the quality of life of other aboriginal communities, and others, across Canada and beyond.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Performance Measurement

Using the tools and approaches developed by our solution will enable us to coordinate and collaborate on the necessary changes we need to reverse this plague of diabetes. We bring our sense of community and friendly competition to the table to challenge one another to be our best. The Smart Cities technology we have prototyped will tie in actual results on the behaviours we seek to modify, showing us where to go to next, and transparently reveal whether we are elevating ourselves into a new era of health, or further deteriorating. Our traditional ways will give this new technological approach the heart that it needs in order for it to be relevant to us. The outcome is admittedly ambitious, but it is achievable and so important to achieve.

The outcomes of the success of the implementation of our Smart Cities proposal are measurable first in the principle goal figure of reducing new cases of diabetes, and secondly, in the lifestyle measures that reduce the risk of diabetes. All measures are available to be measured by our application through unlinked aggregation. These specific measures include.

- The capacity of public transportation
- An individual's distance to programs and services
- Citizen awareness of available programs and services
- Number of people attending public programs and services or using videos within the app.
- Number of people completing in-app challenges or Competitions
- CANRisk surveys completed in-person, and through the Akwesasne Community Application.

Avoidance of diabetes going forward would indicate a major overall improvement in health and well-being for this community, and provide a way forward for other communities that adopt the protocol we will model.

In combining the new digital tools and medical knowledge the modern world provides with our traditional approaches that protected our health and environment in the past, our community will build a modern foundation of health to move forward, as with health, all things are possible.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project timelines, deliverables, and milestones that are ambitious yet attainable

Our project timeline spans a total of 24 months with notable milestones throughout that frame. Implementation of the application, dashboard, greenhouses and electric transportation system will all fall under this 2-year approach. Broken into a 4 phases, like many software projects, the creation of our application and dashboard will entail the strategy and validation of our findings to date as well as design and development. Working in tandem, the implementation phase of the Greenhouses and Transportation System will be completed with the same time constraints due to feature reliance on application qualities.

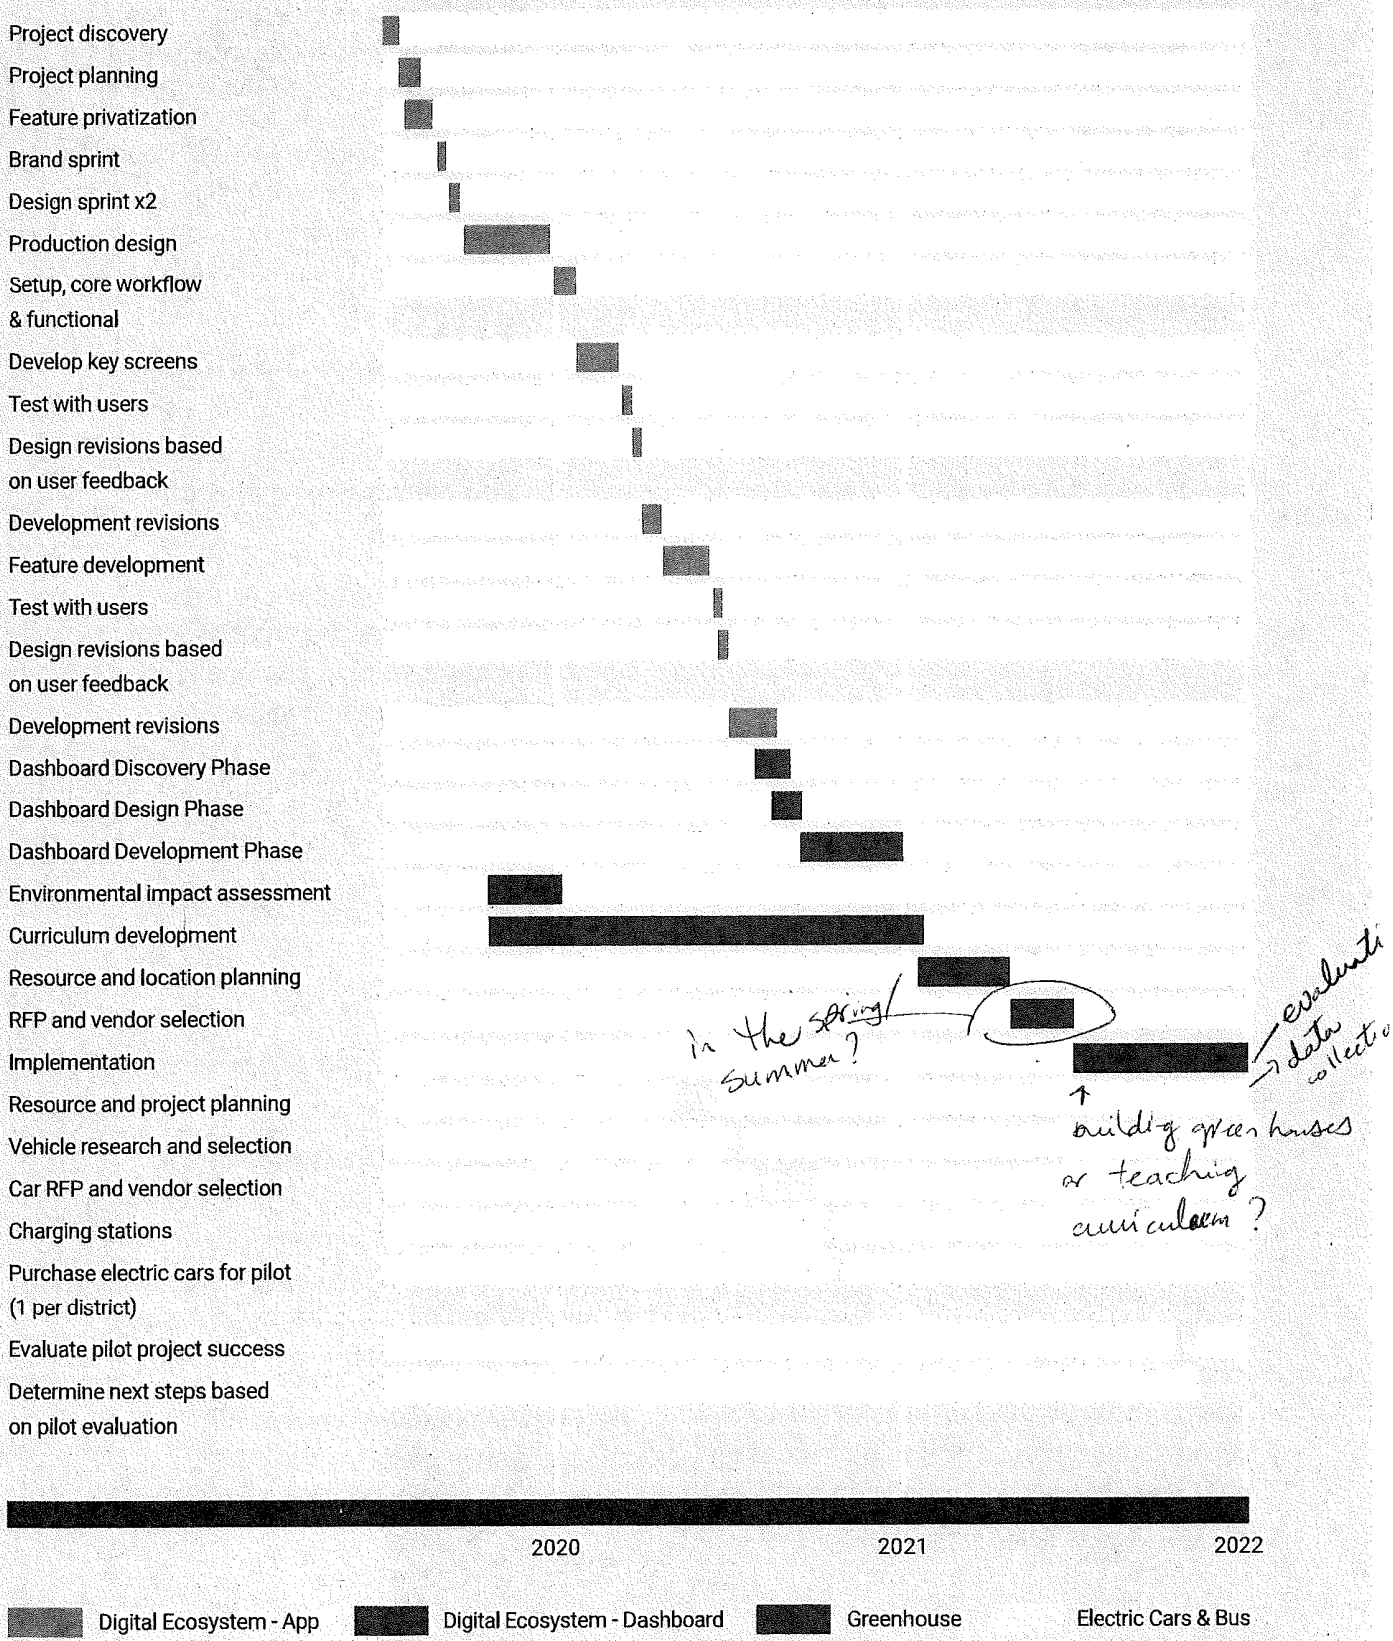
• SEE TIMELINE ON PAGE 20

• SEE MILESTONES ON PAGES 22 – 24

Our planned health and wellness initiatives contained in our solution are intended to reduce the prevalence of new cases of diabetes. Measurement is critical to monitoring the impact of these initiatives on stemming new cases of diabetes. In a workshop format organized by our consultants at zu, our Directors of the Mohawk Council of Akwesasne identified key performance indicators believed to capture the essence of our planned approaches. Working collaboratively, we developed 3 core metrics to measure the effectiveness of our initiatives health and with each metric, we ask 5 critical questions. Our 3 core metric categories are Access, Participation, and Screenings. Our 5 critical questions regarding each KPI are: Why does it matter? What affects it? What can we control? What are the measurables? What are the targets?

Key Performance Indicator #1: Accessibility

The Access KPI is defined as a measure of accessibility by community members to public health and wellness programs. For example, individuals seeking opportunities for active living, seeking health care, or at-risk individuals meeting medical program requirements. Measurable factors include the capacity of public transportation, an individual's distance to programs and services, and citizen awareness of available programs and services.



Why does Access matter? Transportation, location and awareness of opportunities all impact the community's and at-risk individuals' ability to live active lifestyles, obtain healthy food options and take advantage of any services not in their home location.

What affects Access? Home location, income, access to public transportation, access to an automobile, distance to the desired service, location of healthy food options.

What can we control about Access? Transportation options, scheduling, and coordination of transportation options, the

location of activities, location of healthy food options, delivery options.

Access Measurables - Program and services enrollment numbers, program and services communication engagement (social media engagement, application analytics, communication reach). Public transit capacity and utilization (seats available, usage). Greenhouse Food Box delivered/picked up.

Access Targets - Increase in program and services enrollment, increase in public awareness of Akwesasne programs and services, increase public transportation capacity, increase in public transportation usage, increase in the number of locations for healthy food options, increase in healthy food options used.

Key Performance Indicator #2: Participation

The Participation KPI is defined as the number of community members and at-risk individuals making use of public programs, services and completing app challenges. This includes the number of people attending public programs and services and the number of people completing in-app challenges.

[redacted]

Why does Participation matter? Participation levels indicate the uptake of these programs, services, and app challenge uptake, and are a precursor to them having positive effects. Tracking will inform future programming by indicating that oversubscribed programs should be scaled, and less popular ones should be re-examined. Initial participation levels for community activity will establish a baseline, so that modifications can be shown to improve or reduce participation levels. [redacted]

What affects Participation levels? Location of opportunity, distance, accessibility, weather, quality of offering, ties to Akwesasne heritage, the motivation of the individual, awareness of opportunity.

What can we control about Participation levels? Access to transportation, the location of opportunity, cost, awareness, motivation, quality, association with Akwesasne heritage.

Participation Measurables - Number of attendees for programs and services, number of completed in-app challenges, feedback on the experience. [redacted]

Participation Targets - Increase participation number for programs, services and app challenges. Increase participation numbers in targeted age groups: youth, family, and senior.

Key Performance Indicator #3: Screenings

The Screenings KPI is defined as the number of CANRisk surveys completed by undiagnosed community members. This includes both CANRisk surveys completed in-person, and through the Akwesasne Community Application.

Why does Screening matter? Early intervention in diabetes risk factors can prevent long-term illness; broader

community CANRisk screening results establish a baseline from which our challenge can measure its overall effectiveness; a CANRisk baseline allows comparison of community rates to national standards; a CANRisk baseline provides a clear picture of those at-risk in Akwesasne.

What affects Screening participation rates? Education about diabetes and health risks; awareness of what the survey results mean; public perception, access to survey.

What can we control about Screening participation rates? Increase the availability of survey; increase education and awareness of what individuals should do given the results of their survey; facilitating streaming of at-risk individuals to clinics for preparation of personal plans for diabetes prevention.

Screening Measurables - Number of CANRisk surveys completed; the number of individuals recommended to health professionals.

Screening Targets - Increase in the number of CANRisk survey completions; increase streaming of at-risk individuals to clinics for personal prevention plans.

Project Management

HUMAN RESOURCES

The Smart Cities project will provide many benefits towards new skill development, as well as full and part time labour opportunities. Part of the value of these employment opportunities will be knowing that the work directly benefits our community and has the higher purpose of improving health outcomes and quality of life at Akwesasne. There are many specific roles to fill, which we are confident we can recruit — or train and recruit — from our own community.

- For overall project oversight, A Project Manager position and an Assistant Project Manager will be secured to oversee the components of the Akwesasne Smart Cities project.
- To prepare the team for the Smart Greenhouse System, Economic Development will organize and familiate an agritech course so that the community will have a trained workforce from which to choose the actual employee team for the greenhouse implementations.
- Electric Public Transportation System drivers for the three small electrical vehicle programs — the Smart Taxi Service, the Smart Health & Social Programs Delivery, and Food Delivery Services (all for people), as well as drivers for them — will be secured through a job opportunities program drawing from our local employment resources. This will provide our programs with a pool of applicants from which we can select the best team members.
- To facilitate our community member end-users' use of the new technology, we will recruit Akwesasne high school students who will be put to work through a Best Matches program within our community centers in order to offer assistance to the elderly and other technology challenged community members. Here the young will mentor those who would like to learn how to better utilize their smartphones so as to make full use of the Akwesasne Community Application System, and all its various capabilities.
- In addition, our Mohawk Council of Akwesasne Information Services technical team will be trained by our technology partners (zu) to support the technical requirements of the Community Application System Administrative functionality, which is to be housed within our territory. This is

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

the back-end to the mobile Akwesasne Community Application System and is responsible for organizing and supplying the mobile app with much of the information it presents. The training will ensure the Akwesasne Information Services technical team can maintain and administer the system, publish to it, update the app with information, news, educational elements, food inventories, maintain interactions with third party payment systems, make use of the information it aggregates, and so forth.

- **Electric Public Transportation System under-use may impact its viability**

  As the planned Electric Public Transportation System — consisting of the Smart Taxi Service, the Smart Health & Social Programs Delivery, the Smart Delivery Service and Electric Bus Services — is planned to collect minimal fees, there is a risk to the financial viability if there is underutilization of the capacity. This could creates an unsupportable cost burden. While there is a possibility that the smart taxi service may not be utilized, this risk seems rather small given the enthusiastic reactions noted at the community engagements. All have been strongly supported with "Can't wait!" attitudes toward a local taxi service at affordable rates.

  - Mitigating the case of low ridership for the electric vehicles, a fall back deployment is that the bus will still be utilized for the planned weekly runs our college students make to the Iohahiio facility.

    - Mitigating the case the case that the smart taxi and delivery services are not utilized, these vehicles will be re-allocated for use with the health and social programs.

- **Greenhouses in particular locations are underutilized**

  The activities associated with management of the greenhouses in the Smart Greenhouse System will be incorporated into the Akwesasne student curriculum. A greenhouse will be located at the Akwesasne Mohawk School with the purpose of learning and food production. If this greenhouse is not used to minimum required levels the AMS School's greenhouse there is a risk to the viability of the greenhouse system.

  - Mitigating the case of underutilization of the AMS school greenhouse container, that unit will be moved to closer to the Environments Offices and utilized within the agriculture sector for food production. Alternately, it can be relocated to the Iohahiio Education facility and be utilized for future adult courses on Innovative Growing Techniques.

  - This risk is highly un-anticipated as all greenhouses will be worked into the curriculum of the school.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Procurement, including alignment with technology and partnership requirements

MOHAWK COUNCIL OF AKWESASNE PROCUREMENT STRATEGY

Our procurement strategy prescribes that when making purchases our council reaches out to at least three vendors through an RFP Process. For this purpose a purchase team is formed generally involving a finance department representative, a project manager and a manager representing the department impacted by the proposed purchase. This team then oversees the RFP process and reviews the incoming responses.

The Purchase of the Electric Bus for the Electric Public Transportation System will be administered through the Mohawk Council's Department of Community and Social Services along with the Board of Education's Transportation Supervisor. This person is key to the team as all further bus maintenance and bus scheduling decisions will be the responsibility of the transportation supervisor's position.

The intention of the Smart Taxi Service, the Smart Health & Social Programs Delivery, and the Smart Delivery Service is to create increased access of our social clients to have the means to obtain healthier foods, as well as to transport community members to medical appointments. ("Social clients" are individuals getting assistance from Community and Social Services.) These vehicle purchases and services, as well as the Smart Taxi Service Pilot Project will be organized through a team consisting of the Smart Akwesasne Team and the Social and Health Departments.

The Smart Greenhouses system purchases will be reviewed by a team comprised of the Akwesasne Mohawk Board of Education, and representatives from the Department of Tehotienawakon Economic Development program.

And, the most important precursors to desired change may not be what we are originally focusing on so our analysis of impact and influence should be somewhat adaptable.

Stakeholders, including analysis of impact and influence

ANALYZING IMPACT OF PROGRAMS

For each of our Smart Cities project initiative categories, we will put in place oversight teams best representing stakeholders of the area we wish to affect. These stakeholder teams will assist in the identification of success and performance factors, as well as contribute to the ongoing adaptation of measurements to best represent goals and progress attainment. Too many measurements, for instance, will likely be distracting from the most important factors. And, the most important precursors to desired change may not be what we are originally focusing on so our analysis of impact and influence should be somewhat adaptable.

For each of our Smart Cities project initiative categories, we will put in place

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

oversight teams best representing stakeholders of the area we wish to affect. These stakeholder teams will assist in the identification of success and performance factors, as well as contribute to the ongoing adaptation of measurements to best represent goals and progress attainment. Too many measurements, for instance, will likely be distracting from the most important factors. And, the most important precursors to desired change may not be what we are originally focusing on so our analysis of impact and influence should be somewhat adaptable.

AKWESASNE COMMUNITY APPLICATION SYSTEM

A key stakeholder — especially in relation to the central challenge regarding the prevalence of new cases of diabetes — is the Mohawk Council of Akwesasne Health Department. This department will be instrumental in delineating the types of data most important to measure to both be effective in affecting the health precursors associated with our Smart cities Challenge, but also for tweaking our approaches to increase the program's effectiveness over the longer run. Targets of change may shift focus with the maturity of our program. For instance, initial goals may be about engagement and usage rates, which later give way to focus on improving service delivery and costs, which give way to focus on renewal and expansion of educational components, cultural curriculums and even recipes. So measurement must be flexible to take into account learnings and overall maturation of the program.

A stakeholder in all data collection, especially that flowing though the Community Application and Community Application Administrative system, is the Akwesasne Information Services technical team. This team is key to the always necessary step of information aggregation, organization and preparation for analysis by the more specific department stakeholder. The Technical Team will be included for both their technical support and technical knowledge. They will help clarify other team members understanding of the information, and so positively influence decision outcomes.

The Mohawk Council of Akwesasne Health Department will be primary users of the statistics and interpretation of data directly affecting health measurements and behaviours affecting health outcomes. For instance, screening numbers, service engagement and usage numbers, activity levels, food distribution measures, attendance to health services, missed appointments and so forth.

The Mohawk Council of Akwesasne Social Services Department will be keenly interested in the performance of the Electric Public Transportation System. These statistics are key to success factors in their area of responsibility. Central is the measure of (ideally) increasing transportation usage, which when higher is strongly suspected to better the quality of the lives of the social clients.

Our Smart Akwesasne Team and the Mohawk Council of Akwesasne Health Department will be eager for statistics the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

system produces regarding healthy food delivery, number of users obtaining rides to grocery stores and medical destinations, and increases in trip numbers for personal health care evaluations or screenings. Devising methods to capture behaviours of their individual clients in accessing and making use of transportation to increase wellness is tricky. Defining the base case is also challenging as the base case for the new situation does not currently exist. Therefore, much of the initial information will be used to establish a base case from which these departments will try to build performance.

The Akwesasne Mohawk Board of Education, Department of Tehotienawakon, including the Economic Development and Environment Program will all be paying close attention to the performance of the Smart Greenhouse system. This has an educational component and associated measures of success, as students are both involved in staffing a greenhouse, but also in engaging in learning their operation, and so graduating from the course. Economic Development is seeking to create economic value from the Smart Greenhouses, in the way of jobs, job skill development, food production and food cost savings. Economic Development will also be following the measures around the development of job skills and expansion of roles in technical areas to do with the Akwesasne Community Application and Administrative Web System, as there are many associated skills to do with populating the system with information, writing, video production for traditional cultural teaching dissemination, mentoring new users of mobile tech, system programming and maintenance, social tool use and many additional skills associated with maintaining the vitality Internet based systems. Economic Development may also monitor the economic impacts of new services from both a cost and revenue outlook, as well as on the value of keeping money associated with transportation in the community, rather than that money flowing to external transportation options. The Environment Division will be able to calculate the savings in CO2 production enabled by the switch of thousands of travel miles to electric from gas powered vehicles.

Communications strategies for community involvement, training, and feedback

Following the Design Thinking processes that have gotten us this far, we are eager to continue regular community engagements through quick surveys to gain feedback and ideas, so that we can continue to improve the system. With the core of the system based on the Akwesasne Community Application, which is a mobile hub in each community member's pocket, we have an immediate tool through which we can share information, news, questions, and new capabilities.

This is highly advantageous to the rapid evolution of our services. We can both listen directly to feedback and observe behaviour. Through questionnaires, polls,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

message boards and so forth, and we can observe behaviour, measure usage stats and so gain objective data. This may be an important balance as requests for feedback are likely to be weighted towards the opinions of more active or prolific online personalities in the community, with the new users less comfortable with writing essays on their new smartphone.

Additionally, because the Akwesasne Community Application is Internet-based, additional functionality to do with surveying, for example, is only a click away. There is no value to creating our own functionality in most cases, such as for polling — that is already available for free or very low cost online. We will simply use our in app capabilities to post updates that link to surveys, or to video resources, third party educational elements and so forth.

We expect that to best increase engagement with the new Smart City tools of our diverse end users, especially with social clients, that this may best be undertaken in a combination session of in-person instruction with also the online system in hand. Education sessions and review sessions are likely to occur in this way for clients involved in the services of specific departments, to learn how this department's services are now offered via the app. For example, our social clients can be introduced to Smart Taxi, Electric Bus pickup request, and so forth —when they are meeting with case managers. Groups feeling a need for the extra nudge of in-person training can also attend organized evening community engagement sessions, where everyone brings their phone and learns about a newly released function.

Monitoring, controlling and reporting strategies and checkpoints for contingencies and course corrections, if necessary

Following the Design Thinking approach, we will use the app to gather reviews on components, experiences with the services, ideas for improvement, and suggestions on how to make things more efficient. While Design Thinking helps with direction, zu uses the Agile Method for digital product delivery. The idea with Agile is that via frequent meetings with the client, (the Akwesasne Smart Team) progress on the functionality is reviewed and tweaked very regularly, as the application moves from minimum viable product to fully featured one. This emphasizes actual experience with the tool over documentation, and is proven as the best way to deliver software products. The whole approach is about course correction, about feedback from users.

This also provides a built in approach to managing scope while optimizing end result. We've used Design Thinking to collaborate with our community to get a very strong idea of what we need; BUT, until it is in the user's hands, and they are standing and waiting for pick-up from an Electric Bus, we can expect unforeseen problems to crop up, or cool new ideas for enhancement to emerge. It may be that, at this early stage of testing, that a scheduling

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

idea for the Electric Bus is decided to be more important than some already planned feature of the Smart Greenhouse ordering, and since the greenhouse will not reach full production for another year that programming resources will be used by diverting them to the bus scheduling enhancement. So the scope is rebalanced in collaborative agreement between us and zu. Our Project Manager and their Product Owner notes this change of resource use and we move promptly on with development, without the overhead of massive documentation and change orders. When you are inventing new things this is the way to be. (If we are ordering a new community centre and it already has a complete blueprint, then the more formal change order approach is necessary.)

In regards to the purchasing of electric vehicles and greenhouses, a more detailed process of estimates, associated charges and fees, delivery and set-up, even total cost of ownership will be adhered to. Traditional cost controls are more appropriate to capital purchases. Purchasing bespoke software must also fit timelines and deliver certain features, it's just that what's in the final product will be impacted by ideas, epiphanies, and feedback and should be encouraged. Like a cook tasting their cooking along the way.

That being said, zu is well practiced in building digital products and services, including monitoring burn rates and being totally transparent with their clients as their software development project progresses. With their total team recording to time sheets, tracking progress in Jira, tracking our requests in Zendesk, all bolstered by regular weekly meetings with our Project Manager, and not even including the ongoing email, messaging and phone calls between our PM and their PO, there is little room for things to go off the rails without being immediately noticed. More formal reports are generated with every meeting and supplied to Smart Coordinator for review and action when required.

Weekly reviews of zu's Replicon time tracking system, where tasks are assigned a budget aligned to the statement of work, provides our Product Owner with real-time visibility on project health, task churn and slow down caused by blockers or delays. This information is then documented in the weekly Project Status Report provided from zu to MCA and any necessary steps to remove blockers or flag risks are discussed in weekly production meetings with the us.

There is a sweet spot between rigid timelines and development targets, and the serendipity of discovering new methods or better functionality changed by user testing along the way. zu explains they are well practiced at respecting the organizational necessity of steady progress towards agreed upon projects with the idea that we are in fact inventing the future, and the path towards invention may have a few unexpected twists and turns. Through our Production Road Map, several stage gates are implemented as a monitoring and course corrections strategy. Stage Gates are a project management technique in which an initiative or project is divided into distinct stages or phases, separated by decision points. At each of these phases,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

we will revisit scope, timeline, and budget, making any appropriate adaptations where necessary.

Approach to sustaining projects beyond the lifecycle of the challenge, if appropriate

Our vendor partners will be resources to assist us in our plans to gain a maximum lifespan from our Smart Cities Project. While we intend to be self-sufficient in the longer-term continuation of the Smart Cities systems, we also recognize that there is a need to renew and adapt the system with more modern versions of itself. At the very least there will be ongoing maintenance and enhancement of systems, with which the original vendors are expert, and can assist us in becoming expert, as well. This necessity to keep working to improve the system is to both preserve the functionality of things as they will be at the end of the first phase, but also to adapt to new technologies of our modern environment, and to take advantage of the emerging technologies, as we are doing at this point in time.

The Akwesasne Community Application (Mobile and Administrative) will be supported and maintained by the Mohawk Council of Akwesasne Information Services Program. zu may be called upon for more ambitious functional additions from time to time, though this is not currently part of the scope of the plan.

Smart Greenhouses will be sustained in conjunction with the Akwesasne Mohawk Board of Education (AMBE) and the Department of Tehotienawakon Environment Program, for the Akwesasne Mohawk School (AMS) and Tsisnaihne schools. The AMBE, Tehotienawakon Economic Development Programs will jointly utilize and maintain the St. Regis Smart Greenhouse location as it will be used for the school and as a special needs work experience location. We anticipate that this location has the potential to provide economic contribution to sustain the special needs program.

The Electric Bus will be fully sustainable through the budget of the Social Services Department. The Electric Bus expenditure simply represents a redeployment of a portion of and existing budget already dedicated to assisting their clients with transportation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Technology

DETAILS ABOUT THE TECHNOLOGIES INCLUDING RELEVANT APPLICATIONS ELSEWHERE AND RESULTS OF TESTING AND/OR PILOTING IN THE FINALIST PHASE.

In looking at the iPhone as a breakthrough event, it wasn't so much about inventing any of the capabilities it provided as it was wrapping them into one package. Similarly, our Smart Cities Challenge project is about combining the capabilities we know will address our Challenge into an integrated mobile system.

Our Digital Ecosystem encompasses both the Akwesasne Community Application, as well as the infrastructure elements of our plan. Included are native mobile application and web application development, multiple greenhouse implementations, and Akwesasne's first ever public transportation system. Greenhouses and a Smart Taxi service may not be viewed as groundbreaking or emerging technology, but to the Akwesasne community, they most definitely are. Our solution reflects the true needs of the community and will create improved health outcomes, new ways to address our challenges, and opportunities to develop expertise with new technology all through coordinated improvements in infrastructure, information, and accessibility. Akwesasne services will be enhanced with the support and integration of our mobile and web applications, both in what community members receive and in the ability of our public service workers to deliver them. Below we break down the details of the technologies involved, including examining relevant applications used in other jurisdictions, a look at case studies our partner zu has successfully completed and some of the results of testing carried out in this finalist phase.

Mobile application development is the set of processes and procedures involved in writing software for small, wireless computing devices such as smartphones or tablets. Each day thousands of mobile apps are published to the Google Play and Apple App Stores. Some of these mobile apps are games, others are social networks, and many are e-commerce apps. All of these apps, if professionally built, follow a similar mobile app development process.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Dating back to the early adoption of responsive web design in 2011/2012, our partners, źu, have accumulated extensive experience developing responsive mobile websites and native applications, including the use of front-end frameworks such as Bootstrap and Foundation, as well as custom implementations using CSS3, CSS Grid, and Flexbox. zu's team has developed native iOS applications targeting phones and tablets going back to 2009/10 and iOS version 4. This includes both line-of-business applications based on standard UIKit components, along with richer experiences involving animation and physics frameworks such as Box2D and SpriteKit. They have continued to build responsive and native mobile projects since the availability of these devices and their tech stack continues to evolve.

zu develops widely-used native Android applications targeting phones and tablets for high profile clients, with projects dating back to version 4.0 in 2012. They develop for the core Android framework as well as with Google's trusted third party community partner libraries such as RetroFit, OkHttp, and Glide. zu's team has mature knowledge surrounding automated testing strategies for Android including both unit testing and instrumented testing user workflow. This past winter, a zu designer was selected as one of only 20 people worldwide to participate in a prestigious Android design workshop hosted by the Android Development team at the Google offices in San Francisco.

zu employs various modes of automated software testing. zu says: "We frequently unit test our application code with language-specific test frameworks, as well as develop functional tests using tools such as Selenium, WebDriver, Nightwatch.js, and others. We load test our applications using open source tools such as Apache Bench, Siege, and various cloud-based tools."

zu as Digital Partners

zu is an ideal partner for Akwesasne's Smart Cities solution because they offer skills in determining right direction, they have capabilities to build digital products that are required for the vision and they will provide long-term stewardship for the digital systems they have built. They also provide Design Thinking expertise which zu uses to design non-digital process and components, which is a proven method for creating things that will be well received by end users, as they are so much a part of the process of their development.

Here is a sample of the types of major projects and transformational work zu has accomplished in the past 24 years of their existence.

MOBILE AND MOBILE/DESKTOP PLATFORMS

From the development of the TimmyMe iOS App for Tim Hortons' in 2008 on the iPhone, which made sense with the advent of geo-location services, through the years of Blackberry development and its fall from favour. Now into Android development, as well as mobile responsive (or simply 'responsive') design, zu moves into the latest technology. But they always program

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

for the purpose, not just to use a new technology. Currently, zu uses strong skills in iOS, Android and responsive web design to produce and maintain products for a variety of clients. Some projects of note include:

MYSASK 411 PLATFORM

Rebuilding Mysask411 Mobile and Desktop systems from the core (Term: 2013- Present)

Directwest built a 100-year legacy on connecting Saskatchewan buyers and sellers. The phonebook they produced served as the principal source for customers seeking and connecting with local businesses. As times changed, Directwest modernized its business offerings with a suite of digital products and services intended to keep pace with global technological innovation. Along with traditional industries around the world, however, Mysask411's user experience came up against disruptive digital headwinds and competition. The web and mobile versions of the Mysask411 platform struggled to perform on modern devices and needed to be rebuilt. Speed and performance were major issues. The web version and mobile applications had to address both mounting technical debt and a dated user experience.

The Mysask411 platform needed a renewed user experience, informed by users and built to last and adapt. zu was brought onto the project in August of 2013, and has since completed dozens of projects of large and smaller scale to improve the functionality and effectiveness of the suite of services the Mysask411 offers. In addition, zu uses Design Thinking with both DirectWest senior management teams and product teams to identify opportunities for service expansion, which are collected in project backlogs. These are then evaluated and developed on a priority ranking. zu is firmly part of the DirectWest team serving as a digital strategist, developer and long term optimizer of the suite of applications.

HELP ME TELL MY STORY / HELP ME TALK ABOUT MATH

Education Assessment System and iOS application (Term: March 31st 2016 - March 31st, 2019)

The Help Me Tell My Story education platform is another major achievement as an iOS and web system development that also incorporates Indigenous culture. The combination of technologies is similar to what will be deployed for Akwesasne. It has many levels of administrative access and collects data while optimizing the mobile user experience for the end users, who are children.

The Help Me Tell My Story assessment, which takes place by the children interacting with amusing gamified tasks, uses a holistic approach to measure oral language development for Prekindergarten and Kindergarten children. The Help Me Talk About Math application similarly uses a holistic approach to assessment to evaluate grade one students' understanding of seven mathematical processes: communication, making connections, mental mathematics and estimation, problem-solving, reasoning,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

and visualization. Both collect data from the children, their caregivers, their teachers, and Elders in their community and provide immediate access to results for educators and caregivers through easy-to-use web-based tools. The overall purpose of these assessment is to help create a real and measurable change in oral language development and real and measurable change in the mathematical process development of children across Saskatchewan.

Both these systems are extensible for other curriculums and are being extended to have French language versions. The systems have also been made available to other jurisdictions — as is intended with the Akwesasne Community Application — and the general public via the Apple App Store, though without the administrative functionality. zu continues to be a transformative digital partner for the Government of Saskatchewan, Ministry of Education.

Other Notable zu Applications

Here is a brief list of other projects requiring mobile application/web application combinations, as will be required for the Akwesasne project.

TIM HORTONS

TimmyMe iOS Application

When it was first launched, TimmyMe quickly became the top downloaded free iPhone app in Canada and Tim Hortons took notice. With over two million users, the app featured GPS to direct folks to the nearest Tim's drive-thru and included a notepad for taking orders from your co-workers.

SASKATCHEWAN ROUGHRIDERS

iOS Application

zu's created various digital solutions for Saskatchewan's favorite CFL team. In partnership with SaskTel, they took the Roughriders mobile with iPhone and Android apps that deliver schedules, standings, player profiles and stats, news, Twitter integration, videos, live radio streaming, shopping in the RiderStore and more. Rider Nation responded with over 100K downloads in the first year and over 3M sessions, leading to a 52% increase in orders and a 40% increase in customers.

MACKENZIE ART GALLERY

iOS Application

Mackenzie wanted to be a gallery for the 21st century, so zu was brought in to devise ways to use mobile technology as a catalyst for generating discussion, driving foot traffic, and connecting people to art like never before. Now their app is as much a part of the gallery experience as the physical gallery, helping people discover and engage with new exhibits and the permanent collection.

VITERRA MOBILE

Application Android and iOS

Buying and selling of crops require accurate information, and farmers may need that data while literally standing in the middle of a field. Going beyond providing up-to-date commodity prices offered at terminals, zu also created a

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

nitrogen calculator so that farmers could work out their fertilizer needs on the fly. Users can change criteria, toggle results and, ultimately, make informed decisions. Viterra, like the farmers, understood how technology helps people work efficiently and effectively. This responsive website and web app, drawing on Viterra back-end systems for data feeds, experienced 434% first-year growth, representing 25,000 total hrs spent in the app in 1st year with half of all users accessing the app daily, and one-third spending 1-3 mins per session. The zu team was delighted to help them engage with the global farming community.

Approach to future-proofing the technologies (i.e safeguards against vendor-generated proprietary constraints and obsolescence, a workforce that is able to implement and operate the technologies and systems going forward.

Ensuring high quality and extensive customizability, the Akwesasne Community Application will be built as a Native mobile-web application. Native apps are built for specific platforms (iPhone, Android) and are written in the languages the platform accepts (for example, Swift and Objective-C for iOS apps and Java or Kotlin for native Android apps). Native apps are fast and responsive, distributed in app stores, offer intuitive user input and output and don't require an internet connection. In addition, native code is non-proprietary, has an army of developers at our disposal, and is free to use.

Though this is not a frequent occurrence for zu, transition of projects to alternative service providers does happen, and zu is ready by design and choice of frameworks to not have proprietary blockers preventing other suppliers from being able to take over custodianship of the systems they've built. Recent examples of projects being transferred away from zu include the planned-from-the-start repatriation of the Drupal-based City of Saskatoon websystem; and the repatriation of the PotashCorp websystem — after nearly 20 years of internal zu management — to the new Nutrien management team. (In both these cases, the relationship continues with zu being invited to contribute to new initiatives). In all cases of project repatriation, a transition plan is developed in consultation with the client on how to best setup the environments necessary for maintaining system health long-term and to provide the client team with strategies to maintain and optimize the system.

System longevity

Achieving long-term value from any digital asset requires a commitment to supporting the software development lifecycle. The increasingly rapid pace at which mobile and web technology evolves, and best practices, online threats and user expectations change make it hard to keep up. zu's support and optimization model is designed to keep the Akwesasne team aware of issues affecting application health and security. They will also keep us on track regarding opportunities for iterative

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

enhancements and to take advantage of new trends or technologies, as they do with their other long-term clients.

ZU SUPPORT AND ENHANCEMENT SERVICES INCLUDE:

Support: Emphasizing continual testing and proactive analysis of known security threats and asset risks.

Optimization: Focusing on keeping pace with modern devices, browsers and operating systems impacting the performance of the platform for users.

Continual support and optimization go hand-in-hand to ensure our digital assets' long-term viability is maintained. zu's technical expertise and development processes make future adaptations such as API development, continued system integrations and reengineering cost-effective and made with ease. Services include:

- Monthly browser, OS and device testing
- Host environment performance measurement
- Optimization backlog development
- Major risk assessment and resolution
- Quarterly reporting
- Continued system integration
- API creation
- Design heuristics review
- Digital brand alignment

zu understands that the development of web-based tools and mobile applications can leave companies feeling handcuffed in their ability to operate systems going forward. Prior to completion of the Services, Akwesasne and zu will put in place an agreement zu for the maintenance and support of the Akwesasne Community Application; the agreement in Appendix A.

TECH EXPERIENCE OPPORTUNITIES FOR AKWESASNE MOHAWK FIRST NATION

Looking further into the future, this proposed digital eco-system will introduce the Akwesasne community to opportunities to take part in new technology in their community, both for those with existing expertise and those who hope to develop skills.

The Mohawk Council of Akwesasne works closely with the Ontario Emerging Jobs Institute (OEJI). OEJI is a unique offering that provides instruction from industry leaders and hands-on training for jobs of the future. Students train for the growing demand for skilled workers in areas identified as high need including topics such as web development, digital marketing, social media marketing, artificial intelligence, graphic design and search engine optimization. Currently, of the 160 students attending this program, 11 are from the Akwesasne First Nation.

The Mohawk Council of Akwesasne also currently has 15 personnel as a part of their Information Services team. This includes;

- 1 Manager
- 1 Program Support Officers
- 4 Network Analysts
- 4 Hardware Technicians
- 3 Software Analysts and 2 Help Desk Technicians

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The team supports provides a range of IT services to all departments and programs within MCA including the Akwesasne Mohawk Board of Education. Information Services oversees the maintenance, repair, upgrade, etc. of more than 800 computers and 25 individual networks and one wide area network. The Software Analyst team supports 75 different specialized software, some of which are built programmed in house. We feel we have the technical and human capacity that is able to implement and operate the proposed technologies and systems going forward. There will be opportunities for zu to train our team to the extent we find appropriate, knowing that zu could remain as principal stewards of the systems, or as helpers, or could be completely replaced by the Akwesasne team, at our option.

How the technologies comply with relevant legislative and regulatory requirements

LEGISLATIVE REQUIREMENTS

In Canada, mobile applications are regulated under the Personal Information Protection and Electronic Documents Act (PIPEDA). The Act, enacted in 2000, governs how private organizations collect, use and disclose personal information. MCA and zu commit to comply with all applicable laws regarding the protection of personal information including PIPEDA. Please reference our Preliminary Privacy Impact Analysis for in depth analysis.

FLEXIBLE DEVELOPMENT STANDARDS

Our Smart Cities Solution currently presents limited interoperability between technologies such as existing community systems, services, and infrastructure. However, our partner zu is well-versed creating necessary interactions (such as have been necessary in their past projects with many types of interactions) and uses due diligence in all expected and potential integrations. A few instances of interoperability have been identified and will be explored in the next phase for development. These include:

- Requesting, Tracking and Paying for MCA's Smart Taxi service within the application
- Ordering, Delivering and Paying for Greenhouse produce, and the 'Green Food Box' within the application
- Integration and interoperability with third-party fitness and health tracking applications
- Future interoperability with Telus health.

RIDE HAILING SERVICES & SMART GREENHOUSE INTEROPERABILITY

When developing our public transportation system and integrating it with the application, there are three pieces of interoperability requiring third party software and frameworks. First off, like other ride hailing services, (ie. Uber, Lyft, Instacart), our app requires access to the CoreLocation framework. This allows individuals to both request rides and share location addresses with a driver

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

through geolocation, and order groceries to their specific location. This framework provides classes and protocols to configure and schedule location delivery and send location events to the server. The CoreLocation framework also lets our application define geographic regions and monitor a device's movements as it crosses defined boundaries. Secondly, to display point-to-point directions on a map within the app, iOS developers use a Framework called MapKit. Registering the app as a routing app then makes directions available to the Maps app and all other mapping software on a user's device. Android routes and directions, however, are made possible by the Google Maps Android API. Thirdly, to use a cashless system that allows credit and debit transactions and so remove all risk of human-to-human cash transfers — we will interoperate with one of two leading companies in the mobile payment market, Braintree or Stripe. Both payment frameworks are used by current, emerging and established companies and follow both the Code of Conduct for the Credit and Debit Card Industry in Canada, as well as PIPEDA.

FITNESS AND HEALTH APPLICATION INTEROPERABILITY

With health and fitness applications extremely prevalent today, understanding the interoperability of default and leading health applications will maximize the advantages of integration with them. To ensure the Akwesasne data is stored and managed exclusively under MCA Information Services we investigated the leading brands in health and data tracking. We need to understand the complexities and privacy concerns of the applications we intend to use, such as Apple Health, Google Fit, and Samsung Health, as well as the wearables offered by Fitbit, Garmin, and Apple Watch. Google Fit was subsequently quickly dismissed due to the requirement that any app that reads Google Fit data must also store any collected health data with Google.

APPLE HEALTH

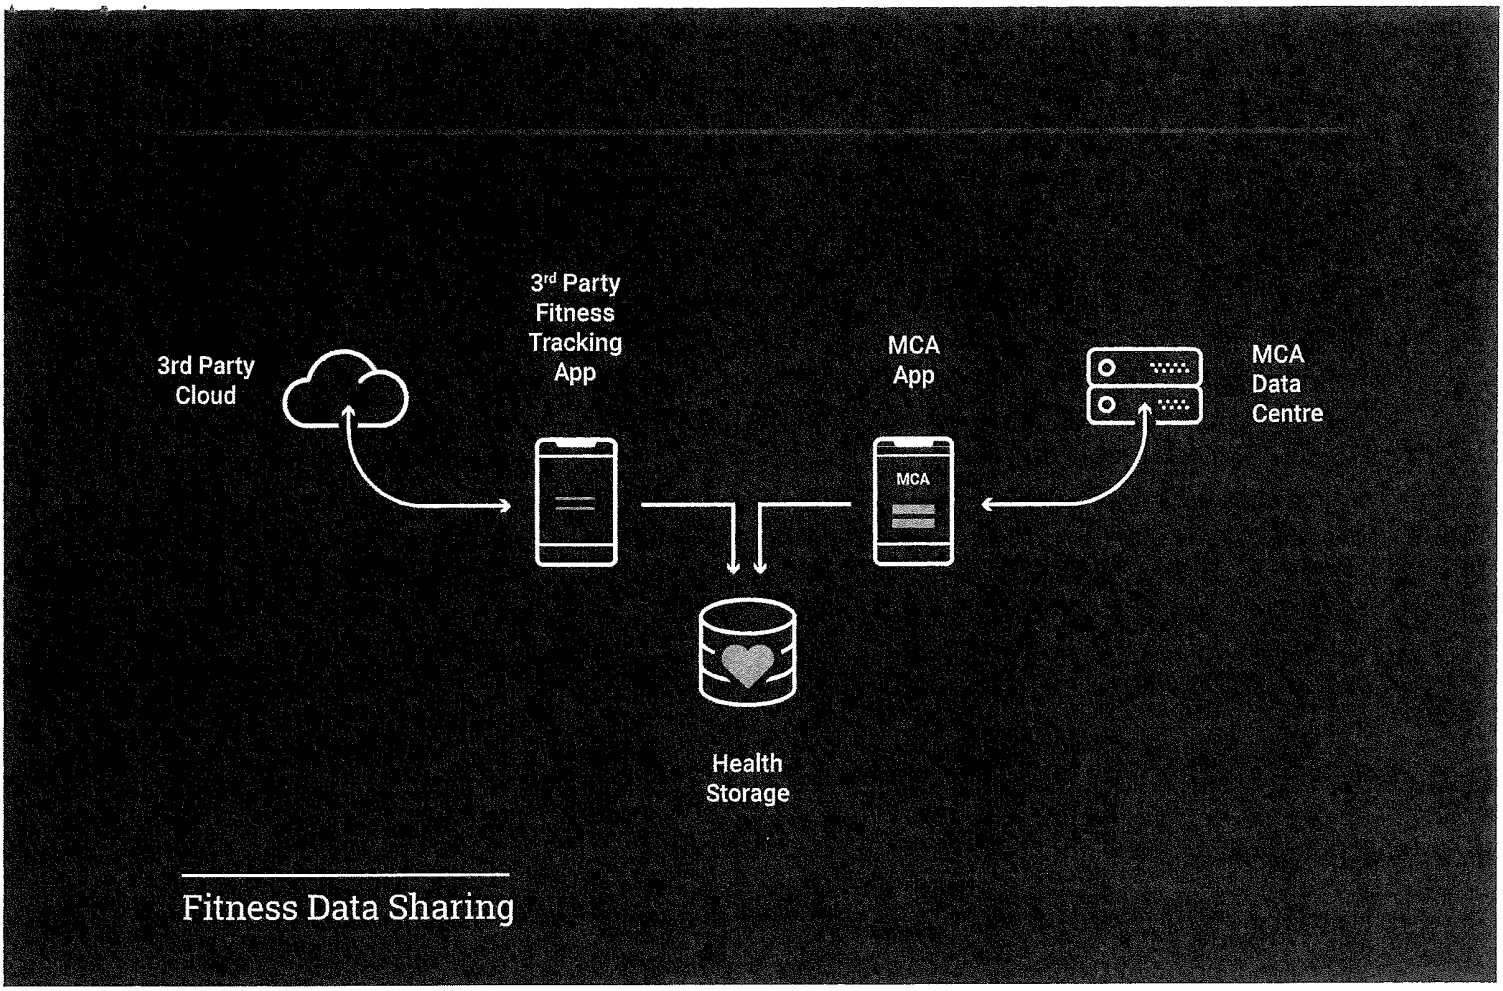
Apple Health provides operating system level storage for health/fitness data through a framework called HealthKit. Apple's intent is for 3rd party app developers to create apps that integrate with HealthKit to make "rich" fitness data available to both the Apple Health App and HealthKit. Any app can request permission to read/write a number of different types of health information based on a large list of "categories" provided by Apple. Once fitness information is stored in HealthKit, it's essentially available to any app that the user grants access to read from HealthKit. While the HealthKit framework appears somewhat complex, it's capable of surfacing any data recorded by the Health App, or any other "service" (tracker apps), both as granular data and aggregate statistic. This is all good news.

SAMSUNG HEALTH

Samsung smartphones come with the Samsung Health App (aka "S Health") pre-installed. The Samsung Health app is also freely available on the Google Play store for installation on non-Samsung devices. In many ways, Samsung Health is analogous

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

to Google Fit, but with two key distinctions. Any application that wishes to read/write/share data with Samsung Health must be approved as an official Samsung partner application. Unlike Google Fit, no Samsung account is required to use Samsung Health, though Samsung promotes the creation and use of an account to sync/backup data to Samsung's cloud service, and to make data available across multiple devices.



In conclusion, the health app ecosystem for Android is, unfortunately, more fragmented than iOS. There is no analog to HealthKit (operating system level storage) for Android, and it's up to individual apps to be responsible for the storage and sharing of health data.

WEARABLES

- Fitbit does not directly integrate with Apple, Samsung, or Google health apps, though fitbit does allow access to data through a web-based API.
- Garmin provides a Garmin connect app for both platforms and so can sync data to any of the health apps discussed above.
- Apple Watch does not provide health tracking on its own. Rather, it relies on "WatchOS" extensions provided by applications installed on accompanying phones that can read and store biometrics to Apple Health.

With this background in mind, we plan to make use of Samsung Health (Android) and HealthKit (iOS) systems. We can then migrate the data users are currently tracking on their devices while maintaining a familiar user experience for individuals comfortable with their current applications. Privacy concerns remain at the forefront of our build; as stated, MCA and zu commit to complying with all applicable laws regarding the protection of personal information such as that found in The Personal Information Protection and Electronic Documents Act. Privacy is also key to earning the trust of users, as their engagement and acceptance is also a key measurable for our initiative's success.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Fitness Data Sharing

TELUS HEALTH INTEROPERABILITY

The Mohawk Council of Akwesasne is in preliminary talks with Telus Health to implement their proprietary software throughout all Canadian jurisdictions. The opportunities and capabilities of this homegrown system is interesting but needs exploration. Further research and discovery will need to be completed during the strategy phase of implementation.

REPLICABILITY ACROSS CANADA

We suspect that the factors contributing to a higher prevalence of diabetes in the Akwesasne community hold true for all Indigenous communities across Canada.

If we succeed in having a real impact on health outcomes in Akwesasne through the areas of focus we have piloted, we will be open to having our approach and software replicated for use by other first nation communities. We are energized by the possibility of improving the health of other communities via our Smart Cities approach to targeting causative factors we suspect are consistent culprits. While the software may be directly applicable to other communities as it stands upon completion, some degree of customization will undoubtedly be necessary for its deployment, given the specifics of that second situation. Ideally, a consistent

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

core could be maintained so those future improvements could be rolled out amongst all future users.

ROLES AND RESPONSIBILITIES OF TECHNOLOGY PARTNERS

The role of zu in this project includes helping our team collaboratively identify the strategic direction, providing the design for products and services including the development/programming and support of the Akwesasne Community Application, and it's integrated systems. Within our governance structure, prior to selection of both the Greenhouse System & Electric Public Transportation System technology partners a public tender will be requested for both personnel and strategic implementation.

IDENTIFICATION OF RISKS (E.G PRIVACY ISSUES, CYBERSECURITY BREACHES) AND DEVELOPMENT OF APPROPRIATE MITIGATION STRATEGIES

No Internet technology is risk-free. However, as we intend to program to best practice standards, and follow the available standards for privacy, system security, data back-up and so forth, we will reduce risk to the acceptable baseline all Internet-based systems face. At this time there are no known risks in the implementation of technology particular to this project.

ACCESSIBILITY AND USABILITY OF THE TECHNOLOGIES TO DIVERSE USERS, RESIDENTS AND OTHER STAKEHOLDERS THAT SUPPORT THEIR UPTAKE AND ACCEPTANCE.

Web Content Accessibility Guidelines (WCAG) 2.0 and Authoring Tool Accessibility Guidelines 2.0 covers a wide range of recommendations for making web content more accessible. Following these guidelines makes content accessible to a wider range of people with disabilities, including blindness and low vision, deafness and hearing loss, learning disabilities, cognitive limitations, limited movement, speech disabilities, photosensitivity and combinations of these. Following these guidelines will also often make your web content more usable in general. (http://www.w3.org/TR/WCAG20/)

Each page and feature will be developed with an understanding and incorporation of Web Content Accessibility. Some key elements of the guidelines include the 'Skip to Content' link which allows people to quickly access content by skipping primary and secondary navigation. A redeveloped application will also be screen reader enhanced optimizing the site for visibly impaired individuals. Appropriate contrast will need to be designed between links, text, images and any user interface elements on each page.

zu's team has relevant experience in developing websites and mobile platforms within these guidelines.. From these projects, zu has learned best practices that will be transferable to Directwest. Throughout development, zu will test the mobile platform to ensure that it is meeting level AA Web Content Accessibility. We will also be sure to use the Authoring Tool Accessibility Guidelines 2.0 for content created and migrated to MCA.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Governance

GOVERNANCE FRAMEWORKS AND STRATEGIES TO OVERSEE AND MANAGE PROJECTS, PROJECT RISKS, FINDS, AND PARTNERS THAT ARE RIGOROUS, TRANSPARENT, EFFECTIVE, AND PROVIDE VALUE FOR MONEY

Since the late 90's MCA has been in a Nation Building process, a process that allows for the investigation and negotiation of a draft Akwesasne Governance Agreement. The process was initially termed a Nation Building process and has since been renamed Entewatathá:wi or "We Will Govern".

The overall goal of this process is to investigate the extent of Canada's commitment to negotiate a Self-Government Agreement specific to Akwesasne where MCA exercises jurisdiction. Entewatathá:wi has been working towards establishing the laws, regulations, policies, practices, and institutions that will govern the northern territory of Akwesasne. The Road to Self-Governance Negotiation of a final agreement on Governance will provide clear formal recognition by Canada of Akwesasne's governance institutions and address the relationship of Akwesasne's and Canada's laws. Negotiations have also begun with Ontario and Quebec on some jurisdictional issues. Self-Governance is a long and grueling process that involves negotiations with the government of Canada, our own local governments and leaders, educating and consulting our community and making sure we protect our inherent rights as Akwesasronon. Ultimately, it will be our community that determines whether or not to accept the negotiated Akwesasne Governance Agreement by holding a community referendum.

- Governance / Council Portfolio's include:
- Department of Technical Services
- Akwesasne Mohawk Board of Education
- Executive Services
- Department of Health
- Department of Housing
- Department of Justice
- Public Safety
- Department of Tehotiiennawakon
- Tehotiiennawakon - Environment Division

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Mohawk Council of Akwesasne Carries out projects with at least three personnel involved, Manager, Assistant, and Technician. Project timelines are created with project management theories. Regular project meetings are held with key personnel involved, this includes outside contractors. Mohawk Councils Finance policy requires 3 quotes for anything purchased over 1000.00.

- Managers can sign off up to 5000.00.
- Directors sign up to 50,000.00 with mandatory RFP process.
- The Executive Director signs up to 100,000.00.
- Any Contracts, payments over 100,000.00 must be processed by a Mohawk Council Resolution(MCR). There are 13 chiefs on council and 7 are required to sign in agreement of a decision through the MCR Process.

In working with clientele, their partners and unique stakeholder groups over the years, zu have some proven ideas on governance that can assist in our process as well. As a partnership we believe strongly in the benefit of open communication but recognize the need to focus the collaboration where possible. Before project kickoff, key client decision makers and approved deadlines will be revisited and finalized.

STRATEGY

Typically projects are built in phases with initial consulting and strategy leading to a deliverable such as a communications brief, information architecture, low-fidelity concept sketches or an experience prototype in the form of wireframes or a mobile prototype for user testing. During this phase, the client's Project Coordinator (PM or Manager) will help coordinate meetings, demonstrations and communicate feedback and approvals at our Product Owner, who is the main point of contact from kickoff to launch. The client's Project Champion (Director level) will be available to provide insight during consultations and liaise with executive and board members who require visibility. An Executive Sponsor (Executive Member) or Committee is often involved early on to set direction with our team but will be consulted throughout the phase to ensure objectives are being met.

PRODUCTION DESIGN AND DEVELOPMENT

Once the direction is set, active production begins with weekly demonstrations of progress as outlined in the project timeline. The Project Coordinator and Project Champion will be required to attend these meetings to provide input and liaise with executive and board members who require visibility. An Executive Sponsor or Executive Committee will be consulted throughout production to ensure objectives are being met at key milestones outlined in the project timeline.

Deliverables will be submitted to the client's Project Coordinator for internal feedback. Any approvals or sign off will follow in weekly production meetings creating a feedback loop from the start of production design and into development. Once development demonstrations begin,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

a Technical Lead (Client IT Group Member) will join the client's team to coordinate integrations, flag risks and provide materials and support to our developers if required.

Finally, active user acceptance testing will be performed within the feedback cycle and then again prior to launch. By the end of the project, end-to-end testing will be completed internally at zu and on the client side to reach final approval. Once the product is approved, the asset will go through predefined steps for launch as outlined in the project timeline.

ESCALATION

Throughout the entire process, from strategy to production and launch planning, any issues that require escalation beyond weekly project meetings will be addressed with the Account Manager by the client's manager/director representative. If unresolvable, issues will be escalated to the Executive Sponsor by the client's executive team member.

Details about the partners and their role, capacity and readiness

zu is our only major partner defined through the Smart Cities Challenge. They build digital products and services and uses a design strategy to drive innovation within organizations. Founded in Saskatoon in 1995, zu is a happy, motivated team of 35 confident in achieving success on every project and committed to working with clients building modern solutions for mature industry problems. zu's team is a mix of Design Thinking experts, analysts, production designers, developers, IT and client support specialists focused on building tools that are informed by users and meet client business objectives. Their services are grouped to correspond with the lifecycle of digital products.

Collectively zu has the bench strength and the decades of experience to hit home runs on big, challenging projects. Our technical depth and our cosmopolitan appreciation for style and elegance are focused by our adhesion to the user-centric approach to design. Our plans are therefore on target, our ability to execute proven and not easy to replicate, and the result for the MCA application and Smart Cities Challenge project will embody a balance between being uniquely engaging, practically sustainable and innovative. Our combination of youthful design, project sensibility and decades of programming experience, deployment and support means the best of all worlds for the Akwesasne web system, especially when it comes to creating something for today and for tomorrow.

RISK MANAGEMENT APPROACH

The goal of our risk management is to decrease the chance that we don't deliver working software to a happy client. We want our client to have participated in choices involving adding or chopping features and scope so that the most important features are accomplished on time and on budget.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

To assist with managing risk throughout projects, zu utilizes a Project Status Report. This document allows MCA and zu to communicate and provide weekly project status updates during client demos. We can highlight milestones, design concepts or major features and flag them if there is an issue, or if everything is on target. This will also highlight past accomplishments, key activities for the next week and upcoming issues that should be addressed early. We can track all decisions that impact the project, along with a budget update.

Communication is critical for project success. Our approach is to maximize project visibility with clients and form a tight-knit relationship with our project leader, the Product Owner. We document these plans in a project charter before kickoff. This document acts as a reference for key decision makers on the production side and the client side. It includes key milestones and project objectives. Put into action, our Product Owner becomes our client's main point of contact for ongoing production and flagging any issues, risks or challenges as they come up.

The myth still exists that software and complex systems can be planned out like building a bridge. That Gantt charts and timelines and feature sets are predictive of project success. This is not so, and is proven in the terrible track record of software projects that have failed, even though all these risk-reducing factors were in place.

zu has long ago recognized the importance of the Agile method for software building that accepts lack of predictability and instead focuses achieving project success by accomplishing important things first, by allowing the scope to be modified to make the most effective use of the constraints of time and money, to recognize dead-ends quickly and double down on good ideas that arise in the process of building. Transparency and approval for what is being done, what is done and what will be done are discussed in sprints with the client at regular and short intervals.

EVIDENCE AND DETAILS ABOUT THE PARTNERSHIPS, INCLUDING THEIR NATURE, TERMS, ACCOUNTABILITY STRUCTURE, AND FINANCIAL REQUIREMENTS.

On the 30th day of September 2018 The Mohawk Council of Akwesasne and zu.com communication Inc. entered into a contractual partnership between client and consultant. Please refer to the confidential annex for our Master Service Level Agreement and Memorandum of Understanding during the Finalist phase of the Smart Cities Challenge.

APPROACH TO PARTNERSHIPS THAT RETAINS COMMUNITY CONTROL OVER SENSITIVE AND PERSONAL DATA

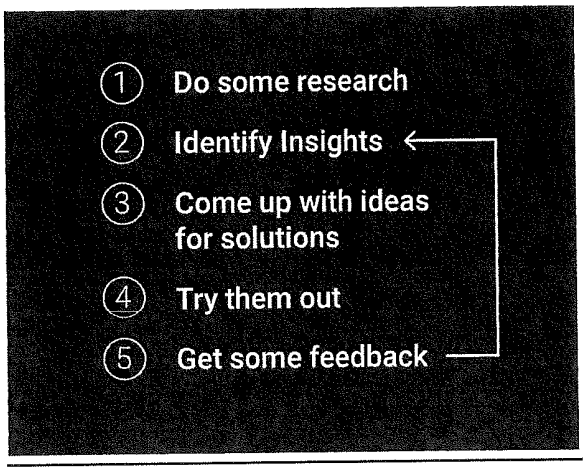
Although zu is the contracted firm to build the technical aspects of the app/web portal, Mohawk Council will own the rights of the system and house and retain all data created with the system. All data collected, used, and disclosed will be managed under the Mohawk Council of Akwesasne stored on MCA internal data centers and servers. Please refer to our Preliminary Privacy Impact Assessment for an in-depth analysis of information privacy.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Engagement

APPROACH TO ENGAGING WITH, GAINING ACCEPTANCE FROM, AND ONBOARDING RESIDENTS AND OTHER STAKEHOLDERS FOR PROJECTS THAT ENSURE ONGOING ALIGNMENT BETWEEN THE OUTCOMES AND THEIR CONCERNS AND NEEDS.

In order to understand where we are going in the implementation phase, it is important to understand where we have been over the Finalist phase. As strong believers in human-centered design, and designing with users and for your users, we have put Community Engagement at the forefront of our Smart Cities Challenge solution.



Over the past several months, we facilitated workshops with inclusive user groups, interviewed internal and external stakeholders, hosted community engagement events, and surveyed and user tested our prototypes with Akwesasne community members. The 5 stage approach brought by Design Thinking was executed by our partners at zu through a series of trips to our community. We completed the recyclable model several times to come to the prototyping and feature prioritization of our Community Application, narrow in on our Smart Greenhouse concept from several implementation ideas, and understand the true needs of the community for the execution of our Electric Public Transportation System.

To ensure a substantial amount and quality of community engagement, we leveraged the Design Thinking methodology and process, which is a **practical approach** to finding **creative solutions** to problems, inspired by traditional design methods, or more simply, an approach to problem-solving, which we will dig a bit deeper into and outline below.

"Thinking like a designer" means leveraging empathy, experimentation, and often technology, to produce solutions that help real people. Design Thinking is heavily rooted in Human-Centered Design, which emphasizes a user-first approach: finding out what users really need, then balancing solutions for those needs with the possibilities of technology, and requirements that define success for the business.

Several popular Design Thinking structures have emerged over the years. Most have the same basic underlying model:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

A common Design Thinking structure

1. Do Some Research

Research is critical to Design Thinking. Gathering information about a problem helps define the problem (or more typically, problems), so we can determine what the right problem is to solve. Design thinking research takes the form of interviews, usability testing, surveys, looking at analytics, and so forth. And research never really stops as feedback goes back in the top and then becomes the subject of feedback once more.

To ensure we look at user needs from multiple angles, we follow four research themes.

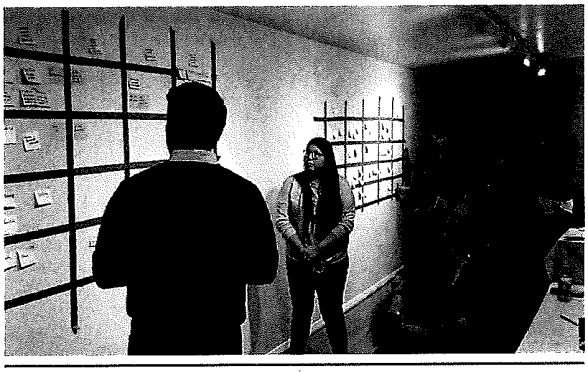
About Them - Takes the form of indirect research about Akwesasne and our community members living here. We looked at existing internal data, industry and community reports, and aggregated data. This indirect research included:

- Akwesasne Satisfaction and Experience Surveys
- Akwesasne Cultural Orientation Guides
- Mohawk Council of Akwesasne Department of Health - Annual Reports
- Mohawk Council of Akwesasne -Healthy Eating and Active Living (HEAL) Program - Indicator Reports
- Mohawk Council of Akwesasne - Strategic Plan
- Mohawk Council of Akwesasne - Comprehensive Community Plan

With Them - The most common method of "with them" research — or "with Us" in this case — is a simple 30 to 45 minute 1:1 interview in person or on the phone with the interviewee. "With them" interviews were undertaken with our community members themselves and also with groups and individuals that regularly interact with community members. In the finalist stage of our work, our "With Them" research included interviews with many distinguished individuals including:

- Amber Montour (Manager, Wholistic Health)
- Sarah Thompson (RN, Supervisor)
- Della Adams (Traditional Medicine Employee)
- Lesley Bero (Program and Diabetes Prevention Manager)
- Karole Mitchell (Community Health Nurse)
- Cindy Francis-Mitchell (Assistant Director of Health)
- Andrew Francis (Data Health Management Coordinator)

During these interviews, we asked straight



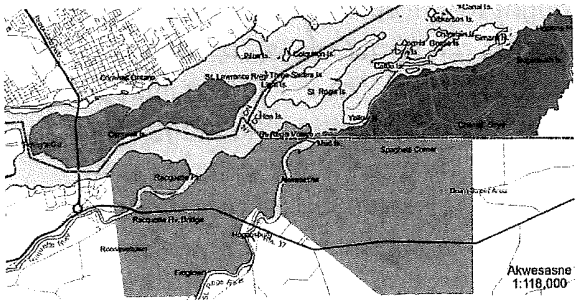
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

forward, open-ended questions to gather information and insight while leaving the interview loosely scripted. This allowed our interviewers to adapt their line of questioning and vary which answers received more detailed follow up questions. We ask, for instance, What do they know about the client? Where they see their clients struggle? What questions are clients asking? What can be done to make the user's experience better?

"Be them" - The "be them" method allows researchers to gain empathy for a user's pain points by walking through an entire journey exactly as they would experience it, from start to finish, in the most natural context possible. As a part of our research phase we had MCA employees take us through their diabetes journey. Each journey started with being screened for diabetes, to find out if they were free of symptoms, pre-diabetic, or diagnosed diabetic. Then it was understanding the implications of their assessment, and how they were to manage their life in each case for the long term. This led the research team to an understanding of their journey, all the user's actions, touch points, thoughts, and emotions experienced by the individual through the process, often including their family's experience with the individual's journey. In approaching any particular event or process as a journey, fewer possibly important elements will be missed. More details will be noted this way, when subjects are asked to tell a story exactly how they walked through it, rather then if people are simply asked to describe what they remember about an experience.

2. Identitfy Insights

Once we finished the research stage, we sought to extract meaning from it. Pulling insights out of our research, and choosing the really important ones is an incredibly valuable step in setting the stage for effective ideation. Many folks typically want to brainstorm on ideas without adding new nuggets of information to the conversation, and so get nowhere new.



Journey Mapping workshop with Akwesasne community members and stakeholders

But Design Thinking has us start with a load of information, and then provides methods to identify insights efficiently and collaboratively. These insights then feed the creation of really innovative ideas. In our workshops with MCA stakeholders we used the techniques of the practice, we group shared and affinity mapped to identify patterns and themes. We wrote and edited challenge statements to concentrate on the most important underlying challenges of diabetes.

Our preliminary research and stakeholder workshops led us to the following key insights.

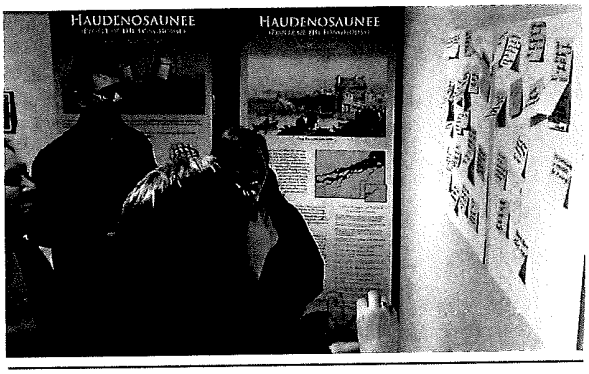
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Key Insights

Map of Akwesasne and it's districts

FOOD INACCESSIBILITY

Inaccessibility to healthy food alternatives in Akwesasne is two-fold. First, our traditional Mohawk diet was based on growing, fishing and hunting, but has been severely damaged by pollution. Mercury levels are high in both the Saint Lawrence River and the surrounding soil. Community members have been cautioned to limit their diet of locally caught fish to one per year! We are told our traditional farming practices may produce unsafe food when grown on the polluted soil of Akwesasne. Second, due to the jurisdictional impediments, with border crossings causing delays in both direction of travel, healthy groceries and produce for many families can be up to a 30-minute commute away. With many community members living without vehicles, and with a scarcity of public transportation on the reservation, getting proper food regularly can be almost an impossible feat for many.



NETWORK ACCESSIBILITY

Being in a rural area of Ontario, the Akwesasne First Nation finds itself with insufficient mobile network capabilities. In all 3 districts, our community expresses frustration with so-called "dead zones" in many areas. This lack of contact creates barriers to our members receiving information regarding events, community activities, or communication for transport. Recognizing the value of our current efforts that made us a finalist of the Smart Cities Challenge, the Mohawk Council of Akwesasne has plans to leverage our efforts and take this as an opportune time to update Akwesasne's mobile infrastructure. Using their own internal budgets, the Mohawk Council will actively support the development of the Smart Akwesasne solution by providing necessary infrastructure.

TRANSPORTATION ACCESSIBILITY

Lack of public transit, combined with the lack of personal vehicles for many, makes it extremely difficult for Akwesasne people to gain access to opportunities offered in our three principal communities. As spoken to above, the opportunities we are most concerned about for community members are accessibility to food, to health services, to fitness locations and activities, to community events, and to other social services. With the implementation of our Smart Cities solution we will create accessibility to these opportunities. With the Smart Cities project in place our people will enjoy the possibility and option of traveling between districts, and with minimal financial burden. Accessibility has been determined to be one of our key strategies to reduce new cases of diabetes in the community.

Ideation Workshop on 'How Might We' statements with Akwesasne community members

WESTERNIZATION

Since the imposition of Western culture on our community, the Mohawk people have been subject to drastic change in their daily diet. First, many community members have moved away, not just from their home territory, but from their traditional lifestyle and food sources. There they are eating the fatty and carb-heavy alternatives that are convenient and cheap, whether from chain restaurants or other seemingly economical options. Second, the fast-paced, consumption-oriented lifestyle now everywhere is still very new to our culture. Healthcare workers, particularly those involved from a diabetes prevention/ management point of view state, observe that the people of Akwesasne are practicing less and less the holistic and traditional approaches to medicine. Our people increasingly have come to accept the disease that comes with westernization and western ideas about health. We become used to taking pharmaceutical drugs to combat metabolic and diabetic disorder, rather than look for answers in our traditional approaches to health.

CHECKUP FREQUENCY IN HEALTH & DENTAL

It is apparent that community members, particularly men, do not see a doctor regularly. This of course contributes to poorer health outcomes. Many factors may be in play with this behaviour including: pride and the desire to show strength; a genetic predisposition that allows Mohawks to actually handle pain better than others; the absence of a male doctor within the community. Again, lack of options for public transportation also plays a key role in this exacerbating this unfortunate infrequency of interactions with health and dental services.

HEALTHCARE SYSTEM DISCONNECTION

Further difficulties arise from the complicating reality that Akwesasne people and their families —though one community of Mohawks — live in 3 jurisdictional areas: Ontario, Quebec and the state of New York where they are dual-citizens. It is not hard to imagine the complications this causes our own internal health care efforts: having to interact with three separate systems none of whom are recognized for ease of use. Our people may be using health and dental services from multiple institutions located in different jurisdictions. And so we find many of our health client's records to be inaccurate and/or incomplete. This causes an overall lack of transparency, and makes difficult our ability to even assess where we are as a community health wise. Issues in terms of data consistency, information collection and information aggregation make it difficult to even begin to interpret the overall system's performance in a holistic way. How will we

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

find insights worth acting upon without good information?

The poor state of record keeping caused by these overlapping jurisdictions is extremely straining on healthcare professionals. These folks are trying to help and are striving to accurately diagnose the individuals they see. But they just don't have the basic information of an accurate medical history to work with. We need to give our health care professionals, and the people themselves, complete and accurate baseline health records. Knowing where we are as a system and as individuals is key to knowing where to go and whether we are heading in the right direction. Health assessment is based on measurable data, and the health of the system is based on measuring the improvement in outcomes. Improvements and consolidation are needed in the medical records of our people. We cannot expect that this improvement will be provided by the three medical systems we deal with. This centralization will be something we need to build ourselves. It will be important in our battle to reduce new cases of diabetes in our community.

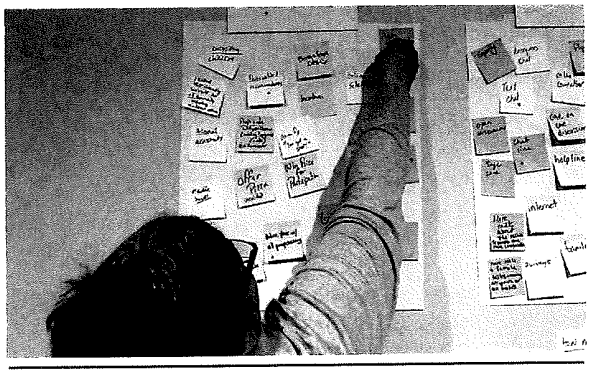
LOSS OF TARGET DEMOGRAPHIC FOLLOWING PRIMARY SCHOOL

Individuals from 12-25 are our primary target demographic for preventing new cases of diabetes. When this cohort are in our community and in school on the reserve, The Department of Health has the opportunity to educate them. Given our people's increased susceptibility to metabolic diseases and diabetes, we have to act proactively with our young people to prevent new cases. Akwesasne is home to three Akwesasne Board of Education Elementary (AMBE) Schools. These schools include Ahkwesahsne Mohawk School, Kana:takon School, and Tsi Snaihne School. While in school our children receive instruction about nutrition and health promoting lifestyles, learning to make habits of healthy choices. Following graduation from our schools, however, our students only secondary schooling options are off reserve. Our losing access to them following primary education means we have lose our opportunity to continue training them for long term health. This insight identifies a barrier we target to overcome.

GOAL OF INSIGHTS

Our goal of identifying insights is to better define the problem(s) and understand what are we really trying to solve. Insights set the stage for idea generation. But before we generate ideas we use an interim step to reframe insights as questions.

The How Might We framework is particularly effective for inspiring creative solutions for two reasons:



1. Its phrasing implies that a solution is possible.
2. It's often easier to craft solutions when you're trying to answer a specific question.

Collaboratively with zu, we crafted How Might We Statements. These are intended to create a road map that will lead us to generate new ideas to help the Akwesasne community.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Our How Might We Statements included:

- How Might We reduce the time and distance to healthy food?
- How Might We create a solution that bridges the gap between traditional and modern medicine?
- How Might We make people feel more comfortable discussing sensitive topics with health care professionals?
- How Might We maintain health education and contact with our people through High School?
- How Might We motivate people to take advantage of existing programming?
- How Might We encourage people to get screened for pre-diabetes earlier?

'How Might We' Statements being explored during Akwesasne community workshop

3. Come up with some ideas for solutions

Referencing our How Might We Statements, our next step was coming up with ideas to solve them. There's seemingly no end to the number of ways to approach idea generation (aka brainstorming or ideation). Ideas can be generated individually, as a group, or both. Ideas for solutions can be written, drawn, built in 3D, acted out, etc. The key is to focus on generating lots of possibilities, not necessarily trying to find the silver bullet solution right off the top.

Using a combination of individual and group ideation tends to result in the best solutions because:

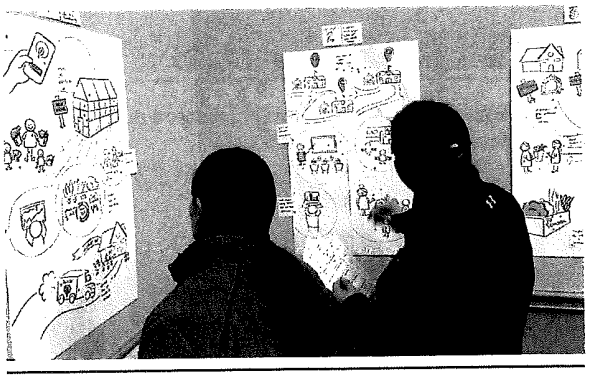
- Individuals working alone can focus their thoughts to come up with more fully formed ideas.
- People working in a group can then use the individual ideas as springboards to evolve their own idea, build on another's idea, or come up with more new ideas.

In a small group session with health care professionals, council representatives and community members we began writing, drawing, and acting out solutions. This resulted in nearly a hundred different solutions to the above How Might We statements. We derived solutions that would make food and healthcare more accessible through various approaches including transportation improvements, diabetes prevention education (choice), cooking classes (variety). We had ideas regarding increasing programs offered that promote healthier lifestyle and provide

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

fitness resources, including tweaking our competitive nature with district games, where individuals compete against one another in sport and art. We envisaged anonymous helplines for health care advice and direction. We identified the implementation of greenhouses as a good idea: they are increasingly practical to operate; they would be an educational enhancement if associated with our schools; they would increase our accessibility to healthy produce. Additionally, moving our agriculture into greenhouses would decrease our exposure to toxins in the food we have no choice but to grow in our now polluted soil.

This group session produced over a hundred ideas. Participants were energized by the opportunity to develop their own ideas, to build on another's idea, and to see their idea taken further than they imagined when the whole group contributed on theirs. We saw useful innovation happen and produce good ideas. We used Design Thinking approaches to make choices as a group. We voted on favorites to focus down on the best of the hundred. We took the finalists further and worked until these most viable ideas became prototypes.



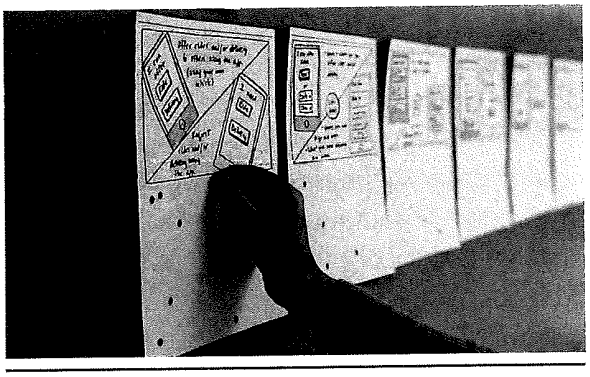
4. Try ideas out

Prototyping possible solutions is the least expensive way to fail, and the fastest way to learn. Prototypes can be digital, paper, or a combination of any kinds of materials, sometimes looking like arts and crafts. Participants can prototype a process, a pamphlet, a script. From our ideation session, we sketch-prototyped, and digitally-prototyped several concepts based on ideas we had discovered in the stakeholder engagement from our workshop.

SMART GREENHOUSE SYSTEM SKETCHED-PROTOTYPES

Through our workshops it was evident that the implementation of a Smart Greenhouse System was crucial to bringing healthy, affordable and accessible food to the community. To determine a strategy which would create the best benefit for our community, we narrowed the options down to three:

- 1 Large Community Greenhouse supporting all districts
- 3 Medium Community Greenhouses supporting each district
- Several neighbourhood operated community greenhouses supplying the homes in those neighbourhoods.



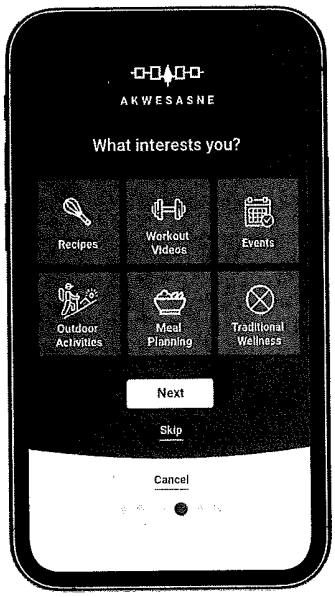
Smart Greenhouse System Prototype during community engagement

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

ELECTRIC TRANSPORTATION SYSTEM SKETCHED-PROTOTYPES

Likewise, our ideation workshops made us aware that some form of transportation system in the community was going to be necessary to our Smart Cities approach. This led us to prototype multiple concepts to potentially solve this clear barrier to many of the issues we identified as insights. These transportation solutions included:

- Ride-Sharing System connecting individuals who can offer rides with individuals who need them.
- MCA operated and subsidized Smart Taxi Service



Electric Transportation System Prototype during community engagement

AKWESASNE MOBILE/WEB APPLICATION DIGITAL PROTOTYPE

In the finalist phase, a goal for the combined team was to create a working prototype of the Akwesasne Community Application. The application will allow the necessary communication and coordination for the whole Smart Cities approach to work, like glue for all the parts. Prototyping is a major milestone in the Design Thinking approach to building a product or service, as it is the artifact representing the culmination of all the previous work, and is a clear target for what the next stages seek to create. So, following Design Thinking exercises with users where features were developed by users, early versions of our application prototype was created by our partners (zu) in AdobeXD. This online, interactive version of our app allowed community members to navigate through the its functions using their devices in ways close to having a working application.

This digital prototype, a replica of the application, demonstrates initial sign up and login screens, as well as 4 tabs: Wellness, Nutrition, Fitness, and Community. Sub menus for these tabs each bring additional screens showing how these new opportunities to Akwesasne will work. The application, which is expected to expand in capability over time, provides room for expansion of functionality in future phases. With extensive engagement and feedback from the community to ensure proof of concept, followed by cycles of iterative prototypes produced and shared with each round incorporating feedback followed by more user-testing — we produced a prototype interface. On the following page is a link to the the Akwesasne Community Application prototype.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CLICK THE LINK TO VIEW THE PROTOTYPE

https://adobe.ly/2ERy3X3

- Features and functionality of prototype include:
- Login screens with terms of use, privacy policy including collection, use, and disclosure messaging
- Ordering and payment of the Smart Delivery Service (for food deliveries from the Green Food Bag and Smart Greenhouses)
- Requesting and payment of rides from the Electric Public Transportation System
- Traditional and modern health resources in the forms of videos, blogs, podcasts, and recipes
- Booking of traditional, holistic and community healthcare appointments
- Access and storage CANRisk survey results, with prompts to take necessary action
- Compete in activities alone, or with friends in order to gain rewards
- Events and programs page to stay up to date and aware of opportunities in the community

5. Get some feedback

Getting feedback from our community on these more mature prototypes was the next critical step to ensure our solution would meet their expectations. The majority of our this wider community feedback and user-testing would be completed at our community engagement events.

We were aware of the lack of transportation limiting participation for many. So we made sure to host community engagement events in each of the three districts so there was ample opportunity for everyone to contribute to our Smart Cities Solution. For both the Smart Greenhouse System and the Electric Public Transportation System, we used a multifaceted approach to get good feedback from users. We mobilized a number of strategies:

Interviews - Members of our team and zu's were stationed around the meeting space in

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

order to answer questions, pose their own questions back to users and to follow up to enquire why certain notes were given or decisions made.

Dot voting - Allowed community members to simply leave adhesive dots on parts of the solution sketch they really liked or approved of.

Feedback Notes - Gave users the opportunity to provide feedback by writing comments on adhesive notes and sticking them anywhere on the sketches. Their comments led to other participants also dot voting on the stickies themselves, giving approval or making further suggestions, all in a casually collaborative and efficient way.

Voting box - With multiple concepts and many participants, we simply wanted to give individuals the ability to vote for their overall favourite concept. This gave us an idea of which concept would be likely to benefit the community the most, and so be adopted for actual use by them.

This resulted in a more flushed out application prototype that we were extremely excited to get it into the hands of our users. Gaining feedback on this now more mature prototype came through a number of methods:

1:1 user testing - Members of the zu team had community members work with the application under one of our team's observation. This provides some the highest quality insight into the apps success in the presentation of features and functionality.

Dot Voting - As in our previous use of dot voting on interface sketches, we now made printouts of the application screens, taped them to the wall and encouraged community members to vote on their favourite features.

Feedback Notes - Feedback notes gather more specific insights, new ideas and enhancements — then just votes. And participants enjoy the ability to leave feedback and suggestions right next to interface features, and to see what other folks are saying. This is a high quality feedback method providing insights very useful to the designers.

Interviews - Members of our team and zu's were again standing ready to answer questions, and to engage in brief conversations to clarify exactly the nature of the participants opinion, idea or critique.

Getting feedback on our prototypes was in essence just more research. We gathered information about how people use the solution, where they stumble, what they liked, what they disliked, and things we can make better. Design Thinking has led us to a Smart Cities Solution that we can confidently say was designed and created by and for the community using it. This engagement with users is the missing step in so many software projects that fail. Our extensive efforts in community engagement on the app greatly increases our potential for success.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Data & Privacy

PRELIMINARY PRIVACY IMPACT ASSESSMENT (PIA) OR PRELIMINARY RATIONALE ANALYSIS (PRA) WITH EVIDENCE THAT RELEVANT PRIVACY AUTHORITIES WERE CONSULTED AND THEIR GUIDANCE WAS CONSIDERED IN ITS DEVELOPMENT

Following an in-depth analysis of our Smart Cities Challenge solution(s), and multiple meetings with the Privacy Commissioners of Canada, Ontario, and Quebec, we are confident in taking the appropriate measures to ensure the minimization, anonymization, consensual and security in the collection, use and disclosure of information. To both implement and maintain an effective future-proofed solution, while constantly measuring our progress, a number of PII and non-PII data points will need to be collected. Within our PPIA, we highlighted ways in which we intend and commit to comply with the Personal Information Protection and Electronic Documents Act.

Types of methods of data collection, generation, analysis, storage and transmission, and plans for re-use, re-distribution, derivative production, archiving, and preservation that reflects the entire data lifecycle in project design.

As members of the communities ourselves, and proud of Akwesasne individualism, we approach the collection, generation, analysis, storage, and transmission of data as if it were our own.

Collected - Personal information will be collected within the application through. This data will be gathered anonymously from inception and in aggregated form to gain insight into the progress of the community. Collected information will include personal information, aggregated information, and device information.

Personal Information - Full name, Home address, Email address, Credit Card Numbers, Age Range, Telephone and Login Details. This information is fully encrypted at first point of contact, in transit and at rest.

Aggregated Information - Gender, Race, Age Range, Workplace, Height & Weight, BMI, Waist Circumference, Physical Activity Levels, Diet, Fruits and Vegetable Intake, Blood Pressure, Blood Sugar Levels, Family History in Relation to Diabetes

Device Information - Device IDs, Internet Protocol (IP) address, Unique Device Identifier, Cookies tracking, and Location Tracking (While using the app)

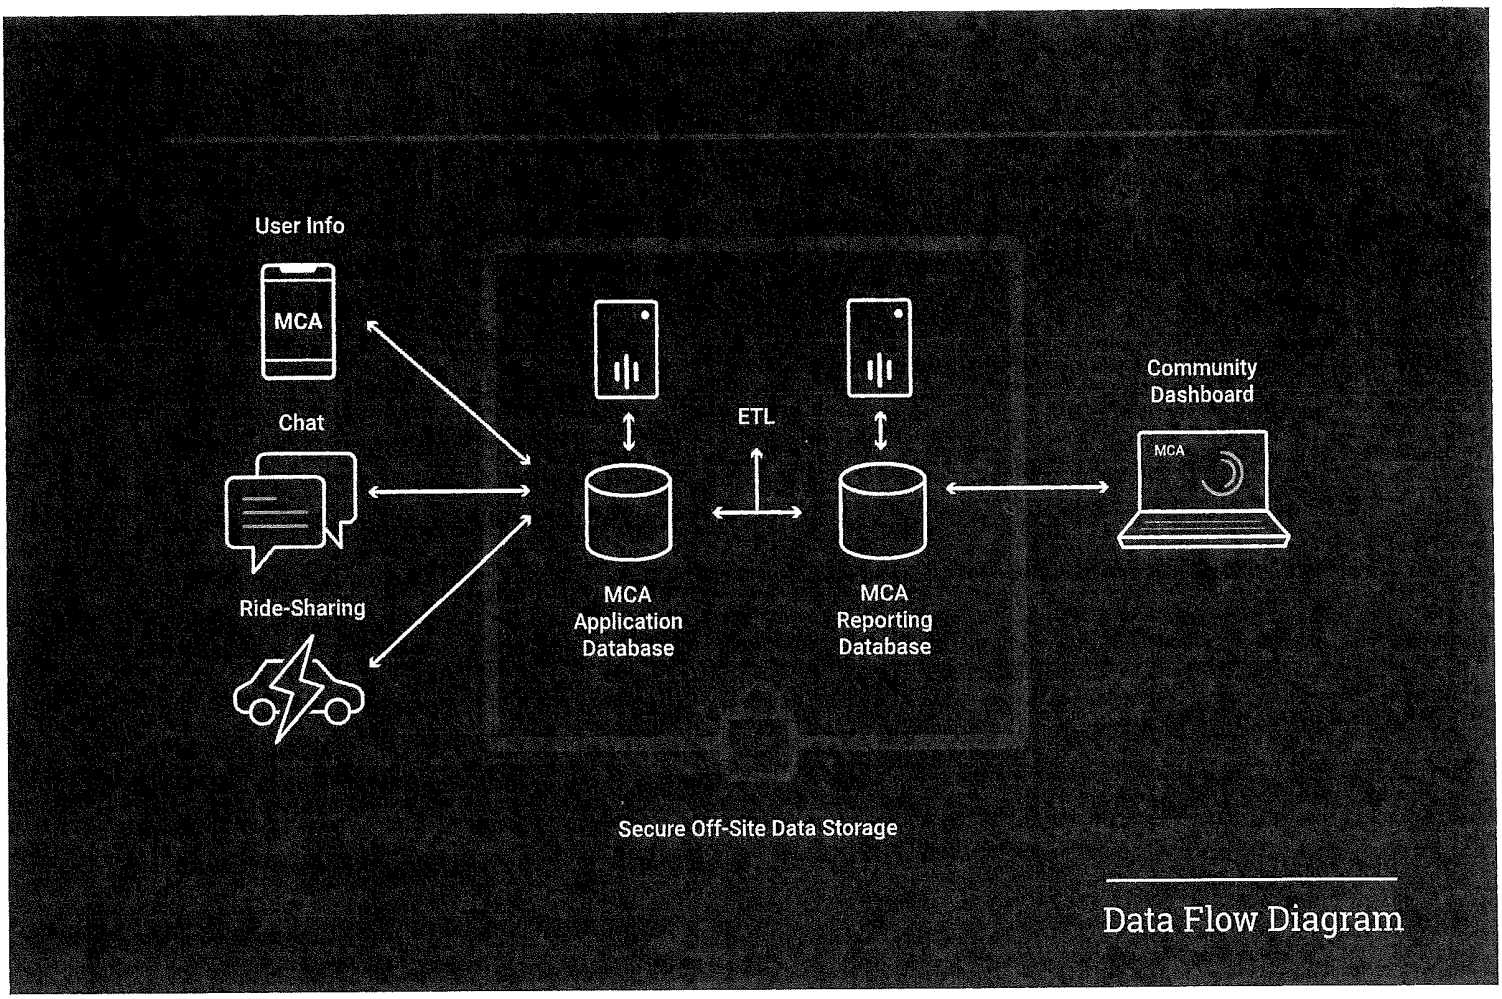
Adept in the security of information, our partners, zu, have been ensuring the safe

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

disclosure of information for over 23 years. All data surfaced and in transit between the application and Mohawk Council of Akwesasne Servers, will be managed through;

- SSL encrypted communication for all data in transit.
- Credentialed access to sensitive information at all touch points.
- Strong, AES encryption of sensitive data at rest.
- Secure, off-site storage of data backups
- Logical, and physical separation of collected PII and de-identified, aggregate data that will power community dashboards and open data initiatives.
- An extract, transform, load (ETL) step to pull data from the community application database into a separate repository of information used to generate redistributable reports that are devoid of PI.

Use - The use of the collected information will ultimately allow us to measure the success of our Smart Cities Solution. It will provide us insight into the communities progress enabling us to adapt our approach in areas of low participation and capitalize on areas of high participation. All information will be fully encrypted through SSL, and in an aggregated form to not tie information to an individual or key identifier.



Disclosure - All information not highlighted as aggregate information, will be fully encrypted and untied to the individual at initial contact, in transit and at rest. Personal information will not be made available to any third parties but only Mohawk Council of Akwesasne internal trend analysis and measurement

Efforts made to integrate security and privacy considerations into project design, particularly those that were raised users, residents, and other stakeholders.

Balancing design standards, user experience, and the privacy implications resulting from the former are all considerations necessary for the implementation of our Community Application. Below we highlight several best practices to integrate security and privacy considerations into our project design.

- Identification of what personal information is being, or may be, collected about them at time of consent
- Identification of all purposes for which information is collected, used or disclosed at time of consent
- Provide information to individuals in manageable and easily-accessible ways
- Multi-Factor Authentication
- "Just-in-Time" privacy notice where possible
- Treating consent as a dynamic and interactive process.
- Be positioned to demonstrate - either in the case of a complaint from an individual or a proactive query from

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Data Flow Diagram

a privacy regulator - that we have a process in place to obtain consent from individuals.

- Obtain consent from a parent or guardian for any individual unable to provide meaningful consent themselves
- The ability of an individual's right to withdraw consent
- The ability of an individual's right to review and update personal information logged

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Budget & Project Breakdown

zu's projects are tracked hour by hour, day, by day, week by week and month by month. Their time tracking system called Replicon records their time in 15-minute increments. The time spent is fed into burn and resource charts that are scrutinized against detailed work plans produced at the beginning of each production phase and broken down further by each week by zu's experienced product owners. The PO's work with zu's designers and developers to further break down work on key features into bite-sized "user stories", that are then used to create tasks in Jira and Replicon for assigning work and recording time respectively.

The Akwesasne team is kept in the loop via zu's weekly progress reports that feature a cost breakdown to date, budget forecast for the week ahead and expected spend upon completion. Risks are flagged in the report and discussed in weekly production meeting with the Akwesasne team. A decision log is kept by zu to maintain transparency throughout the project. Between their time tracking system, weekly reports and weekly status meeting, we'll be kept informed of risks, spend totals and decisions to ensure proper cost control from kickoff to launch. Work is completed upon our approval with production billing rate of $140/hr and a standalone strategy rate of $175/hour.

Our Smart Cities Solution will be assembled using, really no experimental technologies or untested software approaches. Therefore, our estimates are straightforward and not based on speculative math. Nevertheless, public tenders under the oversight of the before mentioned committees should provide us with competitive prices for the equipment and installation of the equipment we need to build the Electric Public Transportation and Smart Greenhouse Systems.

zu Strategy & Design Consultation	$176,200.00
Community Engagement Events	$29,500.00
Project Coordinator Salary	$8,000.00
Travel	$7,000.00
Subtotal	**$220,700.00**
Taxes (11%)	$24,277.00
Expenditure Total	**$244,977.00**

** Remainder of budget will be used through the spring finalist stages, including presentation and travel*

Implementation Phase Requirements

While our Challenge couldn't be more significant to our community, the proposed Smart Cities system does not require special attention in regards to either municipal, provincial, or federal legislation, nor for reporting or policy requirements. Our consultation with Indigenous groups, since this is ourselves, is about ensuring we are inclusive of the many voices of our community. To that end, we have relied on many types of engagement to determine our initial approaches, and as touchpoints at every step of the planning and process of solution delivery. The most complex areas of legislative impact are around personal data privacy, and the risks of trying to build a comprehensive understanding of the state of our people's health. This is covered in our Preliminary Privacy Impact Assessment.

Community Employment Benefit

Our Smart Cities project will provide many benefits towards new skill development, as well as full and part time labour opportunities. Part of the value of these employment opportunities will be every participant knowing that the work they are involved in directly benefits our community and has the higher purpose

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

of improving health outcomes and quality of life at Akwesasne. The Electric Public Transportation System will create employment through MCA employed Smart Taxi drivers, and bus drivers. The Greenhouse will create opportunities for all ages and ability levels, providing positions in horticulture engineering, gardening, plumbing and electrical, as well as project and inventory management. Volunteers will also be needed and will receive exposure to trades and professions not currently in Akwesasne. The Akwesasne Community Application will also create numerous opportunities. Our Mohawk Council of Akwesasne Information Services team will undoubtedly need more help, and will towards those graduating from Ontario Emerging Jobs Institute for applicants. Hosting, maintaining and enhancing a combined mobile and web-based application like the Akwesasne Community Application requires all manner of skills. These include programming for all the devices and frameworks in use, database management, server management, system security and privacy, CMS management, social feed integrations, location management, training, and more. Some areas will require a depth of expertise, others will be necessary at shallower depths of experience. We are committed to not only innovating the products and services of our community but also developing the expertise and education of our people. It is time for us to make use of the technology that is key to our moving forward with our challenges and opportunities, and to become self-sufficient with these skills.

Commitment to a Climate Lens Assessment

Should we have the opportunity to move forward with the implementation phase, we will commit to completing the Climate Lens Assessment. This will make more sense after the public tenders for solution equipment have been received, and choices made about which equipment provides the best value at that future point in time. We are confident our Smart Cities approach will bring positive climate impact, but will confirm the expected measured effects when appropriate details for the analysis are available.

Risk in Regards to Implementation Plans and the Regulatory Environment

We do not foresee risks to our Smart Cities project in failing to meet relevant municipal, provincial, and federal reporting and legislative requirements. Granted there are always risks associated with making mistakes in regards to construction of buildings, and the Smart Greenhouses are structures. There are information privacy risks. There are labour standards rules. Their are employment related taxes to be paid. There is general reporting to the various Revenue Collection agencies. But none of these seem either notable as unique to our project, nor are new risks that our community does not already face.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Thank you for taking the time to read our proposal. We hope you have found our plans to improve the health of our people through this combination of Design Thinking, Smart Technologies and Web-based Software to be practical, achievable and worthy of being taken to fruition.

Our consultation with Indigenous groups, since this is ourselves, is about ensuring we are inclusive of the many voices of our community.

SCHEDULE "A" to MASTER SERVICE AGREEMENT
STATEMENT OF WORK: SUPPORT AND OPTIMIZATION

RE: Website Support and Optimization Service Agreement between the Mohawk Council of Akwesasne. (the "Client") and zu.com Communications Inc. (the "Webmaster") dated effective the 30th day of September 2018.

Support and Optimization Overview

Retaining long-term value from any digital asset requires a commitment to supporting the software development lifecycle. The increasingly rapid pace at which web technology and best practices, online threats and user expectations evolve make it hard to keep up. Our support and optimization model is designed to keep MCA team members aware of issues affecting site health and security, opportunities for iterative enhancement and potential opportunities to leverage new trends or technologies.

We structure our approach to long-term viability in two ways. The support fee enables your website to be flexible and protected from the changing nature of technology and online threats while the optimization budget allows your website to evolve alongside your corporate and communications strategies. Together, these two approaches to health and optimization ensure the successful transformation of your digital asset over time.

Definitions:

Bug – A bug is defined as a defect or defects in the existing code that produces an incorrect or unexpected result.
Existing code – Refers to code in use at the commencement of support and optimization agreement.
Minor version – Point sequence updates to supported, dependent software. Ex. major.*minor*
Major version – Whole number sequence updates to supported, dependent software. Ex. *major*.minor.

Schedule A: Budget

Annual Support Budget: Fixed TBD broken into a TBD monthly fee.
Monthly fee includes the services outlined in Schedule B: Support Services. The scope of services will be evaluated annually from the initial start date as the website may grow and the scope of support services and fees may be expanded.

Annual Optimization Budget: Recommended TBD broken into a TBD monthly forecast.
The annual optimization budget will include the variable costs dedicated to building out new features, website enhancements and major system upgrades discussed in Schedule C: Optimization Services. Optimization work will only be completed upon client approval at a production billing rate of $140/hr and a standalone strategy rate of $175/hour.

*Any changes in costs as a result of changes to hosting arrangements at the request of the client will be reflected in changes to the monthly fees.
*Variable cost will be affected based on US dollar conversion and hosting usage.

200–303 Pacific Avenue
Saskatoon, SK

zu.com
t 306.653.4747
f 306.653.4774

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

* Any work related to hosting maintenance including server configuration, server maintenance and host provider management will be recorded hourly and billed to the optimization budget at a rate of $140/hr.

Schedule B: Support Services

Support Services Scope:

1. Monthly proactive performance testing and bug diagnosis
    a. New minor version and major version browser/OS testing and 3rd party integrations monitoring for updates or security issues.
    b. Run any automated tests as well as manual testing per code release.
    c. Generate bug report; prioritize non-urgent bugs; catalogue major version browser and OS issues for optimization.

2. Bug resolution
    a. Bugs will be catalogued and prioritized based on services levels outlined in Schedule D.
    b. Bugs will be fixed based on priority.
    c. Minor version browser/OS and 3rd party integrations bugs will be resolved under the fixed support fee outlined in Schedule A.
    d. Major version browser/OS and 3rd party integrations upgrades covered under optimization budget outlined in Schedule A.

3. 3rd party integrations support
    a. Any fixes required to ensure 3rd party integrations are up to date, secure and functioning.
    b. 3rd party integrations may include:
        i. Google Maps
        ii. YouTube
        iii. Google Analytics

4. Drupal Support
    a. Minor version updates and security patches
    b. Deployment support

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

c. Administration View bug diagnosis and resolution

d. Additional local environment setup for ensured redundancy

5. Quarterly Services Reporting

a. Incident tracking and diagnosis

b. Analytics review

c. Document major risks

d. Document known 3rd party feed updates or enhanced feature availability

e. Document new browser/OS and device releases

6. Supported Browsers and Devices:

Monthly Testing - We currently test for the following operating systems and devices:

Device	Versions	OS
iPhone	SE, 8, 8+, X	iOS 11.0+
iPad	Mini, 4th Gen, Pro	iOS 11.0+
Android Phone & Tablet		Android 6.0+

Note: A review of website traffic by browser and OS will be conducted to determine whether backwards compatibility is required. If any one browser or OS makes up more than 10% of the overall traffic, zu will ensure the website is optimized for that instance.

Browser	Versions
Internet Explorer	11.0+

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Safari	Latest version
Firefox	Latest version
Google Chrome	Latest version

Schedule C: Optimization Services

While Support Services ensures asset health, Optimization maintains relevancy, strategic alignment and future growth opportunities. If assets are left stale they will never achieve the long-term value intended for the business or users. We recommend a balance between investing in system upgrades and feature enhancement to keep pace with the evolving nature of web technology and user expectations.

1. Website optimization:
    a. Custom feature development
    b. Section or website-wide content updates
    c. Major version Drupal upgrades (ie. 8.0 – 9.0)
    d. Additional 3rd party tool integration, API development, microservice integration
    e. Production design elements
        i. Infographics
        ii. Data visualization
        iii. Print materials
        iv. Heuristics reviews
    f. Website template adjustments
    g. Website main navigation changes
    h. Strategy services: user testing, stakeholder engagement, design sprints, product design, and development

2. Microsite development and optimization:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

a. Additional microservice websites for campaigns or special needs

b. Development of additional websites such as a dark site for crisis communications, community websites, further form integrations

Schedule D: Service Levels

zu business hours are 8:30 AM – 4:30 PM, Monday-Friday

Team - The developers responsible for performing support services include senior zu team members including one Acquia Drupal certified developer.

Urgent Requests:

1. Impact on all users on given platforms.
2. Website or application is non-functioning or severely degraded.
3. Loss of functionality to an entire section of the website.
4. Notice must be emailed to MCA@zu.com to ensure all members of the production team and support staff are notified.
5. zu will respond within one (1) hour with an estimated timeline to address such a request within business hours.
6. Urgent requests will be resolved at the earliest possible time and as quickly as possible. The team will work continuously until a resolution is met.
7. Urgent requests brought about by actions of the Mohawk Council of Akwesasne, its host provider or 3rd party participants will be resolved. Billing costs associated with these issues will be reviewed on a case by case basis and possibly fall outside the support services budget.
8. Should an urgent request be identified and communicated to zu outside of the stated business hours, and should the issue be deemed unable to be mitigated through a short-term rollback, zu Operations will then assess the next steps on a case-by-case basis in consultation with the Mohawk Council of Akwesasne to determine an appropriate resolution.

Non-urgent requests:

1. Impact on one (1) or more user groups or any device platform.
2. Application continues to work but non-critical functionality is unavailable. Restoration is not time sensitive.
3. Application continues to work but little non-critical functionality is unavailable.
4. Request is made in Zendesk or, if Zendesk is not being leveraged, a request is emailed directly to the Product Owner PO.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

5. Response within eight (8) hours on a timeline for an estimate within business hours.
6. Non-urgent requests will be prioritized and resolved based on a mutually agreeable schedule.
    a. This doesn't include downtime that might occur due to the host provider.

MCA Responsibilities:

1. Grant zu access to MCA's facilities, information technology infrastructure, information and data, and personnel for the provision of the services.;
2. Maintain backup data, and perform all other tasks required or recommended by zu to prevent or mitigate any loss or damage to MCA's data or other information arising out of the provision of the Services;
3. Comply with all reasonable procedures and requirement of zu to facilitate and assist in the provision of the Services
4. Perform those tasks assigned to MCA conscientiously and using qualifies and competent personnel;
5. Active communication with the zu team, and bi-weekly meeting attendance;
6. Drupal CMS content authoring & publishing, including;
    a. The editing of existing and addition of new content and documents
    b. Creation of new pages using existing content and page types
    c. Management of Content Menu Settings and URL Paths
    d. Rearrangement and addition of menu items

Schedule E: Quarterly Performance Reporting

Availability (Current Month; Previous Month; YTD):
- Service Time
- Unplanned Downtime Duration
- Maximum Downtime Duration
- Number of Downtime Occurrences
- Total Page Failures

User Experience (Current Month; Previous Month; YTD):

Executive Summary

Our Smart Cities Challenge: To reduce the prevalence of new cases of diabetes at Akwesasne to the rate of the Canadian average. Our goal looks rather humble, to only be as bad off as the rest of the Canadian population. With this statement, however, the people of Akwesasne draw a line in the sand against the existential threat of diabetes. And our work maybe beneficial to others: Recent research reviewing 111 studies worldwide confirmed a disproportionate burden of diabetic disease complications among all Indigenous peoples regardless of their geographic location.

(From: Global complication rates of type 2 diabetes in Indigenous peoples: A comprehensive review)

We recognize that the situation Akwesasne folks now face was ultimately caused by our loss of traditional ways. A steamroller of westernization disrupted our traditional lifestyles, polluted our natural food sources, and dropped on top of the Akwesasne territory three complicating political jurisdictions, not of our making. Our skills and competencies in the old ways lost relevance. Our elders' ability to provide guidance using traditional teachings and ceremonies was derailed. The temptation of western consumptive habits and modern food, that is, frankly disease causing exacerbated our genetic susceptibility for diabetes, as did our now overly sedentary lifestyles. Our traditions sought to preserve our unique relationship with the environment, to make us a sustainable society. This has been replaced by our acceptance of living in a negatively altered state, and of accepting the need for modern medicine, which does not bring us back to health. It does not cure but keeps us in a state of perpetual decreased vitality.

But how to reverse this trend towards ever worsening health? How can we address this problem in a new way?

We became aware of how organizations and industries were re-inventing themselves and disrupting their existing situation for the better through the use of Design Thinking. With our partners, we learned how to get to the root of our problem, and how to come up with ideas to solve the problem.

We wanted to have all of our community involved. We wanted to make our work transparent so our residents' relationships with our public organizations and with each other would be stronger. We wanted our people involved so the solutions that are

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

designed will work for our people because they were part of developing where we are going at every step.

We started by looking over everything we had previously studied. We brought together our people singly, in groups, and remotely through surveys and phone calls. We discussed and identified problems. We thought of over 100 causes and solutions and then arrived at key insights regarding our predicament. We determined that the precursors leading to high levels of diabetes are related to these rather straightforward factors:

- Food Accessibility
- Network Accessibility
- Transportation Accessibility
- Westernization
- Checkup Frequency in Health and Dental
- Healthcare System Disconnection
- Loss of target demographic following primary school.

(These will be explained in detail later in our proposal).

We learned that the way forward for the health of Akwesasne must be a multipronged approach, working on many battle fronts at the same time. In our own traditions of health we remember from a Haudenosaunee perspective Goodmindedness, Peacefulness, and Strength are synonymous with a unified mind, body, and spirit concept. Similarly, our ability to achieve a healthy state will focus on four pillars that summarize our insights: Wellness, Tradition, Access, and Measurement. These Pillars will become themes for our actions in our Smart Cities approach, and take the form of new tools, and a new way of communicating, remembering and teaching. With the help of technology, the way forward is for us to accurately understand our own condition, organize ourselves for change and then make change happen in measurable, adjustable ways.

In the big picture we are where we are because we could not adapt when westernization and industrial technology changed our environment. This is the same story for Indigenous people the world over and is also a story of misused power. While it is regrettable our current environment offers us much less in many ways then it once did, it also has new things in it. Our elders could walk into the bush and point to dozens of things that had nutritional, medicinal or cultural uses. Now our environment has technologies and machines that we need to recognize as useful and use. And not just use, but develop our own skills in their use.

In the years since we were forced to abandon traditional ways and lost our self-sufficiency, the spirit of our community was also damaged. The disruption to Kanikonhriio or Goodmindedness, and Sken:nen or Peacefulness, led to the loss of our strength in looking after ourselves and each other. It weakened our self-worth, our contribution of shared effort, our access to teachings; all were made difficult. Even food in our own territory can no longer be

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

drawn from the river or grown safely.

Yet the strength of our community can be reinvigorated, especially if we tackle the issue of diabetes. We can make use of new technologies such as mobile communication to help us function like a community again. Systems can be introduced that will make us strong together by keeping us in touch, by responding to each others requests for help or to learn; we can share our learnings and join one another in healthy activities, and get to know one another.

Our health challenges are made harder because we don't know one another. Not in the causal sense of knowing but in the sense that our health services don't have proper information on our individual health. The fracturing of our community across jurisdictions and health districts means we can hardly even know ourselves in the sense of having an accurate medical history, often spread across provinces and countries. So how can we understand the health status of our community or plan to improve it? A mobile application, designed for the purposes of organizing us and our information can give us back this glue that can make us a community again. Modern tools can make our problems understandable, and allow us to find insights into our condition so we can develop ways to reverse our maladaptation to this still relatively newly imposed environment.

Now, in thinking about how technology can help Akwesasne, and what the Smart Cities challenge may permit us to accomplish, we started with a new way of thinking as a group. Design Thinking helps organizations innovate, which is really just a word for adapting. And this approach allowed us make up time for those years when we weren't adapting; we wanted to move ahead but had trouble deciding what needed to be done. Now we have gone over what we know, focussed on a challenge, engaged our community, developed some momentum and made a plan that uses smart technologies as an antidote for the issues caused by previous modernization.

Akwesasne has recognized the Smart Cities Challenge as an opportunity to face our hardest challenge. It has brought our community together and we have found a way to organize ourselves to move forward. While much of the world's technology had caused problems for us in the past, we will now use technology as a raw material to regain our vitality.

Our plan for adoption of technology will be on our terms. Our project probably does not seem earth shattering, which is a rate of change we find disconcerting, anyway. Through the use of about a dozen electric vehicles, the construction of 3 greenhouses adopted by the school curriculum, and a mobile application we can put in everyone's hand we plan to attack the 4 pillars of our challenge. With this limited investment in machines and software we will address the insights about our predicament.

Key to organizing the strength of our community will be the mobile and administrative coordination tool we are calling the Akwesasne Community

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Application. This brings everything together by providing communication amongst our people, coordination of services, access to food and community programs, measurement of service efficiency, and tracking of individual health. With these tools and oversight, we will make progress on our challenge, and reduce the rate of new disease to the rate of other Canadians. It would be nice to target the rate of diabetes in our people of 200 years ago, but for now it will be a major goal to achieve the health of other Canadians.

Our success will represent a watershed in our history. This will be where we began to defeat the most significant health risk for our people. This is where we began to improve the most significant factor for achieving a happy life, that being good health. Our elders knew how to make the most of what the environment offered; we can use that approach again. Tech is like a new herb, we must understand and use it. We will put it to use without obliterating the traditions that are our identity. We will use it while maintaining harmony with the environment.

We can use new things like e-cars and e-buses to get where it is important to go, without adding to the toxic load by burning oil. We can use greenhouses to replace our polluted food sources and gain back a measure of self-sufficiency. Mobile and computer programming can bring back the sharing and helping on which our strength as a nation was based. Digital tools will give us access to our collective memory and to the wisdom of our traditions, from which we regain pride necessary for our progress as a people. Our traditional teachings shows how strength is based on things working together. We will use that approach to work on many things at once to reverse the main threat to our health.

We believe this solution is extensible. Our package of ideas, with its mobile technology, databases, integration of health devices, location sensing, health diagnostics, statistics, transportation logistics, electric vehicles — these are all details to be adjusted for each case. At the center, however, will be the open-source system that is the hub of the services, and this is a non-proprietary system suitable for hosting anywhere. What we have learned, the approaches we take, the way we integrate the very new with the old will surely be helpful to aboriginal nations across Canada and the world over.

We are not the only people whose nation has been knocked out of harmony with the environment because of colonialism. We are not the only aboriginals whose communities were disfigured by imposed change and 'progress'. Regardless of cause, other indigenous people around the world are vulnerable to developing diabetes at the rates we are. They would surely benefit from our experience with this project. They would be welcome to our technology.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Vision

The goal of our Akwesasne Smart Cities Challenge is to leverage smart technologies to reduce new cases of diabetes in Akwesasne to the Canadian national average. Six months ago our preliminary proposal laid out four pillars of focus, and we hold true to that vision in both our process and outcomes. These four pillars are improving approaches to community wellness, incorporation of holistic Indigenous practices, improved access to community services, and finally, tracking of health diagnostics for a measurable approach.

Community Wellness

The approach to our first pillar, community wellness, calls for making existing opportunities more accessible, increasing the number of people taking advantage of these initiatives, while simultaneously improving the existing systems supporting them. The Mohawk Council of Akwesasne, Community Health and numerous individuals in the community provide a number of opportunities for the improvement of physical, mental, spiritual and emotional wellness in their community. These programs include The Green Food Bag, a service offered by the Department of Health, which provides fresh fruit and vegetables to households at a low cost on a monthly basis; daily yoga, pilates and fitness classes at the recreational center, free cooking, knitting, art, and taekwondo classes. Also provided is an adventure club that takes groups of individuals outdoors to experience nature through hiking, bike rides, fishing, and other activities. These are just a few of the many programs and opportunities available to the people of Akwesasne. Unfortunately, participation rates are rather low with stagnant growth uptake. Many individuals are restricted to the programs in their own district or are unaware of when and where things are happening. Our proposed solution will address these impediments in a multi-faceted approach, through improved intrinsic motivators of awareness; ease of scheduling and community connection; by improving accessibility via more affordable transportation, and through measuring the effects of our efforts to further improve existing services.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Adding to the lack of community wellness is the barriers to healthy food sources within the community, including long drives to grocery stores, and high levels of mercury in both the Saint Lawrence River and surrounding soil, stealing our traditional practices of gardening. To address the issue of food insecurity and inaccessibility, we will implement three Smart Greenhouses through a phased roll-out approach at each of the Akwesasne Mohawk Board of Education (AMBE) Schools locating one in each district. The intention of this project is to first create a curriculum based on agricultural education teaching years 6 through 13 on how to grow fruits and vegetables with the importance of a healthy diet. The second goal of this project is to help address the transportational barriers by using students as a vehicle to get healthier options onto young families tables. Lastly, gardening promotes physical health, mental health through stress relief, exercise, brain health, nutrition, and healing, which is not only a contributor to reducing pre-diabetes, [redacted]ut also following the teachings of our [redacted]ndigenous and Mohawk practices.

[redacted]Our Greenhouse implementation is planned [redacted]o be fully automated including temperature [redacted]control, the amount of light saturation, [redacted]umidity levels, soil moisture as well as [redacted]ther factors. Smart greenhouses can [redacted]e controlled remotely over the cloud [redacted]hrough an application, eliminating the [redacted]eed for a person to be present for most [redacted]perational needs. By using IoT, sensors [redacted]nd actuators, factors such as temperature [redacted]nd humidity can be monitored remotely, and changed based on needs to create the most viable growing environment for the products. Although fully automated, connecting children with the natural world and allowing them to explore the outdoors, including our school gardens, will be an integral part of our integrated curriculum. Students work in the garden, weeding, watering and tending to the beds. Classes utilize the space for lessons in science, social studies, math, reading, writing, and painting. A living laboratory, children are growing, experimenting, observing, measuring, comparing, and learning to care for something that is important to the Akwesasne Mohawk Board of Education and to sustainability efforts around the world. A garden is as much a story about the people who create it as it is about the garden itself. School Greenhouse Gardens are spaces for "hands-on" education, incorporating the full cycle of learning associated with healthy food - from growing to nutrition to cooking and eating. This will provide hands-on learning experience and a living classroom for Akwesasne.

Incorporation of Indigenous Community Practices

Many of the issues we face, and particularly the challenge we are experiencing with diabetes, can be attributed to the loss of the traditional ways of diet, activity levels and mindset. To tap into the strength of our traditions we will be integrating these cultural beliefs that served us well for centuries. These practices, even if put to use in combination with modern

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

technologies, will once again help us regain our vitality.

Our intention to incorporate Indigenous Community Practices means we will approach health and wellbeing from more than just the modern clinical perspective. Akwesasne is part of the Haudenosaunee Confederacy and remains connected to our traditional roots. Holistic Indigenous practices encompass three principles that were introduced to our people as the Peacemaker traveled the land: Kankonhriio or Goodmindedness, Sken:nen or Peacefulness, and Kasastensera or Strength. This teaching became known as the Great Law of Peace. Essentially, what the Peacemaker taught throughout the territory was that the practice of Kanikonhriio or Goodmindedness would bring Peace or Skennenkowa to the people in the land. When the Peacefulness was pervasive through the territory, the people would gain a Strength or Kasastensera that could not be overcome by negative forces. From a Haudenosaunee perspective Goodmindedness, Peacefulness, and Strength are synonymous with the concept of mind, body, and spirit. This holistic approach to wellness has gained significant traction in alternative healing practices. The popularity of respecting the interrelationship of mind, body, and spirit is undoubtedly due to its effectiveness, especially in combination with modern medicine or as an alternate. In the Haudenosaunee Wellness Model, the 'health' of Haudenosaunee individuals, families, clans, communities, nations and overall confederacy can be measured using indicators strictly from our teachings and cultural mores. Likewise, an individual can receive guidance on a process to return to a state of 'health' using our traditional teachings and ceremonies.

The Haudenosaunee Environmental Task Force has proceeded with a project to develop an environmental protection process based on their Indigenous world view and relationship with the natural world. Such a process enables individual nations and communities of the Haudenosaunee to protect and restore the natural world, while helping to preserve their unique relationship with it, as a sustainable society. The process devised criteria and indicators for health of the natural world including people, which has a foundation in Haudenosaunee culture and traditions.

Through our Smart Cities Challenge proposal we keep these teachings and values at the center of all solutions, smart or otherwise. The Akwesasne Community Application will embrace holistic Indigenous practices through the teachings it contains the insights it provides to users, and the accessibility of these resources. The application will simply provide the means for the people of Akwesasne to achieve and maintain Good Mindedness, Peacefulness and Strength.

Improved Access to Community Services

The geographical footprint of Akwesasne is unique and includes jurisdictions in Ontario, Quebec and the state of New York. For many citizens, significant distances, travel

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

times and border delays both ways impact accessibility to major services. This limits our access to facilities and infrastructure where physical health, fitness activities and training are provided as well as accessibility to fresh, healthy food.

Without personal vehicles, getting between major public hubs or to a grocery store, fitness and recreation centers, or healthcare providers is unfortunately challenging, and a real impediment to these trips occurring. Right now Akwesasne relies solely on taxi-cab. These companies — based out of surrounding cities Cornwall, Ontario and Massena, New York — charge high rates to travel into the districts of Cornwall Island, St. Regis, and St. Snye. Additional charges accrue due to the extremely sparsely populated community and additional drive time to come into the reservation. Our plan in overcoming this challenge is to bring affordable and accessible public transportation to the community of Akwesasne. To do this we will organize a Mohawk Council of Akwesasne (MCA) subsidized taxi-cab service, as well as designing and beta testing a project for on-demand electric public transit bus services. Through these two transportation initiative we will facilitate the important movement of our citizens between our districts and to needed services including fitness and recreation centers, healthcare providers in various locations and to purchase food at grocery stores. Through a phased roll-out approach we will begin by purchasing an electric vehicle per district in order to gain feedback on the program and truly understand our capacity requirements.

Based on the preliminary research this will lead to four cars per district, a total of twelve cars as allotted in our budget.

Tracking of Health Diagnostics for a Measurable Approach

The prevalence of Diabetes in First Nation communities is disturbing. Diabetes Canada states the rate of diabetes for First Nations individuals living on a reserve is 3-5 times higher than other Canadians. The Canadian national average is 9%. The rate in Akwesasne is 33%. While we plan to include many measurements in the Smart Cities system — to help us understand and influence patterns of behaviour, optimize services and logistics, to provide feedback to help in the iteration of ideas — one measure is preeminent in our challenge: the number of new cases of diabetes in Akwesasne. This one number must be reduced to that of the Canadian national average. This is the goal which all the other pillars and tactics will be organized to achieve.

Consistent with research on diabetes in First Nations populations, the Akwesasne rate is more than three times the Canadian average. Through the aggregated data received from the Akwesasne application, CANRisk surveys completed within the application, individuals referred to the diabetes prevention and management team as well as the number of new cases of diabetes in Akwesasne, we can measure the relation between our efforts and the Smart Cities Challenge initiatives with a real change of diabetes in Akwesasne.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

(CANRisk surveys provide questions that help individuals determine if they are at higher risk of having pre-diabetes or type 2 diabetes.)

Apart from the measuring of health outcomes and diagnostics indicative of medical issues, our work with the Mohawk Council of Akwesasne Executive team also narrowed in on Key Performance Indicators that would indicate if our solution was having a positive effect on the factors contributing to health outcomes; for example, were our chosen tactics shown in the behaviors of the community? Were our solutions achieving key objectives? The Akwesasne Community Application and digital ecosystem through which transportation and participation rates can be collected and analyzed is central to the measurement and understanding of these contributing KPI's.

To address this pillar, and the key performance indicators contributing to your Challenge statement we will collect and aggregate all of the data gathered from the application including CANRisk survey results, usage rates of programs and services, and progress of health metrics in aggregated form and display it in a dashboard view for the Mohawk Council of Akwesasne. This will allow us to understand both baseline data within our community and understand how our efforts are relating to decreasing the new cases of diabetes.

With these four pillars — Wellness, Tradition, Access, and Measurement — at the center of our Smart Cities Challenge, we will improve community wellness by developing better services while creating more affordable access to them. We will incorporate Indigenous Mohawk culture to tap the wisdom held in our traditional teachings and approach all issues with a more holistic mindset respectful of nature. All the while measuring movement towards targets, to show proven results or highlighting a need to adapt to better serve our people.

Reflective of the true needs of the community; as demonstrated through a compelling body of data and evidence and extensive resident engagement. Ambitious, achievable, and meaningful for the community and it's residents.

A human centered-design approach is based on delivering solutions that meet the true needs of the community, that are meaningful, that are aligned through initial and ongoing engagement with the end users. Consequently, our Smart Cities team has kept Community Engagement at the forefront of our Smart Cities Challenge solution. Over the past seven months, we have implemented the Design Thinking methodology in its many forms, facilitating workshops with important user groups, surveying and interviewing internal and external stakeholders. And, as this information provided direction and formed into ideas, prototypes and application interfaces, we gained feedback from Akwesasne community members on our solutions and how they should iterate via rounds of user testing. Our partners,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

zu, knows from experience that it is best to "measure twice and cut once" in designing solutions, which means keep users in the loop until things are completed, or one is likely to complete the wrong thing.

Using the Design Thinking process our outcomes and approach ensures the true needs of the community are served. Community members are the ones who both identified the problems and helped ideate the solutions. They were and are conferred with every step of the way providing feedback on solutions, voting on the best implementation strategies, and user testing our prototypes. In the past consultants sought to implement their own "expert" ideas in prescriptive ways; in Design Thinking, however, users are encouraged to critique things and provide their ideas on what would be a better implementation for the community.

In addressing the question of whether our identified challenge is meaningful to the community, we put forward this data point. During our community engagement events, we surveyed all individuals in attendance and found that 82% of respondents had either suffered from Diabetes themselves or had a family member who did.

Ambitious, achievable and meaningful for the community and its residents

When we look at our Smart Cities Challenge Solution, we believe our challenge statement defines ambition. Despite advancements in medical treatments and technology, diabetes remains a prevalent chronic disease that afflicts a huge number of Canadians and more specifically, Indigenous people. We recognize that reversing the prevalence of diabetes in Akwesasne requires a strong desire, determination, and hard work. This will mean, first, work to be done by the community and the vendor partners in determining what tools will come into existence, followed by commitment by our community members in engaging in the new systems and supporting these new approaches to health, fitness, and traditional mindsets. It is an ambitious undertaking to address a problem affecting so many individuals in the community, across Canada and around the world. We are excited and driven by the opportunity to create a healthier Akwesasne, as well as creating an approach that is intended to be extensible and actually extended to a much wider population.

Although our challenge is ambitious and potentially far-reaching, we have taken a very practical, grassroots approach to solving it. In looking at the many software project debacles over the past years, we observe the common problem that these systems were designed by experts for the many — but failed for the individual users — and so failed for the many, too. We started with individuals as we believe if our approach can be confirmed to work for one it has a much greater chance of working for the many.

The community is telling us our solution, the one they have helped us to develop is

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

achievable. While there are more science-fiction oriented tech in existence, our choices, though less appealing, are based on proven technologies with the basic goal of providing our people with better access to the essentials of life.

- Smart Greenhouses Agriculture solutions account for 6% of all IoT projects, giving us confidence in a successful implementation with capable partners in order to cut operating costs and make the most of the available arable land in Akwesasne.
- The use of electric vehicles (EV) continues to grow with nearly 50,000 plug-in vehicles in Canada and the growth of 68% in 2017. Our Smart Cities Challenge will implement this proven technology as an economic and environmentally sustainable approach, which also meets the practical challenges of transportation for people, and the delivery of quality food and services.
- Design Thinking is reshaping service delivery and product design in industries from tech to banking and everything in between. Business consultancies are buying up Design Thinking shops as they have recognized the importance of Design Thinking to organizational strategy and success. We have chosen to use this approach to identify opportunities and problems and to produce solutions always in touch with our citizen users.
- In partnering with zu we are tapping both their expertise in Design Thinking, but also in their high success rate of creating digital products that centralize an array of components and capabilities. We will create an integrated technological solution that combines mobile applications with an administrative back-end while integrating third-party services and information feeds from other systems associated with services, greenhouse inventories, event scheduling and so forth. Our solution requires us to bring services, educational components, scheduling, information collection, and other capabilities together through a hyper-localized web-application to achieve success through a holistic system of seamlessly flowing parts. The Akwesasne Community Application will be used as an education tool, management software, expediter of services, and a collector of information.

Well-suited to a smart cities approach

Being a Smart City can mean many things. It can look very different depending on where you are and what is your pre-eminent challenge or opportunity. But the objective is always the same – using technology to create a sustainable future and improve the quality of life for people. As we come closer the end of our finalist phase, we are confident our solution takes on both this Smart City approach to technology, but also its approach to openness, integration, transferability, and collaboration.

Openness derives from our commitment to

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

building this project with the community, and not for the community. Unlike many technology projects, we are not using a team of experts working in secret to produce something without their input, which our citizens will then be trained to use. Openness is embodied in what this is for and how it will work. Openness is also driving our planned collection and sharing of data and results, which are used to motivate improvement at an individual and group level, so progress can be celebrated as we move towards improved health. And openness also requires transparently communicating data collecting, use and disclosure with our users, always respecting privacy best practices.

Integration is embodied in the development of tools that fit into the lifestyles and activities of community members, rather than requiring our folks change to fit the system. Integration is represented in the interaction and interdependence of the capabilities we plan to develop in the Akwesasne Community Application. Each capacity — education, transportation, access to services and better food — enables or relies on the next, supporting our recognition of the interplay of curasitive and curative elements associated with our challenge. This dependence of factors is supported by our traditions, where mind, body, and spirit are supportive of a combined single strength. Our traditional teachings tell us there is a wholistic state of balance where maximum strength is attained. Our people can receive guidance on a process to return to a state of 'health' using our traditional teachings and ceremonies. In this case, technology will help us organize and integrate an additional combination of knowledge, tools, accessibility, transportation, measurement, feedback, health services and nutrition. All facets will be integrated in a virtuous circle to achieve more than the sum of the parts.

From the beginning, the approach has been about engaging our community, being open to ideas and feedback, and relying on even the most basic direction of identifying: What do we want this to be about? We believe that a human-centered design and co-design approach consistently produces a collaborative solution for the people and by the people. When one looks at our Smart Cities Challenge integration is a pivotal piece of it, we bring together Healthcare, Education, Public Transportation, Community Initiatives including recreation Integration is a large piece of our project, bringing together many essential services from nutrition, healthcare, education, executive council, public transportation services, data management, traditional practices, and more into one silo and system to provide seamless and high quality service to the community of Akwesasne. This is what integration means to our Smart Cities Proposal, it means bringing people, business and essential community services together to make them more accessible and affordable through collaboration.

Our strategy to solve the challenge that addresses root causes; it targets opportunities for improvement that also exist for many Indigenous communities the world over. As success is realized our

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

approach should be shared. Our system ideas and components can be reused, whether as open-source software or as open-source ideas, all non-proprietary. The technologies will be able to be redeployed in other jurisdictions, incorporating modifications for changes in detail relating to specific communities, health measures, locations, educational elements, transportation challenges, targeted medical conditions and so forth.

National survey data has consistently shown that the national age-adjusted prevalence of diabetes is 3 to 5 times higher in First Nations than in the general population. Diabetes within Indigenous communities The higher rate of adverse health outcomes in Aboriginal peoples is associated with a number of factors, including lifestyle (diet and physical activity), genetic susceptibility, and historic political and psychosocial factors, stemming from a history of colonization that severely undermined Aboriginal values, culture, and spiritual practices. Barriers to care that are unique to Aboriginal settings also exacerbate the problem with fragmented healthcare, poor chronic disease management, high healthcare staff turnover, and limited or non-existent surveillance. In addition, social determinants of health, including low income, lack of education, high unemployment, poor living conditions, lack of social support, negative stereotyping and stigmatization, and poor access to health services compound the problem. This is common across Indigenous communities, and we believe the barrier facing the community of Akwesasne is common across all Indigenous communities big and small throughout Canada. We believe our Smart Cities approach, built with open source tools, solving problems people across Canada are facing makes transferability opportunities endless.

The Mohawk Council of Akwesasne and our digital consultancy zu have come together to build something greater than the sum of its parts. We at MCA bring a wealth of knowledge to the table about the barriers our people face, but also about the capabilities we have, and the strength of our teachings rooted in our culture. zu brings an ability to plan and deploy digital strategy, to build digital tools, and a proven knack for driving digital transformation at municipal, provincial, and federal levels. In combination, we bring an incredible amount of insight and opportunity identification to the Akwesasne Smart Cities Challenge. Our partnership to date has resulted in highly satisfying progress. Because this will be an ongoing battle against the challenge of diabetes and for the pillars of health, and given that technology is a rapidly adapting toolset, we expect this collaboration will span more than the timeline of this Challenge. Together, and with other partners, Akwesasne will foster a sustainable future for our people. And if we are successful, we will seek to share our learnings to improve the quality of life of other aboriginal communities, and others, across Canada and beyond.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Performance Measurement

Using the tools and approaches developed by our solution will enable us to coordinate and collaborate on the necessary changes we need to reverse this plague of diabetes. We bring our sense of community and friendly competition to the table to challenge one another to be our best. The Smart Cities technology we have prototyped will tie in actual results on the behaviours we seek to modify, showing us where to go to next, and transparently reveal whether we are elevating ourselves into a new era of health, or further deteriorating. Our traditional ways will give this new technological approach the heart that it needs in order for it to be relevant to us. The outcome is admittedly ambitious, but it is achievable and so important to achieve.

The outcomes of the success of the implementation of our Smart Cities proposal are measurable first in the principle goal figure of reducing new cases of diabetes, and secondly, in the lifestyle measures that reduce the risk of diabetes. All measures are available to be measured by our application through unlinked aggregation. These specific measures include.

- The capacity of public transportation
- An individual's distance to programs and services
- Citizen awareness of available programs and services
- Number of people attending public programs and services or using videos within the app.
- Number of people completing in-app challenges or Competitions
- CANRisk surveys completed in-person, and through the Akwesasne Community Application.

Avoidance of diabetes going forward would indicate a major overall improvement in health and well-being for this community, and provide a way forward for other communities that adopt the protocol we will model.

In combining the new digital tools and medical knowledge the modern world provides with our traditional approaches that protected our health and environment in the past, our community will build a modern foundation of health to move forward, as with health, all things are possible.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

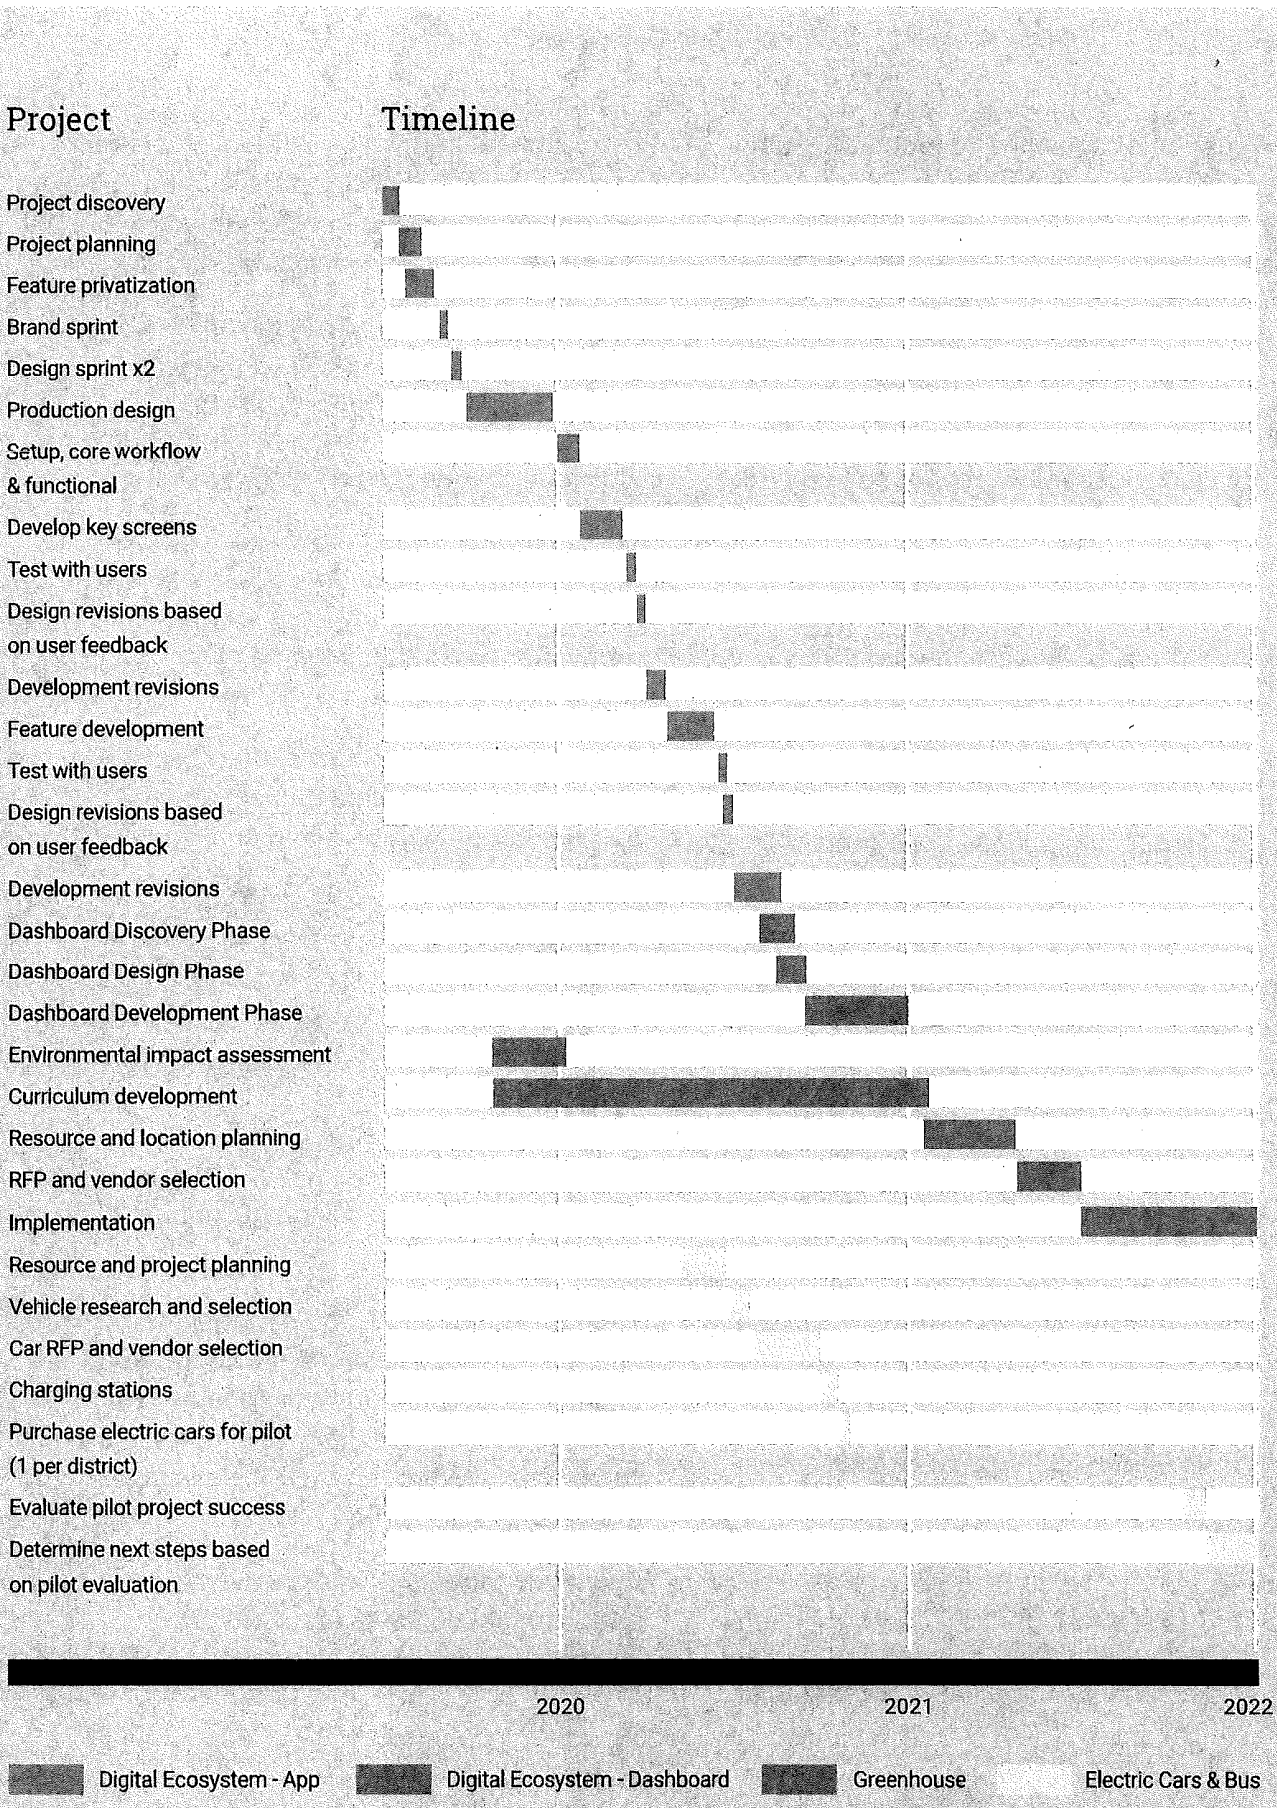
Project timelines, deliverables, and milestones that are ambitious yet attainable

Our project timeline spans a total of 24 months with notable milestones throughout that frame. Implementation of the application, dashboard, greenhouses and electric transportation system will all fall under this 2-year approach. Broken into a 4 phases, like many software projects, the creation of our application and dashboard will entail the strategy and validation of our findings to date as well as design and development. Working in tandem, the implementation phase of the Greenhouses and Transportation System will be completed with the same time constraints due to feature reliance on application qualities.

- SEE TIMELINE ON PAGE 20
- SEE MILESTONES ON PAGES 22 – 24

Our planned health and wellness initiatives contained in our solution are intended to reduce the prevalence of new cases of diabetes. Measurement is critical to monitoring the impact of these initiatives on stemming new cases of diabetes. In a workshop format organized by our consultants at zu, our Directors of the Mohawk Council of Akwesasne identified key performance indicators believed to capture the essence of our planned approaches. Working collaboratively, we developed 3 core metrics to measure the effectiveness of our initiatives health and with each metric, we ask 5 critical questions. Our 3 core metric categories are Access, Participation, and Screenings. Our 5 critical questions regarding each KPI are: Why does it matter? What affects it? What can we control? What are the measurables? What are the targets?

Key Performance Indicator #1: Accessibility



The Access KPI is defined as a measure of accessibility by community members to public health and wellness programs. For example, individuals seeking opportunities for active living, seeking health care, or at-risk individuals meeting medical program requirements. Measurable factors include the capacity of public transportation, an individual's distance to programs and services, and citizen awareness of available programs and services.

Why does Access matter? Transportation, location and awareness of opportunities all impact the community's and at-risk individuals' ability to live active lifestyles, obtain healthy food options and take advantage of any services not in their home location.

What affects Access? Home location, income, access to public transportation, access to an automobile, distance to the desired service, location of healthy food options.

What can we control about Access? Transportation options, scheduling, and coordination of transportation options, the

location of activities, location of healthy food options, delivery options.

Access Measurables - Program and services enrollment numbers, program and services communication engagement (social media engagement, application analytics, communication reach). Public transit capacity and utilization (seats available, usage). Greenhouse Food Box delivered/picked up.

Access Targets - Increase in program and services enrollment, increase in public awareness of Akwesasne programs and services, increase public transportation capacity, increase in public transportation usage, increase in the number of locations for healthy food options, increase in healthy food options used.

Key Performance Indicator #2: Participation

The Participation KPI is defined as the number of community members and at-risk individuals making use of public programs, services and completing app challenges. This includes the number of people attending public programs and services and the number of people completing in-app challenges.

Why does Participation matter? Participation levels indicate the uptake of these programs, services, and app challenge uptake, and are a precursor to them having positive effects. Tracking will inform future programming by indicating that oversubscribed programs should be scaled, and less popular ones should be re-examined. Initial participation levels for community activity will establish a baseline, so that modifications can be shown to improve or reduce participation levels.

What affects Participation levels? Location of opportunity, distance, accessibility, weather, quality of offering, ties to Akwesasne heritage, the motivation of the individual, awareness of opportunity.

What can we control about Participation levels? Access to transportation, the location of opportunity, cost, awareness, motivation, quality, association with Akwesasne heritage.

Participation Measurables - Number of attendees for programs and services, number of completed in-app challenges, feedback on the experience.

Participation Targets - Increase participation number for programs, services and app challenges. Increase participation numbers in targeted age groups: youth, family, and senior.

Key Performance Indicator #3: Screenings

The Screenings KPI is defined as the number of CANRisk surveys completed by undiagnosed community members. This includes both CANRisk surveys completed in-person, and through the Akwesasne Community Application.

Why does Screening matter? Early intervention in diabetes risk factors can prevent long-term illness; broader

community CANRisk screening results establish a baseline from which our challenge can measure its overall effectiveness; a CANRisk baseline allows comparison of community rates to national standards; a CANRisk baseline provides a clear picture of those at-risk in Akwesasne.

What affects Screening participation rates? Education about diabetes and health risks; awareness of what the survey results mean; public perception, access to survey.

What can we control about Screening participation rates? Increase the availability of survey; increase education and awareness of what individuals should do given the results of their survey; facilitating streaming of at-risk individuals to clinics for preparation of personal plans for diabetes prevention.

Screening Measurables - Number of CANRisk surveys completed; the number of individuals recommended to health professionals.

Screening Targets - Increase in the number of CANRisk survey completions; increase streaming of at-risk individuals to clinics for personal prevention plans.

Project Management

HUMAN RESOURCES

The Smart Cities project will provide many benefits towards new skill development, as well as full and part time labour opportunities. Part of the value of these employment opportunities will be knowing that the work directly benefits our community and has the higher purpose of improving health outcomes and quality of life at Akwesasne. There are many specific roles to fill, which we are confident we can recruit — or train and recruit — from our own community.

- For overall project oversight, A Project Manager position and an Assistant Project Manager will be secured to oversee the components of the Akwesasne Smart Cities project.
- To prepare the team for the Smart Greenhouse System, Economic Development will organize and familiate an agritech course so that the community will have a trained workforce from which to choose the actual employee team for the greenhouse implementations.
- Electric Public Transportation System drivers for the three small electrical vehicle programs — the Smart Taxi Service, the Smart Health & Social Programs Delivery, and Food Delivery Services (all for people), as well as drivers for them — will be secured through a job opportunities program drawing from our local employment resources. This will provide our programs with a pool of applicants from which we can select the best team members.
- To facilitate our community member end-users' use of the new technology, we will recruit Akwesasne high school students who will be put to work through a Best Matches program within our community centers in order to offer assistance to the elderly and other technology challenged community members. Here the young will mentor those who would like to learn how to better utilize their smartphones so as to make full use of the Akwesasne Community Application System, and all its various capabilities.
- In addition, our Mohawk Council of Akwesasne Information Services technical team will be trained by our technology partners (zu) to support the technical requirements of the Community Application System Administrative functionality, which is to be housed within our territory. This is

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

the back-end to the mobile Akwesasne Community Application System and is responsible for organizing and supplying the mobile app with much of the information it presents. The training will ensure the Akwesasne Information Services technical team can maintain and administer the system, publish to it, update the app with information, news, educational elements, food inventories, maintain interactions with third party payment systems, make use of the information it aggregates, and so forth.

- **Electric Public Transportation System under-use may impact its viability**

  As the planned Electric Public Transportation System — consisting of the Smart Taxi Service, the Smart Health & Social Programs Delivery, the Smart Delivery Service and Electric Bus Services — is planned to collect minimal fees, there is a risk to the financial viability if there is underutilization of the capacity. This could creates an unsupportable cost burden. While there is a possibility that the smart taxi service may not be utilized, this risk seems rather small given the enthusiastic reactions noted at the community engagements. All have been strongly supported with "Can't wait!" attitudes toward a local taxi service at affordable rates.

  - Mitigating the case of low ridership for the electric vehicles, a fall back deployment is that the bus will still be utilized for the planned weekly runs our college students make to the Iohahiio facility.

    - Mitigating the case the case that the smart taxi and delivery services are not utilized, these vehicles will be re-allocated for use with the health and social programs.

- **Greenhouses in particular locations are underutilized**

  The activities associated with management of the greenhouses in the Smart Greenhouse System will be incorporated into the Akwesasne student curriculum. A greenhouse will be located at the Akwesasne Mohawk School with the purpose of learning and food production. If this greenhouse is not used to minimum required levels the AMS School's greenhouse there is a risk to the viability of the greenhouse system.

  - Mitigating the case of underutilization of the AMS school greenhouse container, that unit will be moved to closer to the Environments Offices and utilized within the agriculture sector for food production. Alternately, it can be relocated to the Iohahiio Education facility and be utilized for future adult courses on Innovative Growing Techniques.

  - This risk is highly un-anticipated as all greenhouses will be worked into the curriculum of the school.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Procurement, including alignment with technology and partnership requirements

MOHAWK COUNCIL OF AKWESASNE PROCUREMENT STRATEGY

Our procurement strategy prescribes that when making purchases our council reaches out to at least three vendors through an RFP Process. For this purpose a purchase team is formed generally involving a finance department representative, a project manager and a manager representing the department impacted by the proposed purchase. This team then oversees the RFP process and reviews the incoming responses.

The Purchase of the Electric Bus for the Electric Public Transportation System will be administered through the Mohawk Council's Department of Community and Social Services along with the Board of Education's Transportation Supervisor. This person is key to the team as all further bus maintenance and bus scheduling decisions will be the responsibility of the transportation supervisor's position.

The intention of the Smart Taxi Service, the Smart Health & Social Programs Delivery, and the Smart Delivery Service is to create increased access of our social clients to have the means to obtain healthier foods, as well as to transport community members to medical appointments. ("Social clients" are individuals getting assistance from Community and Social Services.) These vehicle purchases and services, as well as the Smart Taxi Service Pilot Project will be organized through a team consisting of the Smart Akwesasne Team and the Social and Health Departments.

The Smart Greenhouses system purchases will be reviewed by a team comprised of the Akwesasne Mohawk Board of Education, and representatives from the Department of Tehotienawakon Economic Development program.

And, the most important precursors to desired change may not be what we are originally focusing on so our analysis of impact and influence should be somewhat adaptable.

Stakeholders, including analysis of impact and influence

ANALYZING IMPACT OF PROGRAMS

For each of our Smart Cities project initiative categories, we will put in place oversight teams best representing stakeholders of the area we wish to affect. These stakeholder teams will assist in the identification of success and performance factors, as well as contribute to the ongoing adaptation of measurements to best represent goals and progress attainment. Too many measurements, for instance, will likely be distracting from the most important factors. And, the most important precursors to desired change may not be what we are originally focusing on so our analysis of impact and influence should be somewhat adaptable.

For each of our Smart Cities project initiative categories, we will put in place

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

oversight teams best representing stakeholders of the area we wish to affect. These stakeholder teams will assist in the identification of success and performance factors, as well as contribute to the ongoing adaptation of measurements to best represent goals and progress attainment. Too many measurements, for instance, will likely be distracting from the most important factors. And, the most important precursors to desired change may not be what we are originally focusing on so our analysis of impact and influence should be somewhat adaptable.

AKWESASNE COMMUNITY APPLICATION SYSTEM

A key stakeholder — especially in relation to the central challenge regarding the prevalence of new cases of diabetes — is the Mohawk Council of Akwesasne Health Department. This department will be instrumental in delineating the types of data most important to measure to both be effective in affecting the health precursors associated with our Smart cities Challenge, but also for tweaking our approaches to increase the program's effectiveness over the longer run. Targets of change may shift focus with the maturity of our program. For instance, initial goals may be about engagement and usage rates, which later give way to focus on improving service delivery and costs, which give way to focus on renewal and expansion of educational components, cultural curriculums and even recipes. So measurement must be flexible to take into account learnings and overall maturation of the program.

A stakeholder in all data collection, especially that flowing though the Community Application and Community Application Administrative system, is the Akwesasne Information Services technical team. This team is key to the always necessary step of information aggregation, organization and preparation for analysis by the more specific department stakeholder. The Technical Team will be included for both their technical support and technical knowledge. They will help clarify other team members understanding of the information, and so positively influence decision outcomes.

The Mohawk Council of Akwesasne Health Department will be primary users of the statistics and interpretation of data directly affecting health measurements and behaviours affecting health outcomes. For instance, screening numbers, service engagement and usage numbers, activity levels, food distribution measures, attendance to health services, missed appointments and so forth.

The Mohawk Council of Akwesasne Social Services Department will be keenly interested in the performance of the Electric Public Transportation System. These statistics are key to success factors in their area of responsibility. Central is the measure of (ideally) increasing transportation usage, which when higher is strongly suspected to better the quality of the lives of the social clients.

Our Smart Akwesasne Team and the Mohawk Council of Akwesasne Health Department will be eager for statistics the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

system produces regarding healthy food delivery, number of users obtaining rides to grocery stores and medical destinations, and increases in trip numbers for personal health care evaluations or screenings. Devising methods to capture behaviours of their individual clients in accessing and making use of transportation to increase wellness is tricky. Defining the base case is also challenging as the base case for the new situation does not currently exist. Therefore, much of the initial information will be used to establish a base case from which these departments will try to build performance.

The Akwesasne Mohawk Board of Education, Department of Tehotienawakon, including the Economic Development and Environment Program will all be paying close attention to the performance of the Smart Greenhouse system. This has an educational component and associated measures of success, as students are both involved in staffing a greenhouse, but also in engaging in learning their operation, and so graduating from the course. Economic Development is seeking to create economic value from the Smart Greenhouses, in the way of jobs, job skill development, food production and food cost savings. Economic Development will also be following the measures around the development of job skills and expansion of roles in technical areas to do with the Akwesasne Community Application and Administrative Web System, as there are many associated skills to do with populating the system with information, writing, video production for traditional cultural teaching dissemination, mentoring new users of mobile tech, system programming and maintenance, social tool use and many additional skills associated with maintaining the vitality Internet based systems. Economic Development may also monitor the economic impacts of new services from both a cost and revenue outlook, as well as on the value of keeping money associated with transportation in the community, rather than that money flowing to external transportation options. The Environment Division will be able to calculate the savings in CO2 production enabled by the switch of thousands of travel miles to electric from gas powered vehicles.

Communications strategies for community involvement, training, and feedback

Following the Design Thinking processes that have gotten us this far, we are eager to continue regular community engagements through quick surveys to gain feedback and ideas, so that we can continue to improve the system. With the core of the system based on the Akwesasne Community Application, which is a mobile hub in each community member's pocket, we have an immediate tool through which we can share information, news, questions, and new capabilities.

This is highly advantageous to the rapid evolution of our services. We can both listen directly to feedback and observe behaviour. Through questionnaires, polls,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

message boards and so forth, and we can observe behaviour, measure usage stats and so gain objective data. This may be an important balance as requests for feedback are likely to be weighted towards the opinions of more active or prolific online personalities in the community, with the new users less comfortable with writing essays on their new smartphone.

Additionally, because the Akwesasne Community Application is Internet-based, additional functionality to do with surveying, for example, is only a click away. There is no value to creating our own functionality in most cases, such as for polling — that is already available for free or very low cost online. We will simply use our in app capabilities to post updates that link to surveys, or to video resources, third party educational elements and so forth.

We expect that to best increase engagement with the new Smart City tools of our diverse end users, especially with social clients, that this may best be undertaken in a combination session of in-person instruction with also the online system in hand. Education sessions and review sessions are likely to occur in this way for clients involved in the services of specific departments, to learn how this department's services are now offered via the app. For example, our social clients can be introduced to Smart Taxi, Electric Bus pickup request, and so forth —when they are meeting with case managers. Groups feeling a need for the extra nudge of in-person training can also attend organized evening community engagement sessions, where everyone brings their phone and learns about a newly released function.

Monitoring, controlling and reporting strategies and checkpoints for contingencies and course corrections, if necessary

Following the Design Thinking approach, we will use the app to gather reviews on components, experiences with the services, ideas for improvement, and suggestions on how to make things more efficient. While Design Thinking helps with direction, zu uses the Agile Method for digital product delivery. The idea with Agile is that via frequent meetings with the client, (the Akwesasne Smart Team) progress on the functionality is reviewed and tweaked very regularly, as the application moves from minimum viable product to fully featured one. This emphasizes actual experience with the tool over documentation, and is proven as the best way to deliver software products. The whole approach is about course correction, about feedback from users.

This also provides a built in approach to managing scope while optimizing end result. We've used Design Thinking to collaborate with our community to get a very strong idea of what we need; BUT, until it is in the user's hands, and they are standing and waiting for pick-up from an Electric Bus, we can expect unforeseen problems to crop up, or cool new ideas for enhancement to emerge. It may be that, at this early stage of testing, that a scheduling

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

idea for the Electric Bus is decided to be more important than some already planned feature of the Smart Greenhouse ordering, and since the greenhouse will not reach full production for another year that programming resources will be used by diverting them to the bus scheduling enhancement. So the scope is rebalanced in collaborative agreement between us and zu. Our Project Manager and their Product Owner notes this change of resource use and we move promptly on with development, without the overhead of massive documentation and change orders. When you are inventing new things this is the way to be. (If we are ordering a new community centre and it already has a complete blueprint, then the more formal change order approach is necessary.)

In regards to the purchasing of electric vehicles and greenhouses, a more detailed process of estimates, associated charges and fees, delivery and set-up, even total cost of ownership will be adhered to. Traditional cost controls are more appropriate to capital purchases. Purchasing bespoke software must also fit timelines and deliver certain features, it's just that what's in the final product will be impacted by ideas, epiphanies, and feedback and should be encouraged. Like a cook tasting their cooking along the way.

That being said, zu is well practiced in building digital products and services, including monitoring burn rates and being totally transparent with their clients as their software development project progresses. With their total team recording to time sheets, tracking progress in Jira, tracking our requests in Zendesk, all bolstered by regular weekly meetings with our Project Manager, and not even including the ongoing email, messaging and phone calls between our PM and their PO, there is little room for things to go off the rails without being immediately noticed. More formal reports are generated with every meeting and supplied to Smart Coordinator for review and action when required.

Weekly reviews of zu's Replicon time tracking system, where tasks are assigned a budget aligned to the statement of work, provides our Product Owner with real-time visibility on project health, task churn and slow down caused by blockers or delays. This information is then documented in the weekly Project Status Report provided from zu to MCA and any necessary steps to remove blockers or flag risks are discussed in weekly production meetings with the us.

There is a sweet spot between rigid timelines and development targets, and the serendipity of discovering new methods or better functionality changed by user testing along the way. zu explains they are well practiced at respecting the organizational necessity of steady progress towards agreed upon projects with the idea that we are in fact inventing the future, and the path towards invention may have a few unexpected twists and turns. Through our Production Road Map, several stage gates are implemented as a monitoring and course corrections strategy. Stage Gates are a project management technique in which an initiative or project is divided into distinct stages or phases, separated by decision points. At each of these phases,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

we will revisit scope, timeline, and budget, making any appropriate adaptations where necessary.

Approach to sustaining projects beyond the lifecycle of the challenge, if appropriate

Our vendor partners will be resources to assist us in our plans to gain a maximum lifespan from our Smart Cities Project. While we intend to be self-sufficient in the longer-term continuation of the Smart Cities systems, we also recognize that there is a need to renew and adapt the system with more modern versions of itself. At the very least there will be ongoing maintenance and enhancement of systems, with which the original vendors are expert, and can assist us in becoming expert, as well. This necessity to keep working to improve the system is to both preserve the functionality of things as they will be at the end of the first phase, but also to adapt to new technologies of our modern environment, and to take advantage of the emerging technologies, as we are doing at this point in time.

The Akwesasne Community Application (Mobile and Administrative) will be supported and maintained by the Mohawk Council of Akwesasne Information Services Program. zu may be called upon for more ambitious functional additions from time to time, though this is not currently part of the scope of the plan.

Smart Greenhouses will be sustained in conjunction with the Akwesasne Mohawk Board of Education (AMBE) and the Department of Tehotienawakon Environment Program, for the Akwesasne Mohawk School (AMS) and Tsisnaihne schools. The AMBE, Tehotienawakon Economic Development Programs will jointly utilize and maintain the St. Regis Smart Greenhouse location as it will be used for the school and as a special needs work experience location. We anticipate that this location has the potential to provide economic contribution to sustain the special needs program.

The Electric Bus will be fully sustainable through the budget of the Social Services Department. The Electric Bus expenditure simply represents a redeployment of a portion of and existing budget already dedicated to assisting their clients with transportation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Technology

DETAILS ABOUT THE TECHNOLOGIES INCLUDING RELEVANT APPLICATIONS ELSEWHERE AND RESULTS OF TESTING AND/OR PILOTING IN THE FINALIST PHASE.

In looking at the iPhone as a breakthrough event, it wasn't so much about inventing any of the capabilities it provided as it was wrapping them into one package. Similarly, our Smart Cities Challenge project is about combining the capabilities we know will address our Challenge into an integrated mobile system.

Our Digital Ecosystem encompasses both the Akwesasne Community Application, as well as the infrastructure elements of our plan. Included are native mobile application and web application development, multiple greenhouse implementations, and Akwesasne's first ever public transportation system. Greenhouses and a Smart Taxi service may not be viewed as groundbreaking or emerging technology, but to the Akwesasne community, they most definitely are. Our solution reflects the true needs of the community and will create improved health outcomes, new ways to address our challenges, and opportunities to develop expertise with new technology all through coordinated improvements in infrastructure, information, and accessibility. Akwesasne services will be enhanced with the support and integration of our mobile and web applications, both in what community members receive and in the ability of our public service workers to deliver them. Below we break down the details of the technologies involved, including examining relevant applications used in other jurisdictions, a look at case studies our partner zu has successfully completed and some of the results of testing carried out in this finalist phase.

Mobile application development is the set of processes and procedures involved in writing software for small, wireless computing devices such as smartphones or tablets. Each day thousands of mobile apps are published to the Google Play and Apple App Stores. Some of these mobile apps are games, others are social networks, and many are e-commerce apps. All of these apps, if professionally built, follow a similar mobile app development process.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Dating back to the early adoption of responsive web design in 2011/2012, our partners, zu, have accumulated extensive experience developing responsive mobile websites and native applications, including the use of front-end frameworks such as Bootstrap and Foundation, as well as custom implementations using CSS3, CSS Grid, and Flexbox. zu's team has developed native iOS applications targeting phones and tablets going back to 2009/10 and iOS version 4. This includes both line-of-business applications based on standard UIKit components, along with richer experiences involving animation and physics frameworks such as Box2D and SpriteKit. They have continued to build responsive and native mobile projects since the availability of these devices and their tech stack continues to evolve.

zu develops widely-used native Android applications targeting phones and tablets for high profile clients, with projects dating back to version 4.0 in 2012. They develop for the core Android framework as well as with Google's trusted third party community partner libraries such as RetroFit, OkHttp, and Glide. zu's team has mature knowledge surrounding automated testing strategies for Android including both unit testing and instrumented testing user workflow. This past winter, a zu designer was selected as one of only 20 people worldwide to participate in a prestigious Android design workshop hosted by the Android Development team at the Google offices in San Francisco.

zu employs various modes of automated software testing. zu says: "We frequently unit test our application code with language-specific test frameworks, as well as develop functional tests using tools such as Selenium, WebDriver, Nightwatch.js, and others. We load test our applications using open source tools such as Apache Bench, Siege, and various cloud-based tools."

zu as Digital Partners

zu is an ideal partner for Akwesasne's Smart Cities solution because they offer skills in determining right direction, they have capabilities to build digital products that are required for the vision and they will provide long-term stewardship for the digital systems they have built. They also provide Design Thinking expertise which zu uses to design non-digital process and components, which is a proven method for creating things that will be well received by end users, as they are so much a part of the process of their development.

Here is a sample of the types of major projects and transformational work zu has accomplished in the past 24 years of their existence.

MOBILE AND MOBILE/DESKTOP PLATFORMS

From the development of the TimmyMe iOS App for Tim Hortons' in 2008 on the iPhone, which made sense with the advent of geo-location services, through the years of Blackberry development and its fall from favour. Now into Android development, as well as mobile responsive (or simply 'responsive') design, zu moves into the latest technology. But they always program

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

for the purpose, not just to use a new technology. Currently, zu uses strong skills in iOS, Android and responsive web design to produce and maintain products for a variety of clients. Some projects of note include:

MYSASK 411 PLATFORM

Rebuilding Mysask411 Mobile and Desktop systems from the core (Term: 2013- Present)

Directwest built a 100-year legacy on connecting Saskatchewan buyers and sellers. The phonebook they produced served as the principal source for customers seeking and connecting with local businesses. As times changed, Directwest modernized its business offerings with a suite of digital products and services intended to keep pace with global technological innovation. Along with traditional industries around the world, however, Mysask411's user experience came up against disruptive digital headwinds and competition. The web and mobile versions of the Mysask411 platform struggled to perform on modern devices and needed to be rebuilt. Speed and performance were major issues. The web version and mobile applications had to address both mounting technical debt and a dated user experience.

The Mysask411 platform needed a renewed user experience, informed by users and built to last and adapt. zu was brought onto the project in August of 2013, and has since completed dozens of projects of large and smaller scale to improve the functionality and effectiveness of the suite of services the Mysask411 offers. In addition, zu uses Design Thinking with both DirectWest senior management teams and product teams to identify opportunities for service expansion, which are collected in project backlogs. These are then evaluated and developed on a priority ranking. zu is firmly part of the DirectWest team serving as a digital strategist, developer and long term optimizer of the suite of applications.

HELP ME TELL MY STORY / HELP ME TALK ABOUT MATH

Education Assessment System and iOS application (Term: March 31st 2016 - March 31st, 2019)

The Help Me Tell My Story education platform is another major achievement as an iOS and web system development that also incorporates Indigenous culture. The combination of technologies is similar to what will be deployed for Akwesasne. It has many levels of administrative access and collects data while optimizing the mobile user experience for the end users, who are children.

The Help Me Tell My Story assessment, which takes place by the children interacting with amusing gamified tasks, uses a holistic approach to measure oral language development for Prekindergarten and Kindergarten children. The Help Me Talk About Math application similarly uses a holistic approach to assessment to evaluate grade one students' understanding of seven mathematical processes: communication, making connections, mental mathematics and estimation, problem-solving, reasoning,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

and visualization. Both collect data from the children, their caregivers, their teachers, and Elders in their community and provide immediate access to results for educators and caregivers through easy-to-use web-based tools. The overall purpose of these assessment is to help create a real and measurable change in oral language development and real and measurable change in the mathematical process development of children across Saskatchewan.

Both these systems are extensible for other curriculums and are being extended to have French language versions. The systems have also been made available to other jurisdictions — as is intended with the Akwesasne Community Application — and the general public via the Apple App Store, though without the administrative functionality. zu continues to be a transformative digital partner for the Government of Saskatchewan, Ministry of Education.

Other Notable zu Applications

Here is a brief list of other projects requiring mobile application/web application combinations, as will be required for the Akwesasne project.

TIM HORTONS

TimmyMe iOS Application

When it was first launched, TimmyMe quickly became the top downloaded free iPhone app in Canada and Tim Hortons took notice. With over two million users, the app featured GPS to direct folks to the nearest Tim's drive-thru and included a notepad for taking orders from your co-workers.

SASKATCHEWAN ROUGHRIDERS

iOS Application

zu's created various digital solutions for Saskatchewan's favorite CFL team. In partnership with SaskTel, they took the Roughriders mobile with iPhone and Android apps that deliver schedules, standings, player profiles and stats, news, Twitter integration, videos, live radio streaming, shopping in the RiderStore and more. Rider Nation responded with over 100K downloads in the first year and over 3M sessions, leading to a 52% increase in orders and a 40% increase in customers.

MACKENZIE ART GALLERY

iOS Application

Mackenzie wanted to be a gallery for the 21st century, so zu was brought in to devise ways to use mobile technology as a catalyst for generating discussion, driving foot traffic, and connecting people to art like never before. Now their app is as much a part of the gallery experience as the physical gallery, helping people discover and engage with new exhibits and the permanent collection.

VITERRA MOBILE

Application Android and iOS

Buying and selling of crops require accurate information, and farmers may need that data while literally standing in the middle of a field. Going beyond providing up-to-date commodity prices offered at terminals, zu also created a

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

nitrogen calculator so that farmers could work out their fertilizer needs on the fly. Users can change criteria, toggle results and, ultimately, make informed decisions. Viterra, like the farmers, understood how technology helps people work efficiently and effectively. This responsive website and web app, drawing on Viterra back-end systems for data feeds, experienced 434% first-year growth, representing 25,000 total hrs spent in the app in 1st year with half of all users accessing the app daily, and one-third spending 1-3 mins per session. The zu team was delighted to help them engage with the global farming community.

Approach to future-proofing the technologies (i.e safeguards against vendor-generated proprietary constraints and obsolescence, a workforce that is able to implement and operate the technologies and systems going forward.

Ensuring high quality and extensive customizability, the Akwesasne Community Application will be built as a Native mobile-web application. Native apps are built for specific platforms (iPhone, Android) and are written in the languages the platform accepts (for example, Swift and Objective-C for iOS apps and Java or Kotlin for native Android apps). Native apps are fast and responsive, distributed in app stores, offer intuitive user input and output and don't require an internet connection. In addition, native code is non-proprietary, has an army of developers at our disposal, and is free to use.

Though this is not a frequent occurrence for zu, transition of projects to alternative service providers does happen, and zu is ready by design and choice of frameworks to not have proprietary blockers preventing other suppliers from being able to take over custodianship of the systems they've built. Recent examples of projects being transferred away from zu include the planned-from-the-start repatriation of the Drupal-based City of Saskatoon websystem; and the repatriation of the PotashCorp websystem — after nearly 20 years of internal zu management — to the new Nutrien management team. (In both these cases, the relationship continues with zu being invited to contribute to new initiatives). In all cases of project repatriation, a transition plan is developed in consultation with the client on how to best setup the environments necessary for maintaining system health long-term and to provide the client team with strategies to maintain and optimize the system.

System longevity

Achieving long-term value from any digital asset requires a commitment to supporting the software development lifecycle. The increasingly rapid pace at which mobile and web technology evolves, and best practices, online threats and user expectations change make it hard to keep up. zu's support and optimization model is designed to keep the Akwesasne team aware of issues affecting application health and security. They will also keep us on track regarding opportunities for iterative

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

enhancements and to take advantage of new trends or technologies, as they do with their other long-term clients.

ZU SUPPORT AND ENHANCEMENT SERVICES INCLUDE:

Support: Emphasizing continual testing and proactive analysis of known security threats and asset risks.

Optimization: Focusing on keeping pace with modern devices, browsers and operating systems impacting the performance of the platform for users.

Continual support and optimization go hand-in-hand to ensure our digital assets' long-term viability is maintained. zu's technical expertise and development processes make future adaptations such as API development, continued system integrations and reengineering cost-effective and made with ease. Services include:

- Monthly browser, OS and device testing
- Host environment performance measurement
- Optimization backlog development
- Major risk assessment and resolution
- Quarterly reporting
- Continued system integration
- API creation
- Design heuristics review
- Digital brand alignment

zu understands that the development of web-based tools and mobile applications can leave companies feeling handcuffed in their ability to operate systems going forward. Prior to completion of the Services, Akwesasne and zu will put in place an agreement zu for the maintenance and support of the Akwesasne Community Application; the agreement in Appendix A.

TECH EXPERIENCE OPPORTUNITIES FOR AKWESASNE MOHAWK FIRST NATION

Looking further into the future, this proposed digital eco-system will introduce the Akwesasne community to opportunities to take part in new technology in their community, both for those with existing expertise and those who hope to develop skills.

The Mohawk Council of Akwesasne works closely with the Ontario Emerging Jobs Institute (OEJI). OEJI is a unique offering that provides instruction from industry leaders and hands-on training for jobs of the future. Students train for the growing demand for skilled workers in areas identified as high need including topics such as web development, digital marketing, social media marketing, artificial intelligence, graphic design and search engine optimization. Currently, of the 160 students attending this program, 11 are from the Akwesasne First Nation.

The Mohawk Council of Akwesasne also currently has 15 personnel as a part of their Information Services team. This includes;

- 1 Manager
- 1 Program Support Officers
- 4 Network Analysts
- 4 Hardware Technicians
- 3 Software Analysts and 2 Help Desk Technicians

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The team supports provides a range of IT services to all departments and programs within MCA including the Akwesasne Mohawk Board of Education. Information Services oversees the maintenance, repair, upgrade, etc. of more than 800 computers and 25 individual networks and one wide area network. The Software Analyst team supports 75 different specialized software, some of which are built programmed in house. We feel we have the technical and human capacity that is able to implement and operate the proposed technologies and systems going forward. There will be opportunities for zu to train our team to the extent we find appropriate, knowing that zu could remain as principal stewards of the systems, or as helpers, or could be completely replaced by the Akwesasne team, at our option.

How the technologies comply with relevant legislative and regulatory requirements

LEGISLATIVE REQUIREMENTS

In Canada, mobile applications are regulated under the Personal Information Protection and Electronic Documents Act (PIPEDA). The Act, enacted in 2000, governs how private organizations collect, use and disclose personal information. MCA and zu commit to comply with all applicable laws regarding the protection of personal information including PIPEDA. Please reference our Preliminary Privacy Impact Analysis for in depth analysis.

FLEXIBLE DEVELOPMENT STANDARDS

Our Smart Cities Solution currently presents limited interoperability between technologies such as existing community systems, services, and infrastructure. However, our partner zu is well-versed creating necessary interactions (such as have been necessary in their past projects with many types of interactions) and uses due diligence in all expected and potential integrations. A few instances of interoperability have been identified and will be explored in the next phase for development. These include:

- Requesting, Tracking and Paying for MCA's Smart Taxi service within the application
- Ordering, Delivering and Paying for Greenhouse produce, and the 'Green Food Box' within the application
- Integration and interoperability with third-party fitness and health tracking applications
- Future interoperability with Telus health.

[redacted]

RIDE HAILING SERVICES & SMART GREENHOUSE INTEROPERABILITY

When developing our public transportation system and integrating it with the application, there are three pieces of interoperability requiring third party software and frameworks. First off, like other ride hailing services, (ie. Uber, Lyft, Instacart), our app requires access to the CoreLocation framework. This allows individuals to both request rides and share location addresses with a driver

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

through geolocation, and order groceries to their specific location. This framework provides classes and protocols to configure and schedule location delivery and send location events to the server. The CoreLocation framework also lets our application define geographic regions and monitor a device's movements as it crosses defined boundaries. Secondly, to display point-to-point directions on a map within the app, iOS developers use a Framework called MapKit. Registering the app as a routing app then makes directions available to the Maps app and all other mapping software on a user's device. Android routes and directions, however, are made possible by the Google Maps Android API. Thirdly, to use a cashless system that allows credit and debit transactions and so remove all risk of human-to-human cash transfers — we will interoperate with one of two leading companies in the mobile payment market, Braintree or Stripe. Both payment frameworks are used by current, emerging and established companies and follow both the Code of Conduct for the Credit and Debit Card Industry in Canada, as well as PIPEDA.

FITNESS AND HEALTH APPLICATION INTEROPERABILITY

With health and fitness applications extremely prevalent today, understanding the interoperability of default and leading health applications will maximize the advantages of integration with them. To ensure the Akwesasne data is stored and managed exclusively under MCA Information Services we investigated the leading brands in health and data tracking. We need to understand the complexities and privacy concerns of the applications we intend to use, such as Apple Health, Google Fit, and Samsung Health, as well as the wearables offered by Fitbit, Garmin, and Apple Watch. Google Fit was subsequently quickly dismissed due to the requirement that any app that reads Google Fit data must also store any collected health data with Google.

APPLE HEALTH

Apple Health provides operating system level storage for health/fitness data through a framework called HealthKit. Apple's intent is for 3rd party app developers to create apps that integrate with HealthKit to make "rich" fitness data available to both the Apple Health App and HealthKit. Any app can request permission to read/write a number of different types of health information based on a large list of "categories" provided by Apple. Once fitness information is stored in HealthKit, it's essentially available to any app that the user grants access to read from HealthKit. While the HealthKit framework appears somewhat complex, it's capable of surfacing any data recorded by the Health App, or any other "service" (tracker apps), both as granular data and aggregate statistic. This is all good news.

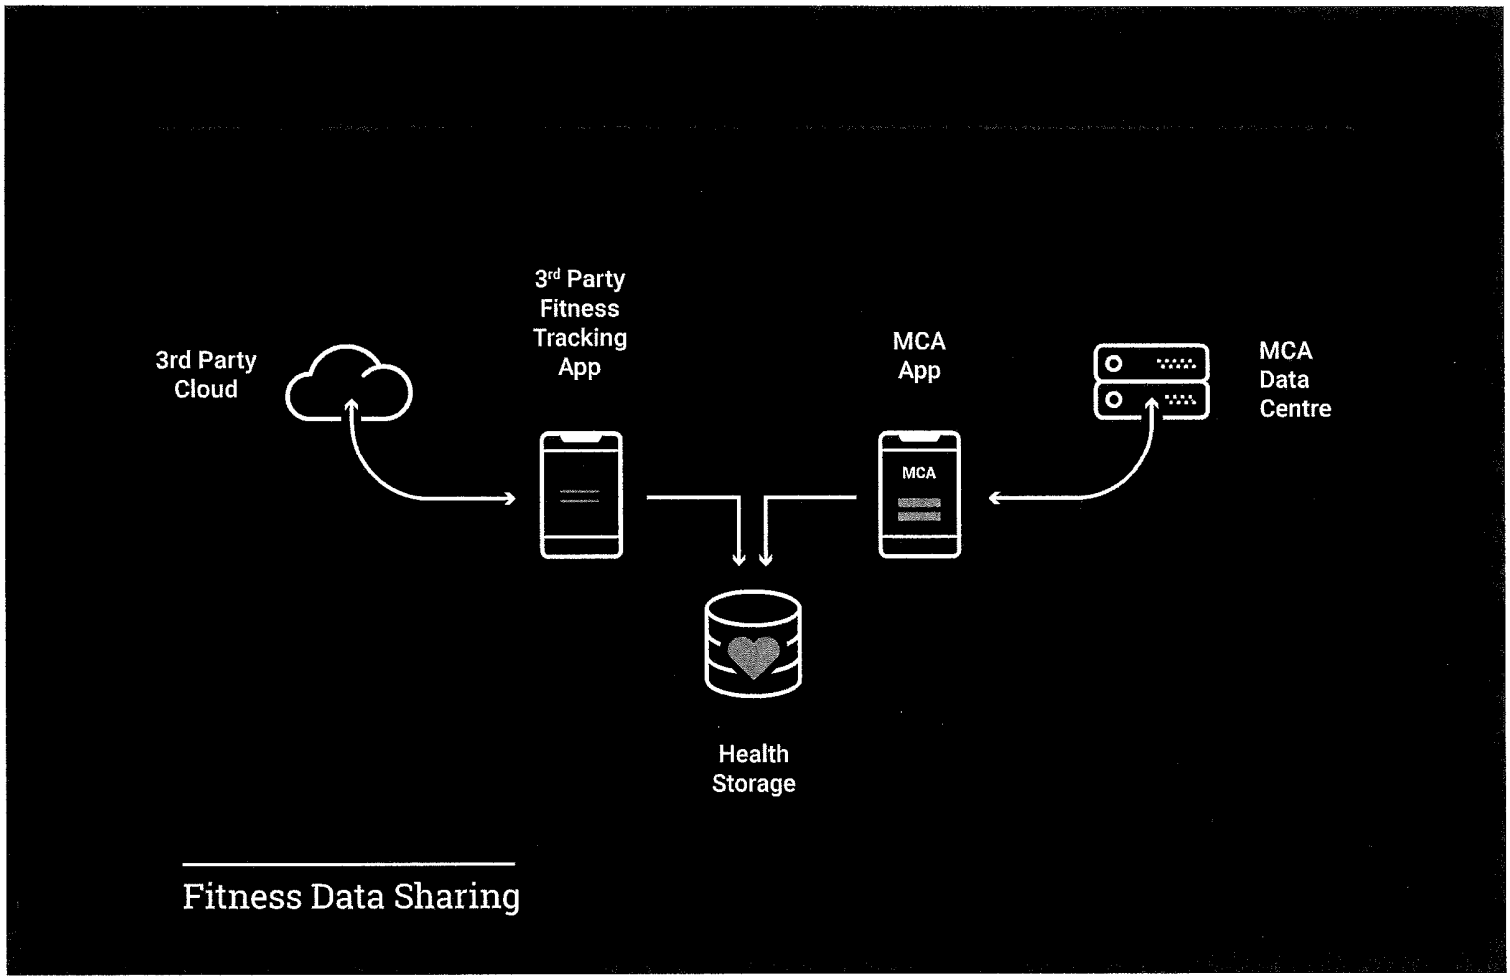
SAMSUNG HEALTH

Samsung smartphones come with the Samsung Health App (aka "S Health") pre-installed. The Samsung Health app is also freely available on the Google Play store for installation on non-Samsung devices. In many ways, Samsung Health is analogous

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

to Google Fit, but with two key distinctions. Any application that wishes to read/write/share data with Samsung Health must be approved as an official Samsung partner application. Unlike Google Fit, no Samsung account is required to use Samsung Health, though Samsung promotes the creation and use of an account to sync/backup data to Samsung's cloud service, and to make data available across multiple devices.

In conclusion, the health app ecosystem for Android is, unfortunately, more fragmented than iOS. There is no analog to HealthKit (operating system level storage) for Android, and it's up to individual apps to be responsible for the storage and sharing of health data.



WEARABLES

- Fitbit does not directly integrate with Apple, Samsung, or Google health apps, though fitbit does allow access to data through a web-based API.
- Garmin provides a Garmin connect app for both platforms and so can sync data to any of the health apps discussed above.
- Apple Watch does not provide health tracking on its own. Rather, it relies on "WatchOS" extensions provided by applications installed on accompanying phones that can read and store biometrics to Apple Health.

With this background in mind, we plan to make use of Samsung Health (Android) and HealthKit (iOS) systems. We can then migrate the data users are currently tracking on their devices while maintaining a familiar user experience for individuals comfortable with their current applications. Privacy concerns remain at the forefront of our build; as stated, MCA and zu commit to complying with all applicable laws regarding the protection of personal information such as that found in The Personal Information Protection and Electronic Documents Act. Privacy is also key to earning the trust of users, as their engagement and acceptance is also a key measurable for our initiative's success.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Fitness Data Sharing

TELUS HEALTH INTEROPERABILITY

The Mohawk Council of Akwesasne is in preliminary talks with Telus Health to implement their proprietary software throughout all Canadian jurisdictions. The opportunities and capabilities of this homegrown system is interesting but needs exploration. Further research and discovery will need to be completed during the strategy phase of implementation.

REPLICABILITY ACROSS CANADA

We suspect that the factors contributing to a higher prevalence of diabetes in the Akwesasne community hold true for all Indigenous communities across Canada.

If we succeed in having a real impact on health outcomes in Akwesasne through the areas of focus we have piloted, we will be open to having our approach and software replicated for use by other first nation communities. We are energized by the possibility of improving the health of other communities via our Smart Cities approach to targeting causative factors we suspect are consistent culprits. While the software may be directly applicable to other communities as it stands upon completion, some degree of customization will undoubtedly be necessary for its deployment, given the specifics of that second situation. Ideally, a consistent

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

core could be maintained so those future improvements could be rolled out amongst all future users.

ROLES AND RESPONSIBILITIES OF TECHNOLOGY PARTNERS

The role of zu in this project includes helping our team collaboratively identify the strategic direction, providing the design for products and services including the development/programming and support of the Akwesasne Community Application, and it's integrated systems. Within our governance structure, prior to selection of both the Greenhouse System & Electric Public Transportation System technology partners a public tender will be requested for both personnel and strategic implementation.

IDENTIFICATION OF RISKS (E.G PRIVACY ISSUES, CYBERSECURITY BREACHES) AND DEVELOPMENT OF APPROPRIATE MITIGATION STRATEGIES

No Internet technology is risk-free. However, as we intend to program to best practice standards, and follow the available standards for privacy, system security, data back-up and so forth, we will reduce risk to the acceptable baseline all Internet-based systems face. At this time there are no known risks in the implementation of technology particular to this project.

ACCESSIBILITY AND USABILITY OF THE TECHNOLOGIES TO DIVERSE USERS, RESIDENTS AND OTHER STAKEHOLDERS THAT SUPPORT THEIR UPTAKE AND ACCEPTANCE.

Web Content Accessibility Guidelines (WCAG) 2.0 and Authoring Tool Accessibility Guidelines 2.0 covers a wide range of recommendations for making web content more accessible. Following these guidelines makes content accessible to a wider range of people with disabilities, including blindness and low vision, deafness and hearing loss, learning disabilities, cognitive limitations, limited movement, speech disabilities, photosensitivity and combinations of these. Following these guidelines will also often make your web content more usable in general. (http://www.w3.org/TR/WCAG20/)

Each page and feature will be developed with an understanding and incorporation of Web Content Accessibility. Some key elements of the guidelines include the 'Skip to Content' link which allows people to quickly access content by skipping primary and secondary navigation. A redeveloped application will also be screen reader enhanced optimizing the site for visibly impaired individuals. Appropriate contrast will need to be designed between links, text, images and any user interface elements on each page.

zu's team has relevant experience in developing websites and mobile platforms within these guidelines.. From these projects, zu has learned best practices that will be transferable to Directwest. Throughout development, zu will test the mobile platform to ensure that it is meeting level AA Web Content Accessibility. We will also be sure to use the Authoring Tool Accessibility Guidelines 2.0 for content created and migrated to MCA.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Governance

GOVERNANCE FRAMEWORKS AND STRATEGIES TO OVERSEE AND MANAGE PROJECTS, PROJECT RISKS, FINDS, AND PARTNERS THAT ARE RIGOROUS, TRANSPARENT, EFFECTIVE, AND PROVIDE VALUE FOR MONEY

Since the late 90's MCA has been in a Nation Building process, a process that allows for the investigation and negotiation of a draft Akwesasne Governance Agreement. The process was initially termed a Nation Building process and has since been renamed Entewatathá:wi or "We Will Govern".

The overall goal of this process is to investigate the extent of Canada's commitment to negotiate a Self-Government Agreement specific to Akwesasne where MCA exercises jurisdiction. Entewatathá:wi has been working towards establishing the laws, regulations, policies, practices, and institutions that will govern the northern territory of Akwesasne. The Road to Self-Governance Negotiation of a final agreement on Governance will provide clear formal recognition by Canada of Akwesasne's governance institutions and address the relationship of Akwesasne's and Canada's laws. Negotiations have also begun with Ontario and Quebec on some jurisdictional issues. Self-Governance is a long and grueling process that involves negotiations with the government of Canada, our own local governments and leaders, educating and consulting our community and making sure we protect our inherent rights as Akwesasronon. Ultimately, it will be our community that determines whether or not to accept the negotiated Akwesasne Governance Agreement by holding a community referendum.

- Governance / Council Portfolio's include:
- Department of Technical Services
- Akwesasne Mohawk Board of Education
- Executive Services
- Department of Health
- Department of Housing
- Department of Justice
- Public Safety
- Department of Tehotiiennawakon
- Tehotiiennawakon - Environment Division

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Mohawk Council of Akwesasne Carries out projects with at least three personnel involved, Manager, Assistant, and Technician. Project timelines are created with project management theories. Regular project meetings are held with key personnel involved, this includes outside contractors. Mohawk Councils Finance policy requires 3 quotes for anything purchased over 1000.00.

- Managers can sign off up to 5000.00.
- Directors sign up to 50,000.00 with mandatory RFP process.
- The Executive Director signs up to 100,000.00.
- Any Contracts, payments over 100,000.00 must be processed by a Mohawk Council Resolution(MCR). There are 13 chiefs on council and 7 are required to sign in agreement of a decision through the MCR Process.

In working with clientele, their partners and unique stakeholder groups over the years, zu have some proven ideas on governance that can assist in our process as well. As a partnership we believe strongly in the benefit of open communication but recognize the need to focus the collaboration where possible. Before project kickoff, key client decision makers and approved deadlines will be revisited and finalized.

STRATEGY

Typically projects are built in phases with initial consulting and strategy leading to a deliverable such as a communications brief, information architecture, low-fidelity concept sketches or an experience prototype in the form of wireframes or a mobile prototype for user testing. During this phase, the client's Project Coordinator (PM or Manager) will help coordinate meetings, demonstrations and communicate feedback and approvals at our Product Owner, who is the main point of contact from kickoff to launch. The client's Project Champion (Director level) will be available to provide insight during consultations and liaise with executive and board members who require visibility. An Executive Sponsor (Executive Member) or Committee is often involved early on to set direction with our team but will be consulted throughout the phase to ensure objectives are being met.

PRODUCTION DESIGN AND DEVELOPMENT

Once the direction is set, active production begins with weekly demonstrations of progress as outlined in the project timeline. The Project Coordinator and Project Champion will be required to attend these meetings to provide input and liaise with executive and board members who require visibility. An Executive Sponsor or Executive Committee will be consulted throughout production to ensure objectives are being met at key milestones outlined in the project timeline.

Deliverables will be submitted to the client's Project Coordinator for internal feedback. Any approvals or sign off will follow in weekly production meetings creating a feedback loop from the start of production design and into development. Once development demonstrations begin,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

a Technical Lead (Client IT Group Member) will join the client's team to coordinate integrations, flag risks and provide materials and support to our developers if required.

Finally, active user acceptance testing will be performed within the feedback cycle and then again prior to launch. By the end of the project, end-to-end testing will be completed internally at zu and on the client side to reach final approval. Once the product is approved, the asset will go through predefined steps for launch as outlined in the project timeline.

ESCALATION

Throughout the entire process, from strategy to production and launch planning, any issues that require escalation beyond weekly project meetings will be addressed with the Account Manager by the client's manager/director representative. If unresolvable, issues will be escalated to the Executive Sponsor by the client's executive team member.

Details about the partners and their role, capacity and readiness

zu is our only major partner defined through the Smart Cities Challenge. They build digital products and services and uses a design strategy to drive innovation within organizations. Founded in Saskatoon in 1995, zu is a happy, motivated team of 35 confident in achieving success on every project and committed to working with clients building modern solutions for mature industry problems. zu's team is a mix of Design Thinking experts, analysts, production designers, developers, IT and client support specialists focused on building tools that are informed by users and meet client business objectives. Their services are grouped to correspond with the lifecycle of digital products.

Collectively zu has the bench strength and the decades of experience to hit home runs on big, challenging projects. Our technical depth and our cosmopolitan appreciation for style and elegance are focused by our adhesion to the user-centric approach to design. Our plans are therefore on target, our ability to execute proven and not easy to replicate, and the result for the MCA application and Smart Cities Challenge project will embody a balance between being uniquely engaging, practically sustainable and innovative. Our combination of youthful design, project sensibility and decades of programming experience, deployment and support means the best of all worlds for the Akwesasne web system, especially when it comes to creating something for today and for tomorrow.

RISK MANAGEMENT APPROACH

The goal of our risk management is to decrease the chance that we don't deliver working software to a happy client. We want our client to have participated in choices involving adding or chopping features and scope so that the most important features are accomplished on time and on budget.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

To assist with managing risk throughout projects, zu utilizes a Project Status Report. This document allows MCA and zu to communicate and provide weekly project status updates during client demos. We can highlight milestones, design concepts or major features and flag them if there is an issue, or if everything is on target. This will also highlight past accomplishments, key activities for the next week and upcoming issues that should be addressed early. We can track all decisions that impact the project, along with a budget update.

Communication is critical for project success. Our approach is to maximize project visibility with clients and form a tight-knit relationship with our project leader, the Product Owner. We document these plans in a project charter before kickoff. This document acts as a reference for key decision makers on the production side and the client side. It includes key milestones and project objectives. Put into action, our Product Owner becomes our client's main point of contact for ongoing production and flagging any issues, risks or challenges as they come up.

The myth still exists that software and complex systems can be planned out like building a bridge. That Gantt charts and timelines and feature sets are predictive of project success. This is not so, and is proven in the terrible track record of software projects that have failed, even though all these risk-reducing factors were in place.

zu has long ago recognized the importance of the Agile method for software building that accepts lack of predictability and instead focuses achieving project success by accomplishing important things first, by allowing the scope to be modified to make the most effective use of the constraints of time and money, to recognize dead-ends quickly and double down on good ideas that arise in the process of building. Transparency and approval for what is being done, what is done and what will be done are discussed in sprints with the client at regular and short intervals.

EVIDENCE AND DETAILS ABOUT THE PARTNERSHIPS, INCLUDING THEIR NATURE, TERMS, ACCOUNTABILITY STRUCTURE, AND FINANCIAL REQUIREMENTS.

On the 30th day of September 2018 The Mohawk Council of Akwesasne and zu.com communication Inc. entered into a contractual partnership between client and consultant. Please refer to the confidential annex for our Master Service Level Agreement and Memorandum of Understanding during the Finalist phase of the Smart Cities Challenge.

APPROACH TO PARTNERSHIPS THAT RETAINS COMMUNITY CONTROL OVER SENSITIVE AND PERSONAL DATA

Although zu is the contracted firm to build the technical aspects of the app/web portal, Mohawk Council will own the rights of the system and house and retain all data created with the system. All data collected, used, and disclosed will be managed under the Mohawk Council of Akwesasne stored on MCA internal data centers and servers. Please refer to our Preliminary Privacy Impact Assessment for an in-depth analysis of information privacy.

Engagement

APPROACH TO ENGAGING WITH, GAINING ACCEPTANCE FROM, AND ONBOARDING RESIDENTS AND OTHER STAKEHOLDERS FOR PROJECTS THAT ENSURE ONGOING ALIGNMENT BETWEEN THE OUTCOMES AND THEIR CONCERNS AND NEEDS.

In order to understand where we are going in the implementation phase, it is important to understand where we have been over the Finalist phase. As strong believers in human-centered design, and designing with users and for your users, we have put Community Engagement at the forefront of our Smart Cities Challenge solution.

Over the past several months, we facilitated workshops with inclusive user groups, interviewed internal and external stakeholders, hosted community engagement events, and surveyed and user tested our prototypes with Akwesasne community members. The 5 stage approach brought by Design Thinking was executed by our partners at zu through a series of trips to our community. We completed the recyclable model several times to come to the prototyping and feature prioritization of our Community Application, narrow in on our Smart Greenhouse concept from several implementation ideas, and understand the true needs of the community for the execution of our Electric Public Transportation System.

To ensure a substantial amount and quality of community engagement, we leveraged the Design Thinking methodology and process, which is a **practical approach** to finding **creative solutions** to problems, inspired by traditional design methods, or more simply, an approach to problem-solving, which we will dig a bit deeper into and outline below.

"Thinking like a designer" means leveraging empathy, experimentation, and often technology, to produce solutions that help real people. Design Thinking is heavily rooted in Human-Centered Design, which emphasizes a user-first approach: finding out what users really need, then balancing solutions for those needs with the possibilities of technology, and requirements that define success for the business.

Several popular Design Thinking structures have emerged over the years. Most have the same basic underlying model:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ATIA - 21(1)(b)

A common Design Thinking structure

1. Do Some Research

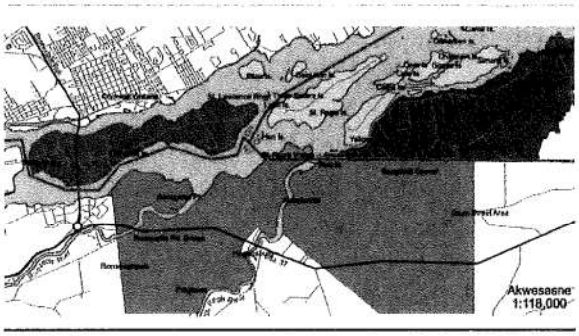
Research is critical to Design Thinking. Gathering information about a problem helps define the problem (or more typically, problems), so we can determine what the right problem is to solve. Design thinking research takes the form of interviews, usability testing, surveys, looking at analytics, and so forth. And research never really stops as feedback goes back in the top and then becomes the subject of feedback once more.

To ensure we look at user needs from multiple angles, we follow four research themes.

About Them - Takes the form of indirect research about Akwesasne and our community members living here. We looked at existing internal data, industry and community reports, and aggregated data. This indirect research included:

- Akwesasne Satisfaction and Experience Surveys
- Akwesasne Cultural Orientation Guides
- Mohawk Council of Akwesasne Department of Health - Annual Reports
- Mohawk Council of Akwesasne -Healthy Eating and Active Living (HEAL) Program - Indicator Reports
- Mohawk Council of Akwesasne - Strategic Plan
- Mohawk Council of Akwesasne - Comprehensive Community Plan

With Them - The most common method of "with them" research — or "with Us" in this case — is a simple 30 to 45 minute 1:1 interview in person or on the phone with the interviewee. "With them" interviews were undertaken with our community members themselves and also with groups and individuals that regularly interact with community members. In the finalist stage of our work, our "With Them" research included interviews with many distinguished individuals including:



- Amber Montour (Manager, Wholistic Health)
- Sarah Thompson (RN, Supervisor)
- Della Adams (Traditional Medicine Employee)
- Lesley Bero (Program and Diabetes Prevention Manager)
- Karole Mitchell (Community Health Nurse)
- Cindy Francis-Mitchell (Assistant Director of Health)
- Andrew Francis (Data Health Management Coordinator)

During these interviews, we asked straight

ATIA - 21(1)(b)

Key Insights

Map of Akwesasne and it's districts

FOOD INACCESSIBILITY

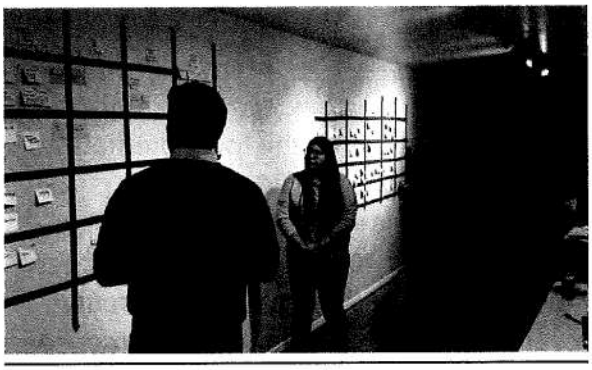
Inaccessibility to healthy food alternatives in Akwesasne is two-fold. First, our traditional Mohawk diet was based on growing, fishing and hunting, but has been severely damaged by pollution. Mercury levels are high in both the Saint Lawrence River and the surrounding soil. Community members have been cautioned to limit their diet of locally caught fish to one per year! We are told our traditional farming practices may produce unsafe food when grown on the polluted soil of Akwesasne. Second, due to the jurisdictional impediments, with border crossings causing delays in both direction of travel, healthy groceries and produce for many families can be up to a 30-minute commute away. With many community members living without vehicles, and with a scarcity of public transportation on the reservation, getting proper food regularly can be almost an impossible feat for many.

NETWORK ACCESSIBILITY

Being in a rural area of Ontario, the Akwesasne First Nation finds itself with insufficient mobile network capabilities. In all 3 districts, our community expresses frustration with so-called "dead zones" in many areas. This lack of contact creates barriers to our members receiving information regarding events, community activities, or communication for transport. Recognizing the value of our current efforts that made us a finalist of the Smart Cities Challenge, the Mohawk Council of Akwesasne has plans to leverage our efforts and take this as an opportune time to update Akwesasne's mobile infrastructure. Using their own internal budgets, the Mohawk Council will actively support the development of the Smart Akwesasne solution by providing necessary infrastructure.

TRANSPORTATION ACCESSIBILITY

Lack of public transit, combined with the lack of personal vehicles for many, makes it extremely difficult for Akwesasne people to gain access to opportunities offered in our three principal communities. As spoken to above, the opportunities we are most concerned about for community members are accessibility to food, to health services, to fitness locations and activities, to community events, and to other social services. With the implementation of our Smart Cities solution we will create accessibility to these opportunities. With the Smart Cities project in place our people will enjoy the possibility and option of traveling between districts, and with minimal financial burden. Accessibility has been determined to be one of our key strategies to reduce new cases of diabetes in the community.



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

forward, open-ended questions to gather information and insight while leaving the interview loosely scripted. This allowed our interviewers to adapt their line of questioning and vary which answers received more detailed follow up questions. We ask, for instance, What do they know about the client? Where they see their clients struggle? What questions are clients asking? What can be done to make the user's experience better?

"Be them" - The "be them" method allows researchers to gain empathy for a user's pain points by walking through an entire journey exactly as they would experience it, from start to finish, in the most natural context possible. As a part of our research phase we had MCA employees take us through their diabetes journey. Each journey started with being screened for diabetes, to find out if they were free of symptoms, pre-diabetic, or diagnosed diabetic. Then it was understanding the implications of their assessment, and how they were to manage their life in each case for the long term. This led the research team to an understanding of their journey, all the user's actions, touch points, thoughts, and emotions experienced by the individual through the process, often including their family's experience with the individual's journey. In approaching any particular event or process as a journey, fewer possibly important elements will be missed. More details will be noted this way, when subjects are asked to tell a story exactly how they walked through it, rather then if people are simply asked to describe what they remember about an experience.

2. Identitfy Insights

Once we finished the research stage, we sought to extract meaning from it. Pulling insights out of our research, and choosing the really important ones is an incredibly valuable step in setting the stage for effective ideation. Many folks typically want to brainstorm on ideas without adding new nuggets of information to the conversation, and so get nowhere new.

Journey Mapping workshop with Akwesasne community members and stakeholders

But Design Thinking has us start with a load of information, and then provides methods to identify insights efficiently and collaboratively. These insights then feed the creation of really innovative ideas. In our workshops with MCA stakeholders we used the techniques of the practice, we group shared and affinity mapped to identify patterns and themes. We wrote and edited challenge statements to concentrate on the most important underlying challenges of diabetes.

Our preliminary research and stakeholder workshops led us to the following key insights.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Ideation Workshop on 'How Might We' statements with Akwesasne community members

WESTERNIZATION

Since the imposition of Western culture on our community, the Mohawk people have been subject to drastic change in their daily diet. First, many community members have moved away, not just from their home territory, but from their traditional lifestyle and food sources. There they are eating the fatty and carb-heavy alternatives that are convenient and cheap, whether from chain restaurants or other seemingly economical options. Second, the fast-paced, consumption-oriented lifestyle now everywhere is still very new to our culture. Healthcare workers, particularly those involved from a diabetes prevention/ management point of view state, observe that the people of Akwesasne are practicing less and less the holistic and traditional approaches to medicine. Our people increasingly have come to accept the disease that comes with westernization and western ideas about health. We become used to taking pharmaceutical drugs to combat metabolic and diabetic disorder, rather than look for answers in our traditional approaches to health.

CHECKUP FREQUENCY IN HEALTH & DENTAL

It is apparent that community members, particularly men, do not see a doctor regularly. This of course contributes to poorer health outcomes. Many factors may be in play with this behaviour including: pride and the desire to show strength; a genetic predisposition that allows Mohawks to actually handle pain better than others; the absence of a male doctor within the community. Again, lack of options for public transportation also plays a key role in this exacerbating this unfortunate infrequency of interactions with health and dental services.

HEALTHCARE SYSTEM DISCONNECTION

Further difficulties arise from the complicating reality that Akwesasne people and their families —though one community of Mohawks — live in 3 jurisdictional areas: Ontario, Quebec and the state of New York where they are dual-citizens. It is not hard to imagine the complications this causes our own internal health care efforts: having to interact with three separate systems none of whom are recognized for ease of use. Our people may be using health and dental services from multiple institutions located in different jurisdictions. And so we find many of our health client's records to be inaccurate and/or incomplete. This causes an overall lack of transparency, and makes difficult our ability to even assess where we are as a community health wise. Issues in terms of data consistency, information collection and information aggregation make it difficult to even begin to interpret the overall system's performance in a holistic way. How will we

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

find insights worth acting upon without good information?

The poor state of record keeping caused by these overlapping jurisdictions is extremely straining on healthcare professionals. These folks are trying to help and are striving to accurately diagnose the individuals they see. But they just don't have the basic information of an accurate medical history to work with. We need to give our health care professionals, and the people themselves, complete and accurate baseline health records. Knowing where we are as a system and as individuals is key to knowing where to go and whether we are heading in the right direction. Health assessment is based on measurable data, and the health of the system is based on measuring the improvement in outcomes. Improvements and consolidation are needed in the medical records of our people. We cannot expect that this improvement will be provided by the three medical systems we deal with. This centralization will be something we need to build ourselves. It will be important in our battle to reduce new cases of diabetes in our community.

[redacted]

LOSS OF TARGET DEMOGRAPHIC FOLLOWING PRIMARY SCHOOL

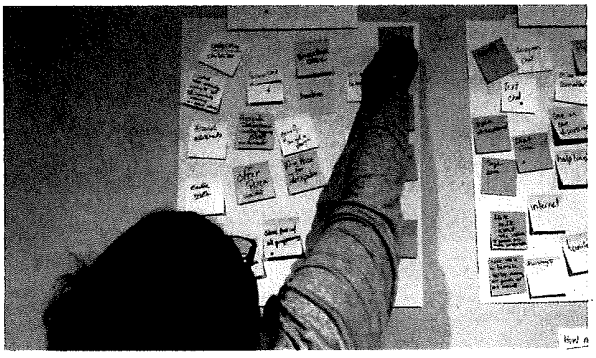
Key target audience

Individuals from 12-25 are our primary target demographic for preventing new cases of diabetes. When this cohort are in our community and in school on the reserve, The Department of Health has the opportunity to educate them. Given our people's increased susceptibility to metabolic diseases and diabetes, we have to act proactively with our young people to prevent new cases. Akwesasne is home to three Akwesasne Board of Education Elementary (AMBE) Schools. These schools include Ahkwesahsne Mohawk School, Kana:takon School, and Tsi Snaihne School. While in school our children receive instruction about nutrition and health promoting lifestyles, learning to make habits of healthy choices. Following graduation from our schools, however, our students only secondary schooling options are off reserve. Our losing access to them following primary education means we have lose our opportunity to continue training them for long term health. This insight identifies a barrier we target to overcome.

GOAL OF INSIGHTS

Our goal of identifying insights is to better define the problem(s) and understand what are we really trying to solve. Insights set the stage for idea generation. But before we generate ideas we use an interim step to reframe insights as questions.

The How Might We framework is particularly effective for inspiring creative solutions for two reasons:



1. Its phrasing implies that a solution is possible.
2. It's often easier to craft solutions when you're trying to answer a specific question.

Collaboratively with zu, we crafted How Might We Statements. These are intended to create a road map that will lead us to generate new ideas to help the Akwesasne community.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Our How Might We Statements included:

- How Might We reduce the time and distance to healthy food?
- How Might We create a solution that bridges the gap between traditional and modern medicine?
- How Might We make people feel more comfortable discussing sensitive topics with health care professionals?
- How Might We maintain health education and contact with our people through High School?
- How Might We motivate people to take advantage of existing programming?
- How Might We encourage people to get screened for pre-diabetes earlier?

'How Might We' Statements being explored during Akwesasne community workshop

3. Come up with some ideas for solutions

Referencing our How Might We Statements, our next step was coming up with ideas to solve them. There's seemingly no end to the number of ways to approach idea generation (aka brainstorming or ideation). Ideas can be generated individually, as a group, or both. Ideas for solutions can be written, drawn, built in 3D, acted out, etc. The key is to focus on generating lots of possibilities, not necessarily trying to find the silver bullet solution right off the top.

Using a combination of individual and group ideation tends to result in the best solutions because:

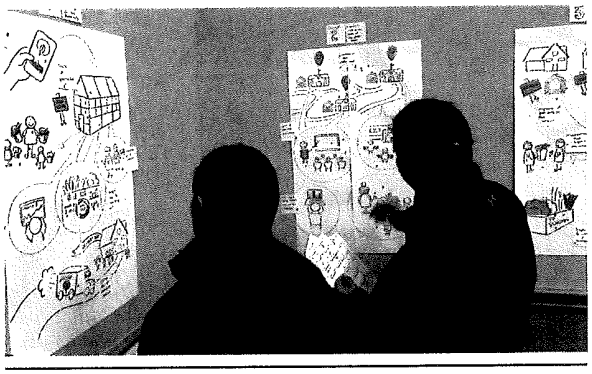
- Individuals working alone can focus their thoughts to come up with more fully formed ideas.
- People working in a group can then use the individual ideas as springboards to evolve their own idea, build on another's idea, or come up with more new ideas.

In a small group session with health care professionals, council representatives and community members we began writing, drawing, and acting out solutions. This resulted in nearly a hundred different solutions to the above How Might We statements. We derived solutions that would make food and healthcare more accessible through various approaches including transportation improvements, diabetes prevention education (choice), cooking classes (variety). We had ideas regarding increasing programs offered that promote healthier lifestyle and provide

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

fitness resources, including tweaking our competitive nature with district games, where individuals compete against one another in sport and art. We envisaged anonymous helplines for health care advice and direction. We identified the implementation of greenhouses as a good idea: they are increasingly practical to operate; they would be an educational enhancement if associated with our schools; they would increase our accessibility to healthy produce. Additionally, moving our agriculture into greenhouses would decrease our exposure to toxins in the food we have no choice but to grow in our now polluted soil.

This group session produced over a hundred ideas. Participants were energized by the opportunity to develop their own ideas, to build on another's idea, and to see their idea taken further than they imagined when the whole group contributed on theirs. We saw useful innovation happen and produce good ideas. We used Design Thinking approaches to make choices as a group. We voted on favorites to focus down on the best of the hundred. We took the finalists further and worked until these most viable ideas became prototypes.



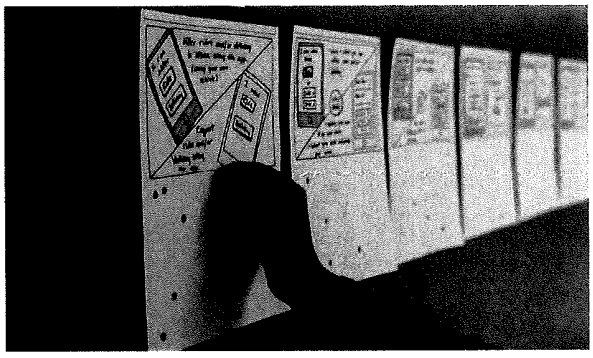
4. Try ideas out

Prototyping possible solutions is the least expensive way to fail, and the fastest way to learn. Prototypes can be digital, paper, or a combination of any kinds of materials, sometimes looking like arts and crafts. Participants can prototype a process, a pamphlet, a script. From our ideation session, we sketch-prototyped, and digitally-prototyped several concepts based on ideas we had discovered in the stakeholder engagement from our workshop.

SMART GREENHOUSE SYSTEM SKETCHED-PROTOTYPES

Through our workshops it was evident that the implementation of a Smart Greenhouse System was crucial to bringing healthy, affordable and accessible food to the community. To determine a strategy which would create the best benefit for our community, we narrowed the options down to three:

- 1 Large Community Greenhouse supporting all districts
- 3 Medium Community Greenhouses supporting each district
- Several neighbourhood operated community greenhouses supplying the homes in those neighbourhoods.



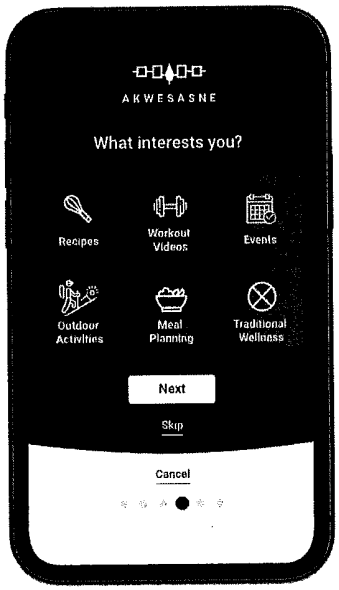
Smart Greenhouse System Prototype during community engagement

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

ELECTRIC TRANSPORTATION SYSTEM SKETCHED-PROTOTYPES

Likewise, our ideation workshops made us aware that some form of transportation system in the community was going to be necessary to our Smart Cities approach. This led us to prototype multiple concepts to potentially solve this clear barrier to many of the issues we identified as insights. These transportation solutions included:

- Ride-Sharing System connecting individuals who can offer rides with individuals who need them.
- MCA operated and subsidized Smart Taxi Service



Electric Transportation System Prototype during community engagement

AKWESASNE MOBILE/WEB APPLICATION DIGITAL PROTOTYPE

In the finalist phase, a goal for the combined team was to create a working prototype of the Akwesasne Community Application. The application will allow the necessary communication and coordination for the whole Smart Cities approach to work, like glue for all the parts. Prototyping is a major milestone in the Design Thinking approach to building a product or service, as it is the artifact representing the culmination of all the previous work, and is a clear target for what the next stages seek to create. So, following Design Thinking exercises with users where features were developed by users, early versions of our application prototype was created by our partners (zu) in AdobeXD. This online, interactive version of our app allowed community members to navigate through the its functions using their devices in ways close to having a working application.

This digital prototype, a replica of the application, demonstrates initial sign up and login screens, as well as 4 tabs: Wellness, Nutrition, Fitness, and Community. Sub menus for these tabs each bring additional screens showing how these new opportunities to Akwesasne will work. The application, which is expected to expand in capability over time, provides room for expansion of functionality in future phases. With extensive engagement and feedback from the community to ensure proof of concept, followed by cycles of iterative prototypes produced and shared with each round incorporating feedback followed by more user-testing — we produced a prototype interface. On the following page is a link to the the Akwesasne Community Application prototype.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Traditional and modern health resources in the forms of videos, blogs, podcasts, and recipes
- Booking of traditional, holistic and community healthcare appointments
- Access and storage CANRisk survey results, with prompts to take necessary action
- Compete in activities alone, or with friends in order to gain rewards
- Events and programs page to stay up to date and aware of opportunities in the community

CLICK THE LINK TO VIEW THE PROTOTYPE

https://adobe.ly/2ERy3X3

- Features and functionality of prototype include:
- Login screens with terms of use, privacy policy including collection, use, and disclosure messaging
- Ordering and payment of the Smart Delivery Service (for food deliveries from the Green Food Bag and Smart Greenhouses)
- Requesting and payment of rides from the Electric Public Transportation System

5. Get some feedback

Getting feedback from our community on these more mature prototypes was the next critical step to ensure our solution would meet their expectations. The majority of our this wider community feedback and user-testing would be completed at our community engagement events.

We were aware of the lack of transportation limiting participation for many. So we made sure to host community engagement events in each of the three districts so there was ample opportunity for everyone to contribute to our Smart Cities Solution. For both the Smart Greenhouse System and the Electric Public Transportation System, we used a multifaceted approach to get good feedback from users. We mobilized a number of strategies:

Interviews - Members of our team and zu's were stationed around the meeting space in

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

order to answer questions, pose their own questions back to users and to follow up to enquire why certain notes were given or decisions made.

Dot voting - Allowed community members to simply leave adhesive dots on parts of the solution sketch they really liked or approved of.

Feedback Notes - Gave users the opportunity to provide feedback by writing comments on adhesive notes and sticking them anywhere on the sketches. Their comments led to other participants also dot voting on the stickies themselves, giving approval or making further suggestions, all in a casually collaborative and efficient way.

Voting box - With multiple concepts and many participants, we simply wanted to give individuals the ability to vote for their overall favourite concept. This gave us an idea of which concept would be likely to benefit the community the most, and so be adopted for actual use by them.

This resulted in a more flushed out application prototype that we were extremely excited to get it into the hands of our users. Gaining feedback on this now more mature prototype came through a number of methods:

prototype testing

1:1 user testing - Members of the zu team had community members work with the application under one of our team's observation. This provides some the highest quality insight into the apps success in the presentation of features and functionality.

Dot Voting - As in our previous use of dot voting on interface sketches, we now made printouts of the application screens, taped them to the wall and encouraged community members to vote on their favourite features.

Feedback Notes - Feedback notes gather more specific insights, new ideas and enhancements — then just votes. And participants enjoy the ability to leave feedback and suggestions right next to interface features, and to see what other folks are saying. This is a high quality feedback method providing insights very useful to the designers.

Interviews - Members of our team and zu's were again standing ready to answer questions, and to engage in brief conversations to clarify exactly the nature of the participants opinion, idea or critique.

Getting feedback on our prototypes was in essence just more research. We gathered information about how people use the solution, where they stumble, what they liked, what they disliked, and things we can make better. Design Thinking has led us to a Smart Cities Solution that we can confidently say was designed and created by and for the community using it. This engagement with users is the missing step in so many software projects that fail. Our extensive efforts in community engagement on the app greatly increases our potential for success.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Data & Privacy

PRELIMINARY PRIVACY IMPACT ASSESSMENT (PIA) OR PRELIMINARY RATIONALE ANALYSIS (PRA) WITH EVIDENCE THAT RELEVANT PRIVACY AUTHORITIES WERE CONSULTED AND THEIR GUIDANCE WAS CONSIDERED IN ITS DEVELOPMENT

Following an in-depth analysis of our Smart Cities Challenge solution(s), and multiple meetings with the Privacy Commissioners of Canada, Ontario, and Quebec, we are confident in taking the appropriate measures to ensure the minimization, anonymization, consensual and security in the collection, use and disclosure of information. To both implement and maintain an effective future-proofed solution, while constantly measuring our progress, a number of PII and non-PII data points will need to be collected. Within our PPIA, we highlighted ways in which we intend and commit to comply with the Personal Information Protection and Electronic Documents Act.

Types of methods of data collection, generation, analysis, storage and transmission, and plans for re-use, re-distribution, derivative production, archiving, and preservation that reflects the entire data lifecycle in project design.

As members of the communities ourselves, and proud of Akwesasne individualism, we approach the collection, generation, analysis, storage, and transmission of data as if it were our own.

Collected - Personal information will be collected within the application through. This data will be gathered anonymously from inception and in aggregated form to gain insight into the progress of the community. Collected information will include personal information, aggregated information, and device information.

Personal Information - Full name, Home address, Email address, Credit Card Numbers, Age Range, Telephone and Login Details. This information is fully encrypted at first point of contact, in transit and at rest.

Aggregated Information - Gender, Race, Age Range, Workplace, Height & Weight, BMI, Waist Circumference, Physical Activity Levels, Diet, Fruits and Vegetable Intake, Blood Pressure, Blood Sugar Levels, Family History in Relation to Diabetes

Device Information - Device IDs, Internet Protocol (IP) address, Unique Device Identifier, Cookies tracking, and Location Tracking (While using the app)

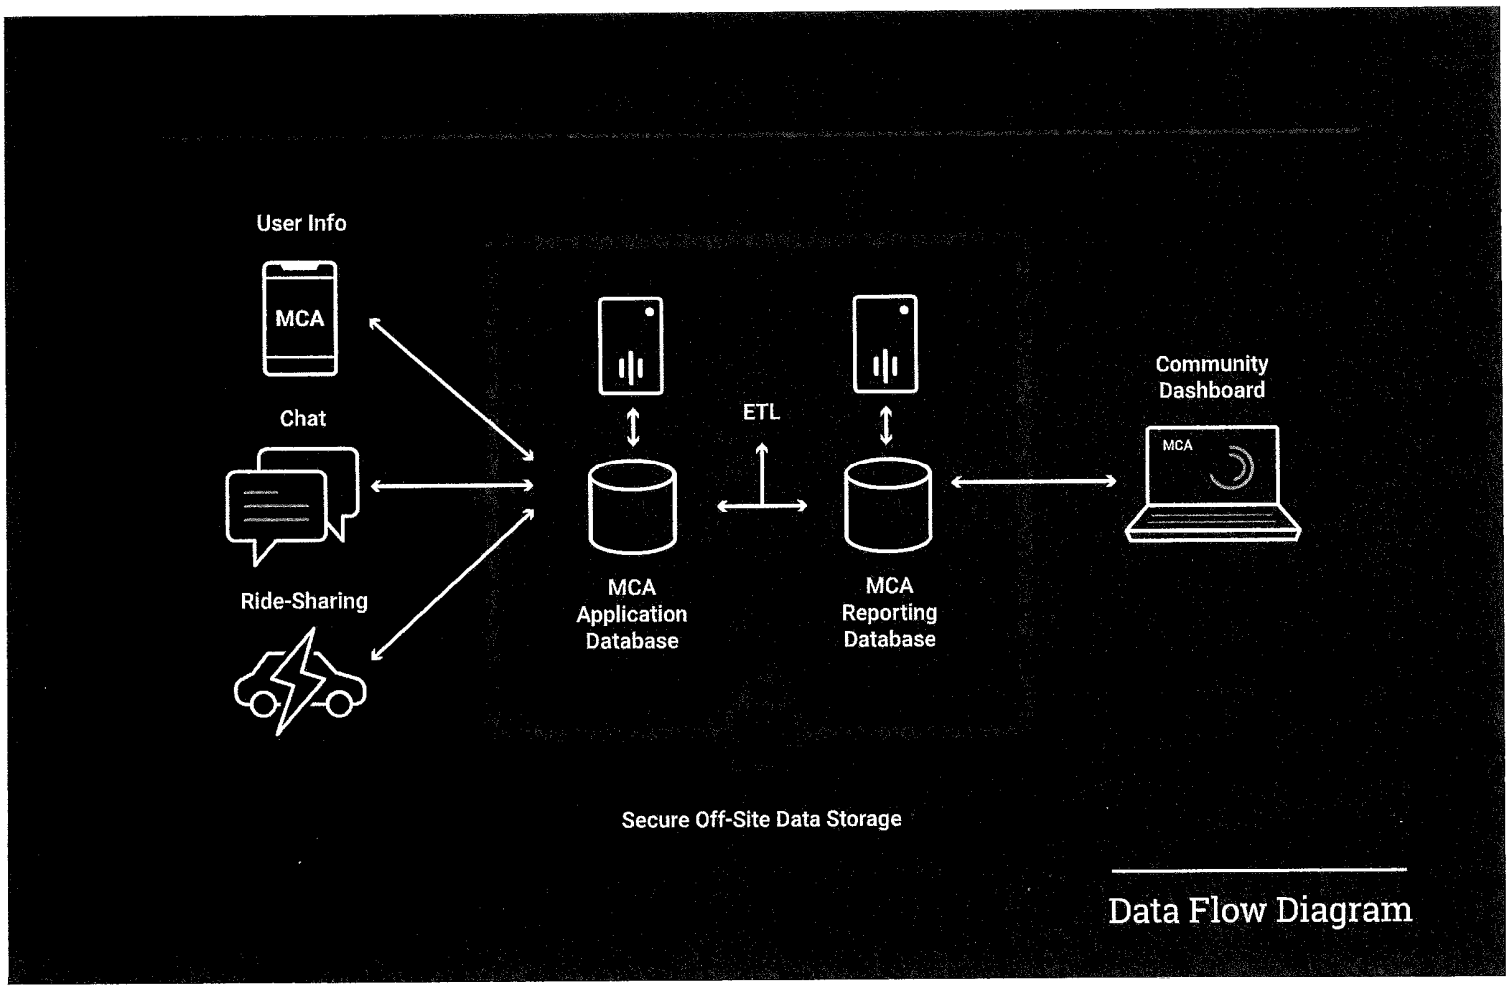
Adept in the security of information, our partners, zu, have been ensuring the safe

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

disclosure of information for over 23 years. All data surfaced and in transit between the application and Mohawk Council of Akwesasne Servers, will be managed through;

- SSL encrypted communication for all data in transit.
- Credentialed access to sensitive information at all touch points.
- Strong, AES encryption of sensitive data at rest.
- Secure, off-site storage of data backups
- Logical, and physical separation of collected PII and de-identified, aggregate data that will power community dashboards and open data initiatives.
- An extract, transform, load (ETL) step to pull data from the community application database into a separate repository of information used to generate redistributable reports that are devoid of PI.

Use - The use of the collected information will ultimately allow us to measure the success of our Smart Cities Solution. It will provide us insight into the communities progress enabling us to adapt our approach in areas of low participation and capitalize on areas of high participation. All information will be fully encrypted through SSL, and in an aggregated form to not tie information to an individual or key identifier.



Disclosure - All information not highlighted as aggregate information, will be fully encrypted and untied to the individual at initial contact, in transit and at rest. Personal information will not be made available to any third parties but only Mohawk Council of Akwesasne internal trend analysis and measurement

Efforts made to integrate security and privacy considerations into project design, particularly those that were raised users, residents, and other stakeholders.

Balancing design standards, user experience, and the privacy implications resulting from the former are all considerations necessary for the implementation of our Community Application. Below we highlight several best practices to integrate security and privacy considerations into our project design.

- Identification of what personal information is being, or may be, collected about them at time of consent
- Identification of all purposes for which information is collected, used or disclosed at time of consent
- Provide information to individuals in manageable and easily-accessible ways
- Multi-Factor Authentication
- "Just-in-Time" privacy notice where possible
- Treating consent as a dynamic and interactive process.
- Be positioned to demonstrate - either in the case of a complaint from an individual or a proactive query from

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Data Flow Diagram

a privacy regulator - that we have a process in place to obtain consent from individuals.

- Obtain consent from a parent or guardian for any individual unable to provide meaningful consent themselves
- The ability of an individual's right to withdraw consent
- The ability of an individual's right to review and update personal information logged

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Budget & Project Breakdown

zu's projects are tracked hour by hour, day, by day, week by week and month by month. Their time tracking system called Replicon records their time in 15-minute increments. The time spent is fed into burn and resource charts that are scrutinized against detailed work plans produced at the beginning of each production phase and broken down further by each week by zu's experienced product owners. The PO's work with zu's designers and developers to further break down work on key features into bite-sized "user stories", that are then used to create tasks in Jira and Replicon for assigning work and recording time respectively.

The Akwesasne team is kept in the loop via zu's weekly progress reports that feature a cost breakdown to date, budget forecast for the week ahead and expected spend upon completion. Risks are flagged in the report and discussed in weekly production meeting with the Akwesasne team. A decision log is kept by zu to maintain transparency throughout the project. Between their time tracking system, weekly reports and weekly status meeting, we'll be kept informed of risks, spend totals and decisions to ensure proper cost control from kickoff to launch. Work is completed upon our approval with production billing rate of $140/hr and a standalone strategy rate of $175/hour.

Our Smart Cities Solution will be assembled using, really no experimental technologies or untested software approaches. Therefore, our estimates are straightforward and not based on speculative math. Nevertheless, public tenders under the oversight of the before mentioned committees should provide us with competitive prices for the equipment and installation of the equipment we need to build the Electric Public Transportation and Smart Greenhouse Systems.

Taxes (11%)	$24,277.00
Expenditure Total	**$244,977.00**

** Remainder of budget will be used through the spring finalist stages, including presentation and travel*

Implementation Phase Requirements

While our Challenge couldn't be more significant to our community, the proposed Smart Cities system does not require special attention in regards to either municipal, provincial, or federal legislation, nor for reporting or policy requirements. Our consultation with Indigenous groups, since this is ourselves, is about ensuring we are inclusive of the many voices of our community. To that end, we have relied on many types of engagement to determine our initial approaches, and as touchpoints at every step of the planning and process of solution delivery. The most complex areas of legislative impact are around personal data privacy, and the risks of trying to build a comprehensive understanding of the state of our people's health. This is covered in our Preliminary Privacy Impact Assessment.

Community Employment Benefit

Our Smart Cities project will provide many benefits towards new skill development, as well as full and part time labour opportunities. Part of the value of these employment opportunities will be every participant knowing that the work they are involved in directly benefits our community and has the higher purpose

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

of improving health outcomes and quality of life at Akwesasne. The Electric Public Transportation System will create employment through MCA employed Smart Taxi drivers, and bus drivers. The Greenhouse will create opportunities for all ages and ability levels, providing positions in horticulture engineering, gardening, plumbing and electrical, as well as project and inventory management. Volunteers will also be needed and will receive exposure to trades and professions not currently in Akwesasne. The Akwesasne Community Application will also create numerous opportunities. Our Mohawk Council of Akwesasne Information Services team will undoubtedly need more help, and will towards those graduating from Ontario Emerging Jobs Institute for applicants. Hosting, maintaining and enhancing a combined mobile and web-based application like the Akwesasne Community Application requires all manner of skills. These include programming for all the devices and frameworks in use, database management, server management, system security and privacy, CMS management, social feed integrations, location management, training, and more. Some areas will require a depth of expertise, others will be necessary at shallower depths of experience. We are committed to not only innovating the products and services of our community but also developing the expertise and education of our people. It is time for us to make use of the technology that is key to our moving forward with our challenges and opportunities, and to become self-sufficient with these skills.

Commitment to a Climate Lens Assessment

Should we have the opportunity to move forward with the implementation phase, we will commit to completing the Climate Lens Assessment. This will make more sense after the public tenders for solution equipment have been received, and choices made about which equipment provides the best value at that future point in time. We are confident our Smart Cities approach will bring positive climate impact, but will confirm the expected measured effects when appropriate details for the analysis are available.

Risk in Regards to Implementation Plans and the Regulatory Environment

We do not foresee risks to our Smart Cities project in failing to meet relevant municipal, provincial, and federal reporting and legislative requirements. Granted there are always risks associated with making mistakes in regards to construction of buildings, and the Smart Greenhouses are structures. There are information privacy risks. There are labour standards rules. Their are employment related taxes to be paid. There is general reporting to the various Revenue Collection agencies. But none of these seem either notable as unique to our project, nor are new risks that our community does not already face.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Thank you for taking the time to read our proposal. We hope you have found our plans to improve the health of our people through this combination of Design Thinking, Smart Technologies and Web-based Software to be practical, achievable and worthy of being taken to fruition.

Our consultation with Indigenous groups, since this is ourselves, is about ensuring we are inclusive of the many voices of our community.

SCHEDULE "A" to MASTER SERVICE AGREEMENT
STATEMENT OF WORK: SUPPORT AND OPTIMIZATION

RE: Website Support and Optimization Service Agreement between the Mohawk Council of Akwesasne. (the "Client") and zu.com Communications Inc. (the "Webmaster") dated effective the 30th day of September 2018.

Support and Optimization Overview

Retaining long-term value from any digital asset requires a commitment to supporting the software development lifecycle. The increasingly rapid pace at which web technology and best practices, online threats and user expectations evolve make it hard to keep up. Our support and optimization model is designed to keep MCA team members aware of issues affecting site health and security, opportunities for iterative enhancement and potential opportunities to leverage new trends or technologies.

We structure our approach to long-term viability in two ways. The support fee enables your website to be flexible and protected from the changing nature of technology and online threats while the optimization budget allows your website to evolve alongside your corporate and communications strategies. Together, these two approaches to health and optimization ensure the successful transformation of your digital asset over time.

Definitions:

Bug – A bug is defined as a defect or defects in the existing code that produces an incorrect or unexpected result.
Existing code – Refers to code in use at the commencement of support and optimization agreement.
Minor version – Point sequence updates to supported, dependent software. Ex. major.*minor*
Major version – Whole number sequence updates to supported, dependent software. Ex. *major*.minor.

Schedule A: Budget

Annual Support Budget: Fixed TBD broken into a TBD monthly fee.
Monthly fee includes the services outlined in Schedule B: Support Services. The scope of services will be evaluated annually from the initial start date as the website may grow and the scope of support services and fees may be expanded.

Annual Optimization Budget: Recommended TBD broken into a TBD monthly forecast.
The annual optimization budget will include the variable costs dedicated to building out new features, website enhancements and major system upgrades discussed in Schedule C: Optimization Services. Optimization work will only be completed upon client approval at a production billing rate of $140/hr and a standalone strategy rate of $175/hour.

*Any changes in costs as a result of changes to hosting arrangements at the request of the client will be reflected in changes to the monthly fees.
*Variable cost will be affected based on US dollar conversion and hosting usage.

* Any work related to hosting maintenance including server configuration, server maintenance and host provider management will be recorded hourly and billed to the optimization budget at a rate of $140/hr.

Schedule B: Support Services

Support Services Scope:

1. Monthly proactive performance testing and bug diagnosis
    a. New minor version and major version browser/OS testing and 3rd party integrations monitoring for updates or security issues.
    b. Run any automated tests as well as manual testing per code release.
    c. Generate bug report; prioritize non-urgent bugs; catalogue major version browser and OS issues for optimization.

2. Bug resolution
    a. Bugs will be catalogued and prioritized based on services levels outlined in Schedule D.
    b. Bugs will be fixed based on priority.
    c. Minor version browser/OS and 3rd party integrations bugs will be resolved under the fixed support fee outlined in Schedule A.
    d. Major version browser/OS and 3rd party integrations upgrades covered under optimization budget outlined in Schedule A.

3. 3rd party integrations support
    a. Any fixes required to ensure 3rd party integrations are up to date, secure and functioning.
    b. 3rd party integrations may include:
        i. Google Maps
        ii. YouTube
        iii. Google Analytics

4. Drupal Support
    a. Minor version updates and security patches
    b. Deployment support

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

c. Administration View bug diagnosis and resolution

d. Additional local environment setup for ensured redundancy

5. Quarterly Services Reporting

a. Incident tracking and diagnosis

b. Analytics review

c. Document major risks

d. Document known 3rd party feed updates or enhanced feature availability

e. Document new browser/OS and device releases

6. Supported Browsers and Devices:

Monthly Testing - We currently test for the following operating systems and devices:

Device	Versions	OS
iPhone	SE, 8, 8+, X	iOS 11.0+
iPad	Mini, 4th Gen, Pro	iOS 11.0+
Android Phone & Tablet		Android 6.0+

Note: A review of website traffic by browser and OS will be conducted to determine whether backwards compatibility is required. If any one browser or OS makes up more than 10% of the overall traffic, zu will ensure the website is optimized for that instance.

Browser	Versions
Internet Explorer	11.0+

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Safari	Latest version
Firefox	Latest version
Google Chrome	Latest version

Schedule C: Optimization Services

While Support Services ensures asset health, Optimization maintains relevancy, strategic alignment and future growth opportunities. If assets are left stale they will never achieve the long-term value intended for the business or users. We recommend a balance between investing in system upgrades and feature enhancement to keep pace with the evolving nature of web technology and user expectations.

1. Website optimization:
    a. Custom feature development
    b. Section or website-wide content updates
    c. Major version Drupal upgrades (ie. 8.0 – 9.0)
    d. Additional 3rd party tool integration, API development, microservice integration
    e. Production design elements
        i. Infographics
        ii. Data visualization
        iii. Print materials
        iv. Heuristics reviews
    f. Website template adjustments
    g. Website main navigation changes
    h. Strategy services: user testing, stakeholder engagement, design sprints, product design, and development

2. Microsite development and optimization:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

a. Additional microservice websites for campaigns or special needs

b. Development of additional websites such as a dark site for crisis communications, community websites, further form integrations

Schedule D: Service Levels

zu business hours are 8:30 AM – 4:30 PM, Monday-Friday

Team - The developers responsible for performing support services include senior zu team members including one Acquia Drupal certified developer.

Urgent Requests:

1. Impact on all users on given platforms.
2. Website or application is non-functioning or severely degraded.
3. Loss of functionality to an entire section of the website.
4. Notice must be emailed to MCA@zu.com to ensure all members of the production team and support staff are notified.
5. zu will respond within one (1) hour with an estimated timeline to address such a request within business hours.
6. Urgent requests will be resolved at the earliest possible time and as quickly as possible. The team will work continuously until a resolution is met.
7. Urgent requests brought about by actions of the Mohawk Council of Akwesasne, its host provider or 3rd party participants will be resolved. Billing costs associated with these issues will be reviewed on a case by case basis and possibly fall outside the support services budget.
8. Should an urgent request be identified and communicated to zu outside of the stated business hours, and should the issue be deemed unable to be mitigated through a short-term rollback, zu Operations will then assess the next steps on a case-by-case basis in consultation with the Mohawk Council of Akwesasne to determine an appropriate resolution.

Non-urgent requests:

1. Impact on one (1) or more user groups or any device platform.
2. Application continues to work but non-critical functionality is unavailable. Restoration is not time sensitive.
3. Application continues to work but little non-critical functionality is unavailable.
4. Request is made in Zendesk or, if Zendesk is not being leveraged, a request is emailed directly to the Product Owner PO.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

5. Response within eight (8) hours on a timeline for an estimate within business hours.
6. Non-urgent requests will be prioritized and resolved based on a mutually agreeable schedule.
    a. This doesn't include downtime that might occur due to the host provider.

MCA Responsibilities:

1. Grant zu access to MCA's facilities, information technology infrastructure, information and data, and personnel for the provision of the services.;
2. Maintain backup data, and perform all other tasks required or recommended by zu to prevent or mitigate any loss or damage to MCA's data or other information arising out of the provision of the Services;
3. Comply with all reasonable procedures and requirement of zu to facilitate and assist in the provision of the Services
4. Perform those tasks assigned to MCA conscientiously and using qualifies and competent personnel;
5. Active communication with the zu team, and bi-weekly meeting attendance;
6. Drupal CMS content authoring & publishing, including;
    a. The editing of existing and addition of new content and documents
    b. Creation of new pages using existing content and page types
    c. Management of Content Menu Settings and URL Paths
    d. Rearrangement and addition of menu items

Schedule E: Quarterly Performance Reporting

Availability (Current Month; Previous Month; YTD):
- Service Time
- Unplanned Downtime Duration
- Maximum Downtime Duration
- Number of Downtime Occurrences
- Total Page Failures

User Experience (Current Month; Previous Month; YTD):
- Average Response Time
- Maximum Response Time

Capacity (Current Month; Previous Month; YTD):
- Average User Capacity
- Maximum User Capacity

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Completed Pages
- Bandwidth Consumption

Performance (Current Month; Previous Month; YTD):

- Average CPU Usage
- Maximum CPU Usage
- Average Latency
- Total Page Hits
- Average Page Load Time
- Maximum Page Load Time

IN WITNESS WHEREOF the parties hereto have executed this Statement of Work to be effective as of the 1st day of January 2019 ending the 31st day of December 2019.

Rhonda Adams,
Manager, Information Services,
Mohawk Council of Akwesasne,
PO Box 579,
Cornwall, Ontario
K6H 5T3

She:kon Rhonda,

Thank you for your email concerning the Akwesasne Smart Cities Proposal. I have been watching the development of this initiative with great interest given the tremendous possibilities and benefits Smart Cities could have for Akwesasne.

The Akwesasne Area Management Board (AAMB) would be pleased to participate in the Smart Cities Proposal by becoming a partner in training and employment opportunities. The AAMB offers a variety of programs and services that could dovetail with Smart Cities including Internships; Training on the Job (Job Opportunities); and Youth Initiatives to engage young people. Our goal is to work with employers to expand the range of opportunities for Akwesasne workers and clearly the initiatives proposed in Smart Cities would match this objective.

The Akwesasne Area Management Board looks forward to receiving more information on the Smart Cities proposal and extends best wishes on the development of this important program.

Skennen,

AKWESASNE AREA MANAGEMENT BOARD

Russell Roundpoint,
Executive Director.

Amberdawn Lafrance
Saint Regis Mohawk Tribe Environment Division
Akwesasne Cultural Restoration Program

March 4, 2019

Rhonda Adams
Project Lead Smart Akwesasne
Manager Information Services
Mohawk Council of Akwesasne

Dear Rhonda Adams:

I am writing to voice my full support of the Smart Akwesasne Project and their proposal to the Smart Cities Challenge.

The Saint Regis Mohawk Tribe's Akwesasne Cultural Restoration (ACR) Program was established in 2013 as a result of the St. Lawrence Environment Natural Resource Damage Assessment Settlement. The name that we have chosen for ourselves in our language is "Áse Tsi Tewá:ton" which means "make it new again". This name and its meaning describe what we are doing for Mohawk culture through the program; we are making it new again, and bringing new life to our traditions and cultural practices and strengthening the connection of our people to the land. The program is overseen by the Akwesasne Restoration Commission which is made up of representatives from the community, the Mohawk Nation Council of Chiefs, the St. Regis Mohawk Tribe, and the Mohawk Council of Akwesasne. The main component of "Áse Tsi Tewá:ton" is the Cultural Apprenticeship Program which is a four-year program in traditional, land-based, cultural practices. We hired eight Cultural Practitioners in the categories of Water, fishing and the use of the river; Horticulture and traditional foods; Medicine plants and healing; and Hunting and trapping. The program graduated 13 apprentices in 2017 and held over 150 community workshops since 2014.

Two goals of the Smart Cities proposal can be directly supported by the ACR program: Greenhouses and Cultural Awareness. The ACR program has the resources to offer traditional teachings related to Indigenous food sovereignty, Haudenosaunee heirloom seed saving, traditional gardening and harvesting practices, Kanien'keha language, and curriculum centered on these teachings.

Sincerely,

Amberdawn Lafrance

Akwesasne Freedom School Office Manager

Re: **Proposal on Curriculum Development for Greenhouses at schools**

Date: March 1, 2019

Tekwanonhweratons (greetings),

I hope this letter reaches you in good health and spirits. I am writing on behalf of the staff, students and families of the Akwesasne Freedom School. We are in support of this program and hope that it will help to build on what we have already created and follow. As Onkwehonwe (native) we have always been instructed to grow our own food for the nourishment and health of our body, mind and soul.

This proposal is absolutely necessary for our youth and families of Akwesasne. Students need the opportunity to learn where their food comes from as well as the work that goes into growing the foods. There is a plethora of knowledge to be shared which covers all subject areas such as science, health, math, social studies and cultural practises. This curriculum will be taught in English and Kanien'keha (Mohawk) which will strengthen language revitalization efforts for the immersion schools and create much needed curriculum. Immersion teachers are often creating their own curriculum for their classes because it is not written in the language needed. This will help alleviate the extra work that these teachers have.

We look forward to being part of such an important project in the near future.

Niawenhko:wa (thank you very much),

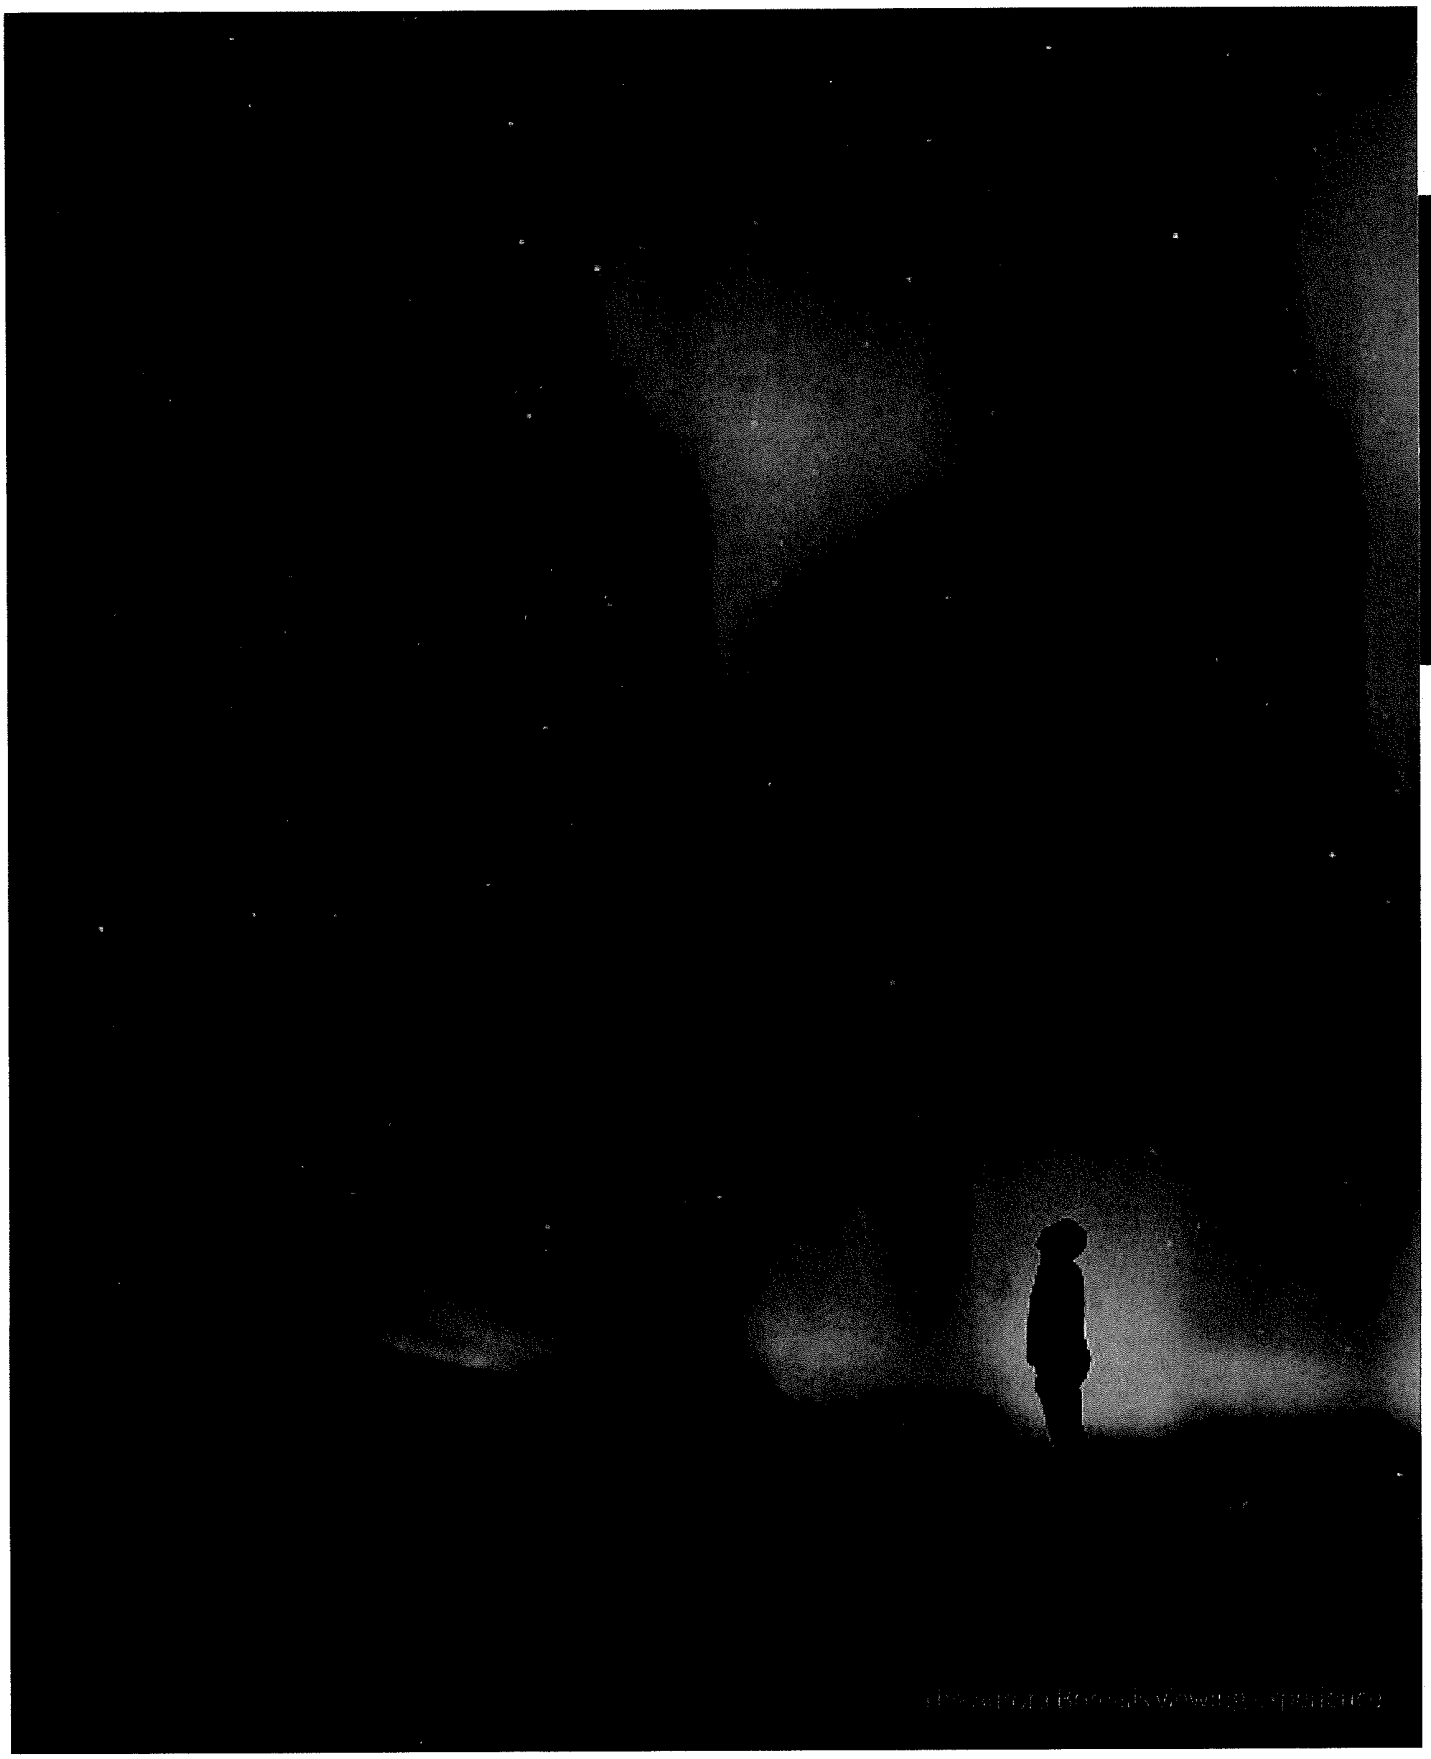
EXECUTIVE SUMMARY



Yellowknife is a place where ambition and ideas can easily turn into reality. It is a small, tightly knit, vibrant community with strong leadership and a desire to foster innovation. The Smart Cities Challenge has engaged the City to envision a future where technology is a key part of everyday life and the design and control of that technology is controlled by clear policy for the benefit of all Yellowknifers.

The City of Yellowknife has done considerable community engagement to understand what a Smart City might mean in the northern context and how it will improve the lives of its residents. The focus of this proposal is on five key impacts: extraordinary skies, tourism, a replicable framework for northern innovation, community connectivity and sustainability. To achieve these impacts there are a series of outcomes that will be attained through the diverse technological innovations to be incorporated into the lampposts much like apps to a smartphone.

These technologies will all be vetted through new strategic thinking that will learn from the best of European and North American Smart City experience to help nurture a Northern Smart City ethos. By pitching Yellowknife as a cold weather lab for smart city innovation, the City will develop replicable plans, tools and ideas that can be spread throughout the north. The focus on dark skies and light pollution reduction will set the City apart in the competitive world of aurora tourism, and provide economic development opportunities and benefits for Yellowknifers. Electric vehicles, improved city services, beacon and geofencing technology and a mesh network will be some of the tools that help the City meet its ambitions of a smart outpost in the boreal forest.

This proposal outlines how the City proposes to take a measured and reasonable approach to reach the stated outcomes that will define success. The Smart Cities Challenge will be the springboard that turns the simple lamppost into a beacon for sustainability.

CHAPTER 1

VISION

Challenge Statement

Yellowknife will experience a rise in our community's social and environmental well-being by transforming the simple lamppost into a beacon for sustainability.

The City of Yelllowknife's Smart Cities Challenge Statement is ambitious and summons stakeholders to explore the complexities of evolving into a Northern Smart City. In the past year, our efforts towards engagement and research have cemented the importance of using information and technology to better the lives of Yellowknifers. We are excited about this opportunity to use the Smart Cities Challenge as a springboard to make Yellowknife a place that defines itself differently: a place in which knowledge, information and Smart City technology become central to our identity as a cold-weather urban laboratory surrounded by the beauty and vastness of the boreal forest.

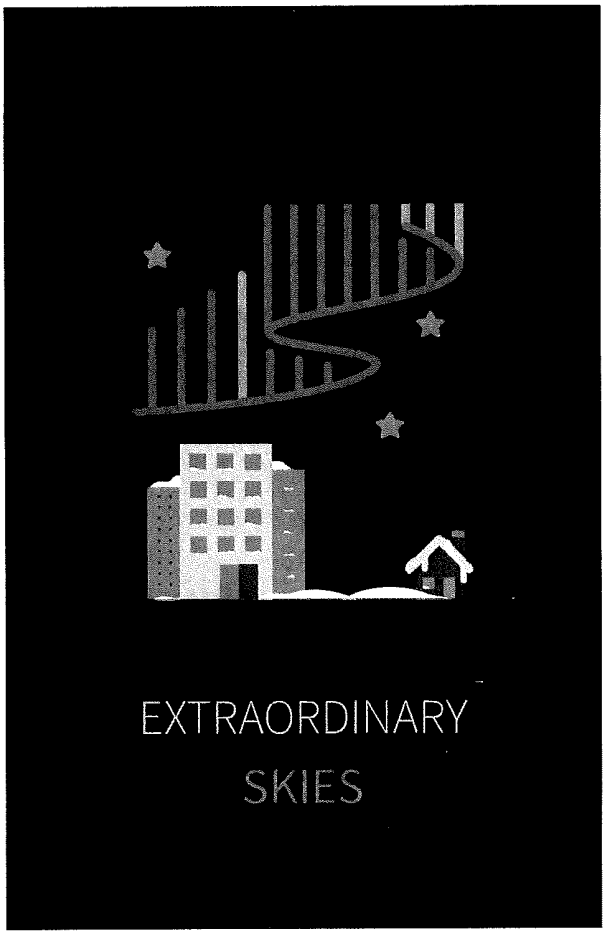
There is considerable work ahead before we achieve this ideal, but the pieces are in place, and we have confidence in our staff, our leadership, and in the passionate and engaged population of the City of Yellowknife.

BUILT ON GOLD, NURTURED BY GOVERNMENT, LIT BY TOURISM AND LOOKING TO TECHNOLOGY

Yellowknife, "where the gold is paved with streets", or Sambaa K'e "the Money Place" in the local Wilideh language, has a fascinating if relatively recent history as a city. Prominently located on the shores of Great Slave Lake, The Yellowknives Dene First Nation have traditionally occupied the region. The location was a rich fishing and hunting ground for the Dene People. The 1930s gold rush lead to the rapid influx of prospectors—complete with vehicles, floatplanes and all the latest and greatest technologies of the time. Yellowknife boomed with the development of two huge gold mines that spread along the shores. In time the city grew and developed a new downtown, became the administrative centre of the Northwest Territories (NWT), and eventually the capital city in 1967.

Growth continued in the 1970s and 80s, following the cycles of boom and bust that accompany the mining sector. The eventual decline and closure of both Con and Giant mines impaired the city's economy, until diamonds came to the rescue and led to a second mining boom in the 1990s. The Government of the Northwest Territories (GNWT) signed a devolution agreement in 2013, setting the stage for government to take a larger role in the economy. Meanwhile, the city core that grew so rapidly in the 1950s and 60s started to show its age, and social problems became more apparent. As the current diamond mines move towards the end of their lifespans, the tourism market, in particular aurora tourism, has emerged as a potential area of economic growth.

Meanwhile, treaties with indigenous governments in the Territories are being settled, or are in the process—which may bring about more opportunities for revitalization and growth led by indigenous governments. This evolution of opportunities (and challenges) isn't unique to Yellowknife alone, but forces us to look to our changing horizon for the next chance to redefine our city, carved out of the boreal forest on the shores of Great Slave Lake.



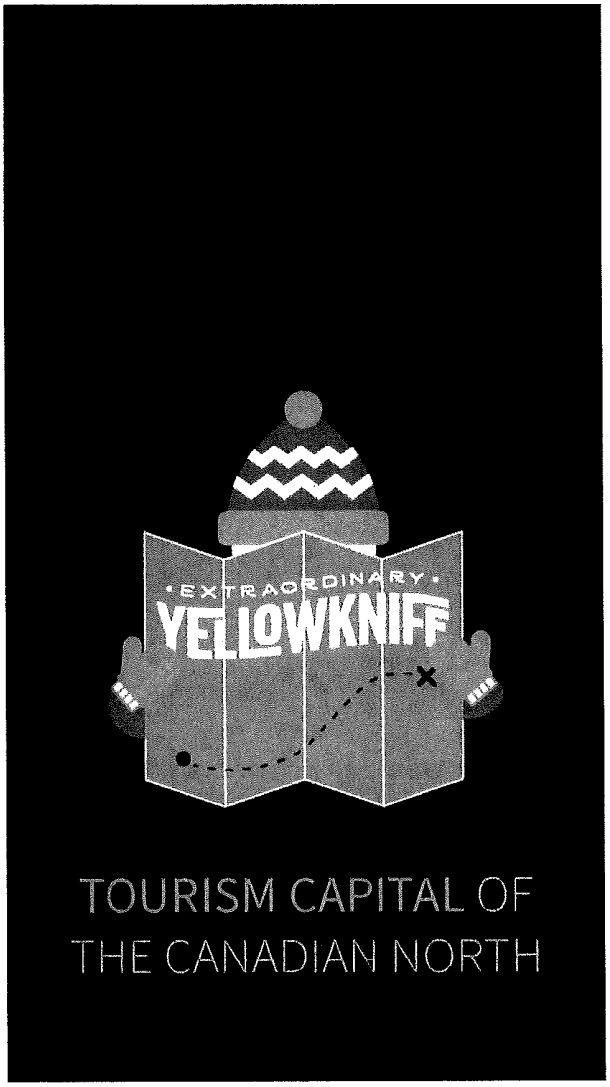
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

IMPACT A:
EXTRAORDINARY SKIES

As often happens with shared resources, the night sky viewing experience has been slowly degraded. The pervasive creep of light pollution has been hastened by technology and the energy saving promise of LED lighting. We know that early adopters often learn key lessons about the adverse side effects of technology, but they also benefit longer, and are able to capitalize on future opportunities. As a leader and early adopter of a Smart City mentality, we propose to use our experience to document and outline the challenges and problems we encounter to guide others down the road of advanced technology.

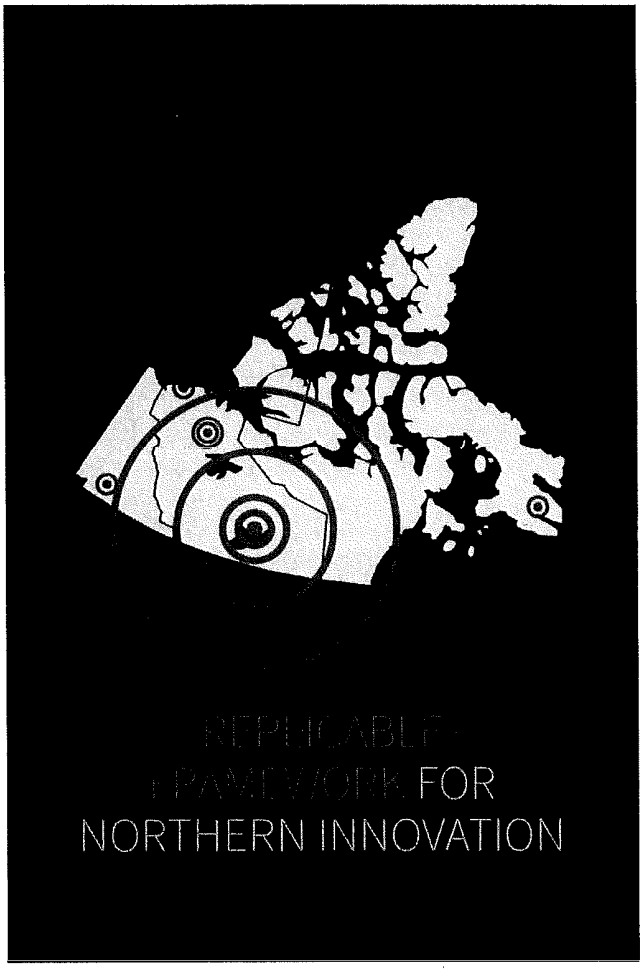
We see the Smart Cities Challenge as our avenue to support other similar-sized cities around Canada, particularly the small towns scattered throughout Canada's North. By implementing a strategic lighting plan alongside interconnected lampposts, and encouraging light reductions city-wide, Yellowknife will lead by example in an area of growing importance. The next step for city lighting is to implement technology that dims and brightens lights at appropriate times. The technology is becoming available to take this city-wide and beyond.

Opening up our skyline to expose the aurora will have multiple benefits for Yellowknifers on top of the economic drivers of tourism. We will become more in tune with the sky and connected with the dancing lights. Decreasing the unnecessary presence of street lighting will allow natural lighting patterns to influence our moods and circadian rhythms without artificial influence. We intend to make the most of this opportunity to not only test the technology, but evaluate and communicate the softer benefits of improved lighting outcomes for human health, community and happiness.



QUOTE

"The Northwest Territories has much to offer travellers – stunning landscapes, rich culture and unforgettable adventure. It also has much to gain. Tourism 2020 is an investment in our people, our communities and our future. This renewable resource has a high return on investment and will create lasting economic opportunities, careers and capacity building throughout the territory."



- Wally Schumann, Minister of Industry, Tourism and Investment

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

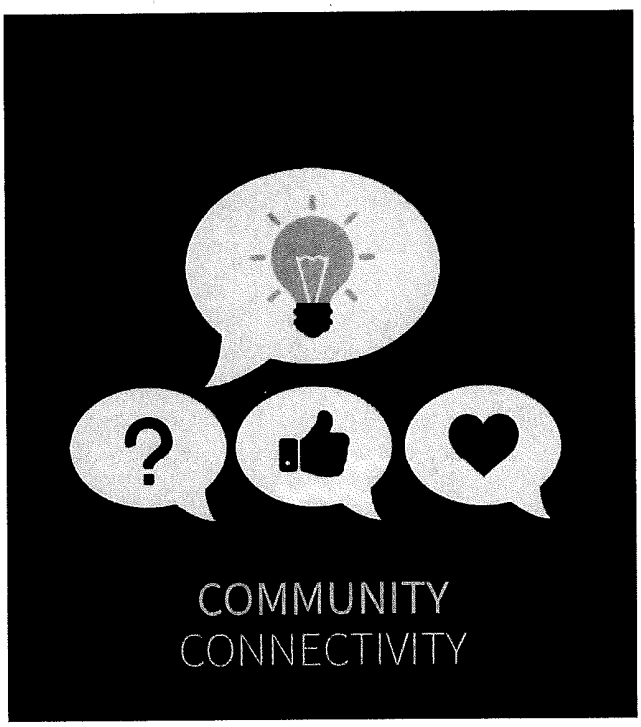
IMPACT B: TOURISM CAPITAL OF THE CANADIAN NORTH

The Smart Cities Challenge will amplify existing efforts to develop our natural tourism resource of "Extraordinary Skies". In 2017-18 over 34,900 tourists travelled to Yellowknife to view the Aurora Borealis or northern lights (GNWT, 2018) . Tourism employs over 12% of NWT residents, with a spinoff effect estimated at $3.80 for every $1 spent (NWT tourism, 2016). The Government of the Northwest Territories (GNWT) expects 35% growth in the industry increasing visitor spending to $235 million by 2020 (GNWT, 2016). Yellowknife happens to be ideally situated under the auroral belt, has clear skies and is regarded by many as the best place in the world to view the northern lights.

IMPACT C: REPLICABLE FRAMEWORK FOR NORTHERN INNOVATION

Yellowknife has the potential to become a place where knowledge and technology combine to carve out a sector of the economy that is defined by our natural and cultivated assets. The city will evolve into an experimental hub of technology and a place of new, innovative enterprise.

The foremost factor encouraging this transformation is the people. Northerners are well known for their resilience, strength of character and resourcefulness, but also for their adaptability and openness to change. Yellowknifers are young and well-educated, having near the highest per capita post-secondary degrees in Canada (McGrath, 2013), and is increasingly multicultural. This unique blend of intellect, diversity, creativity, and youthful vigour, when combined with the knowledge and resilience of our First Nations partners, makes our population a perfect place to build a Smart City.



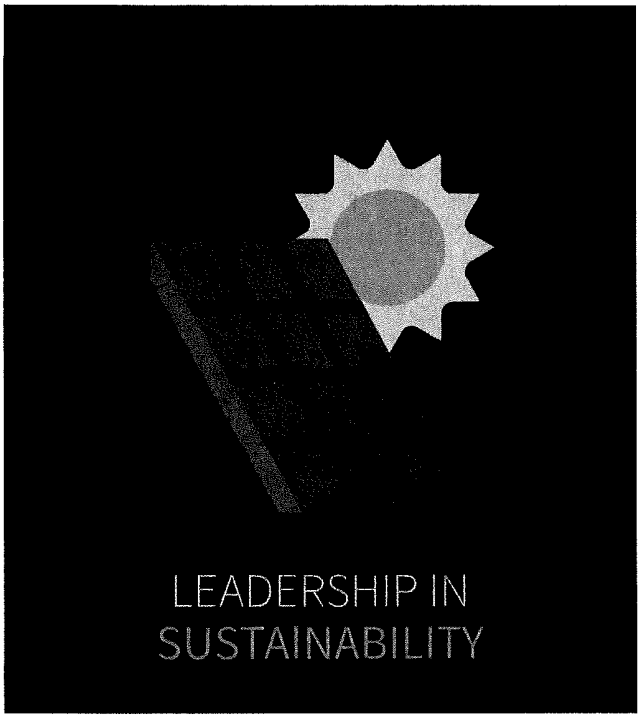
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

We view this opportunity as a springboard to build a sustainable model for economic development built on tourism, research, and innovation. Yellowknife's relatively small size makes the City agile. Its location at the end of the highway, in the midst of a cold and harsh climate, makes the city an ideal laboratory for innovation, cold-weather testing and information technology. We see a future pitch from our new smart-city-endorsed label: "tested in Yellowknife".

The final factor is our politics. We are home to a strong base of democratic idealism, a consensus government that isn't subject to partisanship, and a flair for pushing the envelope. A strong civil society is another feather in our cap, and being a small jurisdiction, our partnerships and engagement are based on human relationships—like the comfort that comes from meeting your elected officials in the grocery store checkout line. The key to our continued evolution into a smart city will be engagement with the population, and particularly our First Nations partners and neighbours. We will develop a new story for a diverse and prosperous Yellowknife centered around technology, innovation and resilience.

IMPACT D: COMMUNITY CONNECTIVITY

Our research has shown that having a clear framework for technology adoption and decision-making is key to making a Smart City. Establishing policies, targets, and strategies into a Smart Cities framework will make the ground rules clear, structure our decisions on technology, and evaluate and measure success. In cities like Barcelona, Glasgow and Copenhagen, these frameworks are already well-advanced; these European case studies can serve as models for our own Smart City Vision. White Arkitekter, the largest architecture firm in Scandinavia and a global leader in sustainability, have been a key stakeholder since the beginning to bring European best practices and experience straight to the Canadian North. Carleton University's Urban Research Lab has helped to understand the North American ex-

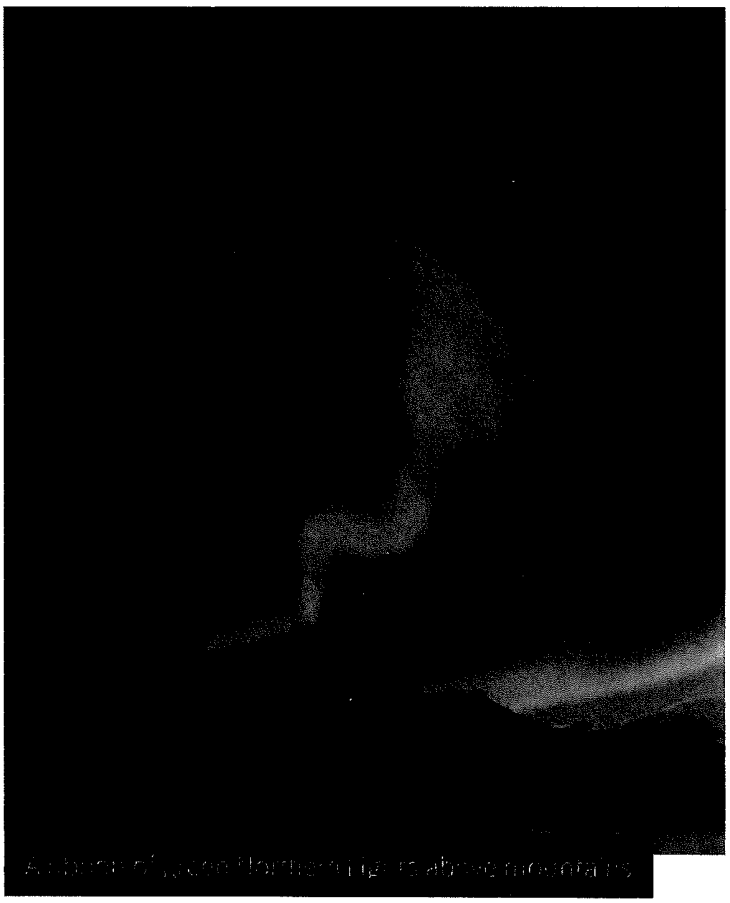


perience with Smart Cities and urban context, while our very own local environmental champion Ecology North has helped the City bring these pieces together in a coherent manner.

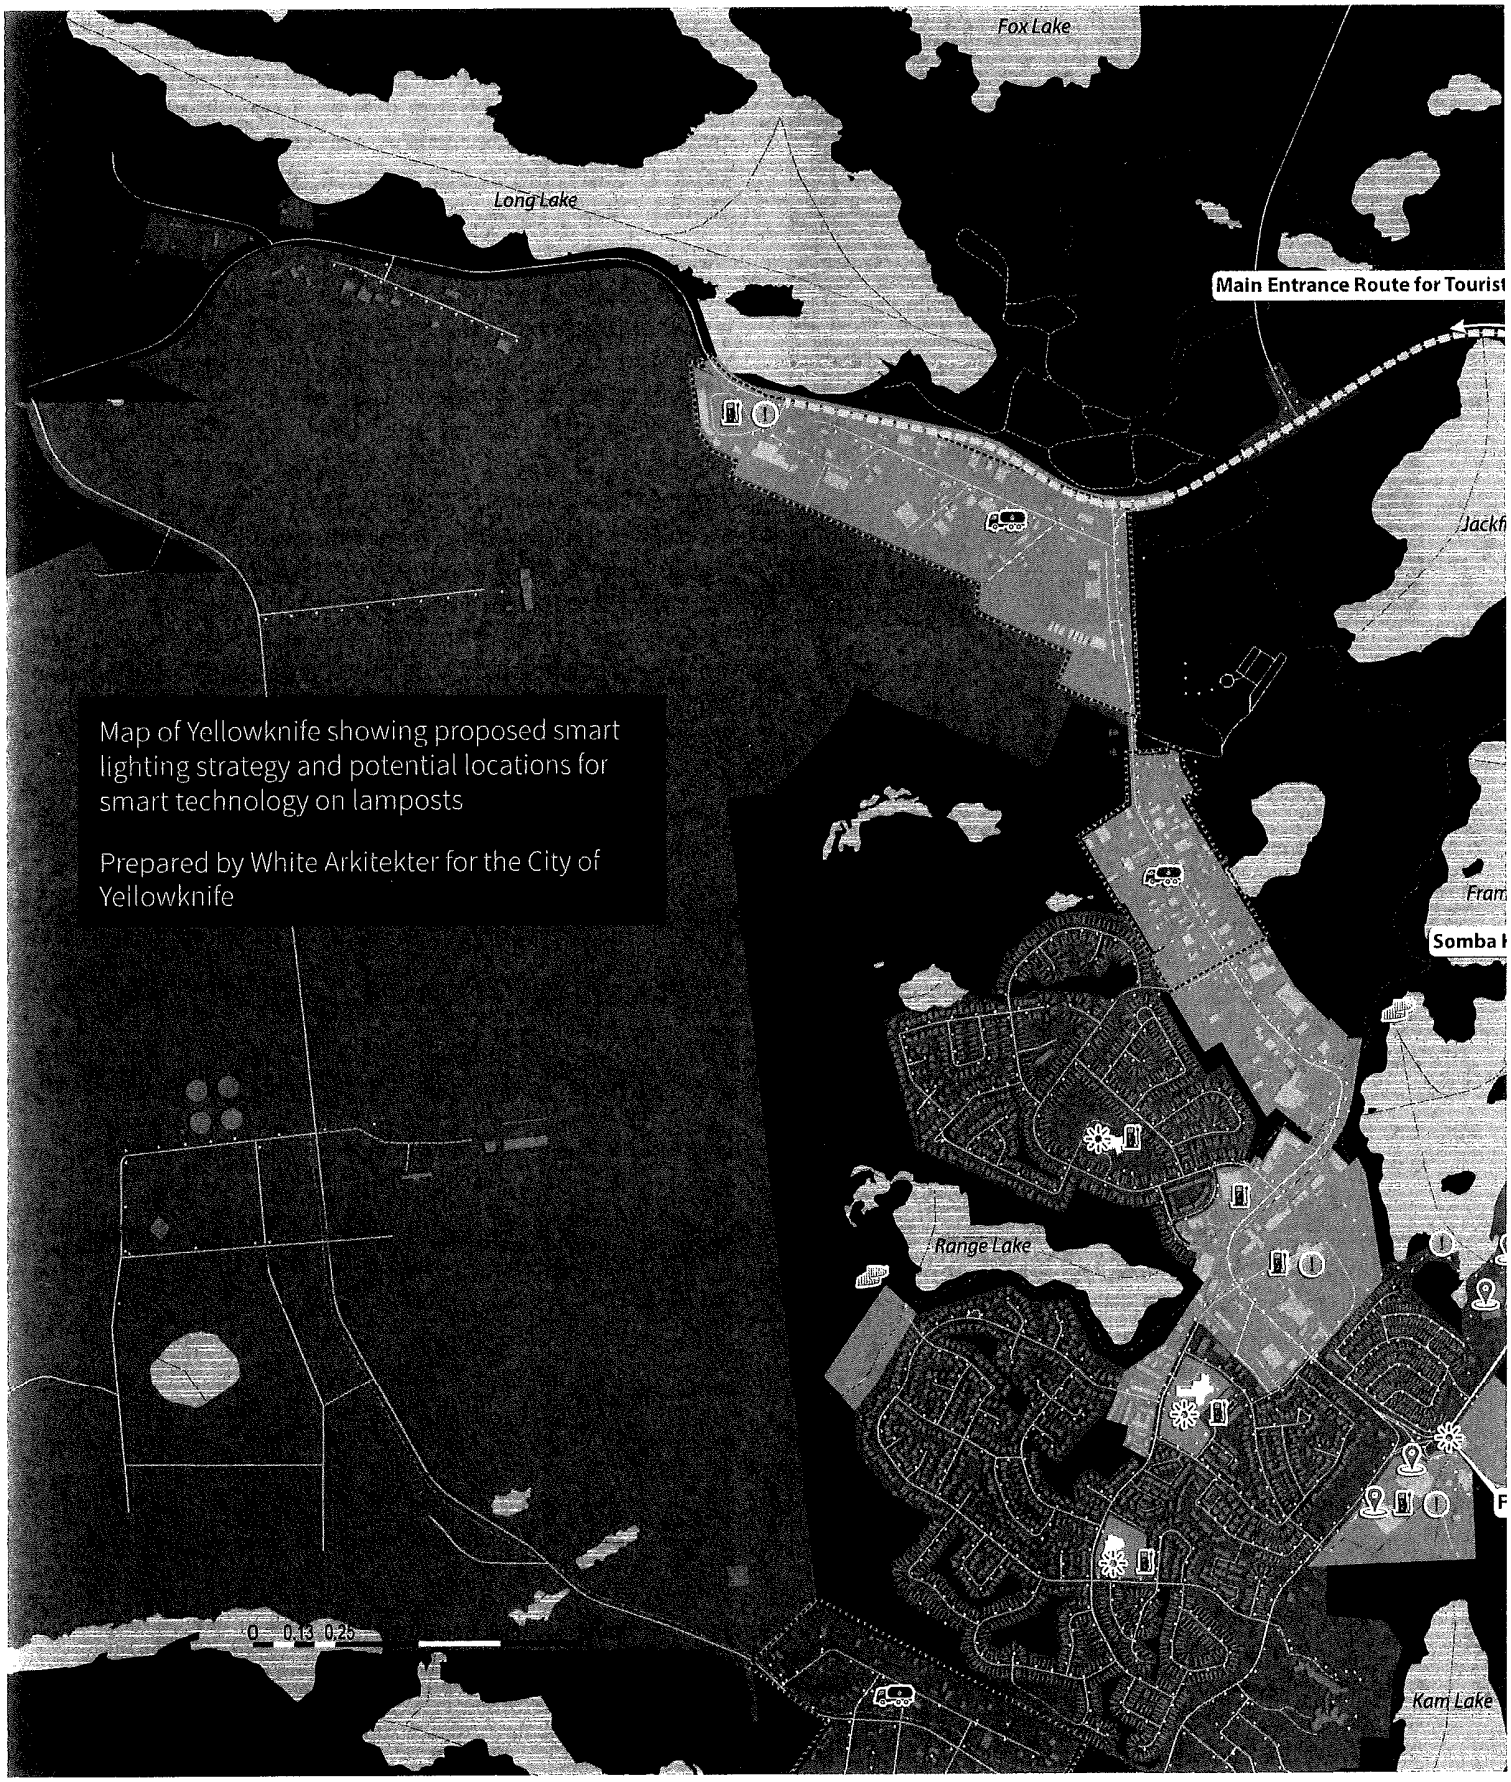
Venturing into the realm of Smart Cities is unchartered territory for the stakeholders. We look forward to an iterative process that includes the necessary checkpoints and protocols to ensure that the project moves forward in a meaningful and manageable manner. Already, the Smart Cities process has sown seeds across city departments on how to improve municipal servics through integrated technology.

One of the key components of our journey will be to develop an Information Technologies Smart Cities Strategic Plan: which will guide our outlook on Information Technology, and create a framework for making decisions around information moving forward. This framework will be based on the experiences of those who have gone before us, but be scaled and adapted to our unique Northern circumstances.

A key part of our transformation will be continuous engagement with Yellowknife citizens. Open data sharing and knowledge transfer will also help the City gain social licence and trust, build partnerships, and leverage funding and ideas. Using the ubiquitous lamppost as a beacon for sustainability, we will create distinct and unique opportunities for citizen and stakeholder engagement within a Smart Cities construct.



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information



IMPACT E: LEADERSHIP IN SUSTAINABILITY

Meanwhile Yellowknifers and tourists will benefit from the adaptation of the lamppost to pose innovative solutions, as suggested by the city's residents. Electric Vehicle (EV) charging stations built right into streetside lampposts will help to encourage adoption of electric vehicles, and prove that they work in the north. Lamppost-based geofencing and beacon technology will help make interpretive materials, event schedules, maps and community knowledge available to tourists, directly through their smart phones and in their mother tongue. Expanded free Wi-Fi would help tourists and locals to connect with services, information, maps and social media. Meanwhile, the majority of city lampposts would be connected to a series of 22 gateways that will move internet protocol (IP) information back to City Hall, and underpin a mesh network and new information hub at City Hall. This network will enable the installation of sensors that can reduce costs for City and other services: such as water and sewer infrastructure, waste, transportation, and data collection on permafrost, climate, and the environment. These improvements in services will help reduce energy and electricity costs and greenhouse gas emissions, improving our already impressive track record of climate leadership and citizenship to promote buy-in and engagement. To this aim we will cultivate transparency, collaboration, replicability and rapid prototyping in our process of becoming a Smart City.

Yellowknife's northern setting creates unique circumstances around infrastructure, resources, and culture. The implementation of a connected network via the lamppost feature in this remote, climatically-harsh location will pave the way for other northern communities on a regional or national scale. Our frameworks and technologies will be replicable and adaptable to other northern contexts. Yellowknife is well-poised to act as a leader and a laboratory for innovative practices. As we move forward in transforming our City, we look to our citizens to embrace the smart tools and networks that will improve the lives of Yellowknifers. The Smart Cities Challenge is an opportunity to build a sustainable model for economic development based on tourism, technology and the potential for Yellowknife to act as an open-air cold weather lab.

CHAPTER 2

PERFORMANCE MEASUREMENT

OUTCOMES

A.1 Increase in Dark-Sky Friendly Neighbourhood trends

A.2 Decrease in sky glow (light pollution) based on 2019 levels

A.3 Increase in public awareness about effects of light pollution

OUTCOMES

B.1 Increase in tourism

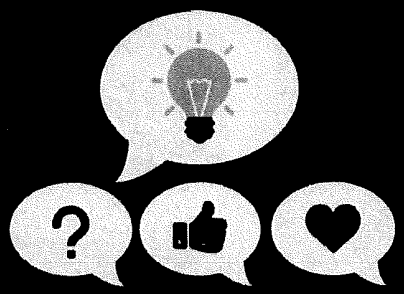
B.2 Increase in quality of Aurora Borealis viewing experiences

B.3 Increase in location-tagging and tourism hashtags

B.4 Increase in use of Ping Street app

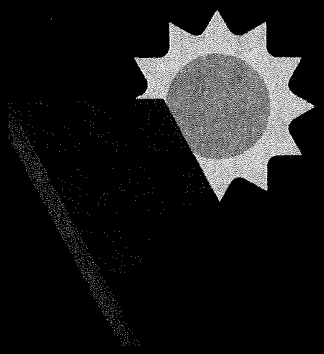
B.5 Sustainable economic diversification and income to local tourism-based businesses

OUTCOMES



C.1 Finalized, scalable and shareable IT strategy for northern municipalities

C.2 Outputs consistent with Smart City Vision at 3 & 5 year Checkpoints



C.3 Participation by external contractors in developing applications for Yellowknife IoT infrastructure

C.4 Reduction in cost and increase in reach of municipal services

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

COMMUNITY CONNECTIVITY

LEADERSHIP IN SUSTAINABILITY

OUTCOMES

D.1 Increase in local expertise and literacy regarding smart cities technology

D.2 Increase in engagement on Placespeak

D.3 Increase in real-time information being updated in the Pingstreet App

D.4 Increase in broadcasting impact and reach

OUTCOMES

E.1 Yellowknife will lead the North in Electric Vehicle penetration

E.2 Make progress toward the targets set in Yellowknife's Corporate and Community Energy Plan

E.3 Reduction in electricity use from dimmable streetlights

E.4 Reduction in water and energy use and carbon emissions from improved city services

E.5 Progress toward achieving United Nations Sustainable Development Goals

CHAPTER 2

PERFORMANCE MEASUREMENT

Measuring success against quantitative and qualitative performance indicators is a key part of Yellowknife's Smart City Plan as highlighted in this proposal. The chart on the previous page summarizes this proposal in five columns that help explain the journey to become a Smart City. The **inputs** tell the story, while **activities** summarize the proposed plan, and the final column, **Impacts**, summarizes the vision. The **outputs** column highlights the deliverables and technologies, while the **outcomes** are the key to performance management. Striving to achieve the impacts and fulfill the vision will be an iterative journey. This journey will recognize a considerable number of actionable variables that must be addressed in order to reach the measurable outcomes.

MEASURING PERFORMANCE

To build consensus, understanding and consistency around a Smart Cities framework, Yellowknife will consider following the International Organization for Standardization Certification ISO 37106:2018 for Sustainable Cities and Communities. This document gives guidance for leaders in cities and communities on how to develop an open, collaborative, citizen-centric and digitally-enabled operating model for their city that puts the vision for a sustainable future into operation (ISO, 2018).

As the basis for a new Smart City Yellowknife vision, the ISO standard will enable processes for the innovative use of technology and data. It will ensure that the City is working within a consistent and globally accepted framework for sustainable cities. Further to this the City will initiate a series of strategies and action plans that will provide a framework to reach the stated impacts. This chapter will highlight the five impact streams that the City has identified to help reach the vision, the outputs which are the plans to get there, and the outcomes that will allow for performance measurement.

IMPACT STREAM A: EXTRAORDINARY SKIES

Yellowknife will maintain its reputation as the the most attractive aurora borealis tourism destination in Canada by focusing on the reduction of light pollution using dark sky principles and a city-wide Lighting Strategy. Putting in place the conditions necessary to achieve Extraordinary Skies starts with a progressive transition to embracing Extraordinary Yellowknife (output A.2). The municipality will slowly phase out lights that are not compliant with the concept of Dark Sky municipalities. Most of the long-term impacts are outside the timeframe of this Smart Cities Challenge, and should be visible over the course of the next 10 years. However, it is anticipated that the implementation of new lighting will have an immediate, noticeable impact on light pollution.

Output A.1 Light pollution baseline in Yellowknife

Output A.2 Development of "Extraordinary Yellowknife" Lighting Strategy to guide municipal retrofit lighting plan

Output A.3 Best practices guide for dark skies compliance

Output A.4 Transitioning of select Yellowknife streetlights to smart lighting technology, in alignment with the Lighting Strategy

Output A.5 Retrofitting of select Yellowknife neighbourhoods into Dark Sky compliant areas

The determination of the current light pollution baseline (output A.1) will show the potential for what is yet to come. Using the latest technology, the Yellowknife Smart Cities Challenge team will measure the current light pollution levels in the City. It has not been decided yet what tool will be used, nor if the light pollution illuminance in the covered or starry sky will be measured. Additional

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

work is underway to determine the best technique that will not provide erroneous results because of changing weather conditions.

The City will evaluate the effectiveness of the motion sensing dimmable light pilot project on School Draw Avenue with regard to energy savings, functionality, safety, security, light pollution reduction and citizen approval. The City and partners will identify appropriate improvements and a plan to expand to lighting retrofits and city wide lighting improvements strategically (output A.4).

As part of a city-wide expansion of dark sky compliance, the City will continue to work toward reductions of unnecessary lighting and improving awareness about the effects of light pollution. This output will be no additional cost for Yellowknife residents as it does not force an immediate retrofit, but rather a long-term change in mentalities. Local retailers will be moving towards Dark Sky friendly lighting fixtures. There is no requirement, but built in incentives and awareness of benefits to encourage homeowners and businesses to change the existing non-compliant lighting fixtures.

Outcome A.1 Increase in Dark-Sky Friendly Neighbourhood trends

Outcome A.2 Decrease in sky glow (light pollution) based on 2019 levels

Outcome A.3 Increase in public awareness about impacts of light pollution

As the centerpiece of Yellowknife's Smart Cities experience, the City will experience a reduction in light pollution, better aurora viewing outcomes and a closer connection with our extraordinary skies. Learning from the pilot project on School Draw Avenue will assist the City as it expects to expand dimmable lighting throughout half of the city within five years. All of this will be done with guidance from the Yellowknife Lighting Strategy once approved by Council. A strategy will also be set for how to start a public awareness campaign to educate and encourage residents and businesses to reduce private lighting and to encourage dark sky compliant fixtures. Efforts will also be made toward strengthening partnerships in order to understand and study the impacts of LED lighting on human health and wildlife.

As motion sensing dimmable lighting is a relatively recent technology there are risks for early adoption. The City intends to work closely with industry and partners to ensure lessons are learned from the pilot project, and that residents understand and are excited about the prospects of dimmable lighting. The biggest risk factor is the potential for perceived safety risks to negatively impact the public appetite for dimmable lights. To mitigate this risk the City will research and communicate the safety and health benefits of motion-sensing dimmable lighting to the people of Yellowknife.

IMPACT STREAM B: TOURISM CAPITAL OF THE CANADIAN NORTH

Yellowknife is happy to be a market leader as a northern tourist hotspot. To maintain and improve this status will require considerable effort in many areas, including efforts to use technology to improve the experience of tourists. This will be done by using smart lighting to better showcase our extraordinary skies (output B.1). Improving tourism products and services while catering to a new brand of Smart City tourism that has the potential to create sustainable economic diversification and provide income to local tourism-based businesses.

Output B.1 Promotion of Extraordinary Skies for tourism (in parallel with outputs A.2 to A.5)

Output B.2 Work with partners to increase availability of resources and information to tourists, using both digital and traditional platforms

Output B.3 Expansion of geofencing infrastructure

Output B.4 Development and installation of beacon technology

Output B.5 Expansion of existing free municipal wireless network

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Outcome B.1 Increase in tourism

Outcome B.2 Increase in quality of Aurora Borealis viewing experiences

Outcome B.3 Increase in location-tagging and tourism hashtags

Outcome B.4 Increase in use of PingStreet app

Outcome B.5 Sustainable economic diversification and income to local tourism businesses

Taking pride in our Extraordinary skies and improving night sky viewing opportunities for tourists will be a key part of the Smart Cities plan. This will be easily tracked by economic indicators that the Government of NWT compiles around tourism, and also adoption and use of apps, social media and beacon technology. But the full story of how a Smart City focus improves the tourism experience will be found in qualitative experience of the tourists itself. To that end the City will continue to work with partners at NWT tourism, the future Yellowknife destination marketing board, and tourism industry providers.

There are global and national issues that pose a risk to tourism in Yellowknife. These are beyond the control of the City, but by improving the experience of tourist through tourism and a Smart City experience that risk will be substantially mitigated.

IMPACT STREAM C: REPLICABLE FRAMEWORK FOR NORTHERN INNOVATION

Developing a clear strategy for making Yellowknife a smart city, as well as an open transparent cold-weather laboratory for smart cities technology, are both key aspects of this plan. Being the hub for the North, Yellowknife also wants to document and communicate successes and failures to help other similar-sized northern communities adopt smart practices, policies and technology that make sense in our harsh climate. The City intends to do this through the following five outputs, measurable by the subsequent outcomes.

Output C.1 Adoption of ISO 37101:2016 Sustainable Cities and Communities

Output C.2 Commissioning of Smart Cities IT strategy and action plan

Output C.3 Creation of Smart City Committee to oversee the integration of Smart Cities vision into municipal services and infrastructure

Output C.4 Expansion of municipally-owned Internet of Things (IoT) infrastructure

Output C.5 Improvement of City Information Hub, backhaul infrastructure and lamppost mesh network.

Output C.6 Development of Engagement Plan, including incentivization plan and protocol for third party participation

Output C.7 Creation of research budget to incentivize entrepreneurial Smart Cities innovation in a northern setting

Outcome C.1 Finalized, scalable and shareable IT strategy for northern municipalities

Outcome C.2 Technology-related outputs consistent with Smart City Vision at 3 & 5 year Checkpoints

Outcome C.3 Measurable improvement in developing applications for Yellowknife IoT infrastructure

Outcome C.4 Reduction in cost and increase in efficiency of municipal services

Key outcomes will be achieved following the development of strategic plans, and the subsequent improvement of the IT strategy and system. This will help turn Yellowknife into a centre where IT and information generated by smart data become key factors in municipal strategic planning, and smart technology solutions are increasingly adopted by the public, society groups, and the private sector.

Incorporating project "checkpoints" at the end of years 3 and 5 is a strategy for course correction that mitigates the risk of misaligning outputs with outcomes. Oversight of the three- and five-year checkpoints will fall under the purview of the Smart Cities Committee. This committee will pro-

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

vide oversight for the assessment and implementation of the IT Strategy in alignment with the Smart CIty vision and is described in more detail in chapters 3 and 5 of this proposal.

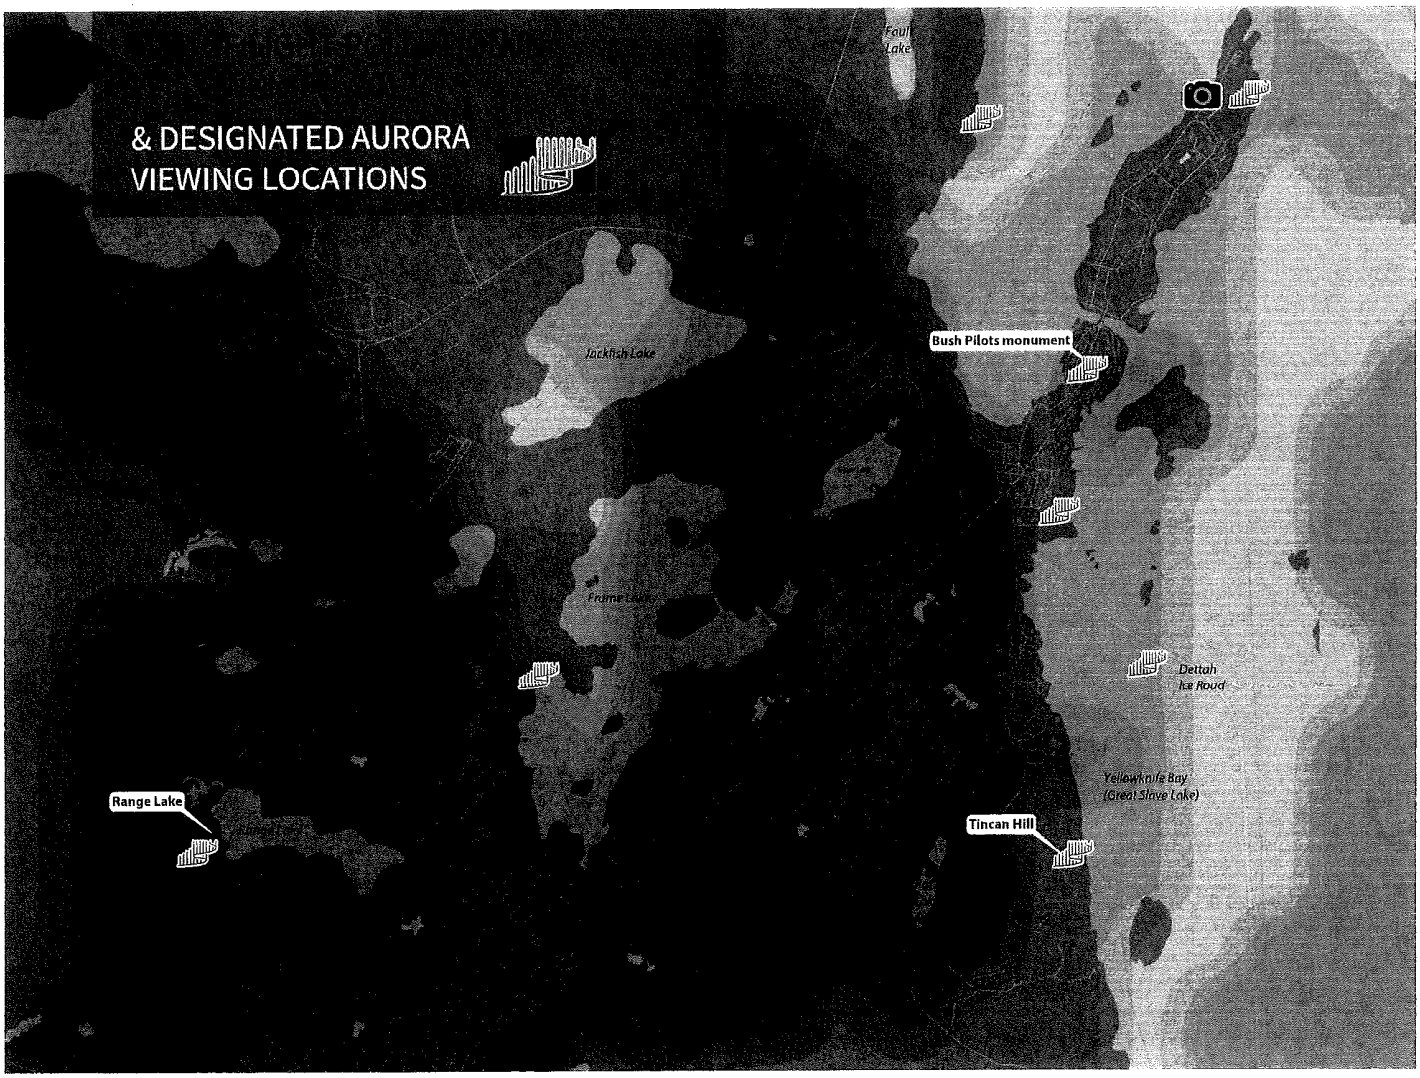
An anticipated risk for Yellowknife is that investors and the private sector will not see the financial benefit of participating in a small market pool. To mitigate this risk, the Incentivization Plan (output C.5) will work with targeted companies and stakeholder groups within the city to design the tools that build the Smart City. A variety of engagement tools will be used: mini challenges, university engagement, rewards and targeted workshops. This Incentivization Plan will be a key element to promote smart cities and encourage engagement.

The backbone technology for the implementation of a Smart City that is replicable across the north will be unleashing the potential of the internet of things (IoT) in Yellowknife, and collecting, organizing and communicating the information in a form that improves the well-being of Yellowknifers (output C.4). This will enable a plethora

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

of sensors to be incorporated into the system using the lamppost as a platform. The number of sensors will be a key outcome. We cannot predict which ones will be included and when but some we have identified as promising include: water and sewer tank sensors, leak detection, parking occupancy, snow level, carbon dioxide, distance measurements, trash bin levels, potable water tank level, wastewater tank levels, manhole open/close detection, light sensor, pedestrian, automobile and bike traffic, ice thickness, wildlife activity, water quality, water contaminants, smart valves, and more.

IMPACT STREAM D: COMMUNITY CONNECTIVITY



Output D.1 Governance structure in place to oversee the development of a Communications Plan and budget

Output D.2 Annual Engagement Plan to build awareness excitement and engagement in Smart City Evolution

Output D.3 Development of Yellowknife Smart City Dashboard to accompany PingStreet App

Output D.4 Installation of WiFi hotspots throughout the City for free internet services

Output D.5 Implementation of training strategy for municipal employees and contractors to build local labour capacity in smart city technology

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The City of Yellowknife has made great strides towards accountability and engagement with residents. In 2015 Yellowknife launched the Pingstreet app; a one-stop mobile application for the City of Yellowknife services. It currently has over 1,300 unique users in Yellowknife and has proven to be an effective tool for fostering an active and informed community. This application is a free, widely available location-based tool that gives users access to information on various city services like parking and transit. In addition, the City has a tool called PlaceSpeak which is a medium for two-way communication between the City of Yellowknife and its residents. This communication and engagement tool was introduced in April 2016 and has since accumulated 1,284 connected participants, 211 comments, and 17 completed surveys across 14 different community consultation projects. The municipal mapping tool City Explorer communicates information spatially in many layers. These tools form the basis for engaging with Yellowknifers digitally and will be incorporated into a strategic plan for Smart City Engagement, which will become part of the Smart City journey.

The Engagement Strategy and Communication Plan (outcome D.1) will help to build awareness and approval among Yellowknife residents about what a Smart City is. It will also assist in addressing any risks or concerns perceived by the public in order to increase local support for a Smarter Yellowknife. Engagement will be increased by a dedicated budget to improve the engagement tools and communication that residents use to access city services, and by maintaining a clear focus on transparency and openness. The Smart City Dashboard and PingStreet app will be the main points of access to municipal services and information and will facilitate residents' interactions with the city.

The City will assess its Engagement Strategy at the end of years three and five of this project's timeline. This will allow the municipality to keep track of its progress, and reorient efforts towards the most critical problems. These assessments serve as built-in checkpoints for course correction and risk mitigation.

Outcome D.1 Increase in local expertise and literacy regarding Smart Cities technology

Outcome D.2 Increase in engagement on Placespeak and City Dashboard

Outcome D.3 Increase in real-time information being updated in City communications

Outcome D.4 Increase in impact, awareness and reach of technology and Smart Cities

Having a connected and engaged population is key to truly embracing the Smart Cities Vision. This is not easy to do with the competing flood of information and media, but cities are becoming more central to the lives of citizens as information and service provision becomes more centralized online. To accomplish the outcome of a more engaged population, the City will develop a strategy and communication plan, improve and coordinate its existing tools, and develop a new tool, as well as engaging stakeholder groups more effectively.

Continually incorporating stakeholder and resident feedback in planning and activities will mitigate risk surrounding public perception and participation. Following the standard set by ISO 37106:2018 and adhering to oversight by stakeholder committees will ensure openness and transparency in communications.

IMPACT STREAM E: LEADERSHIP IN SUSTAINABILITY

With a track record of sustainability, the City of Yellowknife is no stranger to being a northern leader in green innovation. In 2012 the City attained all five corporate and community milestones in the Local Governments for Sustainability and Federation of Canadian Municipalities (FCM) Partners for Climate Protection program. Since then, the City has also been awarded:

- 2011: FCM Sustainable Communities Award for the Smart Growth Development Plan.
- 2013: Green Champion Award and the Sustainable Communities Award for the centralized composting pilot project

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- 2018: FCM Sustainable Communities Award for Energy for district biomass energy system (saving 829 tonnes of CO_2e/year)

The continued effort toward sustainability by the City of Yellowknife is demonstrated in the 2015 to 2025 Corporate and Community Energy Action Plan. Building on the 2006 Energy Plan, this new rendition sets a target for a fifty percent reduction in greenhouse gases by the City Corporation and thirty percent reduction by residents and businesses.

Output E.1 The creation of an incentivization plan for electric vehicle penetration in Yellowknife

Output E.2 Continued improvement of partnerships with key stakeholders

Output E.3 Installation of municipal EV charging stations

Output E.4 Promotion of GHG emission reductions through incentivization of Smart Cities technologies

Output E.5 Assessment of and reporting on progress towards achievement of the UN Sustainable Development Goals.

A Smart City framework will help the City take one more step forward to achieving this ambitious plan. The framework includes best practices, better engagement tools, and harnessing the power of information and technology to reduce energy use and greenhouse gases. Possibilities for improvements include lighting retrofits, electric vehicle encouragement, sensors that reduce costs incurred by the city, energy costs and greenhouse gases, and even incorporating new biomass heating technologies. In order to direct this project's strategy around sustainable action, The United Nations Sustainable Development Goals were selected as overarching key performance indicators. These were selected during the 2-day Community Design Charrette retreat, and through a selection process led by residents and stakeholders were narrowed down to goals that were applicable to the Yellowknife context. In short, 4 goals and 9 targets were chosen the most critical for immediate action in Yellowknife.

See Chapter 6 *Multi-stakeholders 2-day Design Retreat* for the detailed story.

Outcome E.1 Yellowknife will lead the North in Electric Vehicle penetration per capita

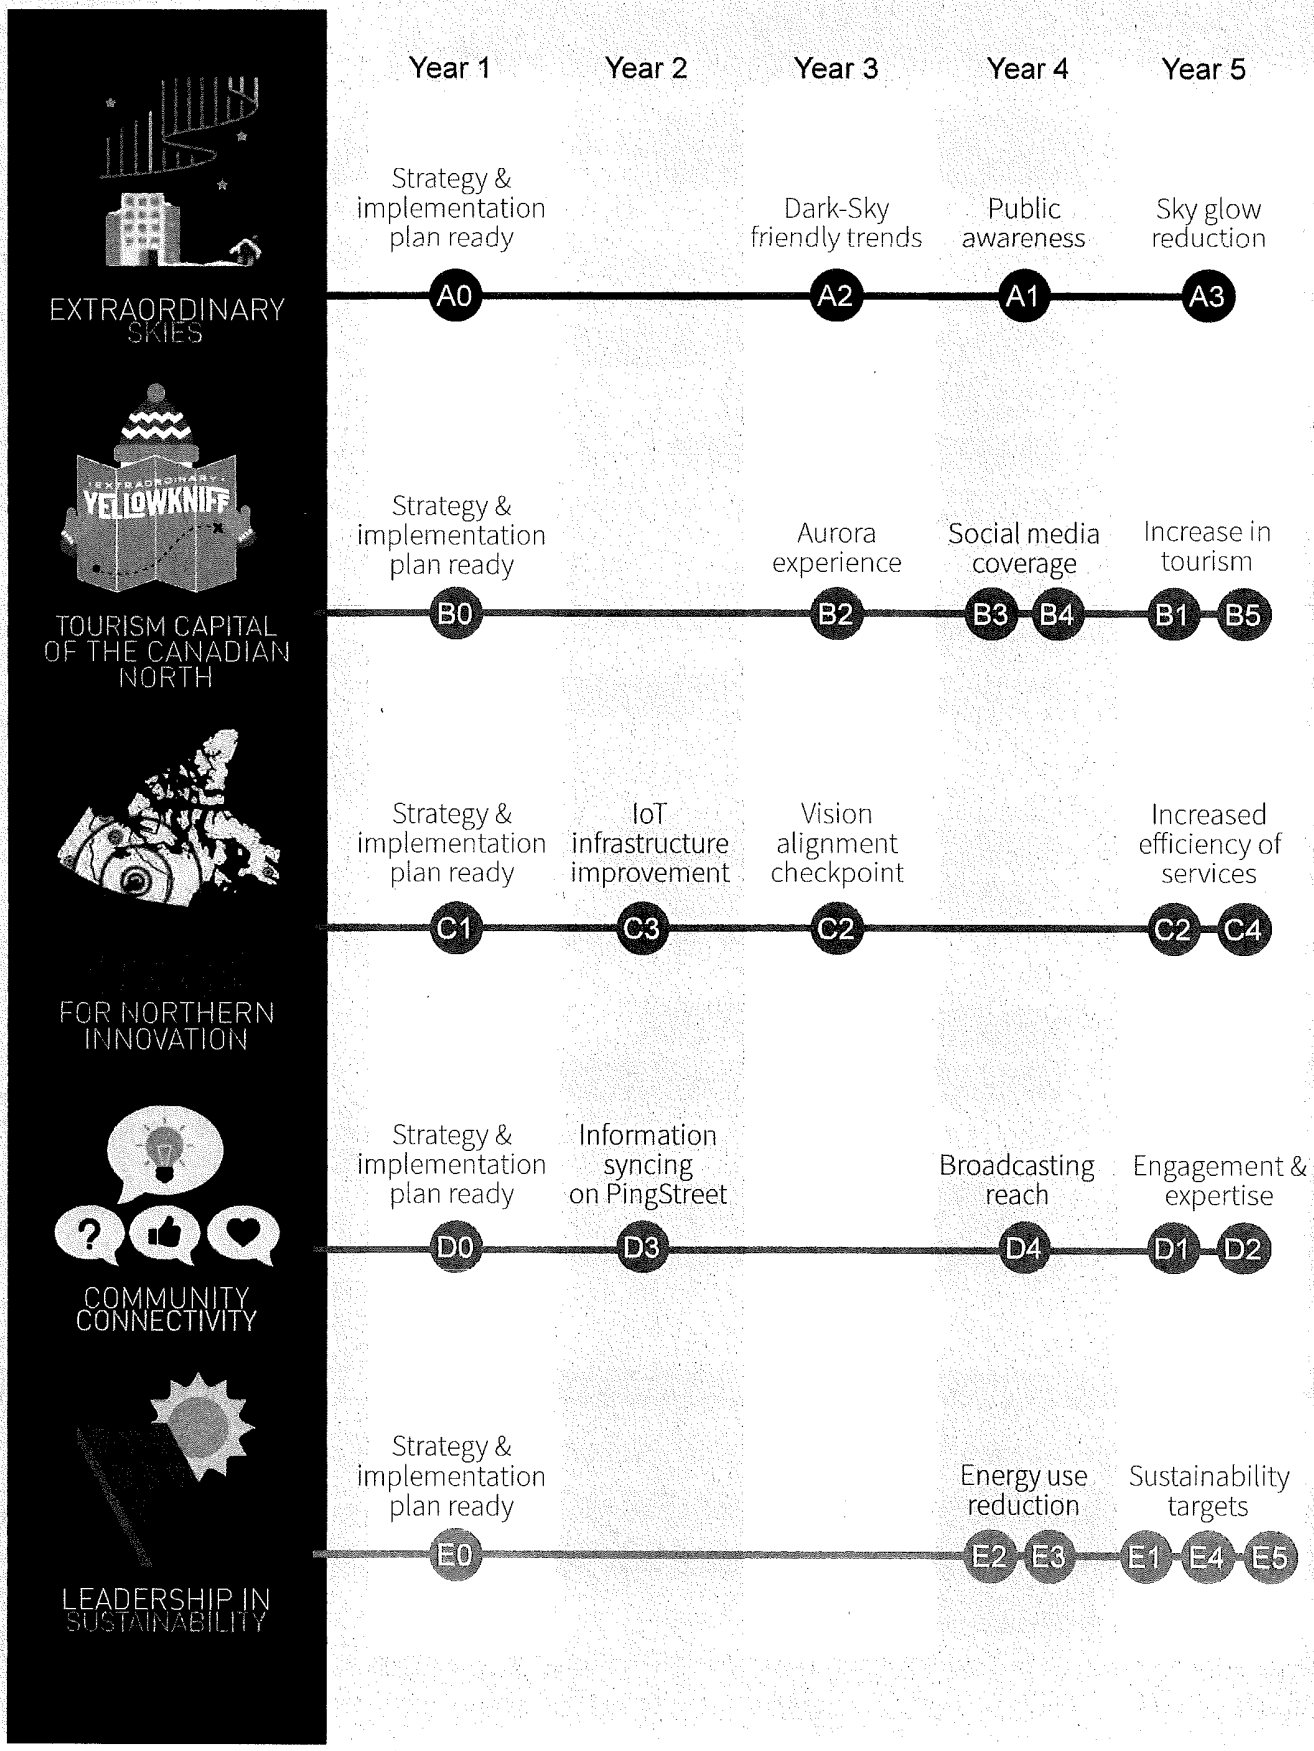
Outcome E.2 Measurable pogress toward the targets set in Yellowknife's Corporate and Community Energy Plan

Outcome E.3 Reduction in electricity use from dimmable streetlights

Outcome E.4 Reduction in water and energy use and carbon emissions from improved city services

Outcome E.5 Progress toward achieving the United Nations Sustainable Development Goals as detailed in the Phase 1 Design Charrette Report

As a true leader in sustainability, the City sees this opportunity as a way to improve its credentials, and use information and the Smart Cities framework as a methodology for more efficient use of internal resources, better services to its citizens, and a reduction in greenhouse gases and energy use.

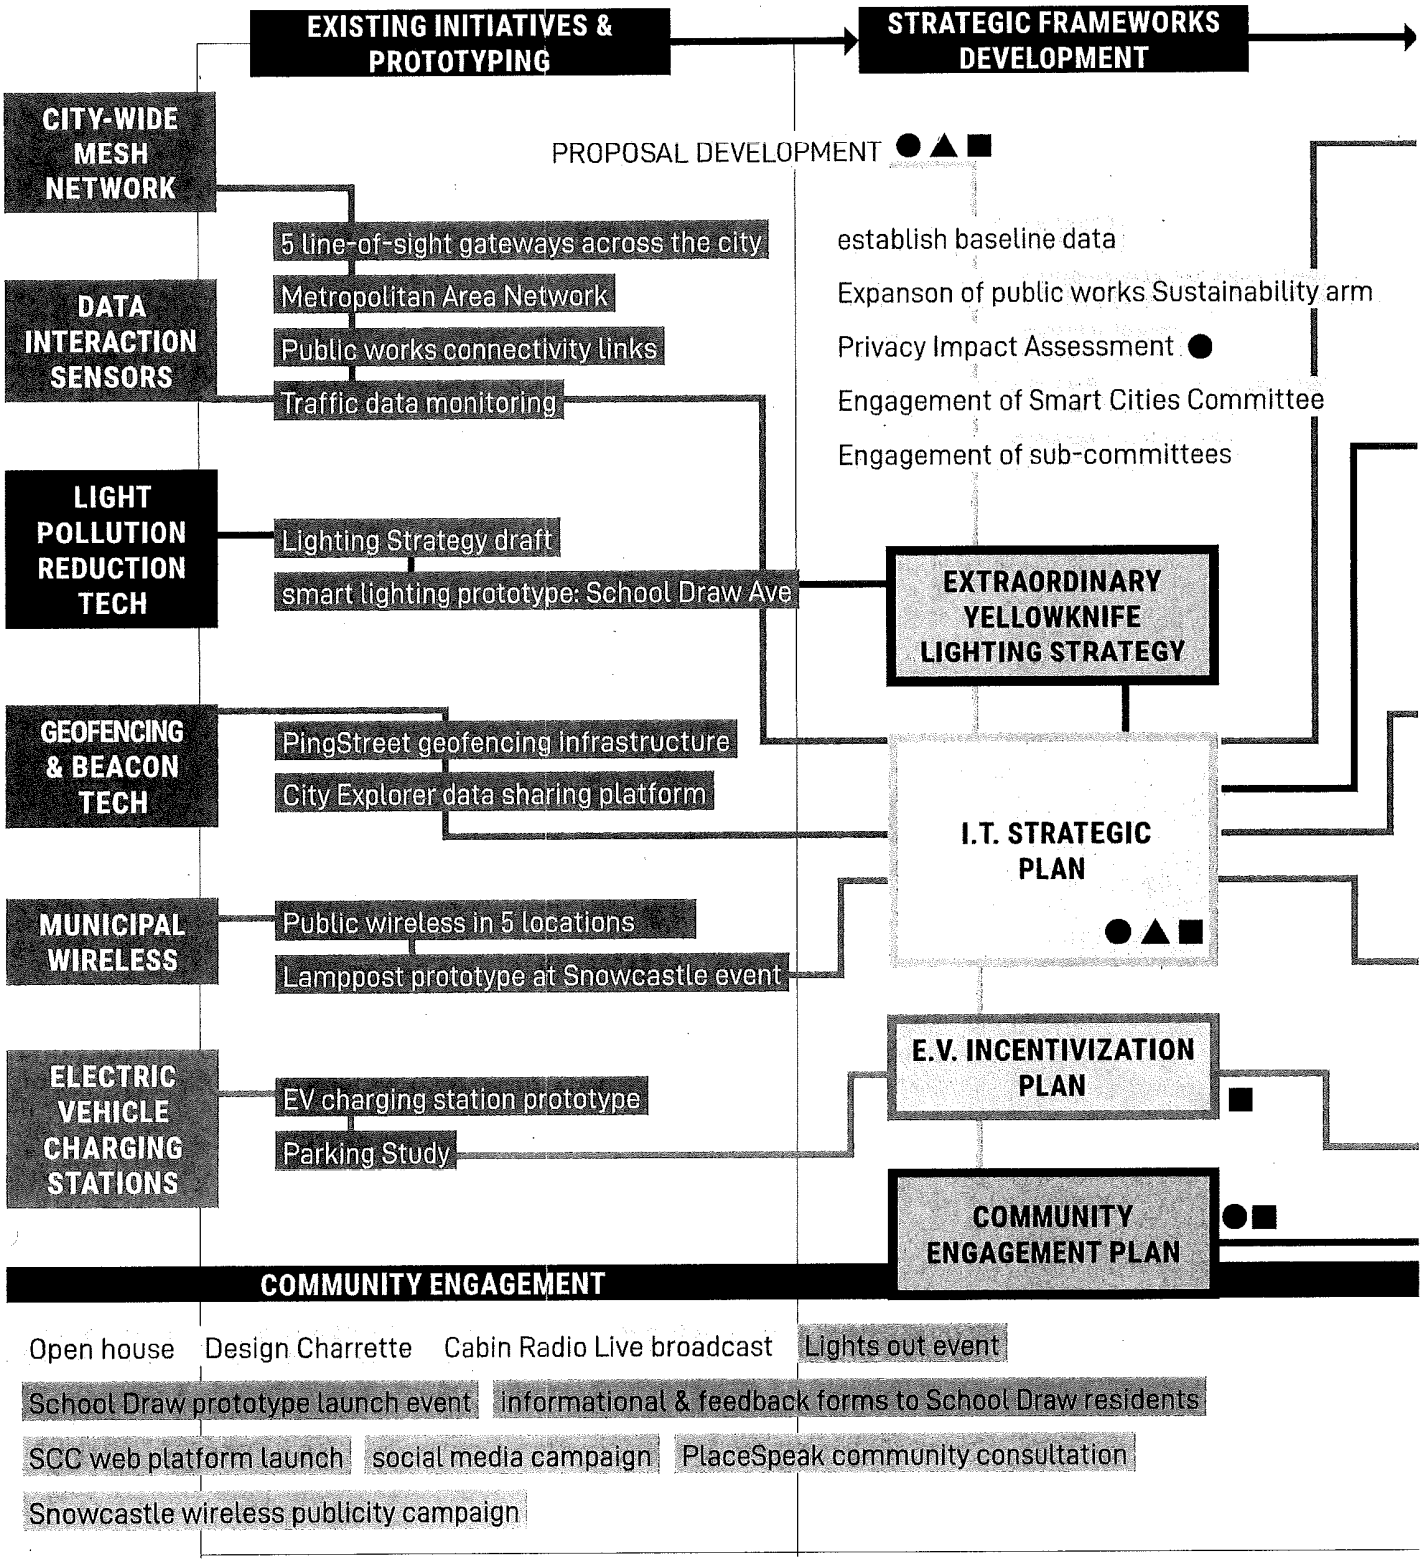


Being more sustainable is clearly a goal that all cities should aspire to. Above what the City is already doing, the Smart Cities approach should help to harness the power of information and technology to further the impact that the City can make.

PAYMENT TIMELINE

Since the Yellowknife SCC project is predicated on the development of coordinated strategies and implementation plans and a myriad of possibilities, it was a challenge to clearly identify outcomes. The following payment timeline will highlight broadly the anticipated timing of key outcomes which will trigger payment.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information



PROPOSED OUTCOMES PAYMENT TIMELINE

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 3

PROJECT MANAGEMENT

CHAPTER 3

PROJECT MANAGEMENT

The Project Management Plan aims to align all project outputs with the Strategic Planning initiatives and the City's guiding vision for Smart Cities. The focus is on the sustainable, long-term achievement of successful implementation activities. This necessitates a certain level of fluidity and adaptability, with built-in checkpoints to ensure continual stakeholder support, financial capacity, and data security. The preceding infographic summarizes the sequence of dependencies and scope of activities. Initiatives and outputs are categorized according to the five key impact streams, and will be filtered through a series of strategic frameworks to minimize risk and guide the team's decision-making processes moving forward.

These strategic frameworks will be informed by the ISO 37106:2018 standard and together will serve as the backbone of the Project Management Plan. As detailed below, these frameworks include: a Smart City Vision for Yellowknife, an Extraordinary Skies Lighting Strategy, an EV Incentivization Plan and a Community Engagement and Research Plan. Results from monitoring existing initiatives, infrastructure, and prototypes will feed into these project-specific strategies, which in turn will guide implementation activities in alignment with the community vision.

EXISTING INITIATIVES & INFRASTRUCTURE

The City of Yellowknife has several current or planned initiatives that demonstrate transparency, develop our partnerships, and establish a platform for community engagement and feedback. These initiatives include: an electric vehicle charging station prototype, a trial smart lighting

CASE STUDY: DARK SKY COMMUNITY

NACKA, SWEDEN

The lighting strategy used in Nacka considers the identity, the spatial, social, biological and the technical features of a site. In the North, a unique phenomenon to highlight is that the sun takes a longer time to rise and fall giving origin to an extended warm light and a long "blue hour" at dusk and dawn. In this sense, the lighting strategy plays an important role in re-describing the city's structure, scale and target point at night, facilitating us the ability to recognize the space and navigate through it. Light needs to be linked to time to change with the use of urban space throughout the day and the year, supporting human needs and encouraging meeting at nighttime. Considering biological conditions ensure the reduction of impacts of the light on human health, well-being and the natural habitats of animals and plants. This method helps to classify the urban space and their qualities to focus the light on humankind and their activities.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

project along School Draw scheduled for March 2019, the continued development of a city-wide data transmission network, Pingstreet app, Placespeak forum, City Explorer online platform, geofencing applications, and free WiFi in city facilities. The city's current data transmission network has collectors in multiple locations throughout the city which can forward information to City Hall and play a role in a future mesh network. The Smart City initiatives already underway in Yellowknife demonstrate the city's existing capacity to achieve this project's outcomes.

RISK MITIGATION THROUGH STAKEHOLDER ENGAGEMENT

To help guide this project, City administration will rely on the guidane of Council. This guidance can be provided in assortment of ways (the assembling of a committee, public engagement openohouses, ensuring that expectations and deliverables of the Smart City project dovetail well with the priorities and ongoing responsibilites of the City. Members of standing committees and directors of departments will influence the implemetnation of action items and fine tune the necessary metrics to evaluate success and mitigate risk.

The City recognizes that the implementation of this project will have ripple effects on an array of stakeholders. The gained experience of facilitating Smart Cities charette and public awareness sessions has created inroads with key stakeholders in tourism and economic development. It is anticipated that the City lean on the expertise with in its networks to ensure that the expectations are clear and that outcomes continue to allign with Challenge Statement.

STRATEGIC FRAMEWORK FOR IMPLEMENTING THE SMART CITIES VISION

The Smart Cities Vision will establish a holistic approach to managing both the new opportunities and the new risks posed by the versatile capacity of smart infrastructure. An external consultant will be determined by an open and transparent RFP process. This consultant will work alongside the City and its partners to build a replicable framework for northern innovation. In the context of this proposal, this strategic framework will be called the Information Technology Strategic Plan, or IT Strategic Plan.

This IT Strategic Plan will be a solid foundation of agreed-upon guidelines to mitigate risk in terms of security and adapt to changing technology. The Plan will establish rules for the treatment of personal information, integration of new technology with existing infrastructure, requirements for IT security, access control, auditing, and the retention and disposition of corporate electronic data. While flexible enough to adapt to changes from council or administration, the IT strategy will feed into the City's overall vision and have the potential to be adapted for use in other Northern communities.

Areas of focus for this strategic plan include: technology standards, privacy standards, an internal business improvement process, education and certification around new technology, and a guide for city departments on implementing and getting the most value from new technology. An allowance has been made in the budget for hiring an external contractor to develop this strategy in tandem with the City (discussed in more detail in the Financial chapter). At the three- and five-year mark, a major course correction checkpoint assessed by the Smart City Committee will confirm the alignment of the project's trajectory with the original vision.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

STRATEGIC FRAMEWORK FOR SMART LIGHTING

Building on the shared knowledge of White Arkitekter, the proposed Yellowknife Smart Lighting Implementation Strategy will take a comprehensive look at lighting in Yellowknife and suggest a strategic path to reduce light pollution, increase health outcomes, take advantage of our natural assets and adhere to the Model Lighting Ordinance (MLO). The MLO is the result of extensive efforts by the International Dark Sky Association (IDA) and the Illuminating Engineering Society of North America (IES). Among its features is the use of lighting zones (LZ0-4) which allow each governing body to vary the stringency of lighting restrictions according to the sensitivity of the area as well as accommodating community intent. In this way, communities can fine-tune the impact of the MLO without having to customize the MLO. The MLO also incorporates the Backlight-Uplight Glare (BUG) rating system for light sources, which provides more effective control of unwanted light. The BUG system is discussed in more detail in the technology chapter of this proposal.

Adoption of this ordinance will follow the established development, review, and approval processes of the City of Yellowknife and be informed by the Smart Cities Committee. The MLO is probably best adopted as an "overlay zoning" ordinance. This means that it overlays, but is different from, land-use zoning. It can be added to or integrated into existing ordinances or codes and cross-referenced to other applicable codes and ordinances such as the electrical code, the sign code, planning ordinances, etc. Ongoing renewal cycles will be included when adopting the ordinance.

The main tenet of the lighting strategy described in the MLO is the division of land into 5 lighting zones, LZ0 to LZ4. These are (1) no ambient lighting, which is for use in areas with little to no human activity (2) low ambient lighting, which is for use in rural and low density areas (3) moderate ambient lighting, which is for use in commercial business districts and high density or mixed use residential districts (4) Moderately high ambient lighting, which is for use in commercial corridors, high intensity suburban commercial areas, and town centers, and finally (5) high ambient lighting which is not a default zone and should only be used in special circumstances. The zoning considerations and recommended use areas for each of the five lighting zones provide the City of Yellowknife with a formula for re-assessing its current lighting strategy in order to develop a clear plan of where lighting zone ratings need to be upgraded or downgraded. Further conversations with the City's Department of Planning will need to occur to see how best to integrate these zoning suggestions.The outcome of this strategic lighting plan aligns with this projects outcomes of decreasing light pollution, improving the aurora borealis viewing experience, expanding smart lighting, and developing standards that can be replicated in other communities across the North.

STRATEGIC FRAMEWORK FOR ELECTRIC VEHICLE INCENTIVIZATION

Similarly to the IT Strategic Plan, the EV Incentivization and Penetration Framework will be developed in accordance with overarching city goals and in collaboration with an independent contractor. The City will use this plan to implement tools for EV incentives, while working with stakeholders like Northlands Utilities to build consensus and readiness for widespread EV adoption.

Following along the appropriate routes of assessment and approval, the development and implementation of this strategy would align with the 2015-2025 Community Energy Plan. The installation of EV infrastructure and subsequent increase in EV penetration would contribute to GHG emissions reductions for the City of Yellowknife which is relevant to the goals establshed in the 2015-2025 Community Energy Plan.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

STRATEGIC FRAMEWORK FOR COMMUNITY ENGAGEMENT

The Engagement Strategy for implementing the Smart Cities Vision is discussed in detail in the Engagement chapter and outlined in brief here. Past engagement with residents and stakeholders has set the precedent for a project that is firmly grounded in feedback and collaboration. The City is committed to the principles of openness and transparency, and will follow the recommendations of the Community Engagement Plan to build community awareness of Smart Cities. Administration along with relevant stakeholders help guide the implementation of the action plan and address budgetary considerations at agreed-upon checkpoints.

PROCUREMENT

The City's general procurement policy will be used as a template to develop a policy specific to the IT department and the Smart Cities project. The current standard policy specifies that procurement from a sole source is allowable up to $20,000. If the amount spent is between $20,000 and $50,000 a minimum of two quotes or a request for quotes (RFQ) is required. For procurement operations estimated at over $50,000, a request for proposal process (RFP) or a request for tender process (RFT) is required. The City also has several Standing Offer Agreements (SOAs) with companies for services that they use on a regular basis such as fuel delivery, minor repairs and maintenance.

Each of the technologies outlined in this proposal faces different challenges in terms of procurement, vendor choice, installation, and maintenance. The decisions made must reflect Yellowknife's particular Northern context: its remoteness, small population, and relatively high density and traffic. A procurement plan based on the IT Strategic Plan will address concerns regarding open data, security, ownership, and feasibility. Cities that purchase from vendors rather than developing the technology can devote more resources to policy & service design. The trade-off is loss of autonomy over the end product. Alternatively, projects that prioritize open data and software interoperability tend to adopt a design-build approach and rely on government support for funding. Due to Yellowknife's size and resources, the most feasible option is to partner with vendors and contractors. Due to the interoperability risks associated with a large pool of vendors, financial feasibility and availability of technical support are increased by limiting the pool of vendors. Based on data security concerns it follows that due consideration be given to the ownership of the end product, and must be evaluated when developing a procurement strategy.

CASE STUDY: EV CHARGING STATION STRATEGY

WHITE ARKITEKER

In implementing Electric Vehicle Chargers we can consider the following stakeholders, their concerns, and corresponding result indicators:

1. Municipality: Achieve sustainability goals while remaining cost-effective. Result Indicators: (a) Air quality improvements, (b) Climate change improvements, (c) cost-effectiveness
2. EV Users: Increased mobility (range & time of driving). Resulting Indicators: (a) Accessibility to chargers, (b) Growth in users
3. Residents (non-EV users): Optimize locations while managing parking pressures. Resulting Indicators: Increased utilization of chargers
4. Commercial Partners: Produce positive business case. Result Indicators: cost reduction
5. Grid Operators Concern: Safeguard Grid Quality Result Indicators: (a) risks of power outage / grid-congestion reduced

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

City administration will work within the framework of existing policies and best practices to ensure fair procurement procedures. Considerations will be made on how to ensure that procurement protocol is in line with the unique realities of Smart Cities technology implementation. The intent is to keep control of the data while working closely with private partners throughout the proocess.

OPERATIONS & MAINTENANCE (O&M)

Within the 5-year scope of this challenge and beyond, effective O&M will necessitate new training for skilled employees at the City. For certain project activities, a vendor may also be chosen as the responsible party for ongoing O&M or training. Investment in local capacity will be vital to long-term support and future-proofing of the infrastructure. Simultaneously the project will generate jobs and cultivate a local labour market capable of working with innovative technology. Work will be done to understand labour demand surrounding Smart City technology in the context of regional challenges and needs.

CONTINGENCIES, COURSE CORRECTIONS & CONTROLS

Decisions made during the implementation phase are dependent on strategic plans to be developed in line with ISO 37106:2018 and with input from external contractors, partners, City Council, and City Administration. As detailed in the Performance Measurement chapter (Impact Stream A), project outputs will be evaluated at the three- and five-year mark to confirm that strategic plans and corresponding action plans are being adhered to; these checkpoints constitute built-in opportunities for course correction.

The Smart Cities Committee will ensure the adherence of outputs to agreed-upon standards at the three- and five-year checkpoints. Further opportunities for course correction are built into the sequencing of activities, as indicated in the Project Management flowchart. These control checkpoints have been divided into three categories, which respectively intend to:

- Assess budgetary constraints and develop a plan to mitigate risk (Financial Checkpoint).
- Ensure continued compliance with security protocol and protection of personal data (Privacy & Security Checkpoint).
- Gather and respond to feedback from all affected parties (Stakeholder Response Checkpoint).

Forums such as the PlaceSpeak app and City Explorer platform are in place to maximize the transparency of operations, open-source sharing of data, and opportunity for resident input. Partnership with the Yellowknives Dene First Nation heightens the project's adaptability, diversity of perspective, and range of impact. Expanding Yellowknife's Smart City infrastructure into the neighbouring community of N'Dilo will test the replicability of this technology in the North, and expand the beneficial impacts of the project. The involvement of consultants, academia and and utilities provides access to research, experience, and capacity, and serves as a solid foundation for the innovative strategies which will achieve our challenge statement.

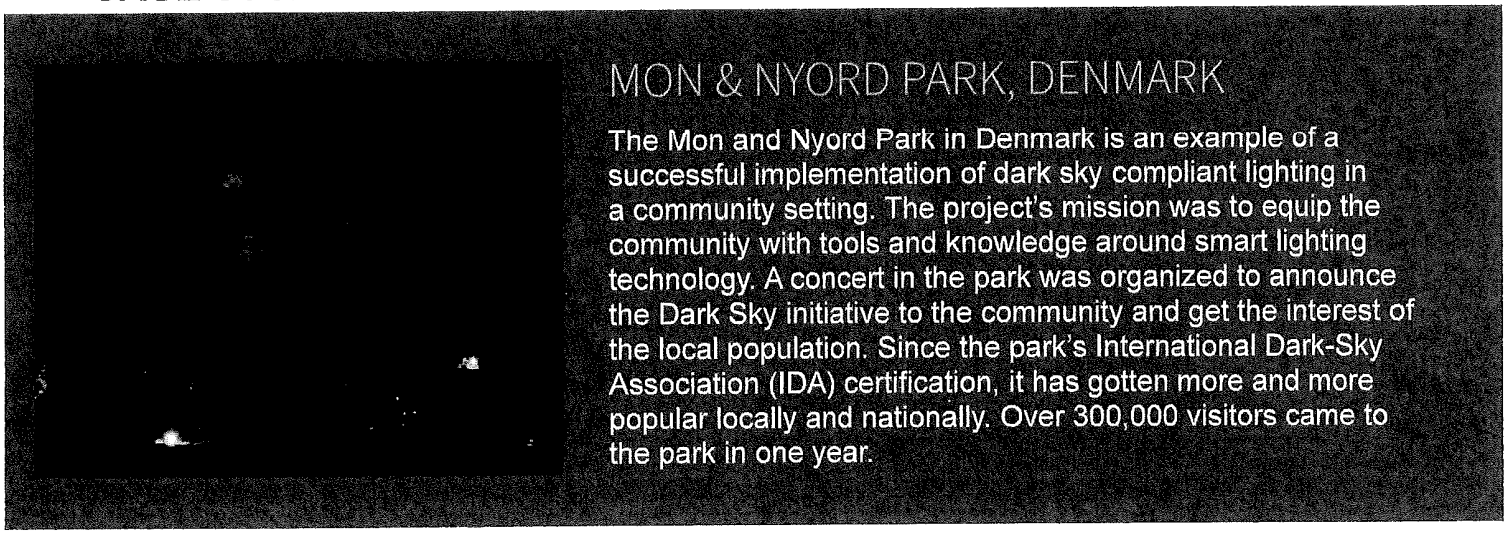
CHAPTER 4

TECHNOLOGY

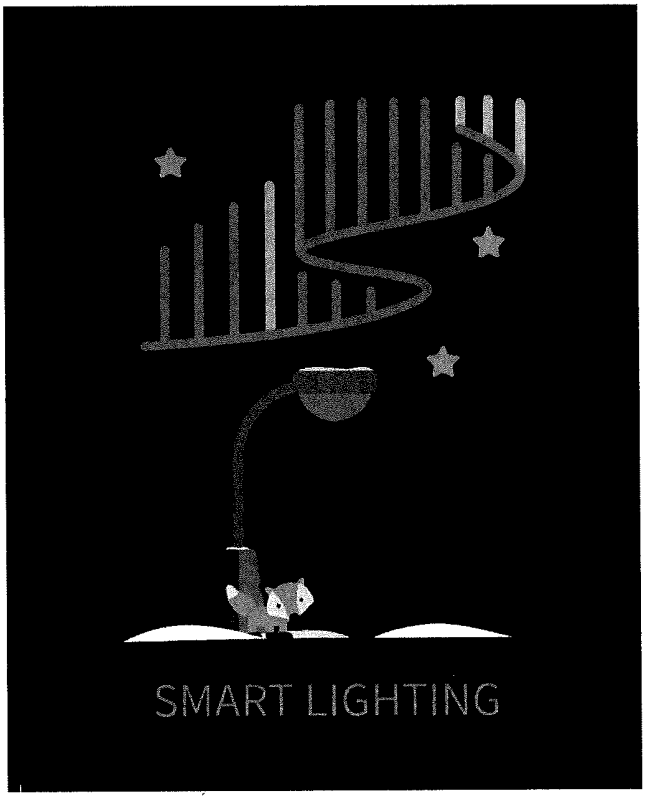


Transforming the ubiquitous lamppost into a beacon for sustainability is the backbone of Yellowknife's planned approach to become a Smart City. The implementation of this smart technology will be guided by the IT Implementation Strategy, which will set the ground rules for technology deployment, and improved policy. This chapter highlights technologies that have been identified in the proposal writing and research stage as promising options to help Yellowknife achieve its challenge statement. In alignment with the governance structure outlined in Chapter 5, the technologies and technology approaches outlined below will need to be approved and reviewed by City of Yellowknife leadership with input from the Smart City Committee.

The backbone of the Smart City vision for Yellowknife is the installation of smart street lighting infrastructure throughout the city. Lighting retrofits must fit within the principles identified by the lighting strategy outlined in the project management chapter and follow an ordered and logical process. The Implementation Strategy will also reflect engagement with the citizens of Yellowknife and their experience with and feedback on the School Draw Avenue lighting prototype. The Lighting Strategy will be developed according to these principles.

Switching to smart lighting has the potential to positively affect people, wildlife, the economy and the natural environment. Orchestrating this switch in the context of Yellowknife will also identify new standards and best practices that are replicable in other northern communities. The strategic thinking around the use of light has been guided by the experience of European leaders such as Copenhagen, and the Swedish experience and knowledge of White Arkitekter. The City will also take advantage of the experience and guidance of the International Dark Sky Association to inform Yellowknife's Lighting Plan moving forward. Project partner and current owner of Yellowknife's lamppost, Northlands Utilities, will bring their experience to the project as a leader in motion sensor lighting technology in North America.

The City will investigate and adopt new Northern-specific lighting best practices that guide light quality, pollution, intensity, and location of light, all with consideration towards Dark Sky principles. Additionally, integrating the combined experience and expertise of our project partners into our lighting strategy is a key step to ensure feasibility and scalability of our proposed technology projects. More on the structure of this smart lighting framework can be found in the project management chapter of this proposal.



CASE STUDY DARK SKY COMMUNITY

MON & NYORD PARK, DENMARK

The Mon and Nyord Park in Denmark is an example of a successful implementation of dark sky compliant lighting in a community setting. The project's mission was to equip the community with tools and knowledge around smart lighting technology. A concert in the park was organized to announce the Dark Sky initiative to the community and get the interest of the local population. Since the park's International Dark-Sky Association (IDA) certification, it has gotten more and more popular locally and nationally. Over 300,000 visitors came to the park in one year.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

SMART LIGHTING

The switch from traditional non-responsive lighting to "smart" adaptive lighting is a technological leap that Yellowknife is prototyping on School Draw Avenue. This prototype will include approximately 10 smart lighting fixtures. Smart lighting in the Yellowknife context means streetlights that are connected to motion sensors which direct the gradual dimming and brightening of the lights in response to motion on the street. The light will be dimmed to a much lower illumination and energy use when the motion sensors are not activated. When a pedestrian, cyclist, or vehicle is detected it will increase to 100% brightness, equivalent to that of a traditional streetlight. The motion sensors that detect movement will initiate a communication pathway from one lamppost to the next that will trigger the subsequent lampposts to illuminate, expanding your field of vision in the direction you are travelling. As you move past a lamppost, the motion sensor will indicate to the lamp to begin dimming back down to the baseline level of illumination.

This vision for smart light is modeled off of the Dark Sky approach laid out by the International Dark Sky Association as well as the ATCO-led award-winning Intelligent Street Lighting Project in Lloydminster, Alberta. The precedent set by Lloydminster for up to 80% energy savings can inform the possibilities for future energy savings from a similar project in Yellowknife (Lopushinsky, 2018). By collaborating with ATCO subsidiary Northland Utilities, Yellowknife is testing the potential for energy, health and safety improvements, while engaging Yellowknife citizens, nearby homeowners and tourists and understanding the public perception, appreciation and challenges of smart lighting. This will help lay the foundation for a lighting strategy that has the potential to be replicated in other locations across the NWT and beyond.

DARK SKY APPROACH

While the focus of the Lighting Strategy is the smart technology, Yellowknife and Northlands Utilities will continue to be guided by the principles established by the International Dark Sky Association. A Dark Sky Community is defined as a community that shows exceptional dedication to the preservation of the night sky through the implementation and enforcement of a quality outdoor lighting ordinance, dark sky education, citizen support of dark skies and new guidelines for night lighting. A municipal lighting ordinance (MLO) zone plan should be created as a base to define the Dark Sky guidelines for lighting. This is discussed in more detail in the project management chapter of this proposal. Our Scandinavian knowledge exchange partners, White Arkiteker, have provided us with a useful and relevant perspective on lighting technology strategy that incorporates: uplight, glare and light trespass maximum acceptable values, lighting design for urban areas that can activate the city at night, and, crucially, lighting technology that can have the right type of light at the right place in the right moment. Additional examples of lighting strategies for winter cities include lighting policies that control light trespass, façade lighting post curfew hours, lighting that can adapt to the reflectance of ground surfaces and that can dim to a minimum when people are not around. This Scandinavian perspective will be integrated into the Yellowknife approach.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

LAMPPOST LIGHTING TECHNOLOGY SPECIFICS

LED lights have provided significant electricity and greenhouse gas savings over traditional high pressure sodium lights. Yellowknife has completed a full retrofit of their streetlights, but research from our technology partners, and a case study from Denmark, established that LED bulbs with a brightness of 3000 Kelvin or less have been shown to be the least disruptive to animal behavior and human circadian rhythms. The soft white lights from these bulbs is dimmable and even color-adjustable (White, 2019). The color of natural light varies according to the season and time of day and the ability of artificial light to align with these changes impacts both people and the environment. As part of this project Yellowknife will develop and communicate best practice for northern street lighting design.

MOTION SENSORS

The smart lampposts our technology partner ATCO piloted in Lloydminster used smart photocell sensors as motion detectors. This technology is relatively affordable and widely available and, having been tested in a similar climate to that of Yellowknife, appears to be the top choice for motion sensing technology.

ADAPTIVE LIGHTING

Temperatures below zero keep the streets covered by snow during a long part of the year. White and reflective surfaces need less light to be visible than darker and rougher surfaces, such as asphalt or gravel. In line with the seasonal changes, the City's light levels should be adjusted not only based on hours of darkness but also on the presence or absence of snow on the streets and thus the perceived brightness of the surroundings. Smart lighting in this case, can also include adaptive lighting that changes in intensity and even spectral composition depending on the season and time of the day. Having a sensor that measures luminance to trigger different light level settings is today not a standard solution, but is under development by a few known manufacturers in the Nordic countries. Extreme low temperatures can also present a challenge to the technology if sensors and fixtures are covered by snow and ice limiting their function. Mitigation of this risk could involve incentivizing research through the commissioning of a design charrette or an RFP process.

DEVELOPMENT STANDARDS

The Backlight-Uplight-Glare (BUG) rating system provides more effective guidance for unwanted light. The B rating takes into account the amount of light in the direction of the light source opposite from the area intended to be lighted, also known as light trespass. The U rating defines the amount of light into the upper hemisphere with greater concern for the light near the horizontal angles, also known as light pollution. Glare can range from annoying to visually disabling and the G rating takes into account the amount of frontlight. BUG rating limits are defined for each light source and are based on the internal and external design of the light source. The BUG rating limits also take into consideration the distance the light source is installed from the property line in multiples of the mounting height. All three elements of the BUG rating system are taken into account when developing a city-wide lighting strategy, and assist in the creation of lighting zones (detailed in the Project Management chapter).

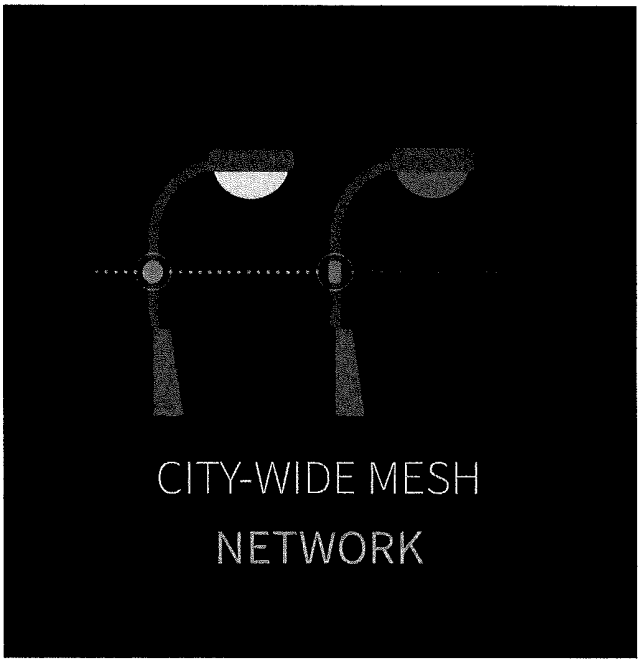
RISKS

It is important to acknowledge that dimmable lighting will be a noticeable change for the public. Maintaining public engagement, monitoring feedback, and addressing concerns is a critical aspect of implementing this technology and will be addressed in more detail in the engagement section of this proposal. We fully anticipate concerns over safety and security, which will need to be addressed up front and in a positive and constructive manner to win Yellowknifers' trust and build confidence in Smart lighting technology. Targeted awarness campaigns in the prototype area can help respond to resident questions. Feedback and opinions will be documented and a reassessment will occur later in the process to evaluate any change in perspective.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

COST

One of the main challenges with lighting retrofits is the high cost and sheer numbers of lights in Yellowknife. The Lighting Strategy and pilot project will identify costs, concerns and lay out a scalable model to spread the technology throughout the City. Following the successful demonstration on School Draw, we believe the energy savings will provide valuable cost-benefit data to influence the completion of the lighting retrofits in Yellowknife and more remote diesel fueled communities throughout northern Canada.



FUTURE-PROOFING

Another challenge is the future-proofing of the system. Technological advances in lighting are happening quickly and being a trailblazer includes risks of obsolescence and being eclipsed by new technology. The Smart City Committee will address this within strategies of IT and lighting to implement open and non-proprietary technology and regularly review and make adjustments for technological innovation and flexibility. This involves implementing a lighting system that allows some flexibility for updates in the near future. This is built on systems where LED modules are easy to replace, where sensors use standard-global connectors, and where the overall technical equipment is interoperable rather than customized.

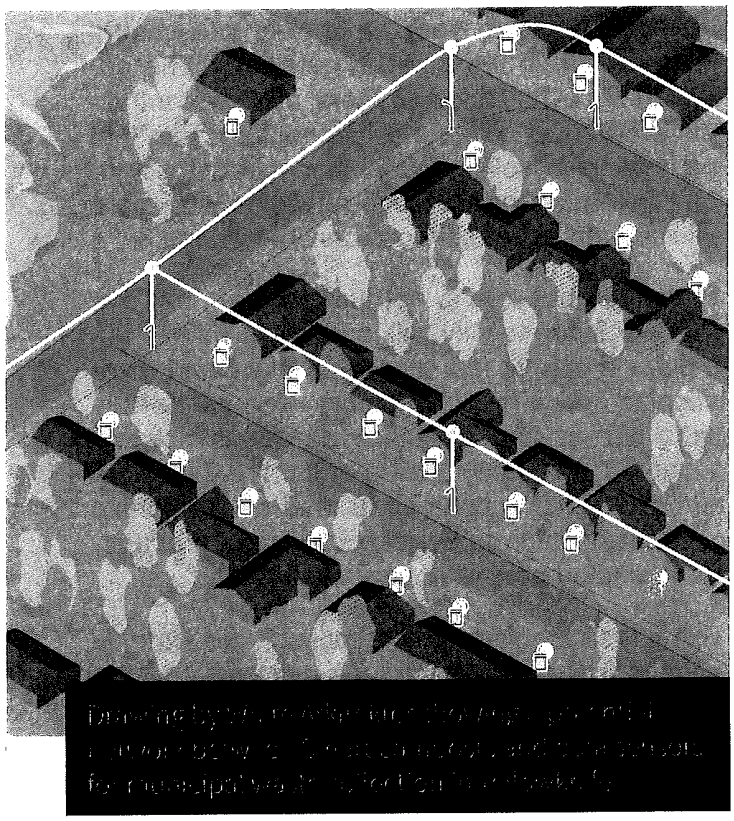
QUOTE

"The City of Yellowknife has prime locations in the city to act as collectors where multiple neighborhoods could uplink to. This means that in each neighborhood, a cabinet or building with equipment can be placed to be a connection point for the lampposts in that area. This equipment can then forward the data to our collector sites and then to City Hall or beyond (Internet). This equipment routes Internet Protocol data(IP) but not other protocols such as Blu-tooth or Zig Bee that are used by many sensors manufactured today. These sensors will need technology to communicate with that can translate to the IP network and beyond"

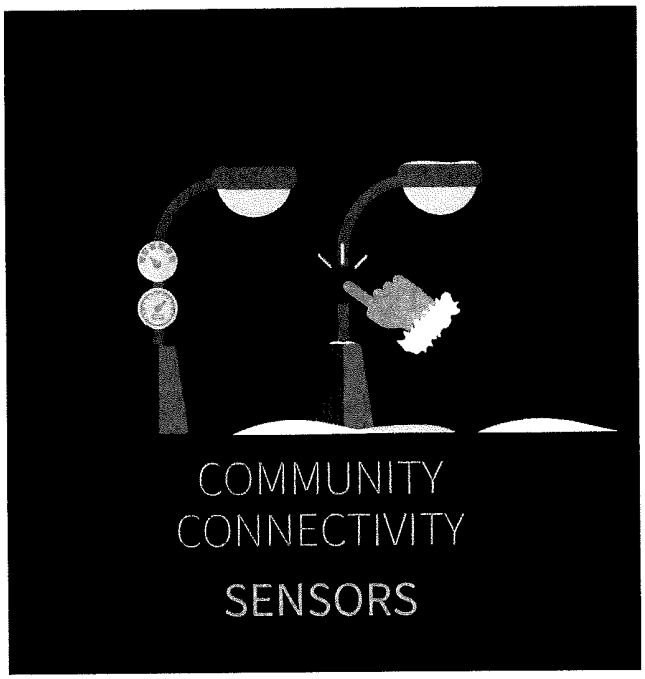
- Chris Golt, Network administrator
City of Yellowknife IT Division

MESH NETWORK

Yellowknife, like most cities, is connected by a spider web of lampposts on almost every street, park, parking lot or corner of the city. In a typical city each one acts alone, powered by an electricity feed, and turned on or off by a photocell, in every sense they are a relatively simple technology which does not often live up to its almost limitless potential. Imagine a city where these lampposts were connected to each other, and to a central information hub via a set of gateways. The potential is ripe for City managers, utilities, contractors, and entrepreneurs to connect sensors into the network to collect information, control a myriad of products and provide residents with more efficient and better services and knowledge.



This mesh network is not just a dream but it is possible, and the City will investigate how to put in place a plan to test a network that could revolutionize how information is provided by the City and other services. This is an ambitious task and requires continual improvement to the City's current system of gateways, as well as supportive policies for information collection and management, and an optimized control centre.



This mesh network will enable improvements to municipal services such as delivery of water, collection of sewage, and monitoring and maintenance of roads and trails (not just snow clearing, but drainage, permafrost damage, traffic flows

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

and streetlight controls). Contractors of services such as waste collection, electricity, fuel, trucked water and sewer delivery could use data to improve services and reduce costs. Further down the road the City envisions opening up the mesh network capabilities and information to businesses and innovators to test applications in the harsh and unique set of northern circumstances. This will create economic benefits and build a knowledge and information based economic hub that puts Yellowknife into the forefront as a small, well controlled laboratory for innovation in Smart Cities technology.

None of this is without risk. The City must ensure its strategy and policy are sound and that Council, Administration and citizens of Yellowknife understand the Smart Cities Vision. Openness and transparency are paramount to gaining trust and confidence in this vision. To do this will take an investment of money, staff and time to ensure the strategic building blocks are in place, while engaging the public and stakeholders and field-testing and improving the technologies that will help build our Smart City.

SENSORS

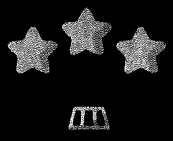
The potential for lampposts to be the foundation of a smart city lies primarily in their ability to act as the network to move information gathered by a range of sensors. The following list of potential sensors was informed by research from our technology partners. There is a vast and growing list of technologies that are possible here, and they are further expanded by creativity and circumstance in how they might be used. This category is intentionally large in order to demonstrate that this smart cities project has potential beyond the scope of this funding and timeline. The intention of Yellowknife is to use sensors to improve municipal services first, outsourced services second and open it up to the limitless possibilities of entrepreneurs in the tech industry when the conditions are right.

PIPED WATER LEAK DETECTION

It is estimated by the Public Works Department that 30% of the city's water is lost to leaks in the system. Aging infrastructure, exacerbated by the challenges of permafrost contribute to the pipe-water system inefficiencies. The cost of this water loss to city finances is measured in hundreds of thousands of dollars a year.

The installation of a smart sensor onto existing fire hydrants provides a promising leak detection monitoring solution already in use in Medicine

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information



SENSOR TECHNOLOGY

TEMPERATURE, HUMIDITY, CO2

Climatic data
- monitor climatic changes
- forest fire smoke detection
- pollution level

LIGHT POLLUTION METER

Brightness of the night sky
- monitor light pollution
- data for astronomy

PARKING OCCUPANCY

Vehicle detection in parking spaces
- monitor vehicle data
- parking lot occupancy in real-time

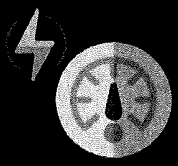
WATER LEAK DETECTION

Water leak detection in water conducts
- measure water consumption
- wireless water conservation

LEVEL DISPLACEMENT

Measures distance to objects
- snow fall monitoring
- ice on roads

WASTE BIN DETECTOR



Collection efficiency
- waste management
- help public works
- full/ empty/ flame risk/ fallen

PUSH BUTTON

Multi-purpose buttons linked to different functions
- survey on satisfaction
- panic button
- control lights

METER READING

monitor consumption
- electricity monitoring
- gas fuel tank
- disfunction detection
- comparison of data

MOTION DETECTOR

Movement of people or objects in a 4 meter radius
- dimmable lighting control
- efficiency of the lighting strategy
- pedestrian safety

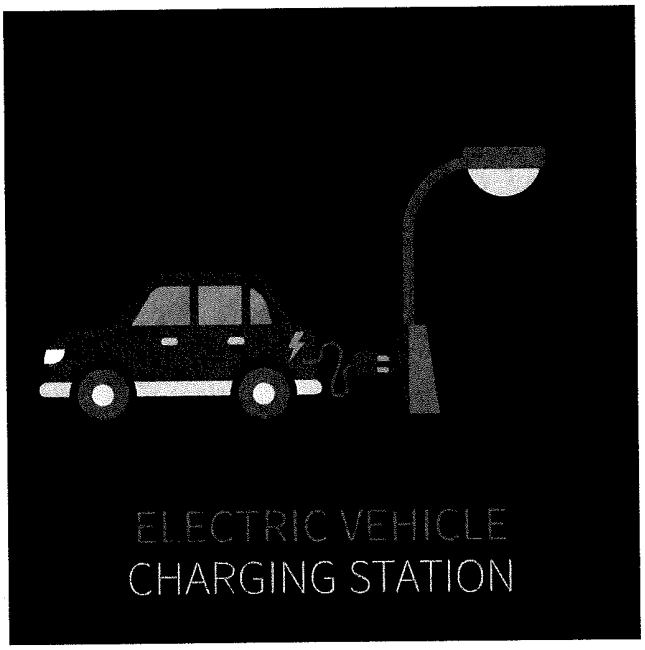
PERMAFROST

Permafrost temperature measurement
- data for geolegist
- monitor changes in permafrost
- thermistor reading

NOISE METER

Noise level in dB
- monitor noisy/quiet spots

WATER/SEWER LEVEL

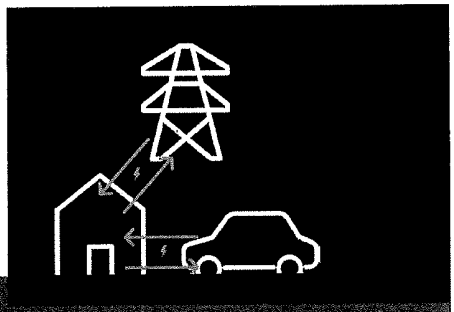


trucked water efficiency
- water/sewer tank level
- measure water consumption

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Hat, Alberta. A portable node uses an acoustic sensor to monitor the sound emitted by water flow in the hydrant and attached piping system. It is highly sensitive to acoustic variation and is capable of detecting even the faintest leaks that traditional monitoring systems often miss. In addition to the sensor itself, the node includes analysis software that monitors the progression of the leak over time. A network of lampposts that would transmit this data to a central data center would enable improved real-time leak detection and potentially save the City considerable time and money.

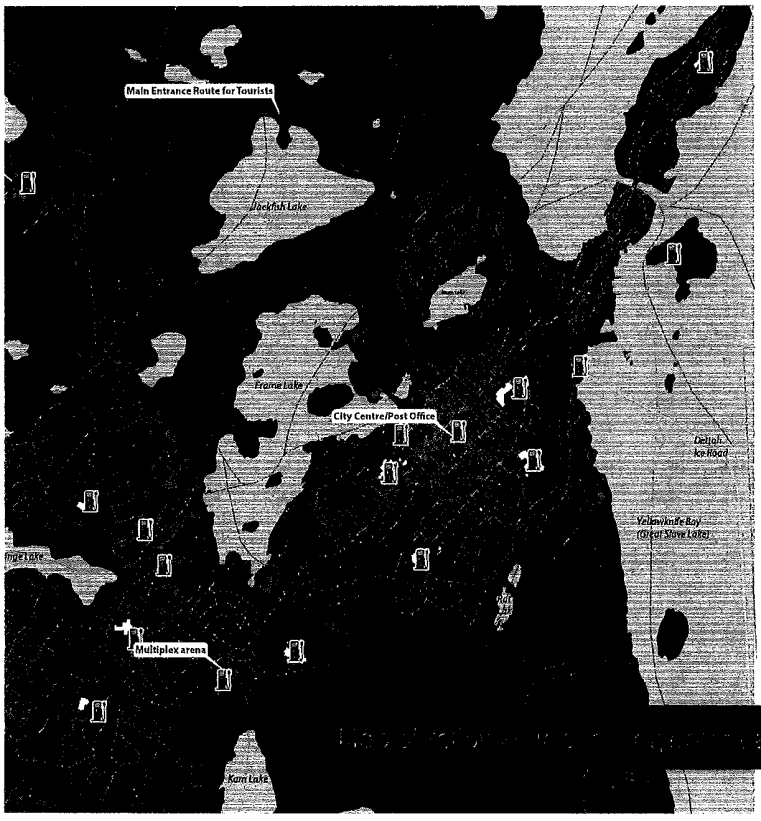
WATER LEVEL MONITORING



Rather unique to the north, trucked water and sewage services fill and empty tanks in and under houses in permafrost areas. Roughly one quarter of Yellowknife houses, including all houses in Dettah and N'dilo, have water delivery on a bi-weekly schedule. This isn't always on an efficient schedule, and an on-demand service could potentially better service these residences using a sensor installed into tanks to relay water level information to the lamppost, and subsequently to the control centre and provider. Challenges with running out of water, and unnecessary service delivery could save citizen's money.

EV CHARGING STATION

The City of Yellowknife wants to be forward looking, and embracing electric vehicles (EV) as the future of vehicular transportation is part of becoming a Smart City. Generally there are two streams of thought on how to do this: incentivize EV purchases or build accessible charging infrastructure. The City is exploring the considerations of both options. Currently there are two EV charging stations in Yellowknife. The City recently installed a phase II charger at City Hall to charge a new electric vehicle owned and maintained by



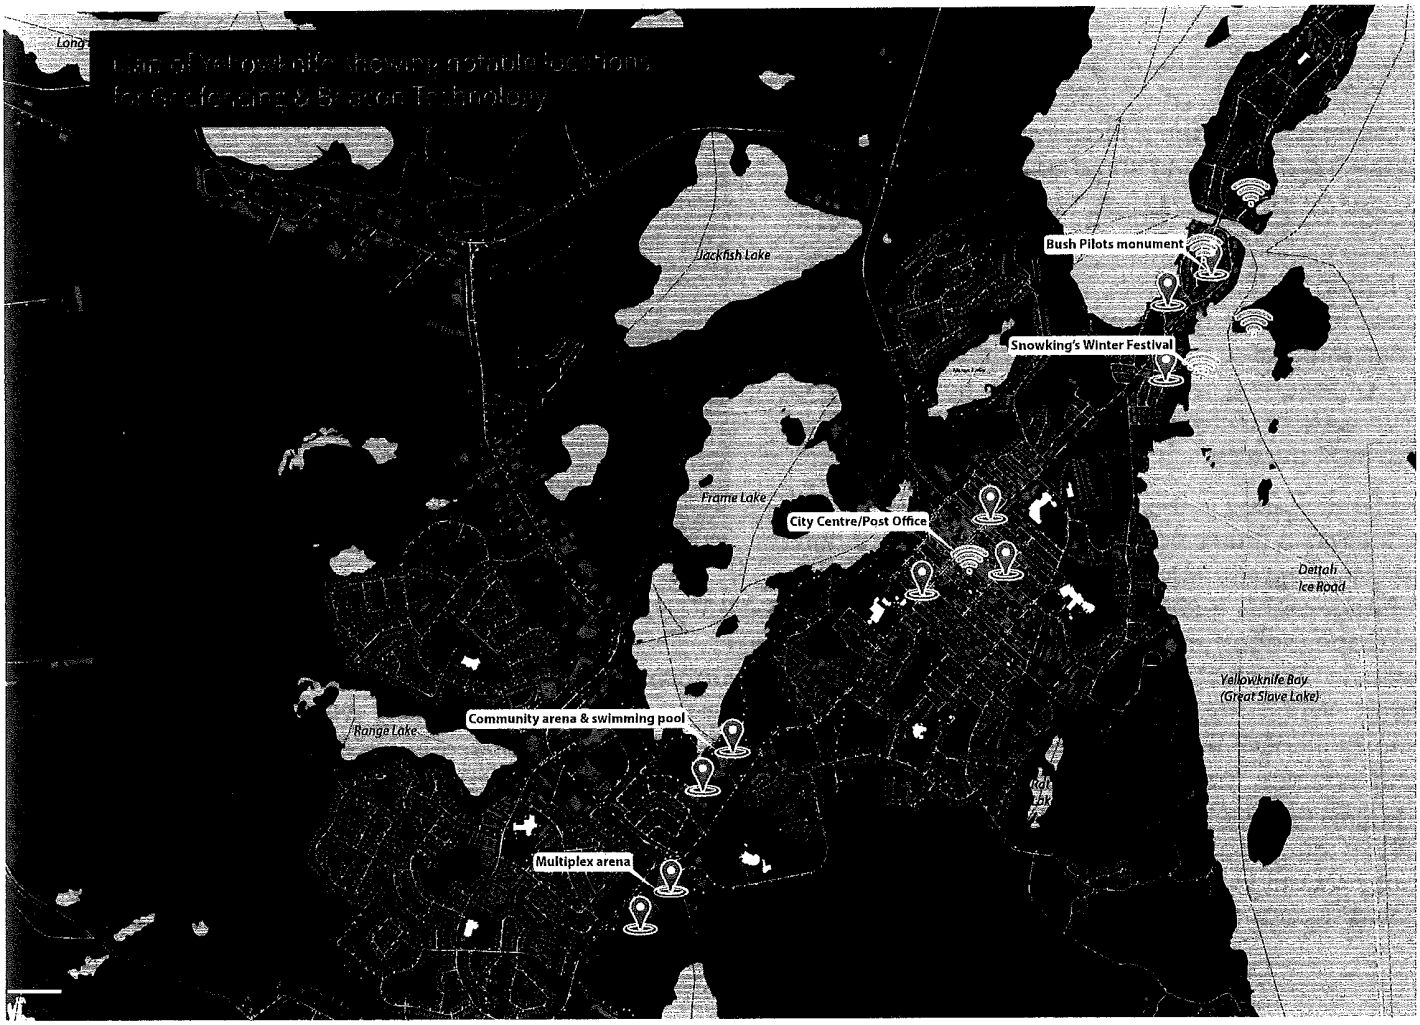
VEHICLE TO GRID

Vehicle-to-grid technology (V2G) helps to stabilize the energy grid through the installation of a new charging system for EVs. The battery of an EV becomes a mobile energy storage system that can supply energy to the grid during periods of high demand. Residents can be paid for the service their car offers to the grid. This is very promising to reduce diesel dependency in a lot of communities in the Northwest Territories.

the new YK Car Share Cooperative but available to City staff during working hours. This initiative will demonstrate the effectiveness of EVs to work in the frigid north and show leadership by the City.

Yellowknife is also working with Northlands Utilities to install one phase II EV charging station on a lamppost located in or in close proximity to the downtown core. The potential of EV charging stations integrated into lampposts provides promise for broadening the demand and possibilities of EVs as electricity becomes the standard fuel of the next decade.

Not anticipated in the timeline of this project, nevertheless a future potential application of EV connectivity via lampposts is vehicle-to-grid energy management technology. Piloted successfully in Copenhagen in 2016, this technology allows electric vehicles to act as mobile energy solutions. When not in use, the vehicle is plugged into stations that connect to a city's energy grid and enables them to provide excess energy to the grid or recieve energy if necessary. This optimizes the power available to the grid and is especially useful in the case of unexpected surges in power usage (Automotive World, 2016).



WIFI

Incorporating WiFi access points into lampposts in key junctures in the City will broaden the existing free municipal wireless network limited to municipal facilities. Exploring how to make digital services more accessible will increase wellbeing for both residents and tourists. The sharing of information is pivotal to the transition towards a smart city.

This is simple technology and easy to replicate and build on. Although not a key part of the Cities Smart City vision, it is another example of the ability of the lamppost to provide services and transmit information. Currently, there are six municipal locations in the city that offer free WiFi: Center Square Mall, the Library, City Hall, Samba K'e park, the Multiplex, and the Fieldhouse. After engaging with residents during a two-day Design Charette in August, 2018 several more sites were put forward as locations where WiFi would be useful: the Snow Castle, Old Town, the Government Dock, the Airport, and the Boat Launch at the Yacht Club. The City is considering the extension of its WiFi at the Snow Castle to improve the experience for tourists and locals at this key tourist location.

The creation of wireless connectivity between lampposts is a solution which could implement multiple smart city services that require a mesh

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

network as a foundation. With the expansion of the public municipal wireless network come several risks, both to the user and the owner. These might include Man in the Middle Attacks (MitM), snooping/sniffing, and malware distribution. The City can help to limit these risks through public education. Risks to the network owner include bandwidth and network abuse (i.e. Denial of Service) and the possible use of the network for cyberattacks (O'Higgins, 2016). Public WiFi operators can protect themselves from liability of network misuse by implementing Terms and Conditions of Use Policies which includes: an indemnity statement, an acceptable use policy, a privacy statement, and a description of service level commitments (O'Higgins, 2016).

CASE STUDY: FREE WIFI

TRONDHEIM, NORWAY

The city of Trondheim is a case study in the use of a municipal wireless network in a larger community. The network auto-connects the user's smartphone device to the most appropriate wireless network nearby at any point throughout the city. Also available is a free wifi map of Trondheim which works without internet connection, helping to find the closest free hotspot.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

GEOFENCING AND BEACON TECHNOLOGY

Geofencing and beacon technologies are platforms for public engagement and ultimately work towards this project's goal of developing an active and informed community. The more immediately available and realizable of the two technologies is geofencing. Geofences are fixed regions that define an area with a width between 200 meters and 2 kilometers on a map. Using GPS technology and cellular coverage, when a user of the associated mobile application passes into that region, they will receive a notification on their device. The notification, or broadcast, is a short 140 character or less message whose contents are defined as part of the geofence. The associated application in Yellowknife is the PingStreet app which is free and widely available to residents. The feasibility of implementing geofences has been demonstrated by the installation of 3 active geofences within the City of Yellowknife. While these geofences do not currently have any associated broadcasts, their broadcasting capability has been piloted with over 1500 subscribers. Expanding this capacity using the smart lamppost infrastructure would increase the City's ability to engage directly with residents to share information like pool schedules, road closure alerts, and event notifications. One of the geofences that is active currently is at the Yellowknives Dene First Nation. They have expressed interest in using the geofence to broadcast cultural events throughout the year to both tourists and residents. This tech collaboration with a First Nations organization is an important feature of this project's replicability in other northern contexts.

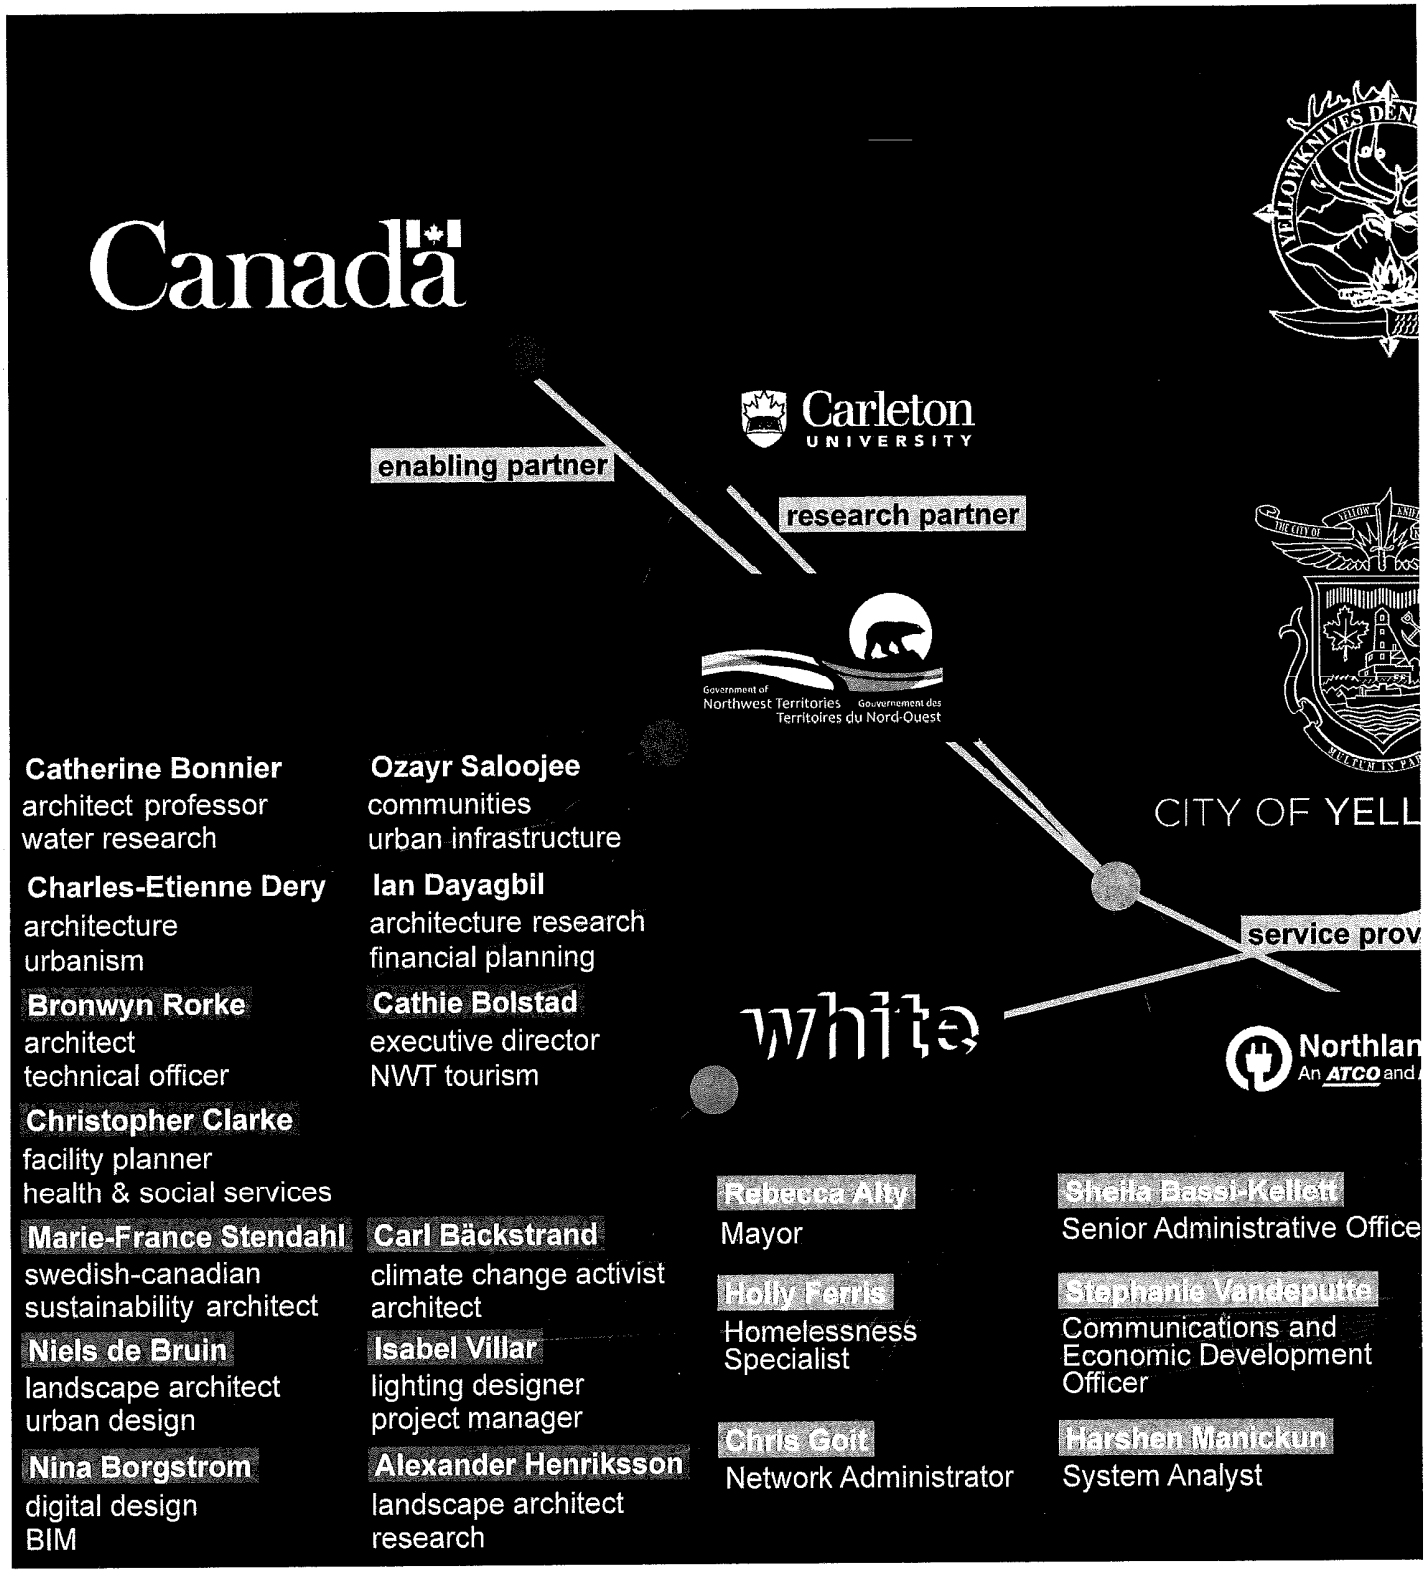
QUOTE

"Dimmable city lights!! How about an application that we could use to get alert when awesome northern lights are showing up."

- *Yellowknife citizen*

A beacon uses bluetooth technology to broadcast a push notification that is triggered when the user comes within a radius of 3 to 25 meters of the beacon. It functions in essentially the same way as a geofence and, within the context of this project, is especially useful for tourism due to the small broadcasting radius. A series of beacon disks installed in lampposts near historical or geographical points of interest could act as an automated active walking tour of the City. It is important to note that users of the PingStreet app would be required to give their consent to receiving notifications from the City via both geofence and beacon broadcasting.

RISKS AND MITIGATION



The standard risk associated with geofences and beacon technology is user privacy. Especially for those who are more technology illiterate, a push notification from the City, even if a consent gateway is established, could be seen as a privacy threat. This project has and will continue to take steps to mitigate the real and perceived risk of this. The City will remain vigilant and up to date on all of their IT systems. We are already in communication with the Office of the Information and Privacy Commissioner of the Northwest Territories regarding the completion of a Privacy Impact Assessment. Privacy concerns such as these are addressed more fully in the Data and Privacy chapter of this proposal.

CHAPTER 5

GOVERNANCE

Collaborative innovation happens when there is a need or a problem whose solution requires creative input from an array of stakeholders.The City's Smart City Vision encompasses the ideas, concerns and expertise of our indigenous peoples, our local enviromental non-profits, our utilities and international support. Smart Cities are increasingly complex, with an ever higher number of stakeholders who hold diverging and converging interests. To manage these diverse partners and stakeholders, a rigorous governance framework is necessary.

The organizing priority of this project's strategy is to maximize the opportunity presented by the Smart Cities Challenge in order to produce the most benefit for residents of the City of Yellowknife. Ensuring security and transparency of the process, the outputs, and data collected is an essential component of this strategy. Any resources put towards realization of smart city outcomes will be filtered through a governance structure created to secure these aims. A template for Smart Cities governance can be found in the Sustainable Development for Communities guidelines document published by the International Organization for Standardization, ISO 37106:2018. This set of guidelines "establishes requirements for a management system for sustainable development in communities, including cities, using a holistic approach, with a view to ensuring consistency with the sustainable development policy of communities." (ISO website)

LOCAL AND HORIZONTAL GOVERNANCE

Strategic plans will be be developed in alignment with City Council mission and the community's vision, as well as ISO standards. Creating a locally relevant governance framework is essential to the success of the overall implementation strategy. The approach thus far has been to prioritize a horizontal partnership structure with several different parties and stakeholders. This horizontal structure aligns with the City's vision of an inclusive and well-managed community which is welcoming and inclusive. As both a centre of government, law, health and social services, the City's traffic and density are unique within the context of northern Canada. This presents a set of governance challenges that are similarly unique. By meeting these challenges with a horizontal governance approach, this project is aiming to ensure that all frameworks are transparent, efficient, and reflective of the needs of the community.

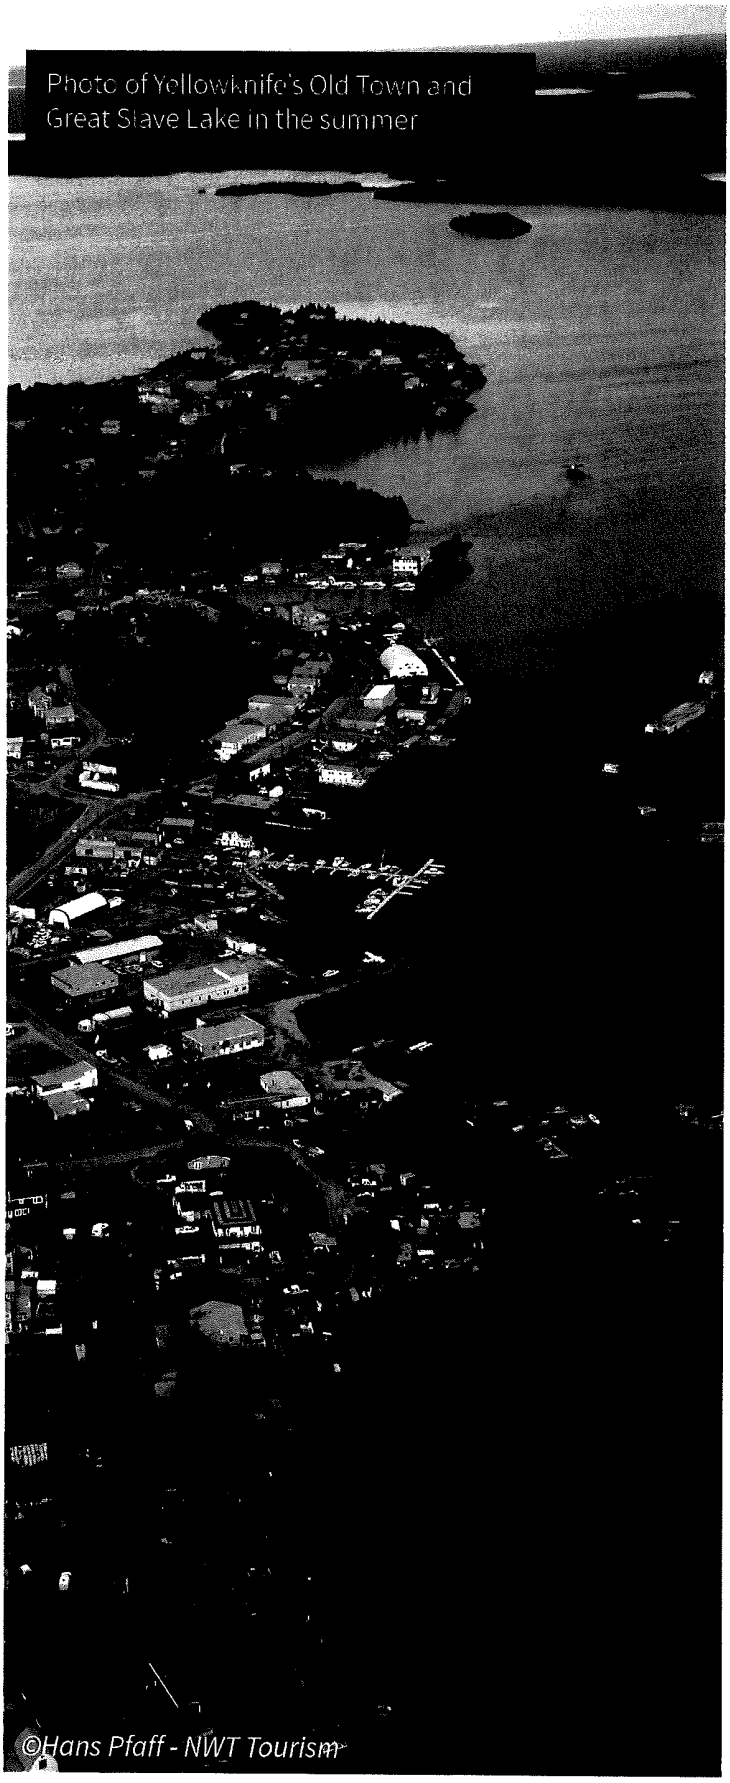
The governance structure of this project is intended to formalize the roles of partners and stakeholders via the creation of a Smart City Committee. The concept for this committee was introduced in the performance measurement chapter of this proposal. This committee will provide direction and information throughout the lifetime of the project, both during the 5 year scope of this proposal and beyond.

PROJECT PARTNERS:

YELLOWKNIVES DÉNE FIRST NATION

"Weledeh Yellowknives Dene are one of the peoples of the T'satsaot'ine. The people were known for the pots, knives, and other tools they made from copper collected in the northerly parts of their territory. Before trapping for the fur trade changed traditional occupancy and land-use pattern north of Tinde'e (Great Slave Lake), the traditional territory of the T'satsaot'ine consisted of lands around Great Slave Lake north to the Coppermine River, and east to the Thelon River. Since 1959, descendants of the T'satsaot'ine tribe have lived mostly at Deninu Kue, Rocher River, Lutsel K'e, Reliance, Ndilǫ, Dettah and Enodah. Today, the people call themselves and their territory after the great T'satsaot'ine leader Akeh-Cho: The Akaitcho Peoples and Akaitcho Territory." (excerpt from ykdene.com)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information



This project is an opportunity to strengthen partnerships with the Yellowknives Dene First Nation (YKDFN) neighbours and to achieve inclusivity, horizontality, transparency and a mutually beneficial arrangement that is in the best interest of residents of Yellowknife, N'Dilǫ and Dettah. Moving towards a holistic and inclusive framework for partnership with our First Nations neighbors is a consideration of critical importance for this project. To this end, YKDFN staff was present during the design charette and the YKDFN community was backed financially by a portion of the $250,000 grant from the first phase of the Smart Cities Challenge. Moving forward, YKDFN participation will be an enabling partnership, in which the City would share resources and try to encourage a continuation of smart city tech into N'Dilǫ.

ECOLOGY NORTH

Ecology North was founded in 1971 in Yellowknife. Over the years the organization has served the City of Yellowknife as the pre-eminent environmental non-profit organization in the North. Ecology North has developed a strong relationship and partnership with the City of Yellowknife, working closely together on many projects, such as the municipal recycling and composting programs, this Smart Cities Challenge, and many co-hosted events throughout the years. As an organization, Ecology North is also active in City of Yellowknife committees and consultation sessions. As a non-profit, Ecology North has a horizontal, inclusive process for decision-making and includes stakeholders and residents in the decision-making process, incorporating diverse perspectives. For this Smart Cities Challenge, the partnership with Ecology North has provided a network for knowledge exchange on sustainable principles. They have facilitated knowledge exchange with the Scandinavian architecture firm White Arkitekter and the Carleton University Urban Research Lab.

NORTHERN CENTRE FOR SUSTAINABILITY

Ecology North and YKDFN are currently partnered on another relevant initiative that will re-

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

inforce the outcomes of the Smart Cities project. The Northern Centre for Sustainability (NCFS) is a project that will leverage federal, private sector and academic funding to build the first Living Building in the circumpolar North, and the first carbon-negative building in Canada. This building will be a demonstration in downtown Yellowknife for replicable, scalable, and adaptable cutting-edge technology for northern settings. An innovation hub in the building will be an incubator for emerging green businesses, entrepreneurs, special interest groups, and indigenous youth. By providing a space for innovation, the NCFS is positioning itself to be a potential Smart Cities partner.

WHITE ARKITEKTER AB

Ecology North has been developing research relations with the White Research Lab at White Arkitekter AB, the largest architecture firm in Scandinavia based in Gothenburg, Sweden. White is an expert in nordic design, and facilitates the transfer of knowledge and practices directly to local architects. White has acted as a sub-consultant to Ecology North as they provided them with case studies on Scandinavian Best Practices for electric vehicle charging stations, urban lighting systems, urban planning, urban design, and the integration of the natural and built environments in the best way possible. Ecology North approached White for a partnership with this question: how can we exchange knowledge? To this point, White has provided much valuable perspective in the visioning of this project.

TECHNOLOGY PARTNER: NORTHLAND UTILITIES

Northland Utilities and their parent company ATCO have been the technology partners for this project since its inception providing technological expertise in the area of adaptive lighting strategies for the project's duration. Representatives from ATCO attended the 2-day design charrette in 2018 and have been involved in the ongoing feasibility studies, in the implementation of prototypes, and the monitoring and collection of data. ATCO states that "ensuring [they] operate in a transparent, ethical and accountable manner is critical in creating strong and sustainable value for [their] share owners and in promoting the company's well-being over the long-term" (ATCO, 2018). In addition to their technological expertise, this demonstrates ATCOs compatibility with this project's own scope and vision.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

POTENTIAL ACADEMIC PARTNER: CARLETON RESEARCH LAB

The Carleton Urban Research Lab was co-founded in 2017 by Professor's Catherine Bonier and Ozayr Saloojee. The focus of the lab revolves around questions of water, cities and equity. It is both an academic and outreach unit in the Azrieli School of Architecture and Urbanism. The lab regularly hosts academic and public events through symposia, workshops and design charrettes. This proposal has benefitted from the expertise of the lab in the areas of Smart City technology, including risks and mitigation strategies and future-proofing, as well as in the areas of data and privacy and project management.

INCREASING CAPACITY

With increasing demand for municipal information technology services such as smart sensors and equipment through Internet of Things functionalities, the City of Yellowknife will be looking at hiring another coordinator in 2019 to increase capacity in this department.

SENSITIVE DATA

In order to retain community control over sensitive data, this project's approach to partnerships will prioritize in-house technology development and maintenance, and limit the number of vendors involved. The City of Yellowknife will retain initial ownership of the information collected through the Smart Cities Challenge infrastructure, and in accordance with applicable legislation, it will be up to City Council to decide on the use of this data. Additionally, part of the funding from this project will be directed toward creating a step-by-step guide for entities interested in buying data generated by Smart City infrastructure and using it for commercial purposes. Sequentially, this guide would need to be developed after the creation of a comprehensive IT Strategy Plan as discussed in the project management chapter. The process of ensuring that the sensitive data usage plan complies with the comprehensive IT Strategy will also be the purview of the Smart City Committee and will serve as a privacy and security "checkpoint" or opportunity for course correction and risk mitigation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 6

ENGAGEMENT

Information technology can be an ever changing and mysterious thing, and the use of technology for the betterment of society can be fraught with challenges. The City of Yellowknife's engagement with residents and interest groups has been very positive, with lots of energy and excitement about the prospects of a Smart City in the north. But undertones of concern are present about privacy, use of data and the ever-present concept of "big brother." This chapter highlights the engagement to date, lessons learned, the plan to engage and communicate with Yellowknifers, and the vision and concepts of Smart Cities. Also highlighted are some of the risks and risk management techniques we are intending to use to get to the city's goals of using knowledge and technology to improve the community's social and environmental well-being by transforming the simple lamppost as a beacon of sustainability.

ENGAGEMENT TO DATE

Yellowknife is a small city that feels like a big town, and meetings between public officials and local citizens happen on the street or in the check-out line everyday. The City of Yellowknife approached engagement using its partners, in particular Ecology North, to get the word out about this project in a grassroots way. Grassroots engagement is effective at building a base of concerned and engaged citizens, that was built on through events, a multi-stakeholder charette and communication plan. The City will build on this approach by spending time in the first two years of the next phase of the project engaging and working with stakeholder groups to build trust in the City's approach, but also to gain feedback about how people see Smart Cities improving their lives.

This starts at the top, and City Council have been engaged and supportive from the very beginning. On April 23, 2018 council moved to unanimously endorse the Smart Cities proposal (City of Yellowknife, 2018). Through close communication with City staff and partner organizations, Council has endorsed sustainable development, climate action and using technology to help improve outcomes for all Yellowknifers.

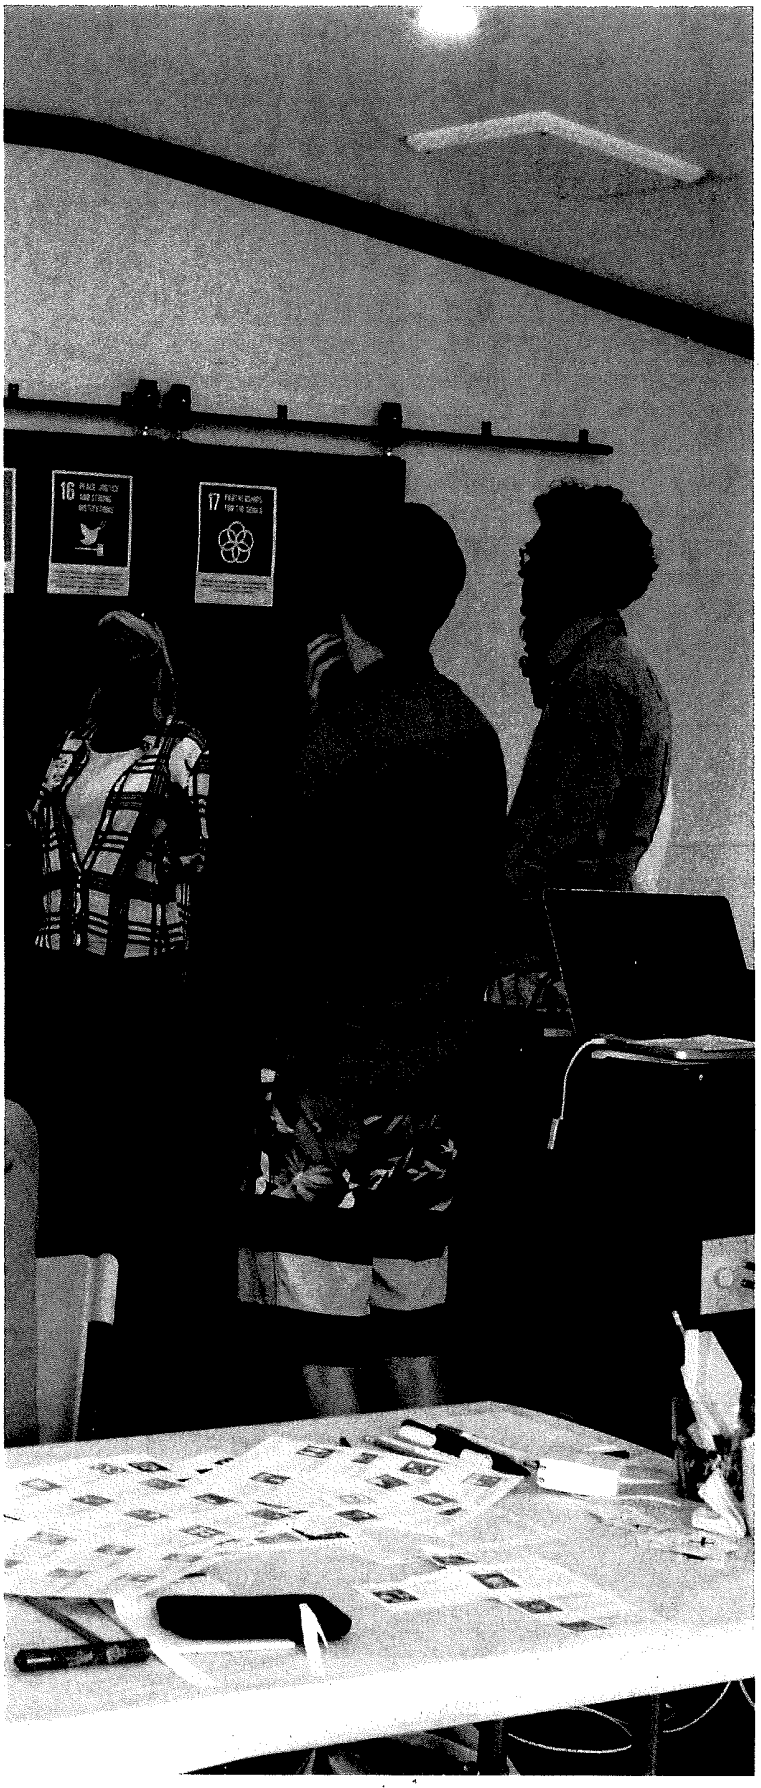
OPEN HOUSE

An Open House event took place on April 3rd 2018, just before the first proposal. Invitations were sent out widely with the objective of gaining ideas and thoughts on using the lamppost as a beacon of sustainability. ATCO demonstrated the technology with motion-sensing luminaires and Ecology North worked on generating ideas and building grassroots support.

We received over 50 individual responses to our request for feedback, and compiled and evaluated this information to help guide us in drafting our proposal. Residents identified key areas of concern, and discovered areas that had not been previously considered, which were incorporated into the project proposal. The community engagement Open House was an invaluable tool to understand the issues at the forefront of residents' minds, and allowed the partners to develop a project and potential solutions that truly meets the needs of Yellowknife.

MULTI-STAKEHOLDERS 2-DAY DESIGN RETREAT

In August of 2018, the Smart Cities Team organized a design retreat at the Yellowknife Ski Club. Taking the time away from computers and meetings would allow all participants' creativity to be stimulated, at the edge of the forest beside Great Slave Lake.



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The full 2-day meeting welcomed participants from all walks of life to share ideas with an innovation mindset. The first day welcomed many Yellowknifers from a diverse range of groups, including but not limited to the tourism industry, academia, architects, landscape architects, and First Nations.

The second day of the charrette was more intimate, and focused on the technical details of implementing a smart street lighting strategy. Those in attendance had vested interest in the proposal, as they would be working on its implementation. This design charrette was a joint facilitation between Ecology North and White Arkitekter AB. Northlands Utilities delivered their knowledge of the lamppost system and technical know how, Yellowknives Dene First Nation shared their deep connection to the land and transformational thinking, and the architects, engineers, politicians, environmentalists, bureaucrats and everyday people brought their Northern innovation, ideas and comments to the table.

The community design charrette was developed to encourage sharing and open discussion through interactive activities. Facilitators initially sought to identify participants' perceptions of Yellowknife and build on the concept of sustainability in a Smart Cities construct, build on the concept of smart lighting that would improve people's connections with the sky and nature, and improve our thriving aurora tourism industry. Many new ideas were brought forward which were duly recorded and discussed and people were truly engaged and excited about the prospects of the Smart City and smart lighting. The full design charrette report is found on the City's Smart Cities Challenge website.

Our community engagement format enabled us to bring together participants from all our partner groups, along with their individual expertise. Participants who attended could engage

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

in discussions with all parties in a one-on-one or small group format. From these discussions, participants could better understand what exactly the Smart Cities Challenge was, some ideas already developed in terms of specific issues the City needed to address and potential ways to address these issues. Participants were invited to ask questions and provide feedback throughout the one-on-one engagement, and then after they had a chance to interact with all the partners as well.

Some guiding questions were displayed on different boards throughout the room and people were invited to write their action ideas on a post-it note for each one they wanted.

Though we invited attendees to answer these questions directly, we also encouraged them to provide further feedback that they might have had. The amount of feedback we received impressed us. On top of this, we engaged a local radio station, Cabin Radio, to attend the first hour of our session and broadcast the entire time through Facebook live to encourage more resident to come. Thanks to our varied promotional methods, we saw solid attendance at the engagement session and received feedback that has helped guide our proposal.

LIGHTS OUT EVENT

On November 20th, in what is one of the darkest and gloomiest times of year, the City held a Lights Out Event to bring awareness and excitement about how light pollution impacts the city, and how the Smart City Challenge intends to tackle lighting issues. The City turned out the lights of City Hall and Samba K'e Park to symbolize future efforts and showcase the night sky. Mother nature had other ideas on this blustery evening, but regardless a good turnout and interesting conversations about what night means to Yellowknife were had.

CONSULTATIONS AND SIDE CONVERSATIONS

Yellowknife is blessed to have what must be one of the most engaged populaces in Canada. This is seen in the number of civil society organizations that work to improve all manner of social, environmental and other disparities and challenges. By choosing to work with Ecology North on this project, the grassroots of the environmental movement were engaged. Ongoing engagement with tourism providers and NWT tourism helped the team understand the tourism opportunities and challenges. Northlands brought the knowledge and tools of its Innovation Hubs to the table.

YELLOWKNIVES DENE FIRST NATION

Yellowknife is founded on Chief Drygeese traditional territory of the Yellowknives Dene First Nation (YKDFN). The twin communities of N'dilo and Dettah share borders, and many YKDFN residents live and work in Yellowknife. The City and YKDFN also work closely on shared infrastructure, festivals, and building a better overall community together. YKDFN were invited to all consultation sessions and participated in the Design Charrette, where ideas and plans to incorporate technologies into N'dilo were conceived and developed. Relationship building around a shared vision has continued with discussions at the leadership level, and at the grassroots between Ecology North and YKDFN staff.

The Smart Cities project will further build on this relationship by bringing principles of reconciliation to the project by actively partnering and sharing resources gained from the Smart Cities Challenge. The City and YKDFN are looking to

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

forge a new bond based on the promise of technology, a growing tourism industry and celebrating culture and heritage.

SOCIAL MEDIA

The City has a communication plan, and has been working on tools to further its engagement using social media, traditional media and other tools such as Placespeak and the Pingstreet app. This is a weakness the City has had to date, developing and enacting this Communication Plan. The process of researching, learning and developing what this proposal will look like for the City is an iterative one. The City wants to be clear with regards to its Smart Cities messaging in order to best manage expectations.

DIMMABLE LIGHTING SCHOOL DRAW PROTOTYPE

As our flagship prototype the School Draw dimmable light installation will highlight a new look for streetscapes in town. The City intends to use this project to highlight the Smart City project and show residents how this technology will improve the night time experience for Yellowknifers and tourists.

To evaluate and build public support for this prototype Ecology North and City Staff interact with residents in the pilot area to explain the project, answer the inevitable questions about what people in the neighbourhood are going to experience and help the team understand people's concerns while building excitement around this prototype. By asking for written feedback, we hope to develop a baseline of knowledge and concerns, and will follow that up after the prototype to evaluate people's experience with the lights, and whether it changed their enjoyment of Yellowknife's Extraordinary Skies.

The City will also celebrate reaching this milestone with a celebratory event in which the partners and the public will get to see the lights working for the first time. This will be the first time that the public will visibly see a manifestation of what their City can look with smart lighting.

CITIZEN QUOTE

"I think it is a brilliant idea. I think it's great... We were just talking about how to integrate services for bicycles, because a lot of us are year-round bikers."

- Aleta, Yellowknife resident

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

FUTURE ENGAGEMENT

Smart Cities are a relatively new concept and a challenging one to define and communicate. The City has chosen not to immediately communicate a Smart City strategy and concepts that are not yet fully developed, but anticipate following the ISO 37106:2018 standard and developing an IT Strategy in the first year of implementation to improve communication and engagement that will follow.

The City at this point without pre-supposing the future strategy and policy direction hopes to embrace concepts of openness, transparency, interoperability, non-proprietary and citizen-centric IT and similar themes for engagement. Tools and strategies will be developed to embed this view so the City becomes a leader in working with its citizens to improve outcomes for everyone. To improve this the City will continually ask for input into new ways to incorporate Smart Cities concepts into its strategies and action plans.

Approaches that the City intends to take to get to this point will be to use our current engagement and outreach tools to gather knowledge. These include Placespeak which is a location based civic engagement platform, and the app PingStreet which provides real-time access to helpful information and engaging tools. Along with ubiquitous social media outlets like Facebook, Twitter, Instagram, and the Smart City Yellowknife website, the City will continue to use the person-to-person, and stakeholder engagement that have been the main platform for engagement to date to communicate the Smart City message.

The plan will lay the groundwork for the use of other tools within the City to reach out to new stakeholder groups. By developing a Research and Engagement Working Group to promote this plan, the City will encourage the public, entrepreneurs, and targeted stakeholder groups to submit expressions of interest and ideas to make the City smarter. Funding in the form of an engagement budget will be provided in years 1 to 5 and each year there will be a different focus (transportation, IT, sensors and tourism, etc) in which the public will be asked in a challenge format to give the City practical, doable ideas for implementation. Other uses of the funds from the engagement budget might be to ask stakeholder groups (ie. artist community to use art to highlight smart city prototypes) or ask seniors to test a technology or envision what a smart city is for them, or hosting workshops for youth to work with technology. Other options might be to host a hackathon in which tech entrepreneurs, or university students from across the country are invited to participate to build solutions that fall within the criteria of our Smart City Vision and concepts.

Other engagement tactics could be to talk with random citizens and ask them how a Smart City or smart streetlights might improve their health, safety or sense of being. Similarly, working with new immigrants to see what needs or wants would make their early transitional years easier could shed light onto areas of improvement. To do all this the Smart Cities Implementation budget will support real hands on learning, workshops, participation with schools and civil society groups. Each of these stakeholder groups brings will attempt to bring out individuals and groups of

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 7

DATA & PRIVACY

PREPARING A PRIVACY IMPACT ASSESSMENT

Part of this strategy is communicating with the Office of the Privacy Commissioner (OPC) to prepare a Privacy Impact Assessment (PIA) that covers the width and breadth of this project. As part of the preparation process for this proposal, the City of Yellowknife has established contact with the OPC and through initial discussions determined that a PIA was not needed at this stage of the project as data is yet to be collected and no privacy impacts are being made. City staff will continue to work closely with the OPC as the project progresses to determine which technologies and aspects of the project require PIAs and to perform this work as necessary prior to the implementation of any potential Smart Cities technologies.

EXISTING POLICY

The City of Yellowknife has established and made public their efforts to integrate security and privacy considerations into municipal technology. This is evidenced in the City's website's privacy policy, which notes user de-identification and gives a complete list of the non-identifying information that is recorded. This sets a precedent for data privacy and security that the Smart Cities Project can expand on. Because the majority of the technologies proposed in this project are not currently in use, their privacy impacts will have to be evaluated by the City or by an independent contractor before they are officially launched.

With regards to compliance with The Personal Information Protection and Electronic Documents Act (PIPEDA), this project in its current iteration does not deal with any personal information. As part of the project management strategy, however, this should be reassessed periodically.

CASE STUDY: ILLINOIS INSTITUTE OF TECHNOLOGY

The Illinois Institute of Technology (IIT) has designated the campus a "living laboratory" by building a microgrid on IITs main campus to experiment with smart technologies. IIT is currently piloting a smart street lighting system configured in a mesh network that communicates with lights that are controlled by the Centre-for Smart-grid Applications.

IIT has also piloted two prototype applications (a) emergency response application, and (b) Safewalks mobile application. The Safewalks application adjusts the brightness of streetlights relative to the pedestrian traffic as determined by real-time data.

IIT is particularly interested in cyber-security for their networked streetlight system. They have identified three areas of vulnerability: (a) the communication network, (b) the remote server, and (c) end devices. Smart software is important in maximizing the utility of smart hardware. Cybersecurity is the most important concerns of IoT in critical services that addresses interests of public trust.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

SMART CITIES CHALLENGE: AN OPPORTUNITY

Collectively the municipality and its partners recognize the Smart Cities Challenge as an opportunity to preemptively address emerging issues regarding technology, ownership and security. As a frontrunner in specifically Northern-Canadian innovation, Yellowknife is well-poised to develop secure frameworks of governance with the well-being of its residents as a central priority. The governance structure ensures diligent and consistent dialogue with a diverse range of residents and stakeholders. The City's commitment to accessible, open-source formats is demonstrated in existing infrastructure like the City Explorer portal and Open Data License Agreement. Moving forward, the development of an IT implementation Strategy can provide the opportunity to solidify a long-term practical approach to secure data management. Emphasis will be placed on ownership structures that retain municipal control of data, as well as a framework for adaptability of open-source policies to suit changing needs and technologies. Investing in smart solutions for the Yellowknife context translates readily to applications in remote and cold-weather communities across the country.

CHAPTER 8
FINANCIAL

Transforming into a Smart City has the potential to improve the services the City offers its citizens and improve the way it offers those services. It will help the City improve internal efficiency by providing more effective structures for communication and data transfer. The up-front investment required to implement these improvements will be paid back through a variety of benefits and service improvements in the future. The following preliminary budget will highlight the estimated costs and the outcomes and some anticipated cost savings that will be triggered within the five year Financial Plan of the City. The preliminary budget is summarized in the budget document on page 66, and will be split generally into the following five sections: Smart Cities Strategy, Extraordinary Yellowknife Lighting Strategy, EV incentivization Strategy, Research and Engagement and Operations & Maintenance budget lines.

SMART CITIES STRATEGY

The Smart Cities Budget will be the largest single budget area and will encompass much of the technology that most people think of when they envision a Smart City. Consistent with the proposal this preliminary budget will not provide too much detail into the costs of individual technologies, as decisions will depend on the Smart City Strategy, research and engagement and the approach to implement the action plan coming out of the strategy. This approach maintains flexibility and doesn't pre-suppose the outcomes. Dollar figures will be used to limit the scale of technological deployment within the five year budgeting window.

The budget for Smart Cities Strategy will include the Strategy itself and development of corresponding IT policy and tools. There are also improvements to Information Technology within the City itself, namely improving the IT hub, connectivity improvements, and expanding the gateways city-wide. Further to these key improvements, the Strategy and further research will highlight approaches (and estimated budget lines) to mesh network development, expansion of geofencing, beacon technology, wifi expansion, sensors and new technology areas.

EXTRAORDINARY YELLOWKNIFE LIGHTING STRATEGY

Similar to the Smart Cities budget the Extraordinary Yellowknife lighting budget will be dependent to a degree on the strategy and lighting plan developed in the first year. This strategy will highlight priority areas within the city and set the conditions for expansion of the smart lighting, based on the evaluation of the School Draw prototype and lighting strategy. Budget lines for lighting have been included in the budget page and will be a considerable portion of the budget.

ELECTRIC VEHICLE INCENTIVIZATION STRATEGY

A relatively small portion of the budget, the EV Incentivization Plan will highlight a Smart City approach to Electric Vehicle integration into Yellowknife. This will primarily entail piloting and evaluating EV charging infrastructure tied to lampposts and how to leverage this with policy, education and awareness tools to encourage adoption of EV's into a Smart Cities framework.

RESEARCH AND ENGAGEMENT BUDGET

Included in the preliminary budget for this project, which is detailed on the following pages, are considerations for research and engagement. In contrast to the technological projects and associated budgets, the project areas of research and engagement are intrinsically less clearly defined. Maintaining public and private engagement and promoting strategic research around the availability and feasibility of various Smart Cities tools and technologies is an essential component to the success of this project, and will require an

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

ongoing budget. Funding will be allocated for research and engagement purposes through the guidance of the Yellowknife Smart City Committee. Decisions on allocating the annual funding to meet the intent and vision behind a Smart Cities framework will be made using an effective, varied and multi-stakeholder approach.

OPERATIONS & MAINTENANCE

The City is going to need the capacity and a coordinator. The Smart Cities Coordinator will be housed in the Sustainability branch of the Public Works and Engineering Department, which is responsible for community energy, waste and broader sustainability initiatives. The Smart Cities Coordinator will manage contracts, coordinate the committees and working groups, coordinate between departments and partners, and general project management of the the Smart Cities project. There will be additional requirements in other departments such as IT, Communications, Public Works and Planning that will be coordinated by the internal existing budgets of those departments.

CASE STUDY:

THE COLUMBUS WAY

In 2016 Columbus, Ohio won a $40M fund from the US Department of Transportation. The non-profit organization that won the bid raised an additional $450M by leveraging public, private and academic associations to develop a Smart Columbus project focused on 'smart corridors', a smart grid and smart street lights. With a vision "to be the model for connected cities for the future" its approach to using narratives to engage citizens in a 'collective vision' from a central hub is a model that Yellowknife can aspire to.

CONSIDERATIONS FOR LONG-TERM OPERATIONS & MAINTENANCE COSTS

There are definitely concerns about the long-term costs of increasing the number of staff and operations budgets with additional technology, actions and engagement demands. Through the accounting and financing mechanism already in place, City Administration will continue to reassess and strategically invest in the Smart Cities project. It is envisioned that energy savings, water savings and improvements to municipal services will more than offset any future costs. Key to this project is developing clear baselines and evaluation protocols to understand, value and communicate the results of pilot projects to corroborate the argument and continue to receive public and council support for funding.

LEVERAGING THE SCC FUNDING

The City recently invested in an institutional grant writer and funding analyst. The role of this new position in relation to the Smart Cities is to support with the leveraging of the Smart City budget to expand the funds available for prototype development, technologies, engagement, research and IT. The goal will be to provide additional funding every year for the project and to extend the five year length of the funding to maximize outcomes for Yellowknife's Smart City evolution.

COST SAVINGS

Yellowknife will see improvements in the well being of citizens as the Smart City Plan is unrolled. There will also be corresponding financial savings that will be linked to the rollout of the technologies. Although it is not possible to fully forecast savings, due to the unknown nature of costs, this project anticipates savings on several fronts. The dimmable lighting will be more energy efficient than the current LED lighting. By dimming

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

the lights to a lower electrical load for the majority of the time, there is an anticipated savings of both energy and cost. Currently Northland Utilities owns the lampposts and rents them to the City. The smart streetlights will reduce energy which should translate in a cost savings to citizens.

The introduction of sensors linked to the mesh network will also help the City to reduce costs. Although it's too early to forecast what those savings might be, there is evidence to suggest that city services would be improved by sensors, and those cost savings could be reinvested to improve municipal service delivery. A few promising applications are in the early detection of water leaks, improving the efficiency of trucked water schedules, solid waste removal efficiency increases and trucked sewer pump-out. There are considerable costs to water treatment, but in Yellowknife an additional cost is heating the water to 4 degrees Celcius to help limit freezing as the water spreads out around the system. A conservative assumption of a 10% reduction would equal over $20,000/yr saving and save 59 tonnes of CO2.

Another important positive impact though will be to improve the long term growth of the tourism industry. In 2017, aurora tourism brought in $57 million to the Yellowknife economy. But the Aurora tourist economy is cyclical and there is more and more competition for lucrative aurora tourism visits. By taking a Smart Cities approach, installing smart lighting that makes Yellowknife's Extraordinary skies more visible, and providing beacon technology and other tourism products in the home language of aurora tourists, the City of Yellowknife will set itself apart from the competition and ensure a stronger tourism product and boost in revenues. Finally, the City is very excited to transform Yellowknife by putting the pieces in place for cold weather innovation in the Smart City realm. An innovation based knowledge economy will promote entrepreneurial and business opportunities, add a growing sector to the economy, reinvigorate the downtown, and make Yellowknife into a unique laboratory for Smart Cities innovation in a northern setting.

Another opportunity for potential is with ties to academia. The City is well positioned to improve partnerships with academia and the Smart Cities framework would be a big area of potential growth, as would the proposal to bring a Polytechnical University to Yellowknife, and how that campus could be grown from scratch as a Smart Campus. These ideas have not been fleshed out in this proposal but the City is eagerly anticipating opportunities to leverage the Smart Cities challenge into a new and burgeoning growth area in the City.

Approximately $25,000 was budgetted for the pilot project of which half was dedicated to initial capital costs and the remaining for lights and installation. The installation of eight lights works out to approximately $1,500 per light.

The $5M award would provide us with the opportunity to scale up the project and expand through most areas of town, with a particular focus on residential neighbourhoods. Budgets, capacity and feedback would be continually considered to ensure that the project is in line with City goals and expectations of the Smart Cities funding requirements.

A more robust financial analysis will be linked to the updating of the City IT hub once recommendations brought forth by the IT Strategic Plan have been vetted by Administration and stakeholders.

As the City pushes the envelope for a more connected and innovated North, Administration will ensure that innovation and risk is balanced with financial accountabilty and continual verification to ensure that deliverables are relevant and that expectations are manageable.

CHAPTER 9

IMPLEMENTATION PHASE REQUIREMENTS

In this chapter the City of Yellowknife intends to show how it will meet requirements of applicable federal, territorial and municipal reporting and policy requirements.

DUTY TO CONSULT WITH INDIGENOUS GROUPS

The Duty to Consult with and accommodate Indigenous Peoples is required when the Crown contemplates actions or decisions that may impact treaty rights. Being a northern city with a close relationship with the Yellowknives Dene First Nation (YKDFN) with whom the City shares a border and with whom we count many shared citizens, it is critical that consultation and collaboration are consistent with the high ideals of both the Crown and the City.

To this end the City of Yellowknife is enthusiastic and proud to have YKDFN as partners in this project. YKDFN will participate in the governance of the project as part of the Smart City Committee and the community of N'dilo and Dettah will share opportunities to participate in the outcomes of the Smart City project.

The City has taken clear steps to include the YKDFN in the finalist stage of the proposal through the design charette and sharing the proposal for review with YKDFN. As a key partner YKDFN will play a key role in designing the strategies and outcomes as part of the Smart City Committee, and we anticipate showcasing YKDFN and Yellowknife history and culture in the engagement portion of the Smart Cities Implementation.

COMMUNITY EMPLOYMENT BENEFIT

Yellowknife's Smart Cities Challenge project intends to support employment opportunities for youth, Indigenous elders, artists, recent immigrants, youth and small-sized and medium-sized businesses and social enterprises. By having targeted workshops, technology based challenges, projects and contracts through the research and engagement budget, it is hoped that creative tools and engagement opportunities will encourage participation of targeted groups to build excitement and opportunities for inclusion into a Smart City. Participation will be tracked and specific engagement sessions and opportunities will be included .

Putting in place the conditions for innovation to flourish will allow for a rise in circular economy, green jobs and social innovation to take place. Turning Yellowknife into the Tourism Capital of the North will benefit all of Yellowknife and YKDFN, and the City will promote opportunities for cultural tourism. Yellowknife as a northern hub for innovation and a Smart City will set about the groundwork for a surge in small scale entrepreneurship, innovation and the knowledge economy.

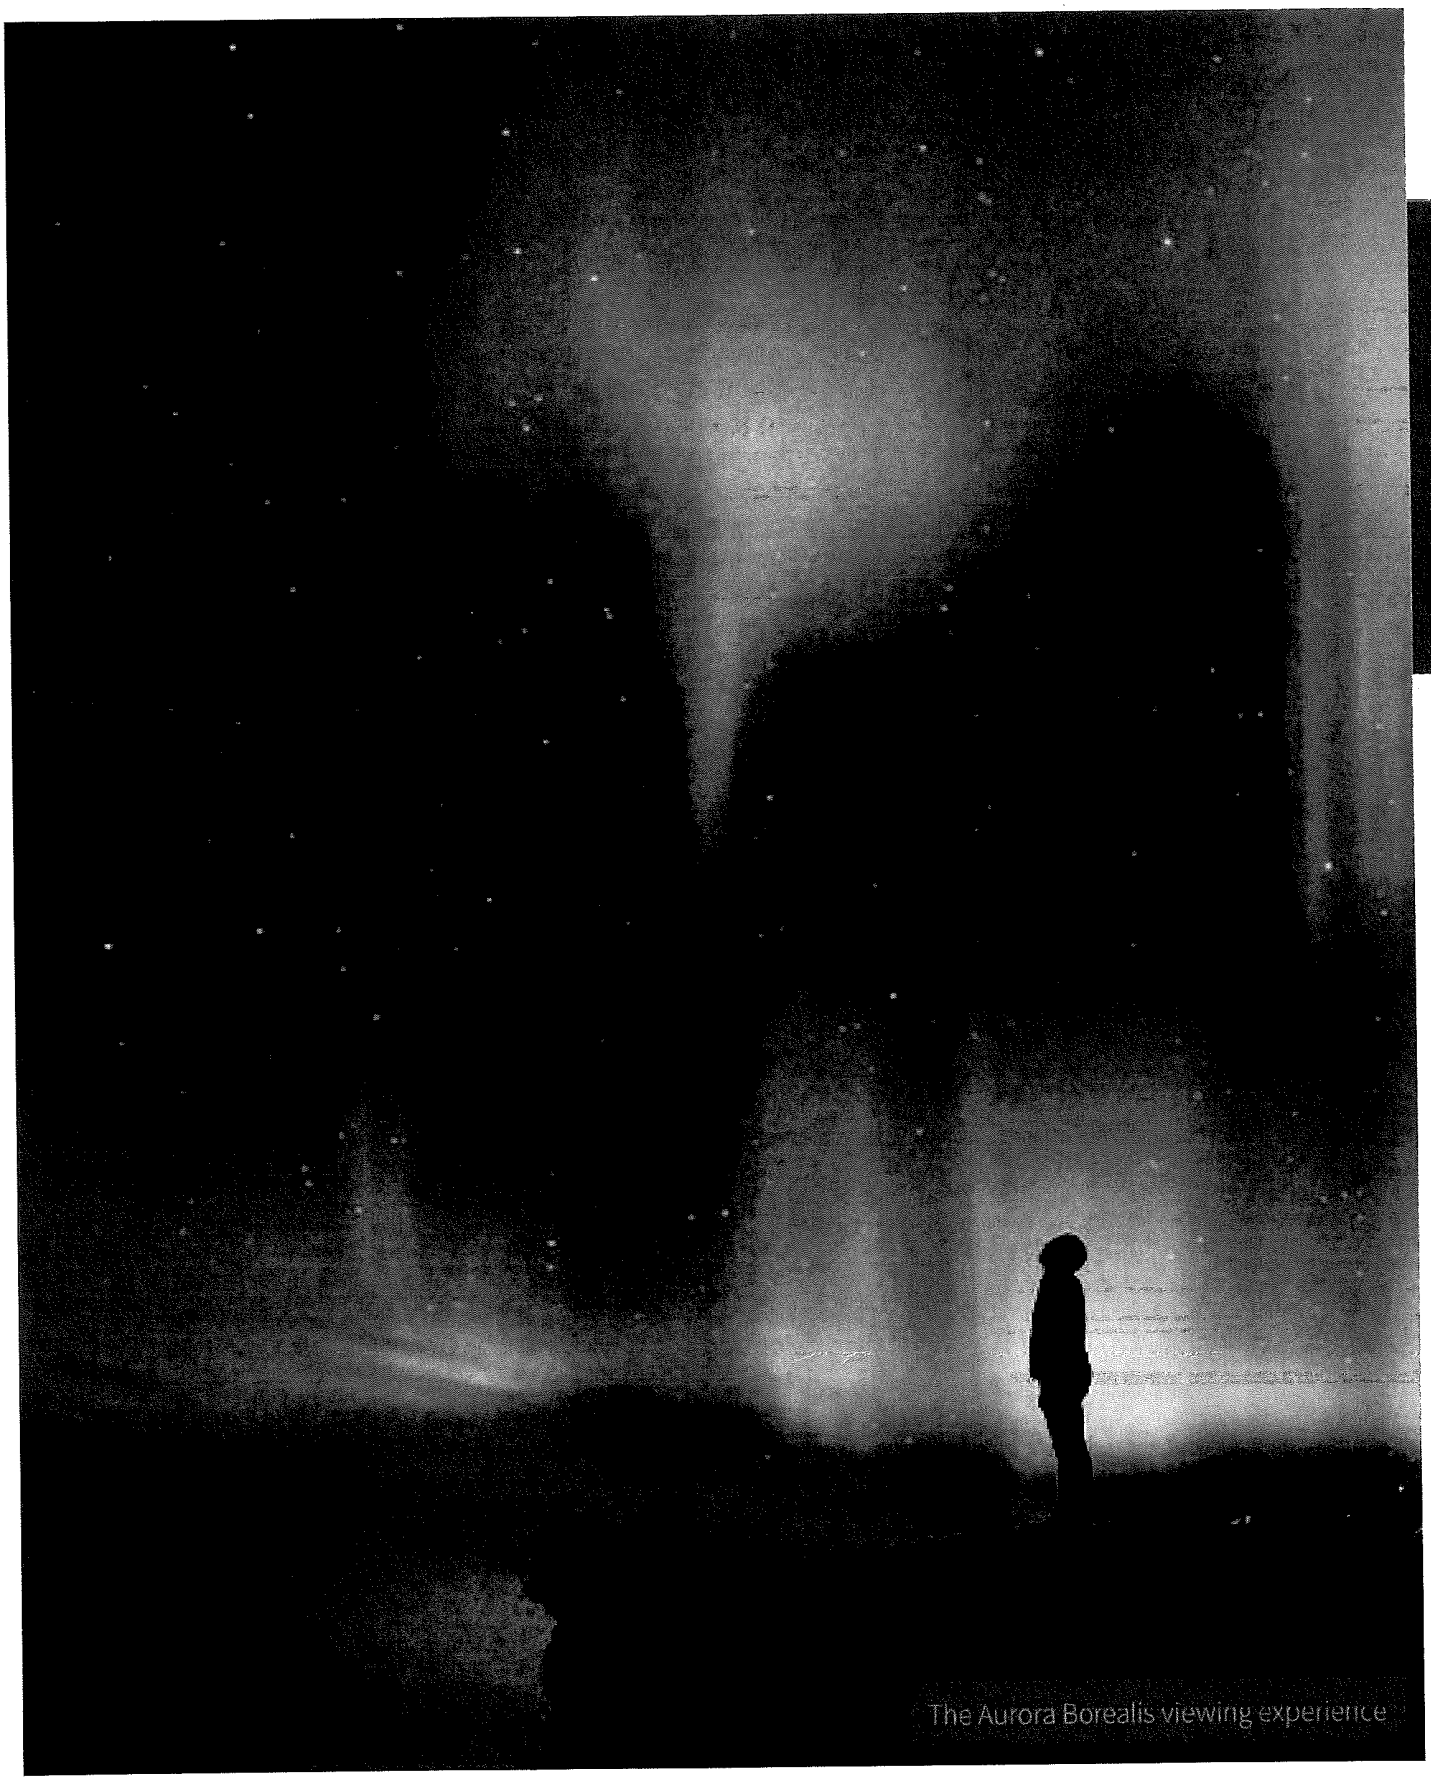
EXECUTIVE SUMMARY



Yellowknife is a place where ambition and ideas can easily turn into reality. It is a small, tightly knit, vibrant community with strong leadership and a desire to foster innovation. The Smart Cities Challenge has engaged the City to envision a future where technology is a key part of everyday life and the design and control of that technology is controlled by clear policy for the benefit of all Yellowknifers.

The City of Yellowknife has done considerable community engagement to understand what a Smart City might mean in the northern context and how it will improve the lives of its residents. The focus of this proposal is on five key impacts: extraordinary skies, tourism, a replicable framework for northern innovation, community connectivity and sustainability. To achieve these impacts there are a series of outcomes that will be attained through the diverse technological innovations to be incorporated into the lampposts much like apps to a smartphone.

These technologies will all be vetted through new strategic thinking that will learn from the best of European and North American Smart City experience to help nurture a Northern Smart City ethos. By pitching Yellowknife as a cold weather lab for smart city innovation, the City will develop replicable plans, tools and ideas that can be spread throughout the north. The focus on dark skies and light pollution reduction will set the City apart in the competitive world of aurora tourism, and provide economic development opportunities and benefits for Yellowknifers. Electric vehicles, improved city services, beacon and geofencing technology and a mesh network will be some of the tools that help the City meet its ambitions of a smart outpost in the boreal forest.

This proposal outlines how the City proposes to take a measured and reasonable approach to reach the stated outcomes that will define success. The Smart Cities Challenge will be the springboard that turns the simple lamppost into a beacon for sustainability.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 1

VISION

Challenge Statement

Yellowknife will experience a rise in our community's social and environmental well-being by transforming the simple lamppost into a beacon for sustainability.

The City of Yelllowknife's Smart Cities Challenge Statement is ambitious and summons stakeholders to explore the complexities of evolving into a Northern Smart City. In the past year, our efforts towards engagement and research have cemented the importance of using information and technology to better the lives of Yellowknifers. We are excited about this opportunity to use the Smart Cities Challenge as a springboard to make Yellowknife a place that defines itself differently: a place in which knowledge, information and Smart City technology become central to our identity as a cold-weather urban laboratory surrounded by the beauty and vastness of the boreal forest.

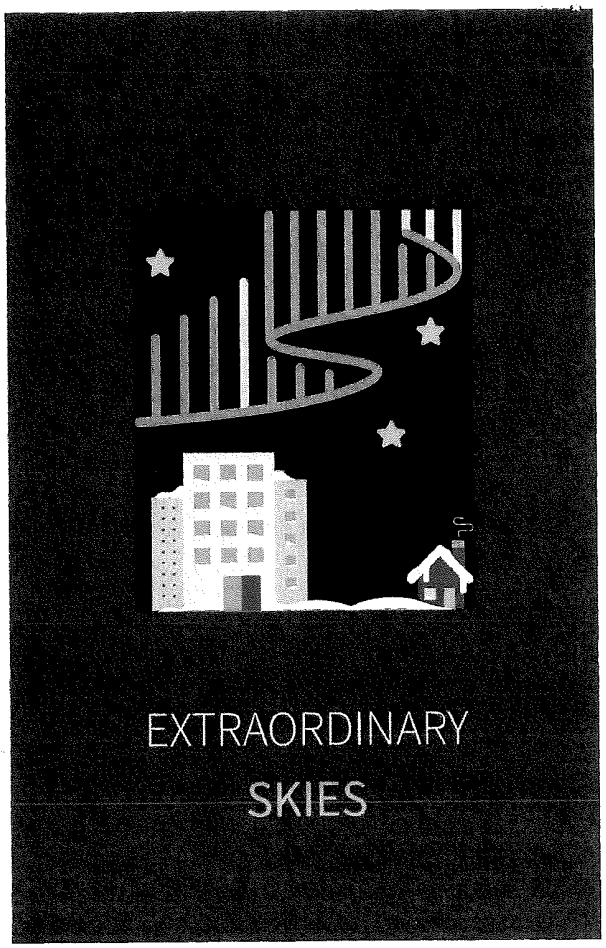
There is considerable work ahead before we achieve this ideal, but the pieces are in place, and we have confidence in our staff, our leadership, and in the passionate and engaged population of the City of Yellowknife.

BUILT ON GOLD, NURTURED BY GOVERNMENT, LIT BY TOURISM AND LOOKING TO TECHNOLOGY

Yellowknife, "where the gold is paved with streets", or Sambaa K'e "the Money Place" in the local Wilideh language, has a fascinating if relatively recent history as a city. Prominently located on the shores of Great Slave Lake, The Yellowknives Dene First Nation have traditionally occupied the region. The location was a rich fishing and hunting ground for the Dene People. The 1930s gold rush lead to the rapid influx of prospectors—complete with vehicles, floatplanes and all the latest and greatest technologies of the time. Yellowknife boomed with the development of two huge gold mines that spread along the shores. In time the city grew and developed a new downtown, became the administrative centre of the Northwest Territories (NWT), and eventually the capital city in 1967.

Growth continued in the 1970s and 80s, following the cycles of boom and bust that accompany the mining sector. The eventual decline and closure of both Con and Giant mines impaired the city's economy, until diamonds came to the rescue and led to a second mining boom in the 1990s. The Government of the Northwest Territories (GNWT) signed a devolution agreement in 2013, setting the stage for government to take a larger role in the economy. Meanwhile, the city core that grew so rapidly in the 1950s and 60s started to show its age, and social problems became more apparent. As the current diamond mines move towards the end of their lifespans, the tourism market, in particular aurora tourism, has emerged as a potential area of economic growth.

Meanwhile, treaties with indigenous governments in the Territories are being settled, or are in the process—which may bring about more opportunities for revitalization and growth led by indigenous governments. This evolution of opportunities (and challenges) isn't unique to Yellowknife alone, but forces us to look to our changing horizon for the next chance to redefine our city, carved out of the boreal forest on the shores of Great Slave Lake.



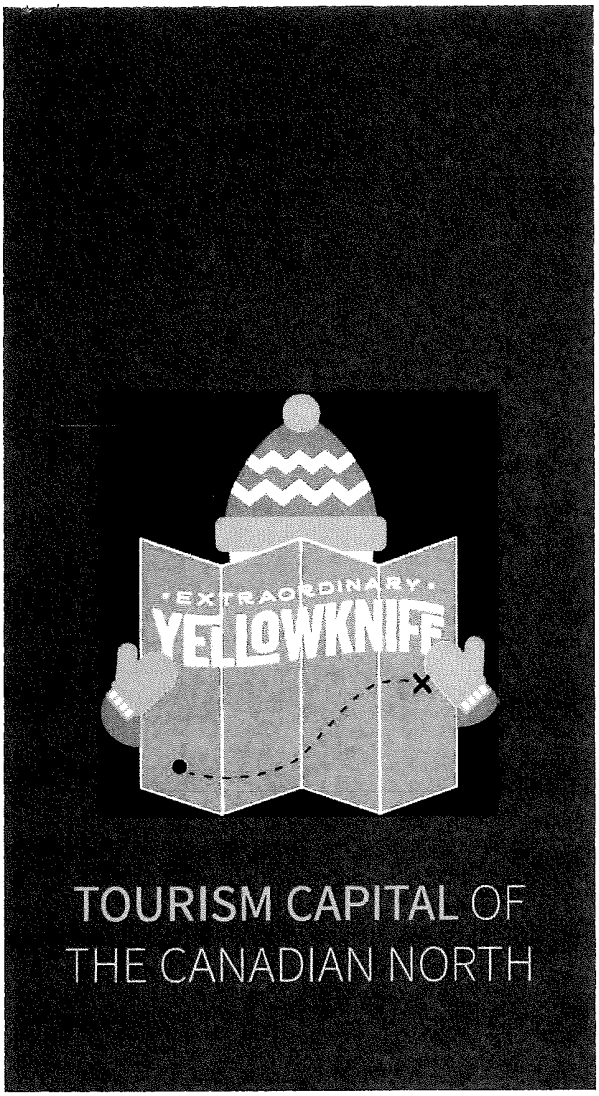
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

IMPACT A: EXTRAORDINARY SKIES

As often happens with shared resources, the night sky viewing experience has been slowly degraded. The pervasive creep of light pollution has been hastened by technology and the energy saving promise of LED lighting. We know that early adopters often learn key lessons about the adverse side effects of technology, but they also benefit longer, and are able to capitalize on future opportunities. As a leader and early adopter of a Smart City mentality, we propose to use our experience to document and outline the challenges and problems we encounter to guide others down the road of advanced technology.

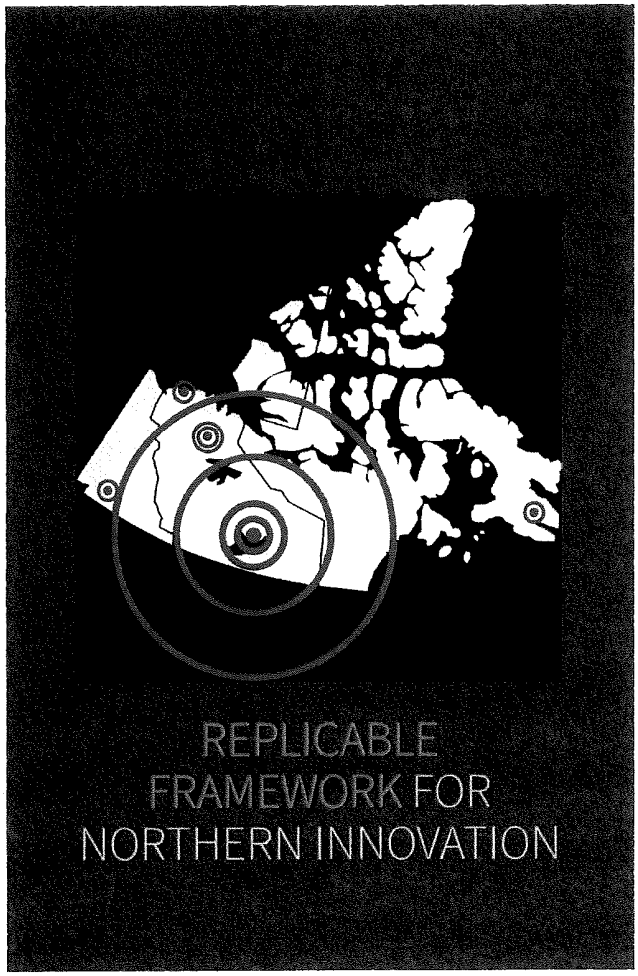
We see the Smart Cities Challenge as our avenue to support other similar-sized cities around Canada, particularly the small towns scattered throughout Canada's North. By implementing a strategic lighting plan alongside interconnected lampposts, and encouraging light reductions city-wide, Yellowknife will lead by example in an area of growing importance. The next step for city lighting is to implement technology that dims and brightens lights at appropriate times. The technology is becoming available to take this city-wide and beyond.

Opening up our skyline to expose the aurora will have multiple benefits for Yellowknifers on top of the economic drivers of tourism. We will become more in tune with the sky and connected with the dancing lights. Decreasing the unnecessary presence of street lighting will allow natural lighting patterns to influence our moods and circadian rhythms without artificial influence. We intend to make the most of this opportunity to not only test the technology, but evaluate and communicate the softer benefits of improved lighting outcomes for human health, community and happiness.



QUOTE

"The Northwest Territories has much to offer travellers – stunning landscapes, rich culture and unforgettable adventure. It also has much to gain. Tourism 2020 is an investment in our people, our communities and our future. This renewable resource has a high return on investment and will create lasting economic opportunities, careers and capacity building throughout the territory."



– Wally Schumann,
Minister of Industry,
Tourism and Investment

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

IMPACT B: TOURISM CAPITAL OF THE CANADIAN NORTH

The Smart Cities Challenge will amplify existing efforts to develop our natural tourism resource of "Extraordinary Skies". In 2017-18 over 34,900 tourists travelled to Yellowknife to view the Aurora Borealis or northern lights (GNWT, 2018) . Tourism employs over 12% of NWT residents, with a spinoff effect estimated at $3.80 for every $1 spent (NWT tourism, 2016). The Government of the Northwest Territories (GNWT) expects 35% growth in the industry increasing visitor spending to $235 million by 2020 (GNWT, 2016). Yellowknife happens to be ideally situated under the auroral belt, has clear skies and is regarded by many as the best place in the world to view the northern lights.

IMPACT C: REPLICABLE FRAMEWORK FOR NORTHERN INNOVATION

Yellowknife has the potential to become a place where knowledge and technology combine to carve out a sector of the economy that is defined by our natural and cultivated assets. The city will evolve into an experimental hub of technology and a place of new, innovative enterprise.

The foremost factor encouraging this transformation is the people. Northerners are well known for their resilience, strength of character and resourcefulness, but also for their adaptability and openness to change. Yellowknifers are young and well-educated, having near the highest per capita post-secondary degrees in Canada (McGrath, 2013), and is increasingly multicultural. This unique blend of intellect, diversity, creativity, and youthful vigour, when combined with the knowledge and resilience of our First Nations partners, makes our population a perfect place to build a Smart City.

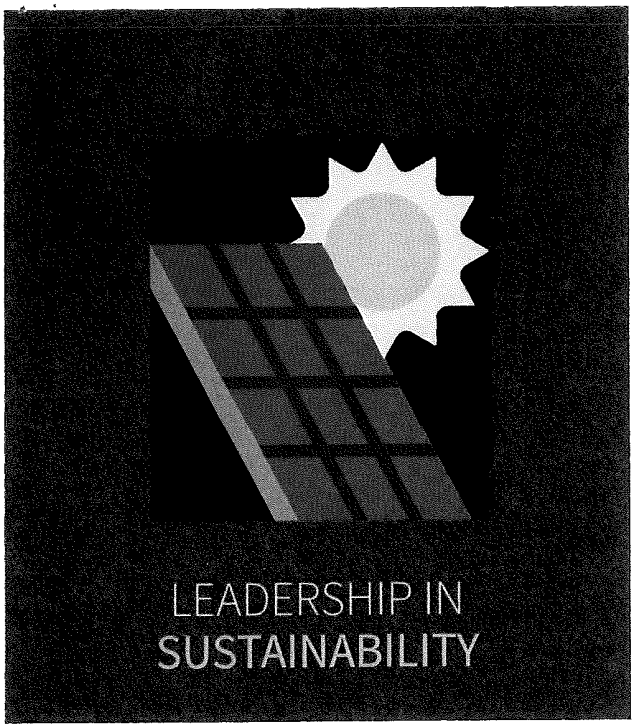
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

We view this opportunity as a springboard to build a sustainable model for economic development built on tourism, research, and innovation. Yellowknife's relatively small size makes the City agile. Its location at the end of the highway, in the midst of a cold and harsh climate, makes the city an ideal laboratory for innovation, cold-weather testing and information technology. We see a future pitch from our new smart-city-endorsed label: "tested in Yellowknife".

The final factor is our politics. We are home to a strong base of democratic idealism, a consensus government that isn't subject to partisanship, and a flair for pushing the envelope. A strong civil society is another feather in our cap, and being a small jurisdiction, our partnerships and engagement are based on human relationships—like the comfort that comes from meeting your elected officials in the grocery store checkout line. The key to our continued evolution into a smart city will be engagement with the population, and particularly our First Nations partners and neighbours. We will develop a new story for a diverse and prosperous Yellowknife centered around technology, innovation and resilience.

IMPACT D: COMMUNITY CONNECTIVITY

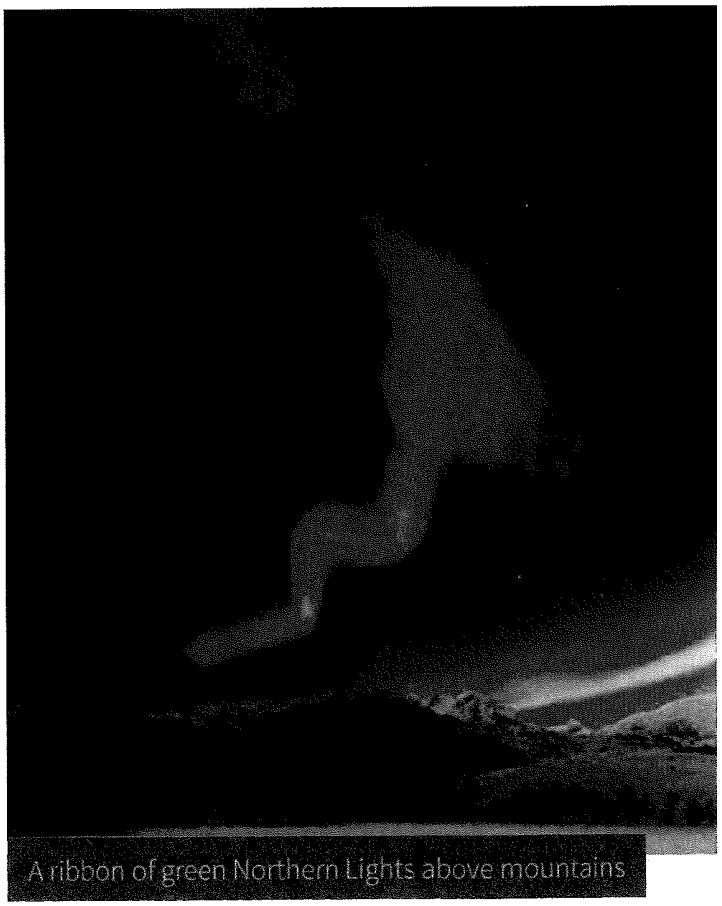
Our research has shown that having a clear framework for technology adoption and decision-making is key to making a Smart City. Establishing policies, targets, and strategies into a Smart Cities framework will make the ground rules clear, structure our decisions on technology, and evaluate and measure success. In cities like Barcelona, Glasgow and Copenhagen, these frameworks are already well-advanced; these European case studies can serve as models for our own Smart City Vision. White Arkitekter, the largest architecture firm in Scandinavia and a global leader in sustainability, have been a key stakeholder since the beginning to bring European best practices and experience straight to the Canadian North. Carleton University's Urban Research Lab has helped to understand the North American experience with Smart Cities and urban context, while our very own local environmental champion Ecology North has helped the City bring these pieces together in a coherent manner.



Venturing into the realm of Smart Cities is unchartered territory for the stakeholders. We look forward to an iterative process that includes the necessary checkpoints and protocols to ensure that the project moves forward in a meaningful and manageable manner. Already, the Smart Cities process has sown seeds across city departments on how to improve municipal servics through integrated technology.

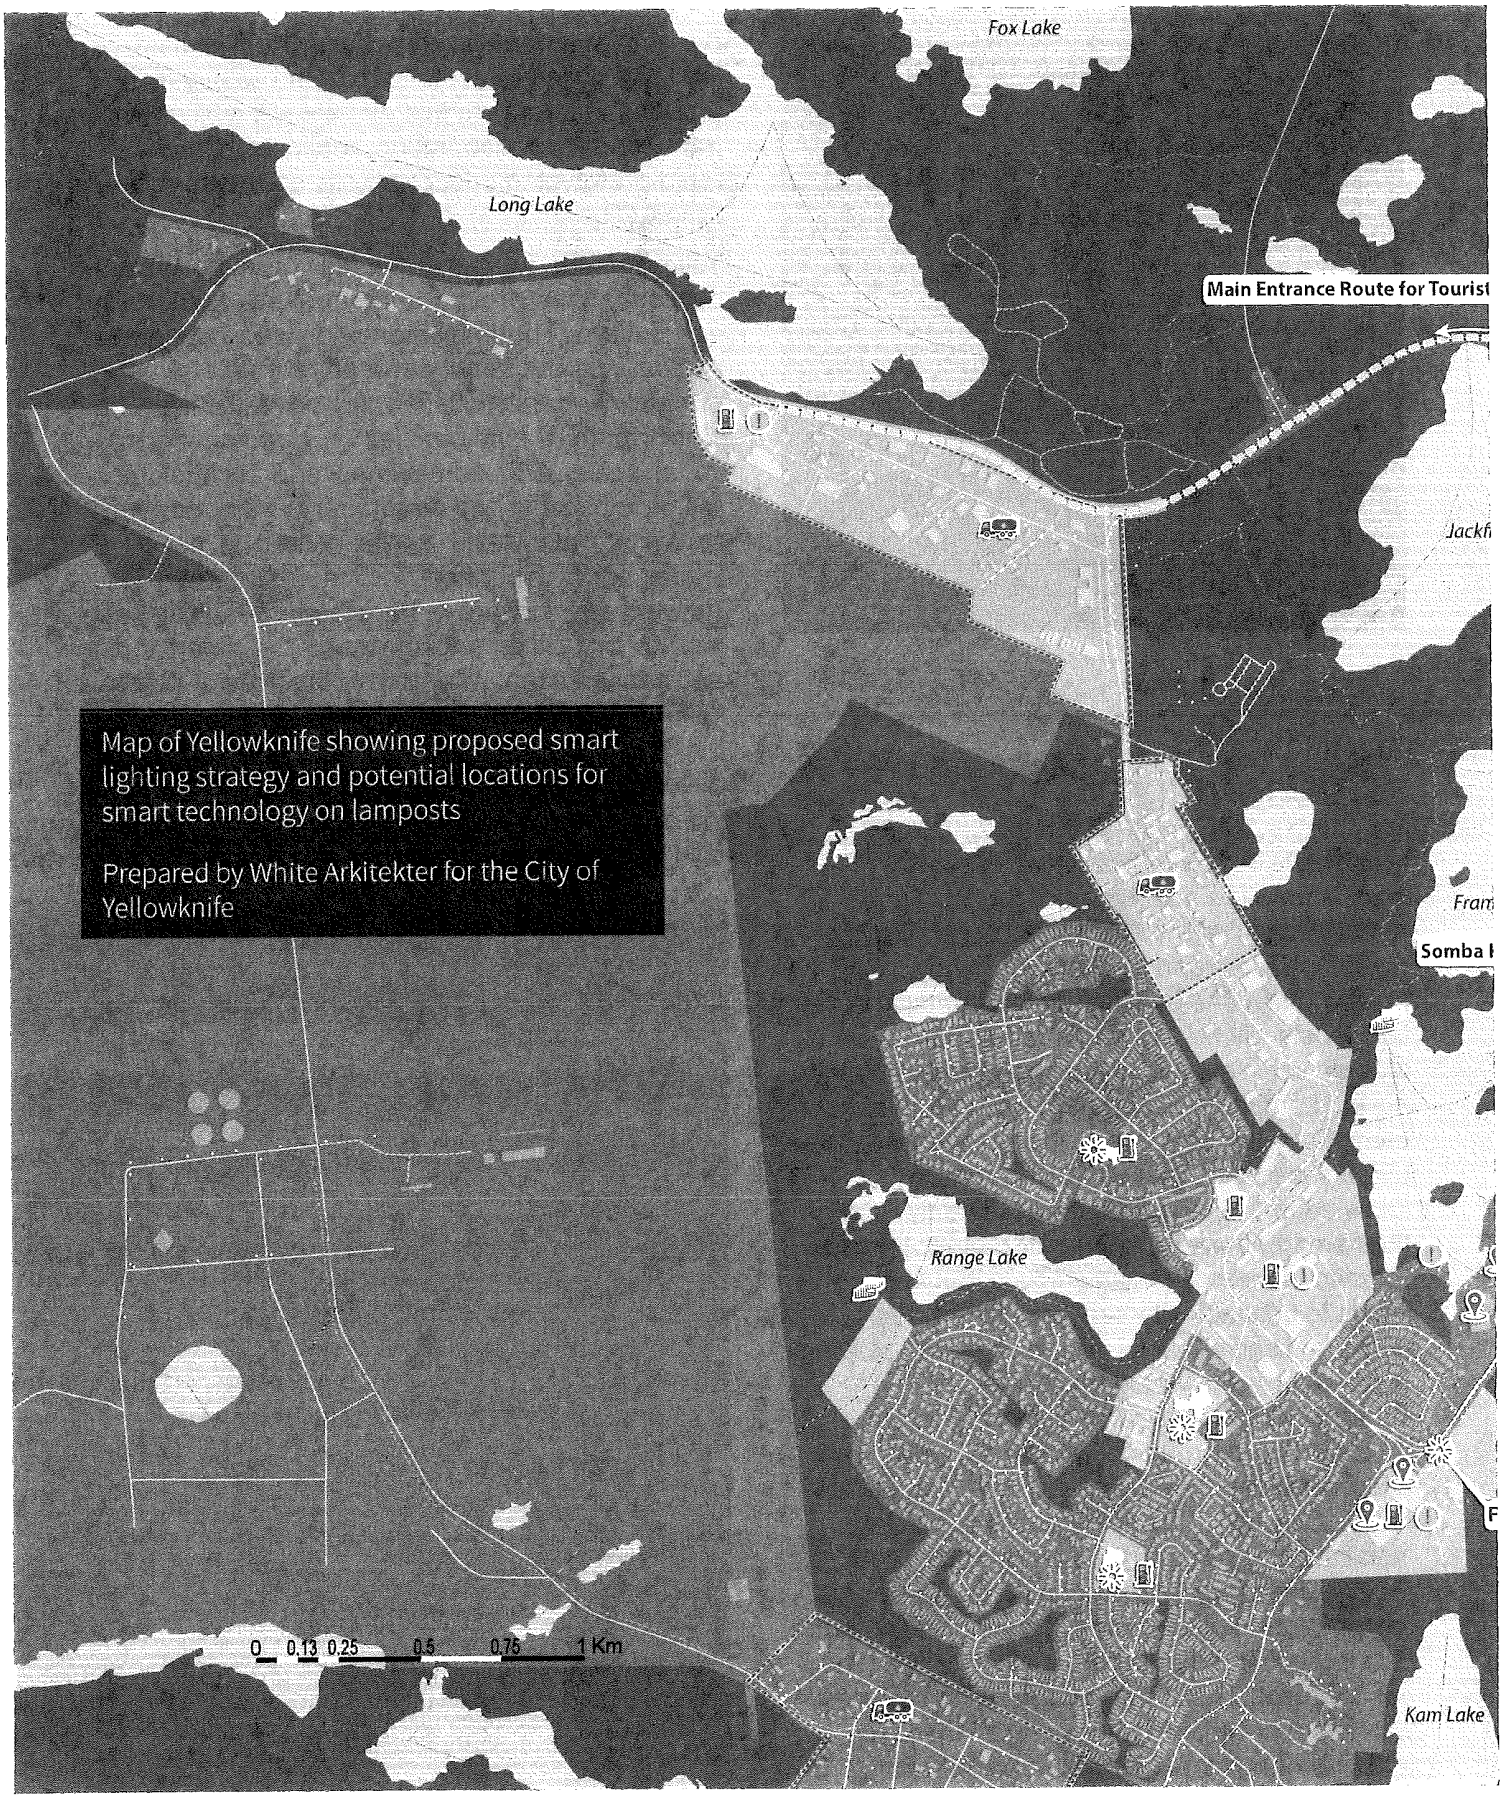
One of the key components of our journey will be to develop an Information Technologies Smart Cities Strategic Plan: which will guide our outlook on Information Technology, and create a framework for making decisions around information moving forward. This framework will be based on the experiences of those who have gone before us, but be scaled and adapted to our unique Northern circumstances.

A key part of our transformation will be continuous engagement with Yellowknife citizens. Open data sharing and knowledge transfer will also help the City gain social licence and trust, build partnerships, and leverage funding and ideas. Using the ubiquitous lamppost as a beacon for sustainability, we will create distinct and unique opportunities for citizen and stakeholder engagement within a Smart Cities construct.



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

IMPACT E: LEADERSHIP IN SUSTAINABILITY



Meanwhile Yellowknifers and tourists will benefit from the adaptation of the lamppost to pose innovative solutions, as suggested by the city's residents. Electric Vehicle (EV) charging stations built right into streetside lampposts will help to encourage adoption of electric vehicles, and prove that they work in the north. Lamppost-based geofencing and beacon technology will help make interpretive materials, event schedules, maps and community knowledge available to tourists, directly through their smart phones and in their mother tongue. Expanded free Wi-Fi would help tourists and locals to connect with services, information, maps and social media. Meanwhile, the majority of city lampposts would be connected to a series of 22 gateways that will move internet protocol (IP) information back to City Hall, and underpin a mesh network and new information hub at City Hall. This network will enable the installation of sensors that can reduce costs for City and other services: such as water and sewer infrastructure, waste, transportation, and data collection on permafrost, climate, and the environment. These improvements in services will help reduce energy and electricity costs and greenhouse gas emissions, improving our already impressive track record of climate leadership and citizenship to promote buy-in and engagement. To this aim we will cultivate transparency, collaboration, replicability and rapid prototyping in our process of becoming a Smart City.

Yellowknife's northern setting creates unique circumstances around infrastructure, resources, and culture. The implementation of a connected network via the lamppost feature in this remote, climatically-harsh location will pave the way for other northern communities on a regional or national scale. Our frameworks and technologies will be replicable and adaptable to other northern contexts. Yellowknife is well-poised to act as a leader and a laboratory for innovative practices. As we move forward in transforming our City, we look to our citizens to embrace the smart tools and networks that will improve the lives of Yellowknifers. The Smart Cities Challenge is an opportunity to build a sustainable model for economic development based on tourism, technology and the potential for Yellowknife to act as an open-air cold weather lab.

CHAPTER 2

PERFORMANCE MEASUREMENT

OUTCOMES

A.1 Increase in Dark-Sky Friendly Neighbourhood trends

A.2 Decrease in sky glow (light pollution) based on 2019 levels

A.3 Increase in public awareness about effects of light pollution

OUTCOMES

B.1 Increase in tourism

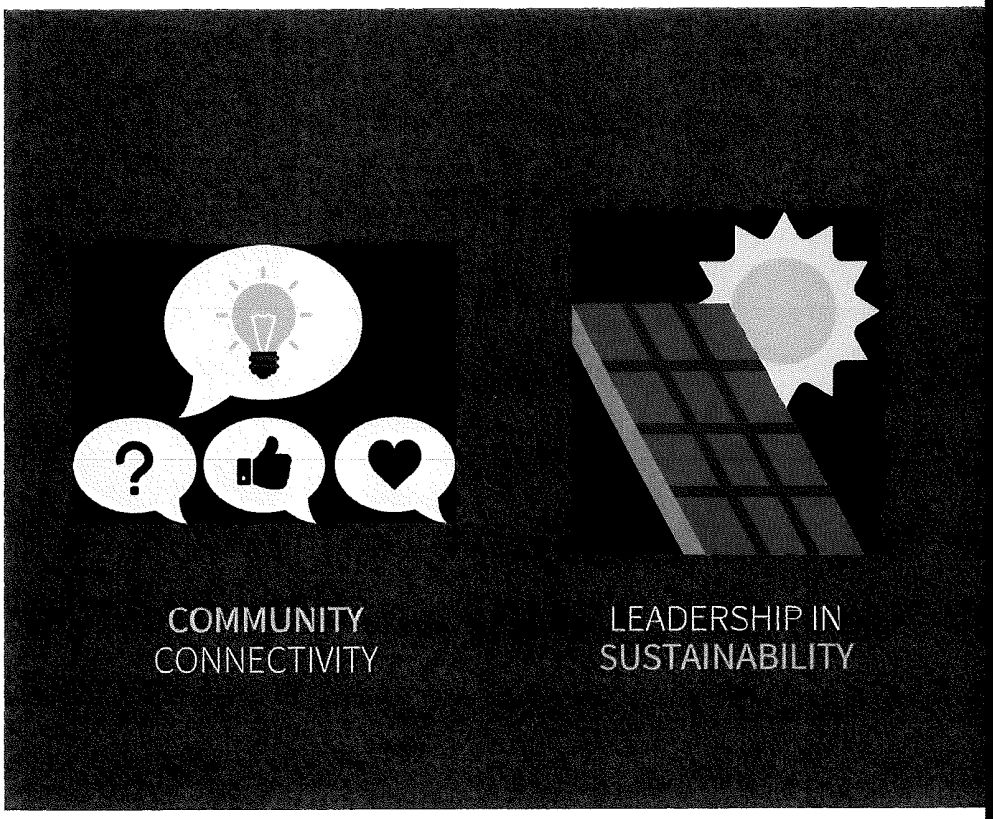
B.2 Increase in quality of Aurora Borealis viewing experiences

B.3 Increase in location-tagging and tourism hashtags

B.4 Increase in use of Ping Street app

B.5 Sustainable economic diversification and income to local tourism-based businesses

OUTCOMES



C.1 Finalized, scalable and shareable IT strategy for northern municipalities

C.2 Outputs consistent with Smart City Vision at 3 & 5 year Checkpoints

C.3 Participation by external contractors in developing applications for Yellowknife IoT infrastructure

C.4 Reduction in cost and increase in reach of municipal services

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

COMMUNITY CONNECTIVITY

LEADERSHIP IN SUSTAINABILITY

OUTCOMES

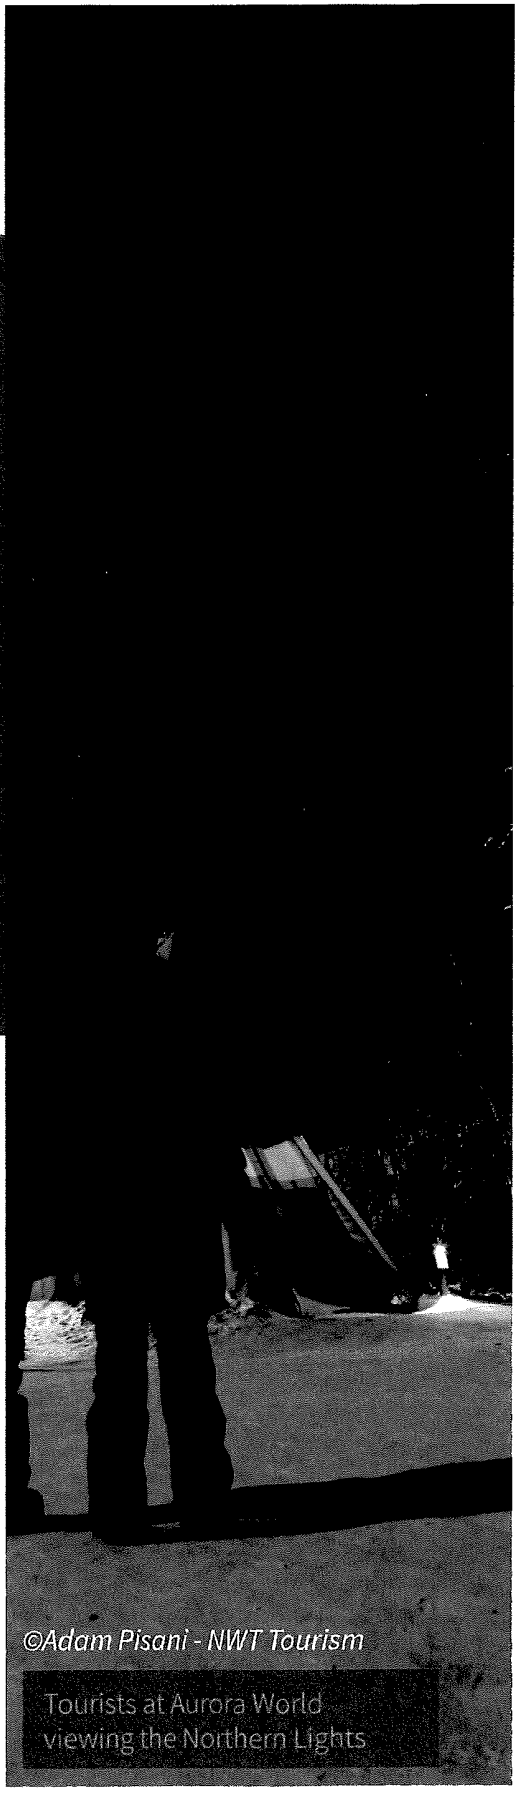
D.1 Increase in local expertise and literacy regarding smart cities technology

D.2 Increase in engagement on Placespeak

D.3 Increase in real-time information being updated in the Pingstreet App

D.4 Increase in broadcasting impact and reach

OUTCOMES



E.1 Yellowknife will lead the North in Electric Vehicle penetration

E.2 Make progress toward the targets set in Yellowknife's Corporate and Community Energy Plan

E.3 Reduction in electricity use from dimmable streetlights

E.4 Reduction in water and energy use and carbon emissions from improved city services

E.5 Progress toward achieving United Nations Sustainable Development Goals

CHAPTER 2

PERFORMANCE MEASUREMENT

Measuring success against quantitative and qualitative performance indicators is a key part of Yellowknife's Smart City Plan as highlighted in this proposal. The chart on the previous page summarizes this proposal in five columns that help explain the journey to become a Smart City. The **inputs** tell the story, while **activities** summarize the proposed plan, and the final column, **Impacts**, summarizes the vision. The **outputs** column highlights the deliverables and technologies, while the **outcomes** are the key to performance management. Striving to achieve the impacts and fulfill the vision will be an iterative journey. This journey will recognize a considerable number of actionable variables that must be addressed in order to reach the measurable outcomes.

MEASURING PERFORMANCE

To build consensus, understanding and consistency around a Smart Cities framework, Yellowknife will consider following the International Organization for Standardization Certification ISO 37106:2018 for Sustainable Cities and Communities. This document gives guidance for leaders in cities and communities on how to develop an open, collaborative, citizen-centric and digitally-enabled operating model for their city that puts the vision for a sustainable future into operation (ISO, 2018).

As the basis for a new Smart City Yellowknife vision, the ISO standard will enable processes for the innovative use of technology and data. It will ensure that the City is working within a consistent and globally accepted framework for sustainable cities. Further to this the City will initiate a series of strategies and action plans that will provide a framework to reach the stated impacts. This chapter will highlight the five impact streams that the City has identified to help reach the vision, the outputs which are the plans to get there, and the outcomes that will allow for performance measurement.

IMPACT STREAM A: EXTRAORDINARY SKIES

Yellowknife will maintain its reputation as the the most attractive aurora borealis tourism destination in Canada by focusing on the reduction of light pollution using dark sky principles and a city-wide Lighting Strategy. Putting in place the conditions necessary to achieve Extraordinary Skies starts with a progressive transition to embracing Extraordinary Yellowknife (output A.2). The municipality will slowly phase out lights that are not compliant with the concept of Dark Sky municipalities. Most of the long-term impacts are outside the timeframe of this Smart Cities Challenge, and should be visible over the course of the next 10 years. However, it is anticipated that the implementation of new lighting will have an immediate, noticeable impact on light pollution.

Output A.1 Light pollution baseline in Yellowknife

Output A.2 Development of "Extraordinary Yellowknife" Lighting Strategy to guide municipal retrofit lighting plan

Output A.3 Best practices guide for dark skies compliance

Output A.4 Transitioning of select Yellowknife streetlights to smart lighting technology, in alignment with the Lighting Strategy

Output A.5 Retrofitting of select Yellowknife neighbourhoods into Dark Sky compliant areas

The determination of the current light pollution baseline (output A.1) will show the potential for what is yet to come. Using the latest technology, the Yellowknife Smart Cities Challenge team will measure the current light pollution levels in the City. It has not been decided yet what tool will be used, nor if the light pollution illuminance in the covered or starry sky will be measured. Additional

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

work is underway to determine the best technique that will not provide erroneous results because of changing weather conditions.

The City will evaluate the effectiveness of the motion sensing dimmable light pilot project on School Draw Avenue with regard to energy savings, functionality, safety, security, light pollution reduction and citizen approval. The City and partners will identify appropriate improvements and a plan to expand to lighting retrofits and city wide lighting improvements strategically (output A.4).

As part of a city-wide expansion of dark sky compliance, the City will continue to work toward reductions of unnecessary lighting and improving awareness about the effects of light pollution. This output will be no additional cost for Yellowknife residents as it does not force an immediate retrofit, but rather a long-term change in mentalities. Local retailers will be moving towards Dark Sky friendly lighting fixtures. There is no requirement, but built in incentives and awareness of benefits to encourage homeowners and businesses to change the existing non-compliant lighting fixtures.

Outcome A.1 Increase in Dark-Sky Friendly Neighbourhood trends

Outcome A.2 Decrease in sky glow (light pollution) based on 2019 levels

Outcome A.3 Increase in public awareness about impacts of light pollution

As the centerpiece of Yellowknife's Smart Cities experience, the City will experience a reduction in light pollution, better aurora viewing outcomes and a closer connection with our extraordinary skies. Learning from the pilot project on School Draw Avenue will assist the City as it expects to expand dimmable lighting throughout half of the city within five years. All of this will be done with guidance from the Yellowknife Lighting Strategy once approved by Council. A strategy will also be set for how to start a public awareness campaign to educate and encourage residents and businesses to reduce private lighting and to encourage dark sky compliant fixtures. Efforts will also be made toward strengthening partnerships in order to understand and study the impacts of LED lighting on human health and wildlife.

As motion sensing dimmable lighting is a relatively recent technology there are risks for early adoption. The City intends to work closely with industry and partners to ensure lessons are learned from the pilot project, and that residents understand and are excited about the prospects of dimmable lighting. The biggest risk factor is the potential for perceived safety risks to negatively impact the public appetite for dimmable lights. To mitigate this risk the City will research and communicate the safety and health benefits of motion-sensing dimmable lighting to the people of Yellowknife.

IMPACT STREAM B: TOURISM CAPITAL OF THE CANADIAN NORTH

Yellowknife is happy to be a market leader as a northern tourist hotspot. To maintain and improve this status will require considerable effort in many areas, including efforts to use technology to improve the experience of tourists. This will be done by using smart lighting to better showcase our extraordinary skies (output B.1). Improving tourism products and services while catering to a new brand of Smart City tourism that has the potential to create sustainable economic diversification and provide income to local tourism-based businesses.

Output B.1 Promotion of Extraordinary Skies for tourism (in parallel with outputs A.2 to A.5)

Output B.2 Work with partners to increase availability of resources and information to tourists, using both digital and traditional platforms

Output B.3 Expansion of geofencing infrastructure

Output B.4 Development and installation of beacon technology

Output B.5 Expansion of existing free municipal wireless network

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Outcome B.1 Increase in tourism

Outcome B.2 Increase in quality of Aurora Borealis viewing experiences

Outcome B.3 Increase in location-tagging and tourism hashtags

Outcome B.4 Increase in use of PingStreet app

Outcome B.5 Sustainable economic diversification and income to local tourism businesses

Taking pride in our Extraordinary skies and improving night sky viewing opportunities for tourists will be a key part of the Smart Cities plan. This will be easily tracked by economic indicators that the Government of NWT compiles around tourism, and also adoption and use of apps, social media and beacon technology. But the full story of how a Smart City focus improves the tourism experience will be found in qualitative experience of the tourists itself. To that end the City will continue to work with partners at NWT tourism, the future Yellowknife destination marketing board, and tourism industry providers.

There are global and national issues that pose a risk to tourism in Yellowknife. These are beyond the control of the City, but by improving the experience of tourist through tourism and a Smart City experience that risk will be substantially mitigated.

IMPACT STREAM C: REPLICABLE FRAMEWORK FOR NORTHERN INNOVATION

Developing a clear strategy for making Yellowknife a smart city, as well as an open transparent cold-weather laboratory for smart cities technology, are both key aspects of this plan. Being the hub for the North, Yellowknife also wants to document and communicate successes and failures to help other similar-sized northern communities adopt smart practices, policies and technology that make sense in our harsh climate. The City intends to do this through the following five outputs, measurable by the subsequent outcomes.

Output C.1 Adoption of ISO 37101:2016 Sustainable Cities and Communities

Output C.2 Commissioning of Smart Cities IT strategy and action plan

Output C.3 Creation of Smart City Committee to oversee the integration of Smart Cities vision into municipal services and infrastructure

Output C.4 Expansion of municipally-owned Internet of Things (IoT) infrastructure

Output C.5 Improvement of City Information Hub, backhaul infrastructure and lamppost mesh network.

Output C.6 Development of Engagement Plan, including incentivization plan and protocol for third party participation

Output C.7 Creation of research budget to incentivize entrepreneurial Smart Cities innovation in a northern setting

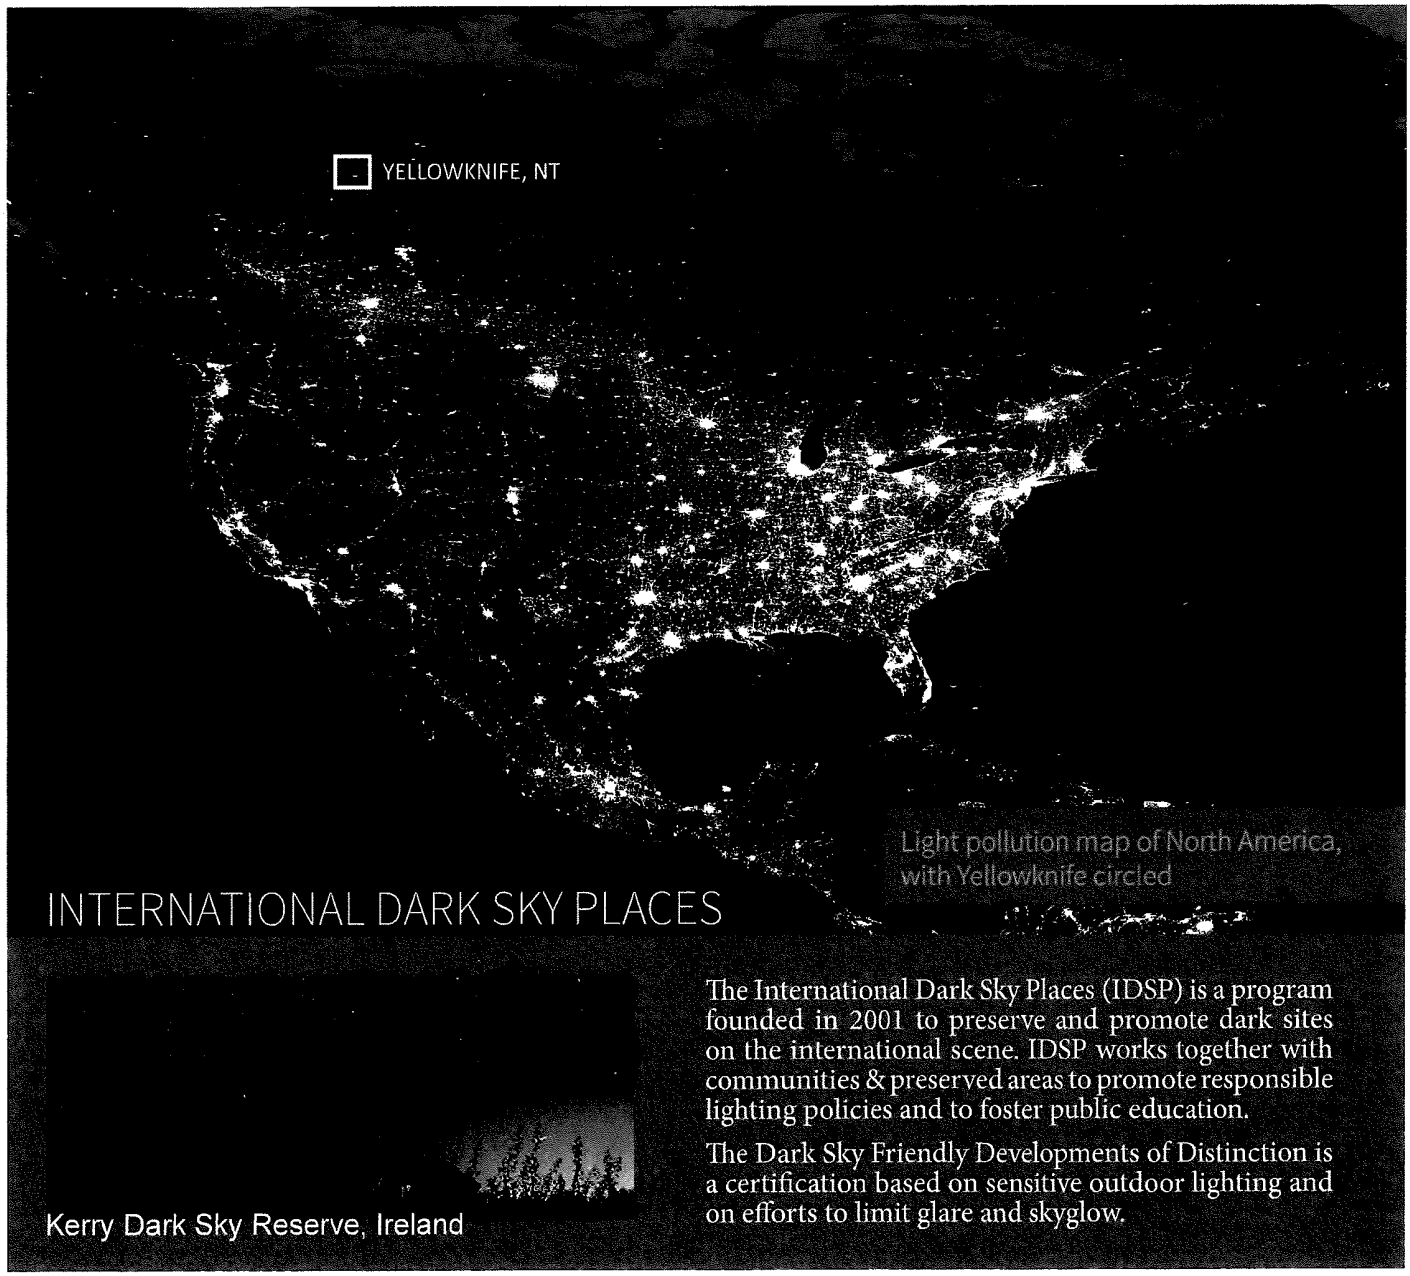
Outcome C.1 Finalized, scalable and shareable IT strategy for northern municipalities

Outcome C.2 Technology-related outputs consistent with Smart City Vision at 3 & 5 year Checkpoints

Outcome C.3 Measurable improvement in developing applications for Yellowknife IoT infrastructure

Outcome C.4 Reduction in cost and increase in efficiency of municipal services

Key outcomes will be achieved following the development of strategic plans, and the subsequent improvement of the IT strategy and system. This will help turn Yellowknife into a centre where IT and information generated by smart data become key factors in municipal strategic planning, and smart technology solutions are increasingly adopted by the public, society groups, and the private sector.



Incorporating project "checkpoints" at the end of years 3 and 5 is a strategy for course correction that mitigates the risk of misaligning outputs with outcomes. Oversight of the three- and five-year checkpoints will fall under the purview of the Smart Cities Committee. This committee will pro-

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

vide oversight for the assessment and implementation of the IT Strategy in alignment with the Smart CIty vision and is described in more detail in chapters 3 and 5 of this proposal.

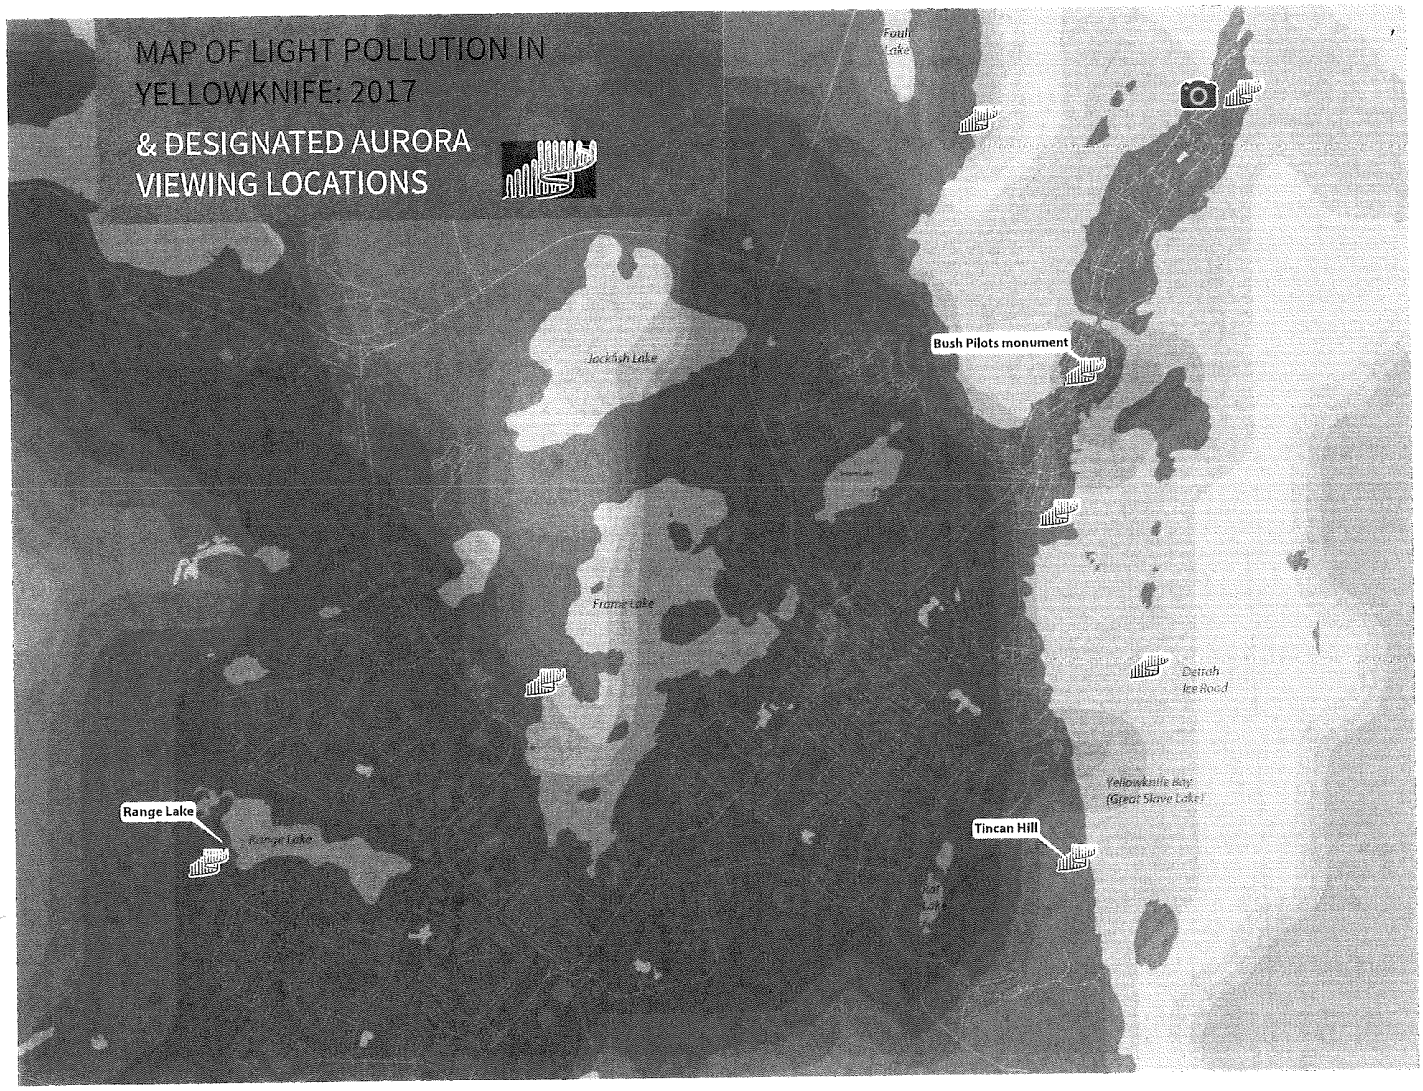
An anticipated risk for Yellowknife is that investors and the private sector will not see the financial benefit of participating in a small market pool. To mitigate this risk, the Incentivization Plan (output C.5) will work with targeted companies and stakeholder groups within the city to design the tools that build the Smart City. A variety of engagement tools will be used: mini challenges, university engagement, rewards and targeted workshops. This Incentivization Plan will be a key element to promote smart cities and encourage engagement.

The backbone technology for the implementation of a Smart City that is replicable across the north will be unleashing the potential of the internet of things (IoT) in Yellowknife, and collecting, organizing and communicating the information in a form that improves the well-being of Yellowknifers (output C.4). This will enable a plethora

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

of sensors to be incorporated into the system using the lamppost as a platform. The number of sensors will be a key outcome. We cannot predict which ones will be included and when but some we have identified as promising include: water and sewer tank sensors, leak detection, parking occupancy, snow level, carbon dioxide, distance measurements, trash bin levels, potable water tank level, wastewater tank levels, manhole open/close detection, light sensor, pedestrian, automobile and bike traffic, ice thickness, wildlife activity, water quality, water contaminants, smart valves, and more.

IMPACT STREAM D: COMMUNITY CONNECTIVITY



Output D.1 Governance structure in place to oversee the development of a Communications Plan and budget

Output D.2 Annual Engagement Plan to build awareness excitement and engagement in Smart City Evolution

Output D.3 Development of Yellowknife Smart City Dashboard to accompany PingStreet App

Output D.4 Installation of WiFi hotspots throughout the City for free internet services

Output D.5 Implementation of training strategy for municipal employees and contractors to build local labour capacity in smart city technology

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The City of Yellowknife has made great strides towards accountability and engagement with residents. In 2015 Yellowknife launched the Pingstreet app; a one-stop mobile application for the City of Yellowknife services. It currently has over 1,300 unique users in Yellowknife and has proven to be an effective tool for fostering an active and informed community. This application is a free, widely available location-based tool that gives users access to information on various city services like parking and transit. In addition, the City has a tool called PlaceSpeak which is a medium for two-way communication between the City of Yellowknife and its residents. This communication and engagement tool was introduced in April 2016 and has since accumulated 1,284 connected participants, 211 comments, and 17 completed surveys across 14 different community consultation projects. The municipal mapping tool City Explorer communicates information spatially in many layers. These tools form the basis for engaging with Yellowknifers digitally and will be incorporated into a strategic plan for Smart City Engagement, which will become part of the Smart City journey.

The Engagement Strategy and Communication Plan (outcome D.1) will help to build awareness and approval among Yellowknife residents about what a Smart City is. It will also assist in addressing any risks or concerns perceived by the public in order to increase local support for a Smarter Yellowknife. Engagement will be increased by a dedicated budget to improve the engagement tools and communication that residents use to access city services, and by maintaining a clear focus on transparency and openness. The Smart City Dashboard and PingStreet app will be the main points of access to municipal services and information and will facilitate residents' interactions with the city.

The City will assess its Engagement Strategy at the end of years three and five of this project's timeline. This will allow the municipality to keep track of its progress, and reorient efforts towards the most critical problems. These assessments serve as built-in checkpoints for course correction and risk mitigation.

Outcome D.1 Increase in local expertise and literacy regarding Smart Cities technology

Outcome D.2 Increase in engagement on Placespeak and City Dashboard

Outcome D.3 Increase in real-time information being updated in City communications

Outcome D.4 Increase in impact, awareness and reach of technology and Smart Cities

Having a connected and engaged population is key to truly embracing the Smart Cities Vision. This is not easy to do with the competing flood of information and media, but cities are becoming more central to the lives of citizens as information and service provision becomes more centralized online. To accomplish the outcome of a more engaged population, the City will develop a strategy and communication plan, improve and coordinate its existing tools, and develop a new tool, as well as engaging stakeholder groups more effectively.

Continually incorporating stakeholder and resident feedback in planning and activities will mitigate risk surrounding public perception and participation. Following the standard set by ISO 37106:2018 and adhering to oversight by stakeholder committees will ensure openness and transparency in communications.

IMPACT STREAM E: LEADERSHIP IN SUSTAINABILITY

With a track record of sustainability, the City of Yellowknife is no stranger to being a northern leader in green innovation. In 2012 the City attained all five corporate and community milestones in the Local Governments for Sustainability and Federation of Canadian Municipalities (FCM) Partners for Climate Protection program. Since then, the City has also been awarded:

- 2011: FCM Sustainable Communities Award for the Smart Growth Development Plan.
- 2013: Green Champion Award and the Sustainable Communities Award for the centralized composting pilot project

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- 2018: FCM Sustainable Communities Award for Energy for district biomass energy system (saving 829 tonnes of CO_2e/year)

The continued effort toward sustainability by the City of Yellowknife is demonstrated in the 2015 to 2025 Corporate and Community Energy Action Plan. Building on the 2006 Energy Plan, this new rendition sets a target for a fifty percent reduction in greenhouse gases by the City Corporation and thirty percent reduction by residents and businesses.

Output E.1 The creation of an incentivization plan for electric vehicle penetration in Yellowknife

Output E.2 Continued improvement of partnerships with key stakeholders

Output E.3 Installation of municipal EV charging stations

Output E.4 Promotion of GHG emission reductions through incentivization of Smart Cities technologies

Output E.5 Assessment of and reporting on progress towards achievement of the UN Sustainable Development Goals.

A Smart City framework will help the City take one more step forward to achieving this ambitious plan. The framework includes best practices, better engagement tools, and harnessing the power of information and technology to reduce energy use and greenhouse gases. Possibilities for improvements include lighting retrofits, electric vehicle encouragement, sensors that reduce costs incurred by the city, energy costs and greenhouse gases, and even incorporating new biomass heating technologies. In order to direct this project's strategy around sustainable action, The United Nations Sustainable Development Goals were selected as overarching key performance indicators. These were selected during the 2-day Community Design Charrette retreat, and through a selection process led by residents and stakeholders were narrowed down to goals that were applicable to the Yellowknife context. In short, 4 goals and 9 targets were chosen the most critical for immediate action in Yellowknife.

See Chapter 6 *Multi-stakeholders 2-day Design Retreat* for the detailed story.

Outcome E.1 Yellowknife will lead the North in Electric Vehicle penetration per capita

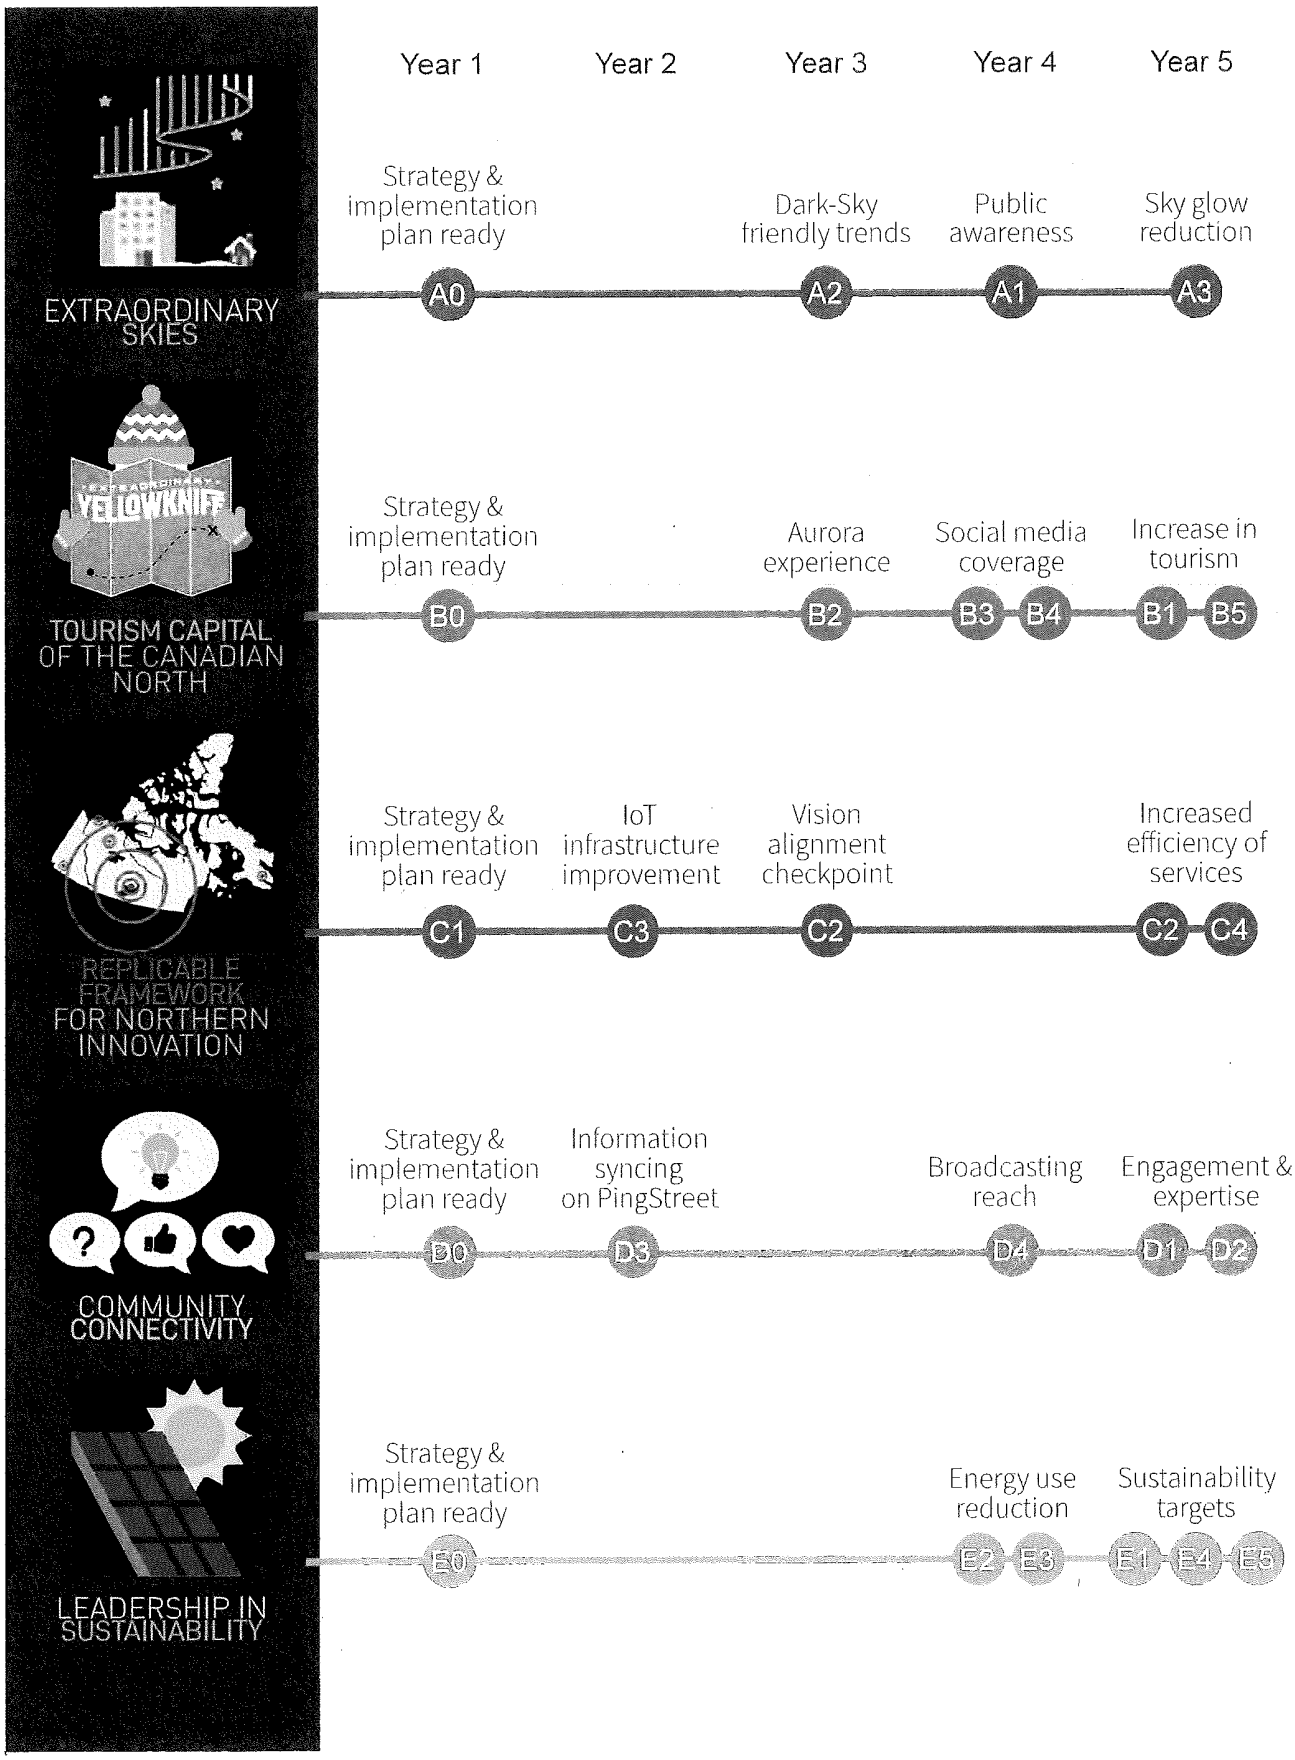
Outcome E.2 Measurable pogress toward the targets set in Yellowknife's Corporate and Community Energy Plan

Outcome E.3 Reduction in electricity use from dimmable streetlights

Outcome E.4 Reduction in water and energy use and carbon emissions from improved city services

Outcome E.5 Progress toward achieving the United Nations Sustainable Development Goals as detailed in the Phase 1 Design Charrette Report

As a true leader in sustainability, the City sees this opportunity as a way to improve its credentials, and use information and the Smart Cities framework as a methodology for more efficient use of internal resources, better services to its citizens, and a reduction in greenhouse gases and energy use.

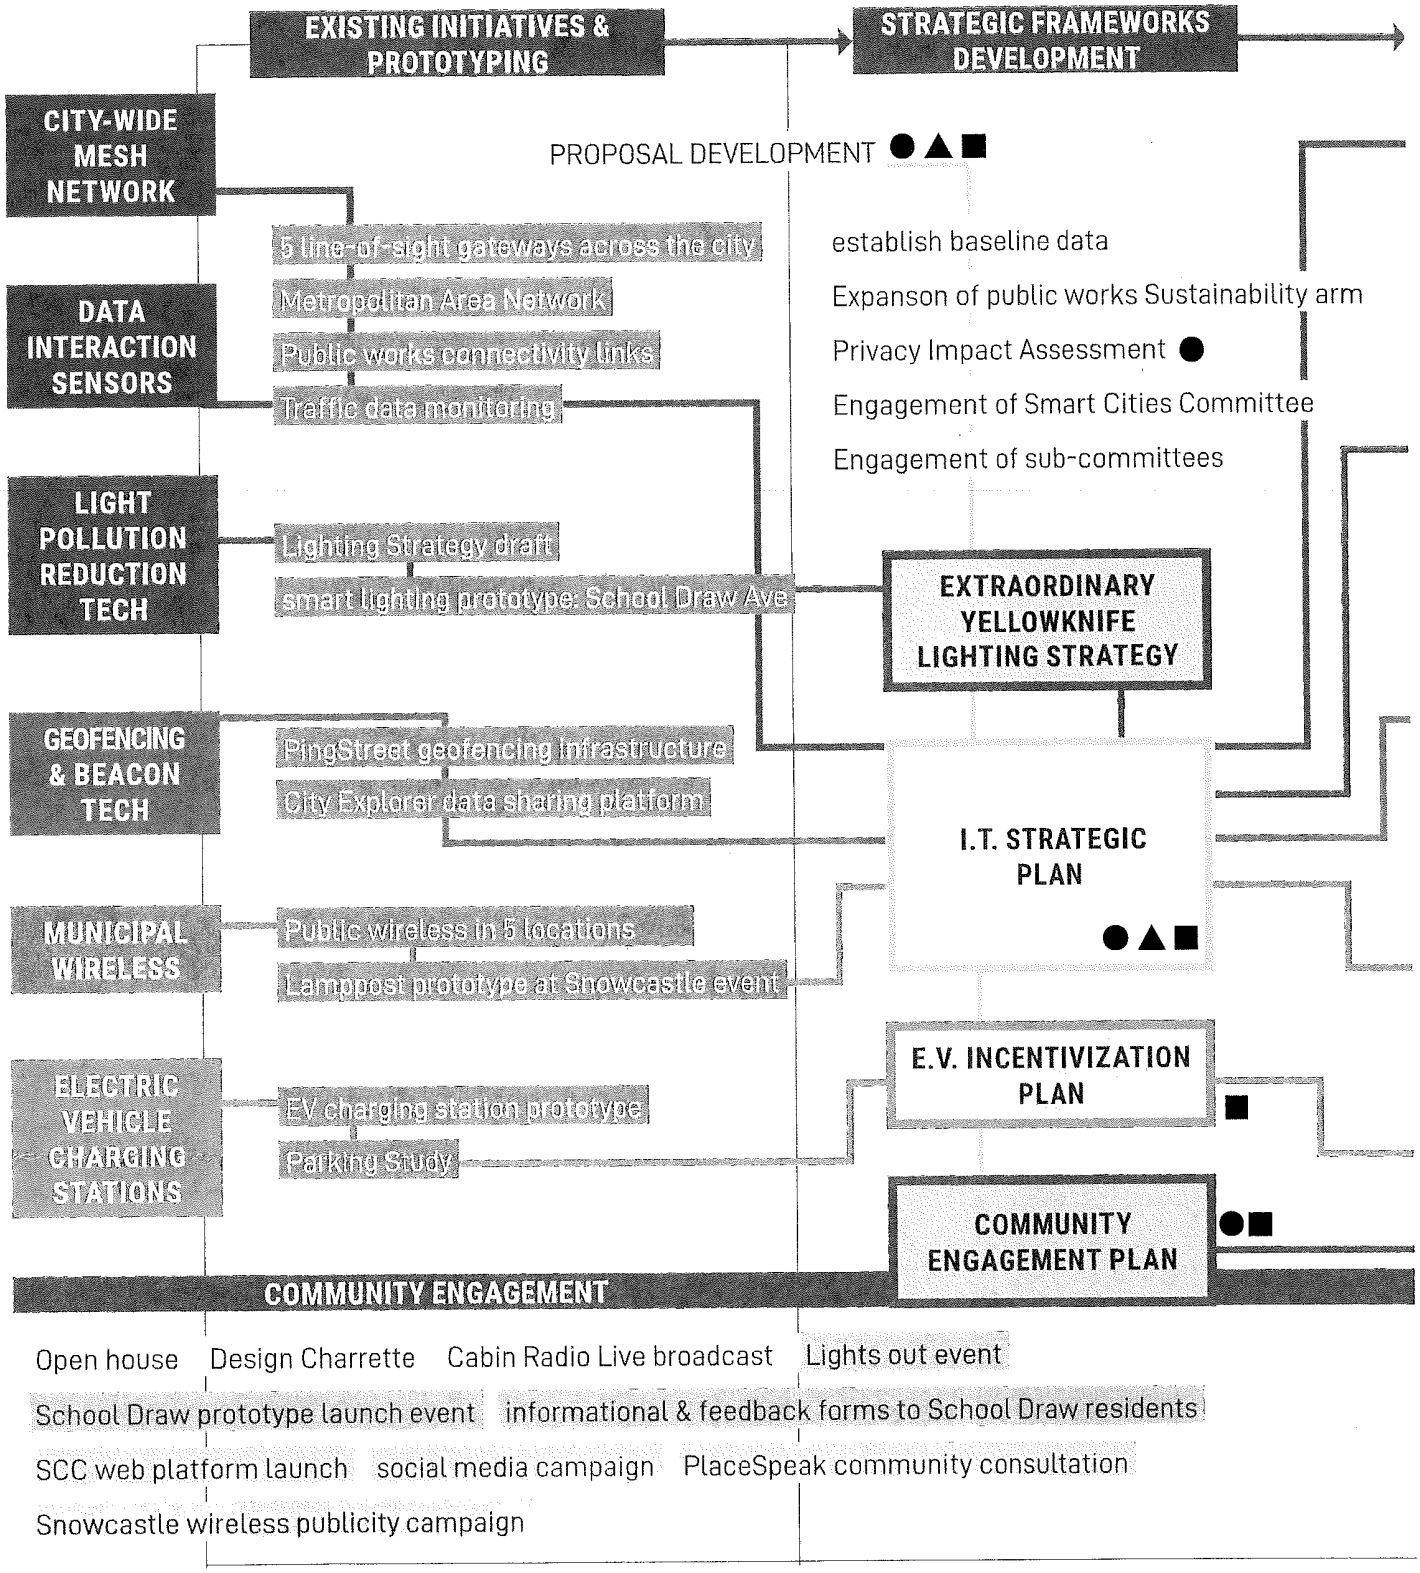


Being more sustainable is clearly a goal that all cities should aspire to. Above what the City is already doing, the Smart Cities approach should help to harness the power of information and technology to further the impact that the City can make.

PAYMENT TIMELINE

Since the Yellowknife SCC project is predicated on the development of coordinated strategies and implementation plans and a myriad of possibilities, it was a challenge to clearly identify outcomes. The following payment timeline will highlight broadly the anticipated timing of key outcomes which will trigger payment.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information



PROPOSED OUTCOMES PAYMENT TIMELINE

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 3

PROJECT MANAGEMENT

The Project Management Plan aims to align all project outputs with the Strategic Planning initiatives and the City's guiding vision for Smart Cities. The focus is on the sustainable, long-term achievement of successful implementation activities. This necessitates a certain level of fluidity and adaptability, with built-in checkpoints to ensure continual stakeholder support, financial capacity, and data security. The preceding infographic summarizes the sequence of dependencies and scope of activities. Initiatives and outputs are categorized according to the five key impact streams, and will be filtered through a series of strategic frameworks to minimize risk and guide the team's decision-making processes moving forward.

These strategic frameworks will be informed by the ISO 37106:2018 standard and together will serve as the backbone of the Project Management Plan. As detailed below, these frameworks include: a Smart City Vision for Yellowknife, an Extraordinary Skies Lighting Strategy, an EV Incentivization Plan and a Community Engagement and Research Plan. Results from monitoring existing initiatives, infrastructure, and prototypes will feed into these project-specific strategies, which in turn will guide implementation activities in alignment with the community vision.

EXISTING INITIATIVES & INFRASTRUCTURE

The City of Yellowknife has several current or planned initiatives that demonstrate transparency, develop our partnerships, and establish a platform for community engagement and feedback. These initiatives include: an electric vehicle charging station prototype, a trial smart lighting

CASE STUDY: DARK SKY COMMUNITY

NACKA, SWEDEN

The lighting strategy used in Nacka considers the identity, the spatial, social, biological and the technical features of a site. In the North, a unique phenomenon to highlight is that the sun takes a longer time to rise and fall giving origin to an extended warm light and a long "blue hour" at dusk and dawn. In this sense, the lighting strategy plays an important role in re-describing the city's structure, scale and target point at night, facilitating us the ability to recognize the space and navigate through it. Light needs to be linked to time to change with the use of urban space throughout the day and the year, supporting human needs and encouraging meeting at nighttime. Considering biological conditions ensure the reduction of impacts of the light on human health, well-being and the natural habitats of animals and plants. This method helps to classify the urban space and their qualities to focus the light on humankind and their activities.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

project along School Draw scheduled for March 2019, the continued development of a city-wide data transmission network, Pingstreet app, Placespeak forum, City Explorer online platform, geofencing applications, and free WiFi in city facilities. The city's current data transmission network has collectors in multiple locations throughout the city which can forward information to City Hall and play a role in a future mesh network. The Smart City initiatives already underway in Yellowknife demonstrate the city's existing capacity to achieve this project's outcomes.

"The City is already relatively smart and doing many of the right things. We just need to build strong frameworks and continue to innovate."

- Harshen Manickum, IT Department, City of Yellowknife

RISK MITIGATION THROUGH STAKEHOLDER ENGAGEMENT

To help guide this project, City administration will rely on the guidane of Council. This guidance can be provided in assortment of ways (the assembling of a committee, public engagement openohouses, ensuring that expectations and deliverables of the Smart City project dovetail well with the priorities and ongoing responsibilites of the City. Members of standing committees and directors of departments will influence the implemetnation of action items and fine tune the necessary metrics to evaluate success and mitigate risk.

The City recognizes that the implementation of this project will have ripple effects on an array of stakeholders. The gained experience of facilitating Smart Cities charette and public awareness sessions has created inroads with key stakeholders in tourism and economic development. It is anticipated that the City lean on the expertise with in its networks to ensure that the expectations are clear and that outcomes continue to allign with Challenge Statement.

STRATEGIC FRAMEWORK FOR IMPLEMENTING THE SMART CITIES VISION

The Smart Cities Vision will establish a holistic approach to managing both the new opportunities and the new risks posed by the versatile capacity of smart infrastructure. An external consultant will be determined by an open and transparent RFP process. This consultant will work alongside the City and its partners to build a replicable framework for northern innovation. In the context of this proposal, this strategic framework will be called the Information Technology Strategic Plan, or IT Strategic Plan.

This IT Strategic Plan will be a solid foundation of agreed-upon guidelines to mitigate risk in terms of security and adapt to changing technology. The Plan will establish rules for the treatment of personal information, integration of new technology with existing infrastructure, requirements for IT security, access control, auditing, and the retention and disposition of corporate electronic data. While flexible enough to adapt to changes from council or administration, the IT strategy will feed into the City's overall vision and have the potential to be adapted for use in other Northern communities.

Areas of focus for this strategic plan include: technology standards, privacy standards, an internal business improvement process, education and certification around new technology, and a guide for city departments on implementing and getting the most value from new technology. An allowance has been made in the budget for hiring an external contractor to develop this strategy in tandem with the City (discussed in more detail in the Financial chapter). At the three- and five-year mark, a major course correction checkpoint assessed by the Smart City Committee will confirm the alignment of the project's trajectory with the original vision.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

STRATEGIC FRAMEWORK FOR SMART LIGHTING

Building on the shared knowledge of White Arkitekter, the proposed Yellowknife Smart Lighting Implementation Strategy will take a comprehensive look at lighting in Yellowknife and suggest a strategic path to reduce light pollution, increase health outcomes, take advantage of our natural assets and adhere to the Model Lighting Ordinance (MLO). The MLO is the result of extensive efforts by the International Dark Sky Association (IDA) and the Illuminating Engineering Society of North America (IES). Among its features is the use of lighting zones (LZ0-4) which allow each governing body to vary the stringency of lighting restrictions according to the sensitivity of the area as well as accommodating community intent. In this way, communities can fine-tune the impact of the MLO without having to customize the MLO. The MLO also incorporates the Backlight-Uplight Glare (BUG) rating system for light sources, which provides more effective control of unwanted light. The BUG system is discussed in more detail in the technology chapter of this proposal.

Adoption of this ordinance will follow the established development, review, and approval processes of the City of Yellowknife and be informed by the Smart Cities Committee. The MLO is probably best adopted as an "overlay zoning" ordinance. This means that it overlays, but is different from, land-use zoning. It can be added to or integrated into existing ordinances or codes and cross-referenced to other applicable codes and ordinances such as the electrical code, the sign code, planning ordinances, etc. Ongoing renewal cycles will be included when adopting the ordinance.

The main tenet of the lighting strategy described in the MLO is the division of land into 5 lighting zones, LZ0 to LZ4. These are (1) no ambient lighting, which is for use in areas with little to no human activity (2) low ambient lighting, which is for use in rural and low density areas (3) moderate ambient lighting, which is for use in commercial business districts and high density or mixed use residential districts (4) Moderately high ambient lighting, which is for use in commercial corridors, high intensity suburban commercial areas, and town centers, and finally (5) high ambient lighting which is not a default zone and should only be used in special circumstances. The zoning considerations and recommended use areas for each of the five lighting zones provide the City of Yellowknife with a formula for re-assessing its current lighting strategy in order to develop a clear plan of where lighting zone ratings need to be upgraded or downgraded. Further conversations with the City's Department of Planning will need to occur to see how best to integrate these zoning suggestions.The outcome of this strategic lighting plan aligns with this projects outcomes of decreasing light pollution, improving the aurora borealis viewing experience, expanding smart lighting, and developing standards that can be replicated in other communities across the North.

STRATEGIC FRAMEWORK FOR ELECTRIC VEHICLE INCENTIVIZATION

Similarly to the IT Strategic Plan, the EV Incentivization and Penetration Framework will be developed in accordance with overarching city goals and in collaboration with an independent contractor. The City will use this plan to implement tools for EV incentives, while working with stakeholders like Northlands Utilities to build consensus and readiness for widespread EV adoption.

Following along the appropriate routes of assessment and approval, the development and implementation of this strategy would align with the 2015-2025 Community Energy Plan. The installation of EV infrastructure and subsequent increase in EV penetration would contribute to GHG emissions reductions for the City of Yellowknife which is relevant to the goals establshed in the 2015-2025 Community Energy Plan.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

STRATEGIC FRAMEWORK FOR COMMUNITY ENGAGEMENT

The Engagement Strategy for implementing the Smart Cities Vision is discussed in detail in the Engagement chapter and outlined in brief here. Past engagement with residents and stakeholders has set the precedent for a project that is firmly grounded in feedback and collaboration. The City is committed to the principles of openness and transparency, and will follow the recommendations of the Community Engagement Plan to build community awareness of Smart Cities. Administration along with relevant stakeholders help guide the implementation of the action plan and address budgetary considerations at agreed-upon checkpoints.

PROCUREMENT

The City's general procurement policy will be used as a template to develop a policy specific to the IT department and the Smart Cities project. The current standard policy specifies that procurement from a sole source is allowable up to $20,000. If the amount spent is between $20,000 and $50,000 a minimum of two quotes or a request for quotes (RFQ) is required. For procurement operations estimated at over $50,000, a request for proposal process (RFP) or a request for tender process (RFT) is required. The City also has several Standing Offer Agreements (SOAs) with companies for services that they use on a regular basis such as fuel delivery, minor repairs and maintenance.

Each of the technologies outlined in this proposal faces different challenges in terms of procurement, vendor choice, installation, and maintenance. The decisions made must reflect Yellowknife's particular Northern context: its remoteness, small population, and relatively high density and traffic. A procurement plan based on the IT Strategic Plan will address concerns regarding open data, security, ownership, and feasibility. Cities that purchase from vendors rather than developing the technology can devote more resources to policy & service design. The trade-off is loss of autonomy over the end product. Alternatively, projects that prioritize open data and software interoperability tend to adopt a design-build approach and rely on government support for funding. Due to Yellowknife's size and resources, the most feasible option is to partner with vendors and contractors. Due to the interoperability risks associated with a large pool of vendors, financial feasibility and availability of technical support are increased by limiting the pool of vendors. Based on data security concerns it follows that due consideration be given to the ownership of the end product, and must be evaluated when developing a procurement strategy.

CASE STUDY: EV CHARGING STATION STRATEGY

WHITE ARKITEKER

In implementing Electric Vehicle Chargers we can consider the following stakeholders, their concerns, and corresponding result indicators:

1. Municipality: Achieve sustainability goals while remaining cost-effective. Result Indicators: (a) Air quality improvements, (b) Climate change improvements, (c) cost-effectiveness
2. EV Users: Increased mobility (range & time of driving). Resulting Indicators: (a) Accessibility to chargers, (b) Growth in users
3. Residents (non-EV users): Optimize locations while managing parking pressures. Resulting Indicators: Increased utilization of chargers
4. Commercial Partners: Produce positive business case. Result Indicators: cost reduction
5. Grid Operators Concern: Safeguard Grid Quality Result Indicators: (a) risks of power outage / grid-congestion reduced

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

City administration will work within the framework of existing policies and best practices to ensure fair procurement procedures. Considerations will be made on how to ensure that procurement protocol is in line with the unique realities of Smart Cities technology implementation. The intent is to keep control of the data while working closely with private partners throughout the proocess.

OPERATIONS & MAINTENANCE (O&M)

Within the 5-year scope of this challenge and beyond, effective O&M will necessitate new training for skilled employees at the City. For certain project activities, a vendor may also be chosen as the responsible party for ongoing O&M or training. Investment in local capacity will be vital to long-term support and future-proofing of the infrastructure. Simultaneously the project will generate jobs and cultivate a local labour market capable of working with innovative technology. Work will be done to understand labour demand surrounding Smart City technology in the context of regional challenges and needs.

CONTINGENCIES, COURSE CORRECTIONS & CONTROLS

Decisions made during the implementation phase are dependent on strategic plans to be developed in line with ISO 37106:2018 and with input from external contractors, partners, City Council, and City Administration. As detailed in the Performance Measurement chapter (Impact Stream A), project outputs will be evaluated at the three- and five-year mark to confirm that strategic plans and corresponding action plans are being adhered to; these checkpoints constitute built-in opportunities for course correction.

The Smart Cities Committee will ensure the adherence of outputs to agreed-upon standards at the three- and five-year checkpoints. Further opportunities for course correction are built into the sequencing of activities, as indicated in the Project Management flowchart. These control checkpoints have been divided into three categories, which respectively intend to:

- Assess budgetary constraints and develop a plan to mitigate risk (Financial Checkpoint).
- Ensure continued compliance with security protocol and protection of personal data (Privacy & Security Checkpoint).
- Gather and respond to feedback from all affected parties (Stakeholder Response Checkpoint).

Forums such as the PlaceSpeak app and City Explorer platform are in place to maximize the transparency of operations, open-source sharing of data, and opportunity for resident input. Partnership with the Yellowknives Dene First Nation heightens the project's adaptability, diversity of perspective, and range of impact. Expanding Yellowknife's Smart City infrastructure into the neighbouring community of N'Dilo will test the replicability of this technology in the North, and expand the beneficial impacts of the project. The involvement of consultants, academia and and utilities provides access to research, experience, and capacity, and serves as a solid foundation for the innovative strategies which will achieve our challenge statement.

CHAPTER 4

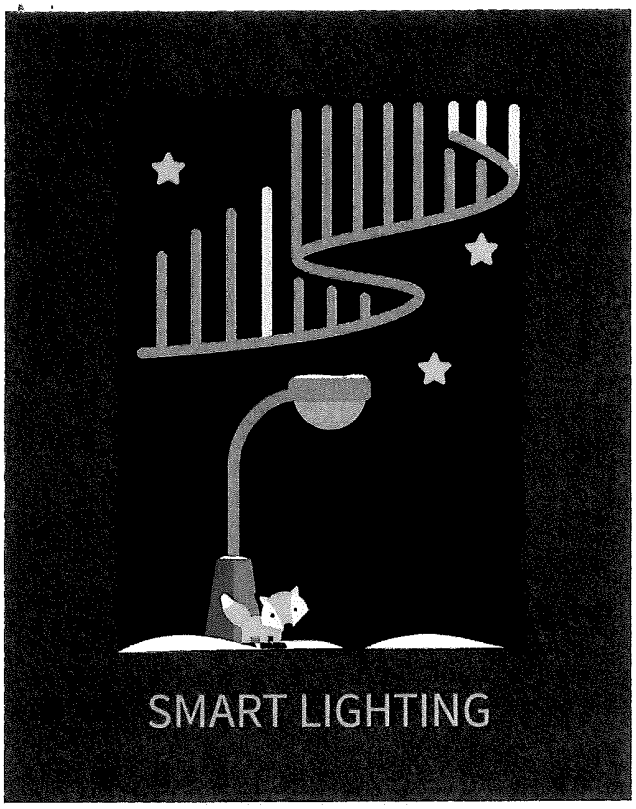
TECHNOLOGY

Transforming the ubiquitous lamppost into a beacon for sustainability is the backbone of Yellowknife's planned approach to become a Smart City. The implementation of this smart technology will be guided by the IT Implementation Strategy, which will set the ground rules for technology deployment, and improved policy. This chapter highlights technologies that have been identified in the proposal writing and research stage as promising options to help Yellowknife achieve its challenge statement. In alignment with the governance structure outlined in Chapter 5, the technologies and technology approaches outlined below will need to be approved and reviewed by City of Yellowknife leadership with input from the Smart City Committee.

The backbone of the Smart City vision for Yellowknife is the installation of smart street lighting infrastructure throughout the city. Lighting retrofits must fit within the principles identified by the lighting strategy outlined in the project management chapter and follow an ordered and logical process. The Implementation Strategy will also reflect engagement with the citizens of Yellowknife and their experience with and feedback on the School Draw Avenue lighting prototype. The Lighting Strategy will be developed according to these principles.

Switching to smart lighting has the potential to positively affect people, wildlife, the economy and the natural environment. Orchestrating this switch in the context of Yellowknife will also identify new standards and best practices that are replicable in other northern communities. The strategic thinking around the use of light has been guided by the experience of European leaders such as Copenhagen, and the Swedish experience and knowledge of White Arkitekter. The City will also take advantage of the experience and guidance of the International Dark Sky Association to inform Yellowknife's Lighting Plan moving forward. Project partner and current owner of Yellowknife's lamppost, Northlands Utilities, will bring their experience to the project as a leader in motion sensor lighting technology in North America.

The City will investigate and adopt new Northern-specific lighting best practices that guide light quality, pollution, intensity, and location of light, all with consideration towards Dark Sky principles. Additionally, integrating the combined experience and expertise of our project partners into our lighting strategy is a key step to ensure feasibility and scalability of our proposed technology projects. More on the structure of this smart lighting framework can be found in the project management chapter of this proposal.



CASE STUDY DARK SKY COMMUNITY

MON & NYORD PARK, DENMARK

The Mon and Nyord Park in Denmark is an example of a successful implementation of dark sky compliant lighting in a community setting. The project's mission was to equip the community with tools and knowledge around smart lighting technology. A concert in the park was organized to announce the Dark Sky initiative to the community and get the interest of the local population. Since the park's International Dark-Sky Association (IDA) certification, it has gotten more and more popular locally and nationally. Over 300,000 visitors came to the park in one year.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

SMART LIGHTING

The switch from traditional non-responsive lighting to "smart" adaptive lighting is a technological leap that Yellowknife is prototyping on School Draw Avenue. This prototype will include approximately 10 smart lighting fixtures. Smart lighting in the Yellowknife context means streetlights that are connected to motion sensors which direct the gradual dimming and brightening of the lights in response to motion on the street. The light will be dimmed to a much lower illumination and energy use when the motion sensors are not activated. When a pedestrian, cyclist, or vehicle is detected it will increase to 100% brightness, equivalent to that of a traditional streetlight. The motion sensors that detect movement will initiate a communication pathway from one lamppost to the next that will trigger the subsequent lampposts to illuminate, expanding your field of vision in the direction you are travelling. As you move past a lamppost, the motion sensor will indicate to the lamp to begin dimming back down to the baseline level of illumination.

This vision for smart light is modeled off of the Dark Sky approach laid out by the International Dark Sky Association as well as the ATCO-led award-winning Intelligent Street Lighting Project in Lloydminster, Alberta. The precedent set by Lloydminster for up to 80% energy savings can inform the possibilities for future energy savings from a similar project in Yellowknife (Lopushinsky, 2018). By collaborating with ATCO subsidiary Northland Utilities, Yellowknife is testing the potential for energy, health and safety improvements, while engaging Yellowknife citizens, nearby homeowners and tourists and understanding the public perception, appreciation and challenges of smart lighting. This will help lay the foundation for a lighting strategy that has the potential to be replicated in other locations across the NWT and beyond.

DARK SKY APPROACH

While the focus of the Lighting Strategy is the smart technology, Yellowknife and Northlands Utilities will continue to be guided by the principles established by the International Dark Sky Association. A Dark Sky Community is defined as a community that shows exceptional dedication to the preservation of the night sky through the implementation and enforcement of a quality outdoor lighting ordinance, dark sky education, citizen support of dark skies and new guidelines for night lighting. A municipal lighting ordinance (MLO) zone plan should be created as a base to define the Dark Sky guidelines for lighting. This is discussed in more detail in the project management chapter of this proposal. Our Scandinavian knowledge exchange partners, White Arkiteker, have provided us with a useful and relevant perspective on lighting technology strategy that incorporates: uplight, glare and light trespass maximum acceptable values, lighting design for urban areas that can activate the city at night, and, crucially, lighting technology that can have the right type of light at the right place in the right moment. Additional examples of lighting strategies for winter cities include lighting policies that control light trespass, façade lighting post curfew hours, lighting that can adapt to the reflectance of ground surfaces and that can dim to a minimum when people are not around. This Scandinavian perspective will be integrated into the Yellowknife approach.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

LAMPPOST LIGHTING TECHNOLOGY SPECIFICS

LED lights have provided significant electricity and greenhouse gas savings over traditional high pressure sodium lights. Yellowknife has completed a full retrofit of their streetlights, but research from our technology partners, and a case study from Denmark, established that LED bulbs with a brightness of 3000 Kelvin or less have been shown to be the least disruptive to animal behavior and human circadian rhythms. The soft white lights from these bulbs is dimmable and even color-adjustable (White, 2019). The color of natural light varies according to the season and time of day and the ability of artificial light to align with these changes impacts both people and the environment. As part of this project Yellowknife will develop and communicate best practice for northern street lighting design.

MOTION SENSORS

The smart lampposts our technology partner ATCO piloted in Lloydminster used smart photocell sensors as motion detectors. This technology is relatively affordable and widely available and, having been tested in a similar climate to that of Yellowknife, appears to be the top choice for motion sensing technology.

ADAPTIVE LIGHTING

Temperatures below zero keep the streets covered by snow during a long part of the year. White and reflective surfaces need less light to be visible than darker and rougher surfaces, such as asphalt or gravel. In line with the seasonal changes, the City's light levels should be adjusted not only based on hours of darkness but also on the presence or absence of snow on the streets and thus the perceived brightness of the surroundings. Smart lighting in this case, can also include adaptive lighting that changes in intensity and even spectral composition depending on the season and time of the day. Having a sensor that measures luminance to trigger different light level settings is today not a standard solution, but is under development by a few known manufacturers in the Nordic countries. Extreme low temperatures can also present a challenge to the technology if sensors and fixtures are covered by snow and ice limiting their function. Mitigation of this risk could involve incentivizing research through the commissioning of a design charrette or an RFP process.

DEVELOPMENT STANDARDS

The Backlight-Uplight-Glare (BUG) rating system provides more effective guidance for unwanted light. The B rating takes into account the amount of light in the direction of the light source opposite from the area intended to be lighted, also known as light trespass. The U rating defines the amount of light into the upper hemisphere with greater concern for the light near the horizontal angles, also known as light pollution. Glare can range from annoying to visually disabling and the G rating takes into account the amount of frontlight. BUG rating limits are defined for each light source and are based on the internal and external design of the light source. The BUG rating limits also take into consideration the distance the light source is installed from the property line in multiples of the mounting height. All three elements of the BUG rating system are taken into account when developing a city-wide lighting strategy, and assist in the creation of lighting zones (detailed in the Project Management chapter).

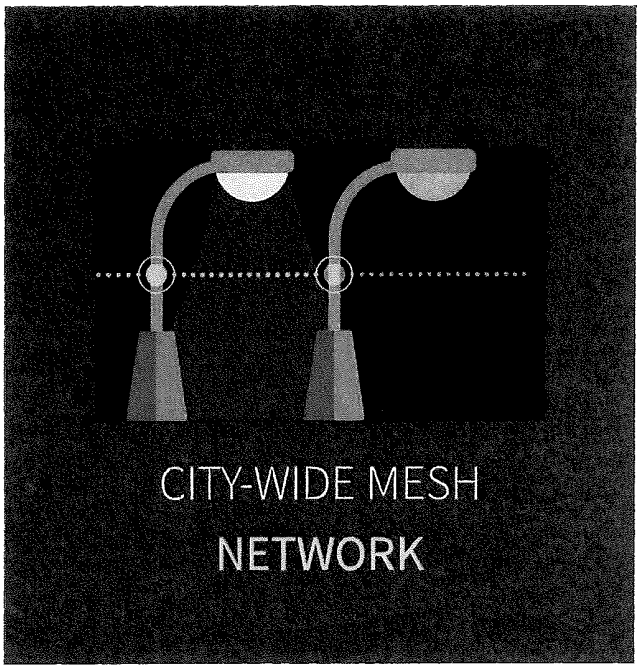
RISKS

It is important to acknowledge that dimmable lighting will be a noticeable change for the public. Maintaining public engagement, monitoring feedback, and addressing concerns is a critical aspect of implementing this technology and will be addressed in more detail in the engagement section of this proposal. We fully anticipate concerns over safety and security, which will need to be addressed up front and in a positive and constructive manner to win Yellowknifers' trust and build confidence in Smart lighting technology. Targeted awarness campaigns in the prototype area can help respond to resident questions. Feedback and opinions will be documented and a reassessment will occur later in the process to evaluate any change in perspective.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

COST

One of the main challenges with lighting retrofits is the high cost and sheer numbers of lights in Yellowknife. The Lighting Strategy and pilot project will identify costs, concerns and lay out a scalable model to spread the technology throughout the City. Following the successful demonstration on School Draw, we believe the energy savings will provide valuable cost-benefit data to influence the completion of the lighting retrofits in Yellowknife and more remote diesel fueled communities throughout northern Canada.



FUTURE-PROOFING

Another challenge is the future-proofing of the system. Technological advances in lighting are happening quickly and being a trailblazer includes risks of obsolescence and being eclipsed by new technology. The Smart City Committee will address this within strategies of IT and lighting to implement open and non-proprietary technology and regularly review and make adjustments for technological innovation and flexibility. This involves implementing a lighting system that allows some flexibility for updates in the near future. This is built on systems where LED modules are easy to replace, where sensors use standard-global connectors, and where the overall technical equipment is interoperable rather than customized.

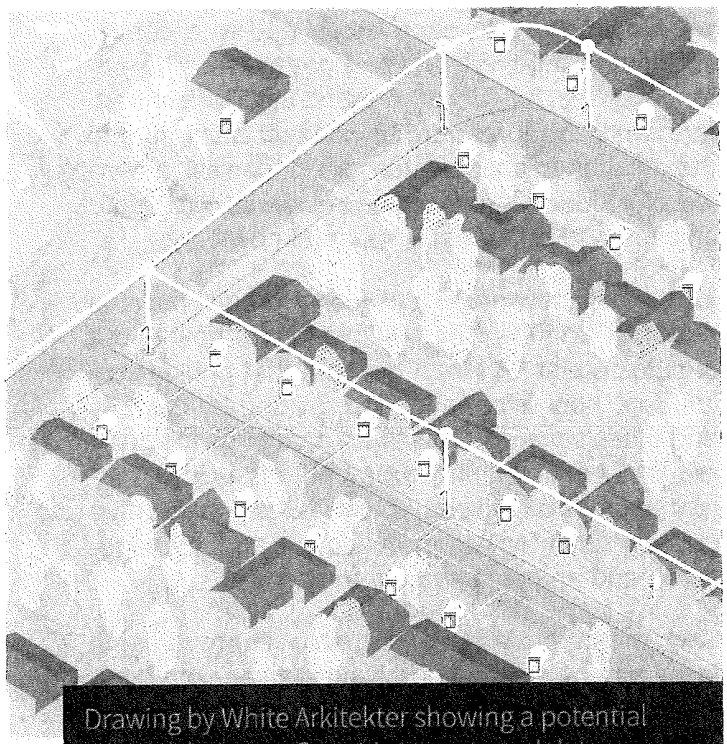
QUOTE

"The City of Yellowknife has prime locations in the city to act as collectors where multiple neighborhoods could uplink to. This means that in each neighborhood, a cabinet or building with equipment can be placed to be a connection point for the lampposts in that area. This equipment can then forward the data to our collector sites and then to City Hall or beyond (Internet). This equipment routes Internet Protocol data(IP) but not other protocols such as Blu-tooth or Zig Bee that are used by many sensors manufactured today. These sensors will need technology to communicate with that can translate to the IP network and beyond"

- Chris Goit, Network administrator City of Yellowknife IT Division

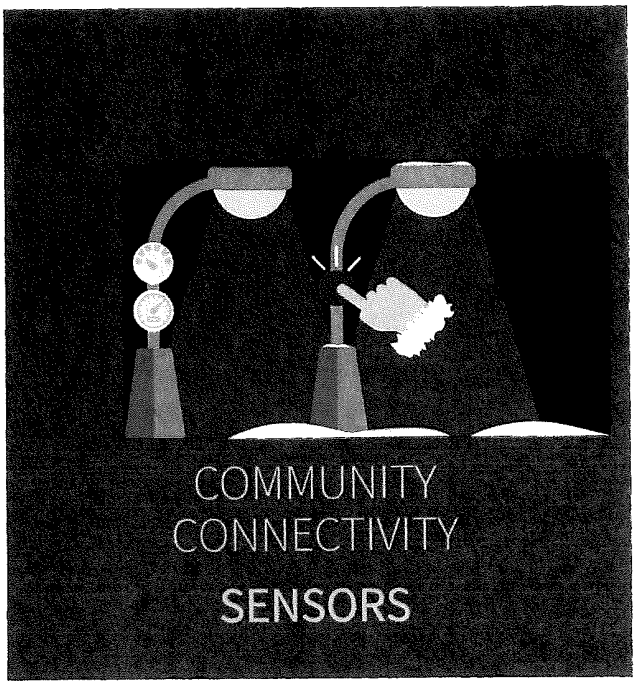
MESH NETWORK

Yellowknife, like most cities, is connected by a spider web of lampposts on almost every street, park, parking lot or corner of the city. In a typical city each one acts alone, powered by an electricity feed, and turned on or off by a photocell, in every sense they are a relatively simple technology which does not often live up to its almost limitless potential. Imagine a city where these lampposts were connected to each other, and to a central information hub via a set of gateways. The potential is ripe for City managers, utilities, contractors, and entrepreneurs to connect sensors into the network to collect information, control a myriad of products and provide residents with more efficient and better services and knowledge.



This mesh network is not just a dream but it is possible, and the City will investigate how to put in place a plan to test a network that could revolutionize how information is provided by the City and other services. This is an ambitious task and requires continual improvement to the City's current system of gateways, as well as supportive policies for information collection and management, and an optimized control centre.

This mesh network will enable improvements to municipal services such as delivery of water, collection of sewage, and monitoring and maintenance of roads and trails (not just snow clearing, but drainage, permafrost damage, traffic flows



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

and streetlight controls). Contractors of services such as waste collection, electricity, fuel, trucked water and sewer delivery could use data to improve services and reduce costs. Further down the road the City envisions opening up the mesh network capabilities and information to businesses and innovators to test applications in the harsh and unique set of northern circumstances. This will create economic benefits and build a knowledge and information based economic hub that puts Yellowknife into the forefront as a small, well controlled laboratory for innovation in Smart Cities technology.

None of this is without risk. The City must ensure its strategy and policy are sound and that Council, Administration and citizens of Yellowknife understand the Smart Cities Vision. Openness and transparency are paramount to gaining trust and confidence in this vision. To do this will take an investment of money, staff and time to ensure the strategic building blocks are in place, while engaging the public and stakeholders and field-testing and improving the technologies that will help build our Smart City.

Drawing by White Arkitekter showing a potential network between Smart Lamposts and data sensors for municipal waste collection in Yellowknife

SENSORS

The potential for lampposts to be the foundation of a smart city lies primarily in their ability to act as the network to move information gathered by a range of sensors. The following list of potential sensors was informed by research from our technology partners. There is a vast and growing list of technologies that are possible here, and they are further expanded by creativity and circumstance in how they might be used. This category is intentionally large in order to demonstrate that this smart cities project has potential beyond the scope of this funding and timeline. The intention of Yellowknife is to use sensors to improve municipal services first, outsourced services second and open it up to the limitless possibilities of entrepreneurs in the tech industry when the conditions are right.

PIPED WATER LEAK DETECTION

It is estimated by the Public Works Department that 30% of the city's water is lost to leaks in the system. Aging infrastructure, exacerbated by the challenges of permafrost contribute to the pipe-water system inefficiencies. The cost of this water loss to city finances is measured in hundreds of thousands of dollars a year.

The installation of a smart sensor onto existing fire hydrants provides a promising leak detection monitoring solution already in use in Medicine

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

SENSOR TECHNOLOGY

TEMPERATURE, HUMIDITY, CO2

Climatic data
- monitor climatic changes
- forest fire smoke detection
- pollution level

LIGHT POLLUTION METER

Brightness of the night sky
- monitor light pollution
- data for astronomy

PARKING OCCUPANCY

Vehicle detection in parking spaces
- monitor vehicle data
- parking lot occupancy in real-time

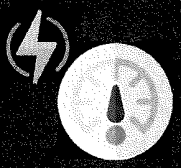
WATER LEAK DETECTION

Water leak detection in water conducts
- measure water consumption
- wireless water conservation

LEVEL DISPLACEMENT

Measures distance to objects
- snow fall monitoring
- ice on roads

WASTE BIN DETECTOR

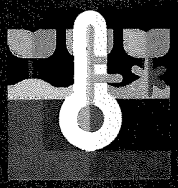


Collection efficiency
- waste management
- help public works
- full/ empty/ flame risk/ fallen

PUSH BUTTON

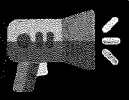
Multi-purpose buttons linked to different functions
- survey on satisfaction
- panic button
- control lights

METER READING



monitor consumption
- electricity monitoring
- gas fuel tank
- disfunction detection
- comparison of data

MOTION DETECTOR



Movement of people or objects in a 4 meter radius
- dimmable lighting control
- efficiency of the lighting strategy
- pedestrian safety

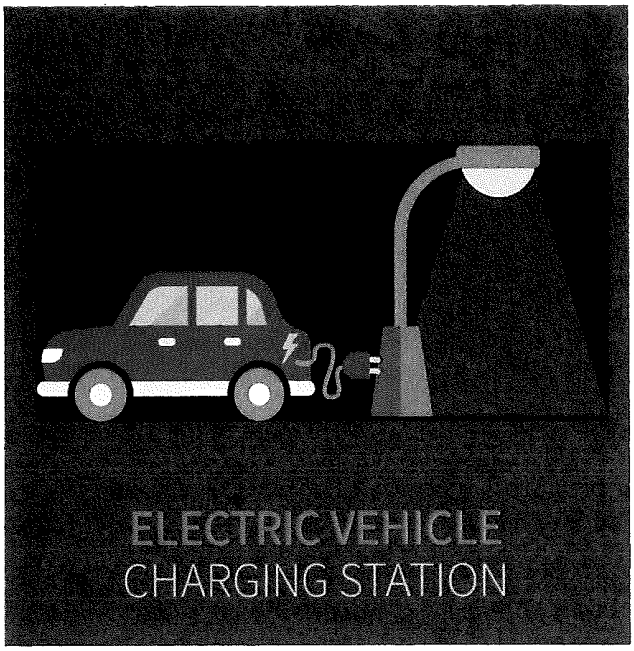
PERMAFROST

Permafrost temperature measurement
- data for geologist
- monitor changes in permafrost
- thermistor reading

NOISE METER

Noise level in dB
- monitor noisy/quiet spots

WATER/SEWER LEVEL



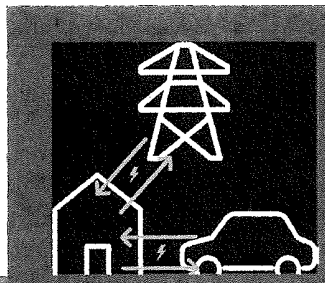
trucked water efficiency
- water/sewer tank level
- measure water consumption

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Hat, Alberta. A portable node uses an acoustic sensor to monitor the sound emitted by water flow in the hydrant and attached piping system. It is highly sensitive to acoustic variation and is capable of detecting even the faintest leaks that traditional monitoring systems often miss. In addition to the sensor itself, the node includes analysis software that monitors the progression of the leak over time. A network of lampposts that would transmit this data to a central data center would enable improved real-time leak detection and potentially save the City considerable time and money.

WATER LEVEL MONITORING

Rather unique to the north, trucked water and sewage services fill and empty tanks in and under houses in permafrost areas. Roughly one quarter of Yellowknife houses, including all houses in Dettah and N'dilo, have water delivery on a bi-weekly schedule. This isn't always on an efficient schedule, and an on-demand service could potentially better service these residences using a sensor installed into tanks to relay water level information to the lamppost, and subsequently to the control centre and provider. Challenges with running out of water, and unnecessary service delivery could save citizen's money.



EV CHARGING STATION

The City of Yellowknife wants to be forward looking, and embracing electric vehicles (EV) as the future of vehicular transportation is part of becoming a Smart City. Generally there are two streams of thought on how to do this: incentivize EV purchases or build accessible charging infrastructure. The City is exploring the considerations of both options. Currently there are two EV charging stations in Yellowknife. The City recently installed a phase II charger at City Hall to charge a new electric vehicle owned and maintained by

Map of Yellowknife showing locations of trucked water and wastewater

VEHICLE TO GRID

Vehicle-to-grid technology (V2G) helps to stabilize the energy grid through the installation of a new charging system for EVs. The battery of an EV becomes a mobile energy storage system that can supply energy to the grid during periods of high demand. Residents can be paid for the service their car offers to the grid. This is very promising to reduce diesel dependency in a lot of communities in the Northwest Territories.

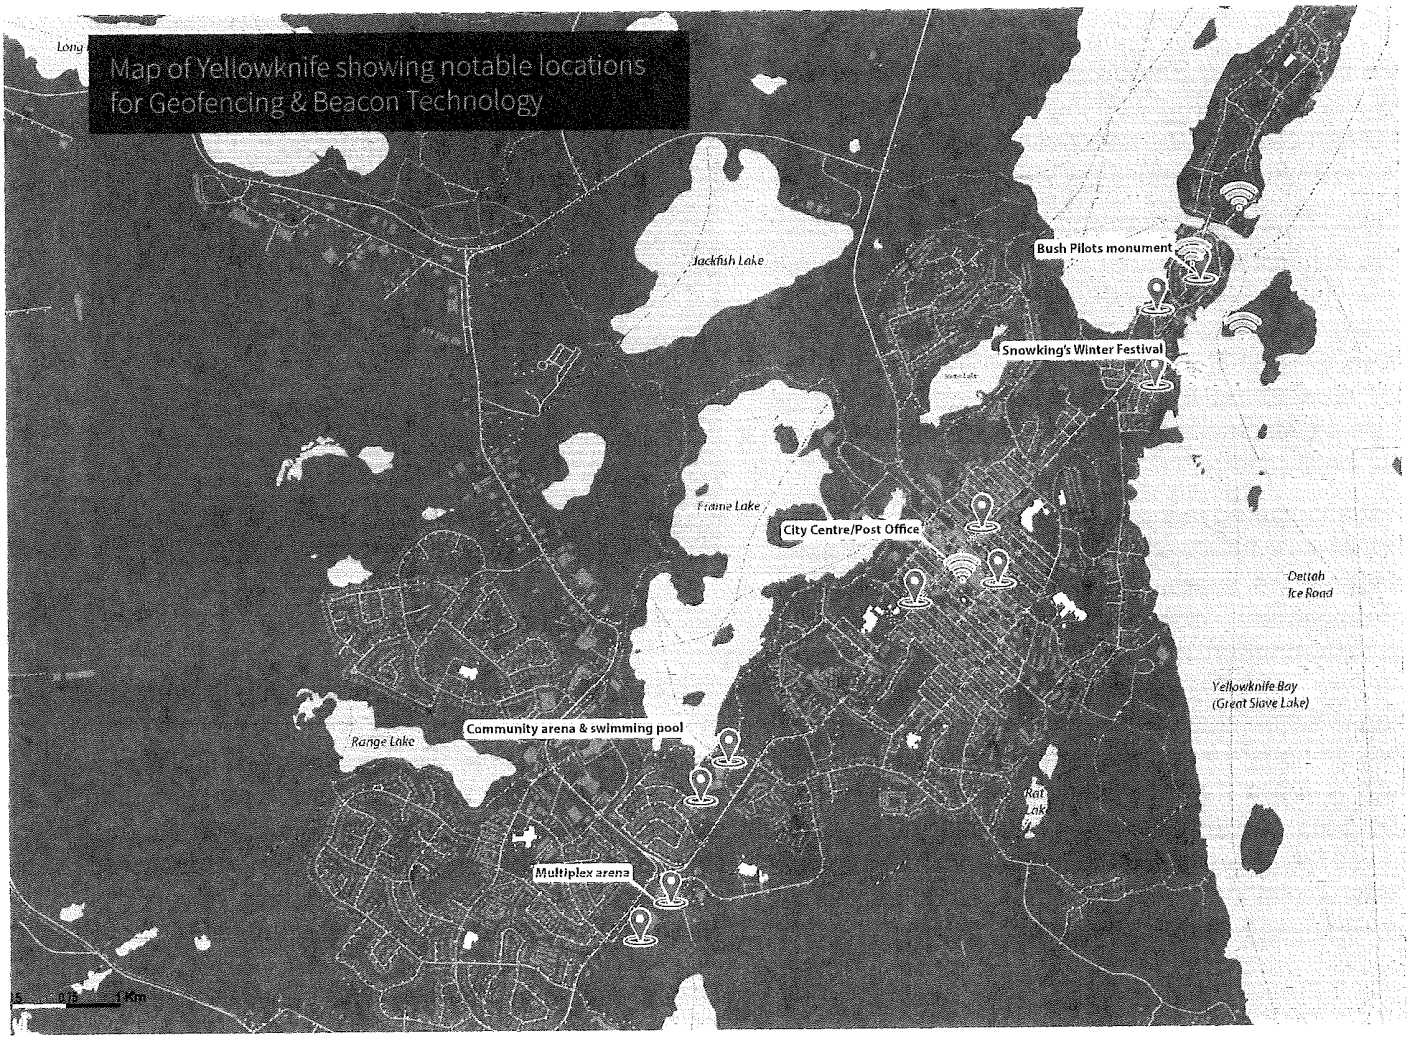
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

the new YK Car Share Cooperative but available to City staff during working hours. This initiative will demonstrate the effectiveness of EVs to work in the frigid north and show leadership by the City.

Yellowknife is also working with Northlands Utilities to install one phase II EV charging station on a lamppost located in or in close proximity to the downtown core. The potential of EV charging stations integrated into lampposts provides promise for broadening the demand and possibilities of EVs as electricity becomes the standard fuel of the next decade.

Not anticipated in the timeline of this project, nevertheless a future potential application of EV connectivity via lampposts is vehicle-to-grid energy management technology. Piloted successfully in Copenhagen in 2016, this technology allows electric vehicles to act as mobile energy solutions. When not in use, the vehicle is plugged into stations that connect to a city's energy grid and enables them to provide excess energy to the grid or recieve energy if necessary. This optimizes the power available to the grid and is especially useful in the case of unexpected surges in power usage (Automotive World, 2016).

Map of Yellowknife showing potential locations for EV charging stations



WIFI

Incorporating WiFi access points into lampposts in key junctures in the City will broaden the existing free municipal wireless network limited to municipal facilities. Exploring how to make digital services more accessible will increase wellbeing for both residents and tourists. The sharing of information is pivotal to the transition towards a smart city.

This is simple technology and easy to replicate and build on. Although not a key part of the Cities Smart City vision, it is another example of the ability of the lamppost to provide services and transmit information. Currently, there are six municipal locations in the city that offer free WiFi: Center Square Mall, the Library, City Hall, Samba K'e park, the Multiplex, and the Fieldhouse. After engaging with residents during a two-day Design Charette in August, 2018 several more sites were put forward as locations where WiFi would be useful: the Snow Castle, Old Town, the Government Dock, the Airport, and the Boat Launch at the Yacht Club. The City is considering the extension of its WiFi at the Snow Castle to improve the experience for tourists and locals at this key tourist location.

The creation of wireless connectivity between lampposts is a solution which could implement multiple smart city services that require a mesh

network as a foundation. With the expansion of the public municipal wireless network come several risks, both to the user and the owner. These might include Man in the Middle Attacks (MitM), snooping/sniffing, and malware distribution. The City can help to limit these risks through public education. Risks to the network owner include bandwidth and network abuse (i.e. Denial of Service) and the possible use of the network for cyberattacks (O'Higgins, 2016). Public WiFi operators can protect themselves from liability of network misuse by implementing Terms and Conditions of Use Policies which includes: an indemnity statement, an acceptable use policy, a privacy statement, and a description of service level commitments (O'Higgins, 2016).

CASE STUDY: FREE WIFI

TRONDHEIM, NORWAY

The city of Trondheim is a case study in the use of a municipal wireless network in a larger community. The network auto-connects the user's smartphone device to the most appropriate wireless network nearby at any point throughout the city. Also available is a free wifi map of Trondheim which works without internet connection, helping to find the closest free hotspot.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

GEOFENCING AND BEACON TECHNOLOGY

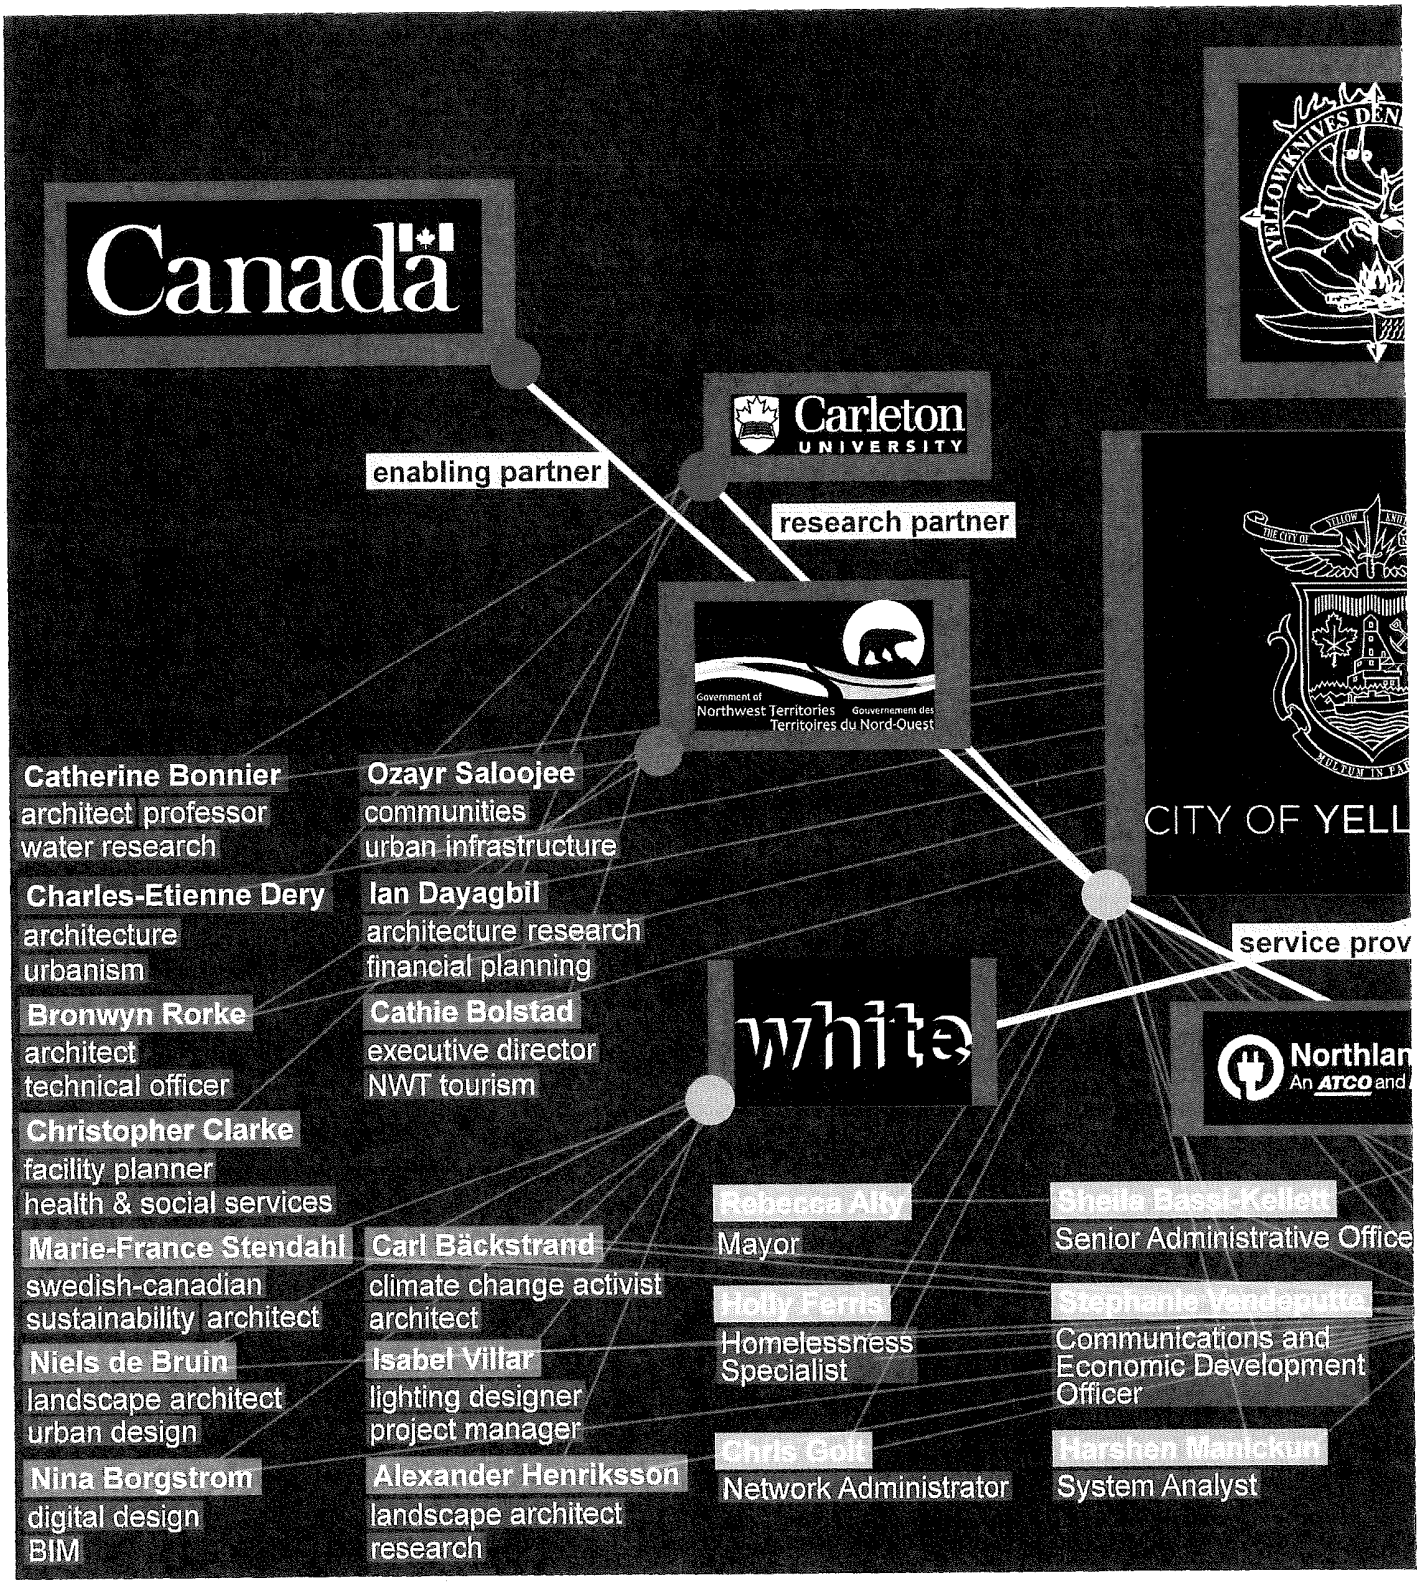
Geofencing and beacon technologies are platforms for public engagement and ultimately work towards this project's goal of developing an active and informed community. The more immediately available and realizable of the two technologies is geofencing. Geofences are fixed regions that define an area with a width between 200 meters and 2 kilometers on a map. Using GPS technology and cellular coverage, when a user of the associated mobile application passes into that region, they will receive a notification on their device. The notification, or broadcast, is a short 140 character or less message whose contents are defined as part of the geofence. The associated application in Yellowknife is the PingStreet app which is free and widely available to residents. The feasibility of implementing geofences has been demonstrated by the installation of 3 active geofences within the City of Yellowknife. While these geofences do not currently have any associated broadcasts, their broadcasting capability has been piloted with over 1500 subscribers. Expanding this capacity using the smart lamppost infrastructure would increase the City's ability to engage directly with residents to share information like pool schedules, road closure alerts, and event notifications. One of the geofences that is active currently is at the Yellowknives Dene First Nation. They have expressed interest in using the geofence to broadcast cultural events throughout the year to both tourists and residents. This tech collaboration with a First Nations organization is an important feature of this project's replicability in other northern contexts.

A beacon uses bluetooth technology to broadcast a push notification that is triggered when the user comes within a radius of 3 to 25 meters of the beacon. It functions in essentially the same way as a geofence and, within the context of this project, is especially useful for tourism due to the small broadcasting radius. A series of beacon disks installed in lampposts near historical or geographical points of interest could act as an automated active walking tour of the City. It is important to note that users of the PingStreet app would be required to give their consent to receiving notifications from the City via both geofence and beacon broadcasting.

QUOTE

"Dimmable city lights!! How about an application that we could use to get alert when awesome northern lights are showing up. "

- *Yellowknife citizen*



RISKS AND MITIGATION

The standard risk associated with geofences and beacon technology is user privacy. Especially for those who are more technology illiterate, a push notification from the City, even if a consent gateway is established, could be seen as a privacy threat. This project has and will continue to take steps to mitigate the real and perceived risk of this. The City will remain vigilant and up to date on all of their IT systems. We are already in communication with the Office of the Information and Privacy Commissioner of the Northwest Territories regarding the completion of a Privacy Impact Assessment. Privacy concerns such as these are addressed more fully in the Data and Privacy chapter of this proposal.

ENCE

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 5

GOVERNANCE

Collaborative innovation happens when there is a need or a problem whose solution requires creative input from an array of stakeholders.The City's Smart City Vision encompasses the ideas, concerns and expertise of our indigenous peoples, our local enviromental non-profits, our utilities and international support. Smart Cities are increasingly complex, with an ever higher number of stakeholders who hold diverging and converging interests. To manage these diverse partners and stakeholders, a rigorous governance framework is necessary.

The organizing priority of this project's strategy is to maximize the opportunity presented by the Smart Cities Challenge in order to produce the most benefit for residents of the City of Yellowknife. Ensuring security and transparency of the process, the outputs, and data collected is an essential component of this strategy. Any resources put towards realization of smart city outcomes will be filtered through a governance structure created to secure these aims. A template for Smart Cities governance can be found in the Sustainable Development for Communities guidelines document published by the International Organization for Standardization, ISO 37106:2018. This set of guidelines "establishes requirements for a management system for sustainable development in communities, including cities, using a holistic approach, with a view to ensuring consistency with the sustainable development policy of communities." (ISO website)

LOCAL AND HORIZONTAL GOVERNANCE

Strategic plans will be be developed in alignment with City Council mission and the community's vision, as well as ISO standards. Creating a locally relevant governance framework is essential to the success of the overall implementation strategy. The approach thus far has been to prioritize a horizontal partnership structure with several different parties and stakeholders. This horizontal structure aligns with the City's vision of an inclusive and well-managed community which is welcoming and inclusive. As both a centre of government, law, health and social services, the City's traffic and density are unique within the context of northern Canada. This presents a set of governance challenges that are similarly unique. By meeting these challenges with a horizontal governance approach, this project is aiming to ensure that all frameworks are transparent, efficient, and reflective of the needs of the community.

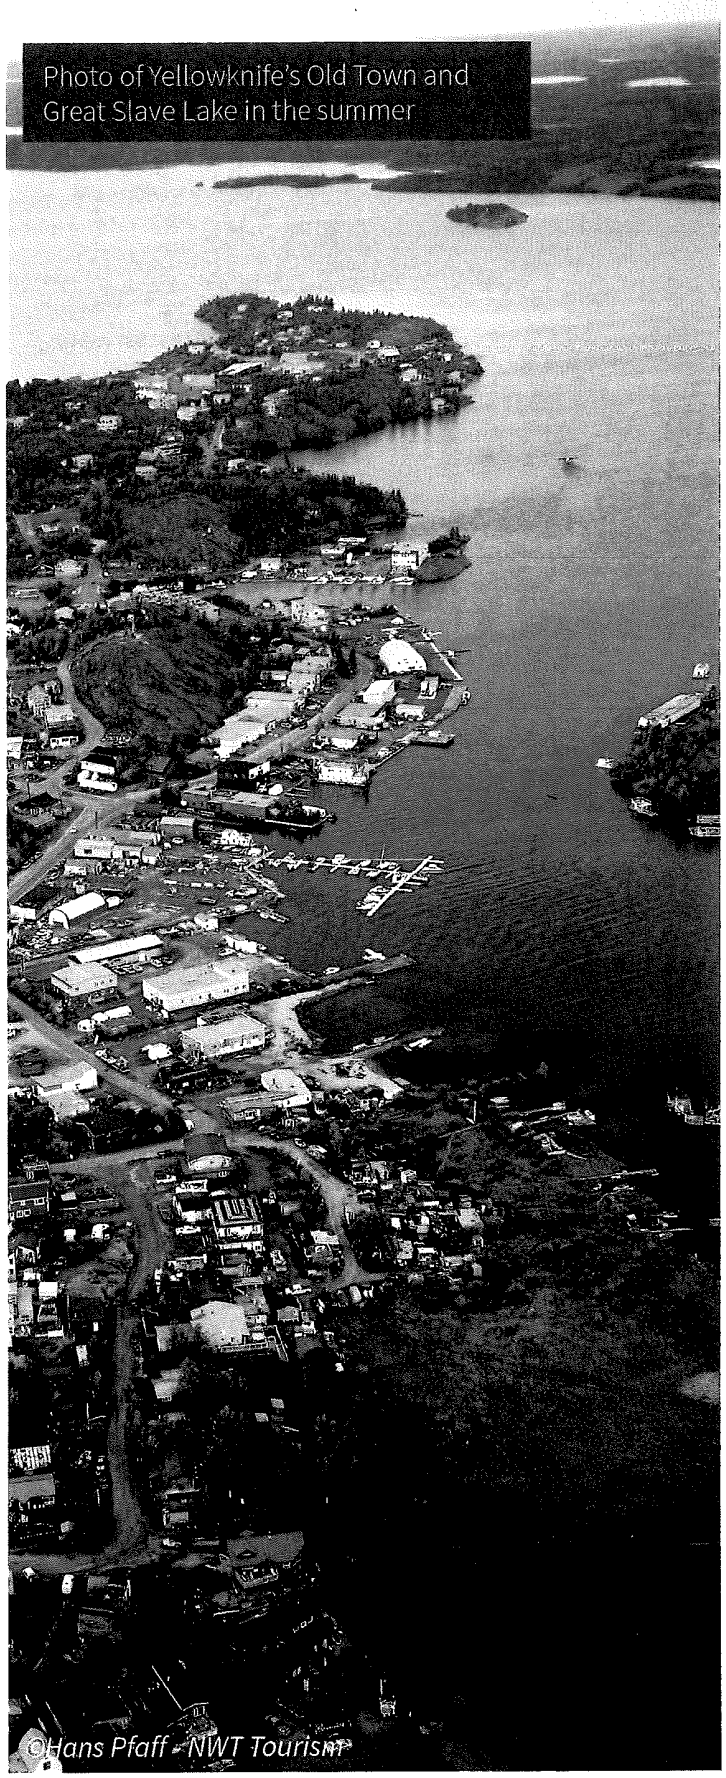
The governance structure of this project is intended to formalize the roles of partners and stakeholders via the creation of a Smart City Committee. The concept for this committee was introduced in the performance measurement chapter of this proposal. This committee will provide direction and information throughout the lifetime of the project, both during the 5 year scope of this proposal and beyond.

PROJECT PARTNERS:

YELLOWKNIVES DENE FIRST NATION

"Weledeh Yellowknives Dene are one of the peoples of the T'satsaot'ine. The people were known for the pots, knives, and other tools they made from copper collected in the northerly parts of their territory. Before trapping for the fur trade changed traditional occupancy and land-use pattern north of Tinde'e (Great Slave Lake), the traditional territory of the T'satsaot'ine consisted of lands around Great Slave Lake north to the Coppermine River, and east to the Thelon River. Since 1959, descendants of the T'satsaot'ine tribe have lived mostly at Deninu Kue, Rocher River, Lutsel K'e, Reliance, Ndilǫ, Dettah and Enodah. Today, the people call themselves and their territory after the great T'satsaot'ine leader Akeh-Cho: The Akaitcho Peoples and Akaitcho Territory." (excerpt from ykdene.com)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information



This project is an opportunity to strengthen partnerships with the Yellowknives Dene First Nation (YKDFN) neighbours and to achieve inclusivity, horizontality, transparency and a mutually beneficial arrangement that is in the best interest of residents of Yellowknife, N'Dilǫ and Dettah. Moving towards a holistic and inclusive framework for partnership with our First Nations neighbors is a consideration of critical importance for this project. To this end, YKDFN staff was present during the design charette and the YKDFN community was backed financially by a portion of the $250,000 grant from the first phase of the Smart Cities Challenge. Moving forward, YKDFN participation will be an enabling partnership, in which the City would share resources and try to encourage a continuation of smart city tech into N'Dilǫ.

ECOLOGY NORTH

Ecology North was founded in 1971 in Yellowknife. Over the years the organization has served the City of Yellowknife as the pre-eminent environmental non-profit organization in the North. Ecology North has developed a strong relationship and partnership with the City of Yellowknife, working closely together on many projects, such as the municipal recycling and composting programs, this Smart Cities Challenge, and many co-hosted events throughout the years. As an organization, Ecology North is also active in City of Yellowknife committees and consultation sessions. As a non-profit, Ecology North has a horizontal, inclusive process for decision-making and includes stakeholders and residents in the decision-making process, incorporating diverse perspectives. For this Smart Cities Challenge, the partnership with Ecology North has provided a network for knowledge exchange on sustainable principles. They have facilitated knowledge exchange with the Scandinavian architecture firm White Arkitekter and the Carleton University Urban Research Lab.

NORTHERN CENTRE FOR SUSTAINABILITY

Ecology North and YKDFN are currently partnered on another relevant initiative that will re-

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

inforce the outcomes of the Smart Cities project. The Northern Centre for Sustainability (NCFS) is a project that will leverage federal, private sector and academic funding to build the first Living Building in the circumpolar North, and the first carbon-negative building in Canada. This building will be a demonstration in downtown Yellowknife for replicable, scalable, and adaptable cutting-edge technology for northern settings. An innovation hub in the building will be an incubator for emerging green businesses, entrepreneurs, special interest groups, and indigenous youth. By providing a space for innovation, the NCFS is positioning itself to be a potential Smart Cities partner.

WHITE ARKITEKTER AB

Ecology North has been developing research relations with the White Research Lab at White Arkitekter AB, the largest architecture firm in Scandinavia based in Gothenburg, Sweden. White is an expert in nordic design, and facilitates the transfer of knowledge and practices directly to local architects. White has acted as a sub-consultant to Ecology North as they provided them with case studies on Scandinavian Best Practices for electric vehicle charging stations, urban lighting systems, urban planning, urban design, and the integration of the natural and built environments in the best way possible. Ecology North approached White for a partnership with this question: how can we exchange knowledge? To this point, White has provided much valuable perspective in the visioning of this project.

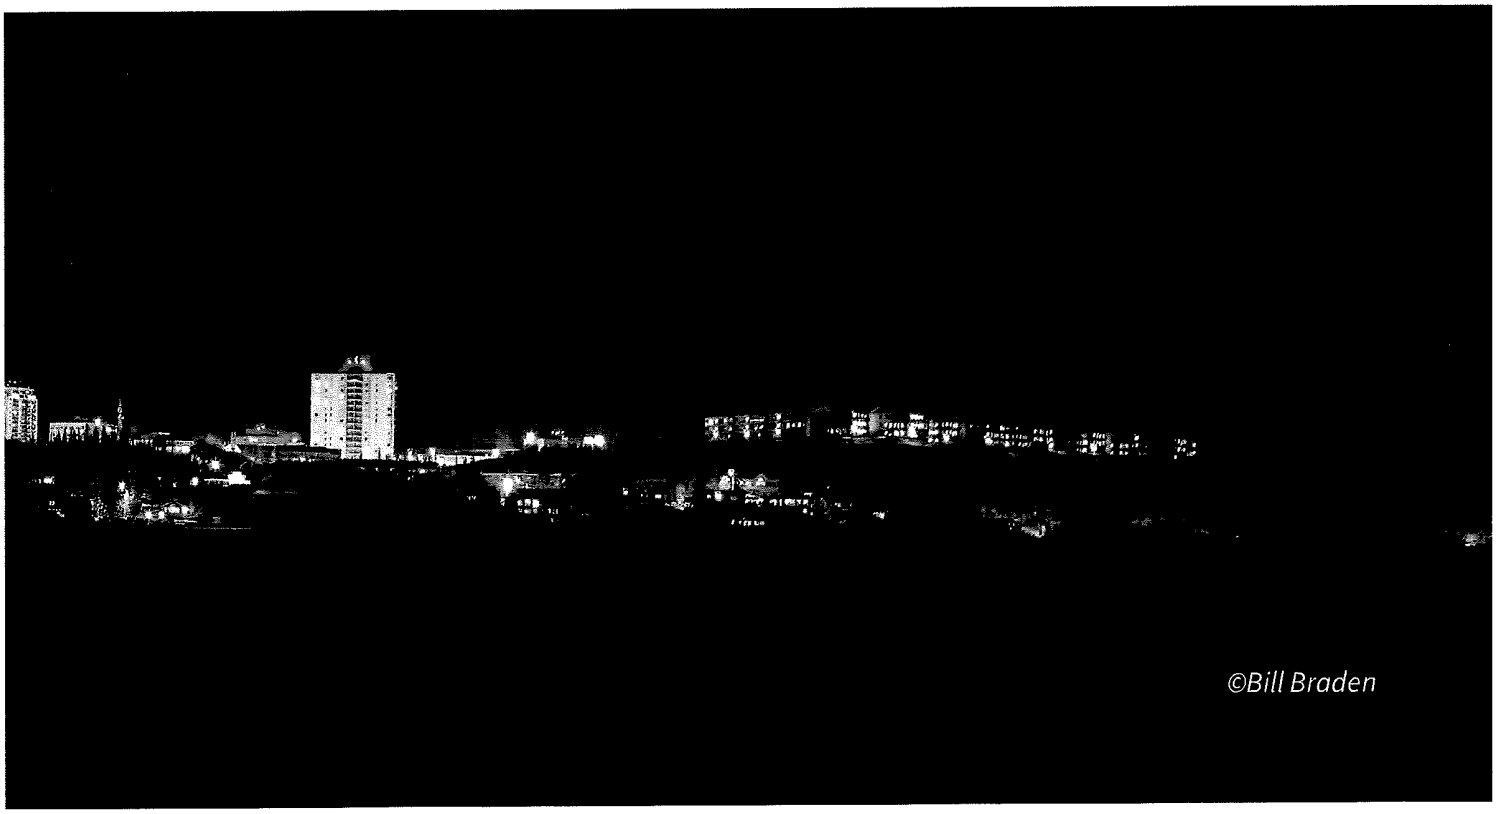
TECHNOLOGY PARTNER: NORTHLAND UTILITIES

Northland Utilities and their parent company ATCO have been the technology partners for this project since its inception providing technological expertise in the area of adaptive lighting strategies for the project's duration. Representatives from ATCO attended the 2-day design charrette in 2018 and have been involved in the ongoing feasibility studies, in the implementation of prototypes, and the monitoring and collection of data. ATCO states that "ensuring [they] operate in a transparent, ethical and accountable manner is critical in creating strong and sustainable value for [their] share owners and in promoting the company's well-being over the long-term" (ATCO, 2018). In addition to their technological expertise, this demonstrates ATCOs compatibility with this project's own scope and vision.

Vew of the Yellowknife skyline from Great Slave Lake in the winter

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

POTENTIAL ACADEMIC PARTNER: CARLETON RESEARCH LAB



The Carleton Urban Research Lab was co-founded in 2017 by Professor's Catherine Bonier and Ozayr Saloojee. The focus of the lab revolves around questions of water, cities and equity. It is both an academic and outreach unit in the Azrieli School of Architecture and Urbanism. The lab regularly hosts academic and public events through symposia, workshops and design charrettes. This proposal has benefitted from the expertise of the lab in the areas of Smart City technology, including risks and mitigation strategies and future-proofing, as well as in the areas of data and privacy and project management.

INCREASING CAPACITY

With increasing demand for municipal information technology services such as smart sensors and equipment through Internet of Things functionalities, the City of Yellowknife will be looking at hiring another coordinator in 2019 to increase capacity in this department.

SENSITIVE DATA

In order to retain community control over sensitive data, this project's approach to partnerships will prioritize in-house technology development and maintenance, and limit the number of vendors involved. The City of Yellowknife will retain initial ownership of the information collected through the Smart Cities Challenge infrastructure, and in accordance with applicable legislation, it will be up to City Council to decide on the use of this data. Additionally, part of the funding from this project will be directed toward creating a step-by-step guide for entities interested in buying data generated by Smart City infrastructure and using it for commercial purposes. Sequentially, this guide would need to be developed after the creation of a comprehensive IT Strategy Plan as discussed in the project management chapter. The process of ensuring that the sensitive data usage plan complies with the comprehensive IT Strategy will also be the purview of the Smart City Committee and will serve as a privacy and security "checkpoint" or opportunity for course correction and risk mitigation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 6

ENGAGEMENT

Information technology can be an ever changing and mysterious thing, and the use of technology for the betterment of society can be fraught with challenges. The City of Yellowknife's engagement with residents and interest groups has been very positive, with lots of energy and excitement about the prospects of a Smart City in the north. But undertones of concern are present about privacy, use of data and the ever-present concept of "big brother." This chapter highlights the engagement to date, lessons learned, the plan to engage and communicate with Yellowknifers, and the vision and concepts of Smart Cities. Also highlighted are some of the risks and risk management techniques we are intending to use to get to the city's goals of using knowledge and technology to improve the community's social and environmental well-being by transforming the simple lamppost as a beacon of sustainability.

ENGAGEMENT TO DATE

Yellowknife is a small city that feels like a big town, and meetings between public officials and local citizens happen on the street or in the check-out line everyday. The City of Yellowknife approached engagement using its partners, in particular Ecology North, to get the word out about this project in a grassroots way. Grassroots engagement is effective at building a base of concerned and engaged citizens, that was built on through events, a multi-stakeholder charette and communication plan. The City will build on this approach by spending time in the first two years of the next phase of the project engaging and working with stakeholder groups to build trust in the City's approach, but also to gain feedback about how people see Smart Cities improving their lives.

This starts at the top, and City Council have been engaged and supportive from the very beginning. On April 23, 2018 council moved to unanimously endorse the Smart Cities proposal (City of Yellowknife, 2018). Through close communication with City staff and partner organizations, Council has endorsed sustainable development, climate action and using technology to help improve outcomes for all Yellowknifers.

OPEN HOUSE

An Open House event took place on April 3rd 2018, just before the first proposal. Invitations were sent out widely with the objective of gaining ideas and thoughts on using the lamppost as a beacon of sustainability. ATCO demonstrated the technology with motion-sensing luminaires and Ecology North worked on generating ideas and building grassroots support.

We received over 50 individual responses to our request for feedback, and compiled and evaluated this information to help guide us in drafting our proposal. Residents identified key areas of concern, and discovered areas that had not been previously considered, which were incorporated into the project proposal. The community engagement Open House was an invaluable tool to understand the issues at the forefront of residents' minds, and allowed the partners to develop a project and potential solutions that truly meets the needs of Yellowknife.

MULTI-STAKEHOLDERS 2-DAY DESIGN RETREAT

In August of 2018, the Smart Cities Team organized a design retreat at the Yellowknife Ski Club. Taking the time away from computers and meetings would allow all participants' creativity to be stimulated, at the edge of the forest beside Great Slave Lake.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Participants of the 2018 Multi-Stakeholders 2-Day Design Retreat

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The full 2-day meeting welcomed participants from all walks of life to share ideas with an innovation mindset. The first day welcomed many Yellowknifers from a diverse range of groups, including but not limited to the tourism industry, academia, architects, landscape architects, and First Nations.

The second day of the charrette was more intimate, and focused on the technical details of implementing a smart street lighting strategy. Those in attendance had vested interest in the proposal, as they would be working on its implementation. This design charrette was a joint facilitation between Ecology North and White Arkitekter AB. Northlands Utilities delivered their knowledge of the lamppost system and technical know how, Yellowknives Dene First Nation shared their deep connection to the land and transformational thinking, and the architects, engineers, politicians, environmentalists, bureaucrats and everyday people brought their Northern innovation, ideas and comments to the table.

The community design charrette was developed to encourage sharing and open discussion through interactive activities. Facilitators initially sought to identify participants' perceptions of Yellowknife and build on the concept of sustainability in a Smart Cities construct, build on the concept of smart lighting that would improve people's connections with the sky and nature, and improve our thriving aurora tourism industry. Many new ideas were brought forward which were duly recorded and discussed and people were truly engaged and excited about the prospects of the Smart City and smart lighting. The full design charrette report is found on the City's Smart Cities Challenge website.

Our community engagement format enabled us to bring together participants from all our partner groups, along with their individual expertise. Participants who attended could engage

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

in discussions with all parties in a one-on-one or small group format. From these discussions, participants could better understand what exactly the Smart Cities Challenge was, some ideas already developed in terms of specific issues the City needed to address and potential ways to address these issues. Participants were invited to ask questions and provide feedback throughout the one-on-one engagement, and then after they had a chance to interact with all the partners as well.

Some guiding questions were displayed on different boards throughout the room and people were invited to write their action ideas on a post-it note for each one they wanted.

Though we invited attendees to answer these questions directly, we also encouraged them to provide further feedback that they might have had. The amount of feedback we received impressed us. On top of this, we engaged a local radio station, Cabin Radio, to attend the first hour of our session and broadcast the entire time through Facebook live to encourage more resident to come. Thanks to our varied promotional methods, we saw solid attendance at the engagement session and received feedback that has helped guide our proposal.

LIGHTS OUT EVENT

On November 20th, in what is one of the darkest and gloomiest times of year, the City held a Lights Out Event to bring awareness and excitement about how light pollution impacts the city, and how the Smart City Challenge intends to tackle lighting issues. The City turned out the lights of City Hall and Samba K'e Park to symbolize future efforts and showcase the night sky. Mother nature had other ideas on this blustery evening, but regardless a good turnout and interesting conversations about what night means to Yellowknife were had.

CONSULTATIONS AND SIDE CONVERSATIONS

Yellowknife is blessed to have what must be one of the most engaged populaces in Canada. This is seen in the number of civil society organizations that work to improve all manner of social, environmental and other disparities and challenges. By choosing to work with Ecology North on this project, the grassroots of the environmental movement were engaged. Ongoing engagement with tourism providers and NWT tourism helped the team understand the tourism opportunities and challenges. Northlands brought the knowledge and tools of its Innovation Hubs to the table.

YELLOWKNIVES DENE FIRST NATION

Yellowknife is founded on Chief Drygeese traditional territory of the Yellowknives Dene First Nation (YKDFN). The twin communities of N'dilo and Dettah share borders, and many YKDFN residents live and work in Yellowknife. The City and YKDFN also work closely on shared infrastructure, festivals, and building a better overall community together. YKDFN were invited to all consultation sessions and participated in the Design Charrette, where ideas and plans to incorporate technologies into N'dilo were conceived and developed. Relationship building around a shared vision has continued with discussions at the leadership level, and at the grassroots between Ecology North and YKDFN staff.

The Smart Cities project will further build on this relationship by bringing principles of reconciliation to the project by actively partnering and sharing resources gained from the Smart Cities Challenge. The City and YKDFN are looking to

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Participants of the 2018 Multi-Stakeholders 2-Day Design Retreat

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

forge a new bond based on the promise of technology, a growing tourism industry and celebrating culture and heritage.

SOCIAL MEDIA

The City has a communication plan, and has been working on tools to further its engagement using social media, traditional media and other tools such as Placespeak and the Pingstreet app. This is a weakness the City has had to date, developing and enacting this Communication Plan. The process of researching, learning and developing what this proposal will look like for the City is an iterative one. The City wants to be clear with regards to its Smart Cities messaging in order to best manage expectations.

DIMMABLE LIGHTING SCHOOL DRAW PROTOTYPE

As our flagship prototype the School Draw dimmable light installation will highlight a new look for streetscapes in town. The City intends to use this project to highlight the Smart City project and show residents how this technology will improve the night time experience for Yellowknifers and tourists.

To evaluate and build public support for this prototype Ecology North and City Staff interact with residents in the pilot area to explain the project, answer the inevitable questions about what people in the neighbourhood are going to experience and help the team understand people's concerns while building excitement around this prototype. By asking for written feedback, we hope to develop a baseline of knowledge and concerns, and will follow that up after the prototype to evaluate people's experience with the lights, and whether it changed their enjoyment of Yellowknife's Extraordinary Skies.

The City will also celebrate reaching this milestone with a celebratory event in which the partners and the public will get to see the lights working for the first time. This will be the first time that the public will visibly see a manifestation of what their City can look with smart lighting.

CITIZEN QUOTE

"I think it is a brilliant idea. I think it's great... We were just talking about how to integrate services for bicycles, because a lot of us are year-round bikers."

- Aleta, Yellowknife resident

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

FUTURE ENGAGEMENT

Smart Cities are a relatively new concept and a challenging one to define and communicate. The City has chosen not to immediately communicate a Smart City strategy and concepts that are not yet fully developed, but anticipate following the ISO 37106:2018 standard and developing an IT Strategy in the first year of implementation to improve communication and engagement that will follow.

The City at this point without pre-supposing the future strategy and policy direction hopes to embrace concepts of openness, transparency, interoperability, non-proprietary and citizen-centric IT and similar themes for engagement. Tools and strategies will be developed to embed this view so the City becomes a leader in working with its citizens to improve outcomes for everyone. To improve this the City will continually ask for input into new ways to incorporate Smart Cities concepts into its strategies and action plans.

Approaches that the City intends to take to get to this point will be to use our current engagement and outreach tools to gather knowledge. These include Placespeak which is a location based civic engagement platform, and the app PingStreet which provides real-time access to helpful information and engaging tools. Along with ubiquitous social media outlets like Facebook, Twitter, Instagram, and the Smart City Yellowknife website, the City will continue to use the person to person, and stakeholder engagement that have been the main platform for engagement to date to communicate the Smart City message.

The plan will lay the groundwork for the use of other tools within the City to reach out to new stakeholder groups. By developing a Research and Engagement Working Group to promote this plan, the City will encourage the public, entrepreneurs, and targeted stakeholder groups to submit expressions of interest and ideas to make the City smarter. Funding in the form of an engagement budget will be provided in years 1 to 5 and each year there will be a different focus (transportation, IT, sensors and tourism, etc) in which the public will be asked in a challenge format to give the City practical, doable ideas for implementation. Other uses of the funds from the engagement budget might be to ask stakeholder groups (ie. artist community to use art to highlight smart city prototypes) or ask seniors to test a technology or envision what a smart city is for them, or hosting workshops for youth to work with technology. Other options might be to host a hackathon in which tech entrepreneurs, or university students from across the country are invited to participate to build solutions that fall within the criteria of our Smart City Vision and concepts.

Other engagement tactics could be to talk with random citizens and ask them how a Smart City or smart streetlights might improve their health, safety or sense of being. Similarly, working with new immigrants to see what needs or wants would make their early transitional years easier could shed light onto areas of improvement. To do all this the Smart Cities Implementation budget will support real hands on learning, workshops, participation with schools and civil society groups. Each of these stakeholder groups brings will attempt to bring out individuals and groups of

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 7

DATA & PRIVACY

PREPARING A PRIVACY IMPACT ASSESSMENT

Part of this strategy is communicating with the Office of the Privacy Commissioner (OPC) to prepare a Privacy Impact Assessment (PIA) that covers the width and breadth of this project. As part of the preparation process for this proposal, the City of Yellowknife has established contact with the OPC and through initial discussions determined that a PIA was not needed at this stage of the project as data is yet to be collected and no privacy impacts are being made. City staff will continue to work closely with the OPC as the project progresses to determine which technologies and aspects of the project require PIAs and to perform this work as necessary prior to the implementation of any potential Smart Cities technologies.

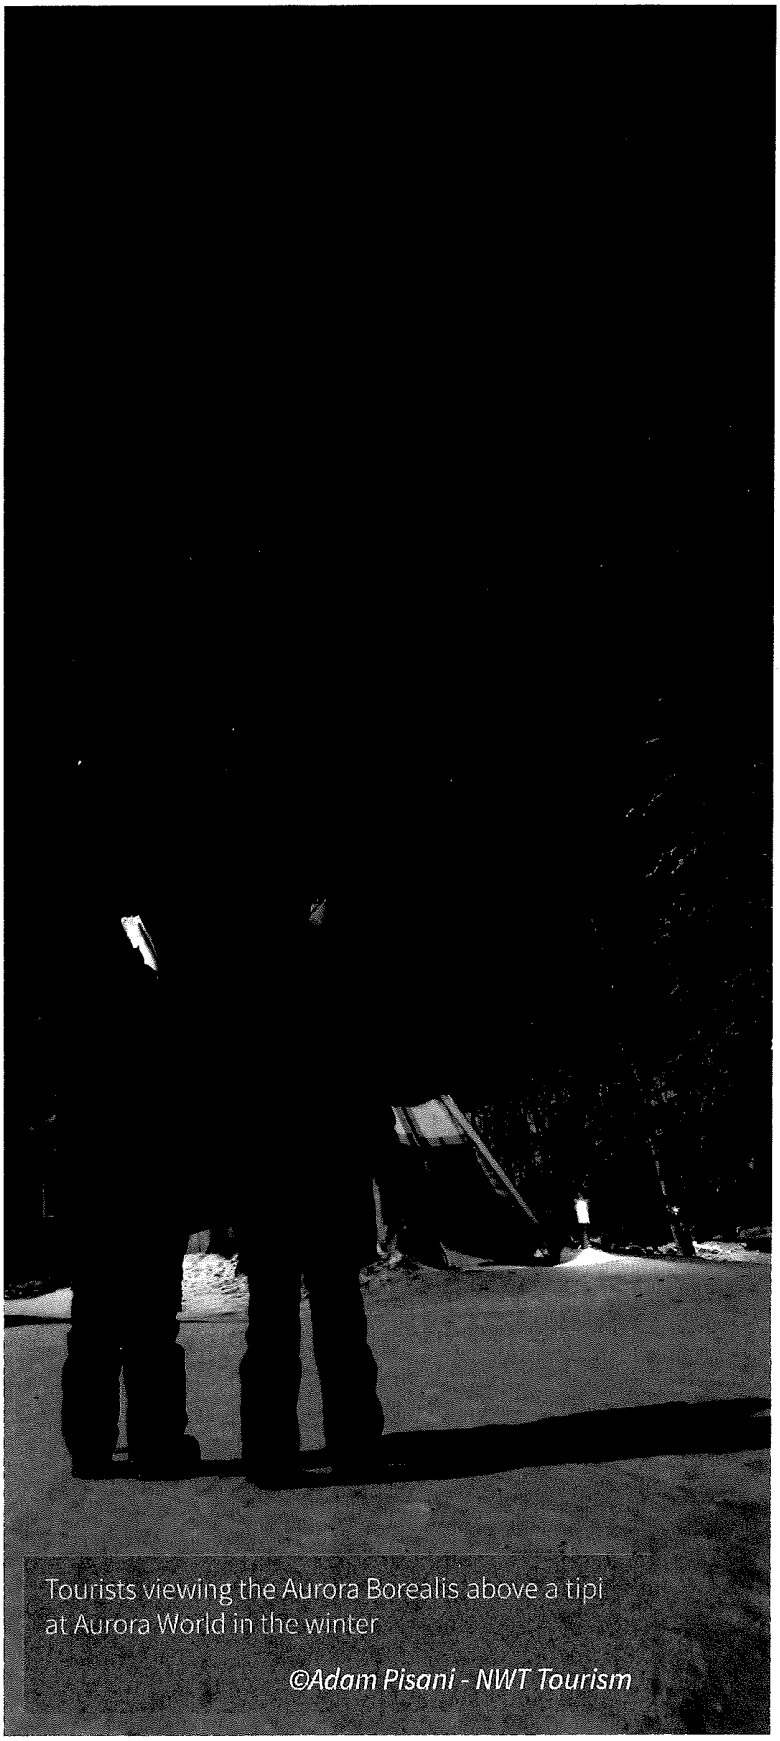
EXISTING POLICY

The City of Yellowknife has established and made public their efforts to integrate security and privacy considerations into municipal technology. This is evidenced in the City's website's privacy policy, which notes user de-identification and gives a complete list of the non-identifying information that is recorded. This sets a precedent for data privacy and security that the Smart Cities Project can expand on. Because the majority of the technologies proposed in this project are not currently in use, their privacy impacts will have to be evaluated by the City or by an independent contractor before they are officially launched.

With regards to compliance with The Personal Information Protection and Electronic Documents Act (PIPEDA), this project in its current iteration does not deal with any personal information. As part of the project management strategy, however, this should be reassessed periodically.

CASE STUDY: ILLINOIS INSTITUTE OF TECHNOLOGY

The Illinois Institute of Technology (IIT) has designated the campus a "living laboratory" by building a microgrid on IITs main campus to experiment with smart technologies. IIT is currently piloting a smart street lighting system configured in a mesh network that communicates with lights that are controlled by the Centre-for Smart-grid Applications.



IIT has also piloted two prototype applications (a) emergency response application, and (b) Safewalks mobile application. The Safewalks application adjusts the brightness of streetlights relative to the pedestrian traffic as determined by real-time data.

IIT is particularly interested in cyber-security for their networked streetlight system. They have identified three areas of vulnerability: (a) the communication network, (b) the remote server, and (c) end devices. Smart software is important in maximizing the utility of smart hardware. Cybersecurity is the most important concerns of IoT in critical services that addresses interests of public trust.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

SMART CITIES CHALLENGE: AN OPPORTUNITY

Collectively the municipality and its partners recognize the Smart Cities Challenge as an opportunity to preemptively address emerging issues regarding technology, ownership and security. As a frontrunner in specifically Northern-Canadian innovation, Yellowknife is well-poised to develop secure frameworks of governance with the well-being of its residents as a central priority. The governance structure ensures diligent and consistent dialogue with a diverse range of residents and stakeholders. The City's commitment to accessible, open-source formats is demonstrated in existing infrastructure like the City Explorer portal and Open Data License Agreement. Moving forward, the development of an IT implementation Strategy can provide the opportunity to solidify a long-term practical approach to secure data management. Emphasis will be placed on ownership structures that retain municipal control of data, as well as a framework for adaptability of open-source policies to suit changing needs and technologies. Investing in smart solutions for the Yellowknife context translates readily to applications in remote and cold-weather communities across the country.

CHAPTER 8

FINANCIAL

Transforming into a Smart City has the potential to improve the services the City offers its citizens and improve the way it offers those services. It will help the City improve internal efficiency by providing more effective structures for communication and data transfer. The up-front investment required to implement these improvements will be paid back through a variety of benefits and service improvements in the future. The following preliminary budget will highlight the estimated costs and the outcomes and some anticipated cost savings that will be triggered within the five year Financial Plan of the City. The preliminary budget is summarized in the budget document on page 66, and will be split generally into the following five sections: Smart Cities Strategy, Extraordinary Yellowknife Lighting Strategy, EV incentivization Strategy, Research and Engagement and Operations & Maintenance budget lines.

SMART CITIES STRATEGY

The Smart Cities Budget will be the largest single budget area and will encompass much of the technology that most people think of when they envision a Smart City. Consistent with the proposal this preliminary budget will not provide too much detail into the costs of individual technologies, as decisions will depend on the Smart City Strategy, research and engagement and the approach to implement the action plan coming out of the strategy. This approach maintains flexibility and doesn't pre-suppose the outcomes. Dollar figures will be used to limit the scale of technological deployment within the five year budgeting window.

The budget for Smart Cities Strategy will include the Strategy itself and development of corresponding IT policy and tools. There are also improvements to Information Technology within the City itself, namely improving the IT hub, connectivity improvements, and expanding the gateways city-wide. Further to these key improvements, the Strategy and further research will highlight approaches (and estimated budget lines) to mesh network development, expansion of geofencing, beacon technology, wifi expansion, sensors and new technology areas.

EXTRAORDINARY YELLOWKNIFE LIGHTING STRATEGY

Similar to the Smart Cities budget the Extraordinary Yellowknife lighting budget will be dependent to a degree on the strategy and lighting plan developed in the first year. This strategy will highlight priority areas within the city and set the conditions for expansion of the smart lighting, based on the evaluation of the School Draw prototype and lighting strategy. Budget lines for lighting have been included in the budget page and will be a considerable portion of the budget.

ELECTRIC VEHICLE INCENTIVIZATION STRATEGY

A relatively small portion of the budget, the EV Incentivization Plan will highlight a Smart City approach to Electric Vehicle integration into Yellowknife. This will primarily entail piloting and evaluating EV charging infrastructure tied to lampposts and how to leverage this with policy, education and awareness tools to encourage adoption of EV's into a Smart Cities framework.

RESEARCH AND ENGAGEMENT BUDGET

Included in the preliminary budget for this project, which is detailed on the following pages, are considerations for research and engagement. In contrast to the technological projects and associated budgets, the project areas of research and engagement are intrinsically less clearly defined. Maintaining public and private engagement and promoting strategic research around the availability and feasibility of various Smart Cities tools and technologies is an essential component to the success of this project, and will require an

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

ongoing budget. Funding will be allocated for research and engagement purposes through the guidance of the Yellowknife Smart City Committee. Decisions on allocating the annual funding to meet the intent and vision behind a Smart Cities framework will be made using an effective, varied and multi-stakeholder approach.

OPERATIONS & MAINTENANCE

The City is going to need the capacity and a coordinator. The Smart Cities Coordinator will be housed in the Sustainability branch of the Public Works and Engineering Department, which is responsible for community energy, waste and broader sustainability initiatives. The Smart Cities Coordinator will manage contracts, coordinate the committees and working groups, coordinate between departments and partners, and general project management of the the Smart Cities project. There will be additional requirements in other departments such as IT, Communications, Public Works and Planning that will be coordinated by the internal existing budgets of those departments.

CASE STUDY: THE COLUMBUS WAY

In 2016 Columbus, Ohio won a $40M fund from the US Department of Transportation. The non-profit organization that won the bid raised an additional $450M by leveraging public, private and academic associations to develop a Smart Columbus project focused on 'smart corridors', a smart grid and smart street lights. With a vision "to be the model for connected cities for the future" its approach to using narratives to engage citizens in a 'collective vision' from a central hub is a model that Yellowknife can aspire to.

CONSIDERATIONS FOR LONG-TERM OPERATIONS & MAINTENANCE COSTS

There are definitely concerns about the long-term costs of increasing the number of staff and operations budgets with additional technology, actions and engagement demands. Through the accounting and financing mechanism already in place, City Administration will continue to reassess and strategically invest in the Smart Cities project. It is envisioned that energy savings, water savings and improvements to municipal services will more than offset any future costs. Key to this project is developing clear baselines and evaluation protocols to understand, value and communicate the results of pilot projects to corroborate the argument and continue to receive public and council support for funding.

LEVERAGING THE SCC FUNDING

The City recently invested in an institutional grant writer and funding analyst. The role of this new position in relation to the Smart Cities is to support with the leveraging of the Smart City budget to expand the funds available for prototype development, technologies, engagement, research and IT. The goal will be to provide additional funding every year for the project and to extend the five year length of the funding to maximize outcomes for Yellowknife's Smart City evolution.

COST SAVINGS

Yellowknife will see improvements in the well being of citizens as the Smart City Plan is unrolled. There will also be corresponding financial savings that will be linked to the rollout of the technologies. Although it is not possible to fully forecast savings, due to the unknown nature of costs, this project anticipates savings on several fronts. The dimmable lighting will be more energy efficient than the current LED lighting. By dimming

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

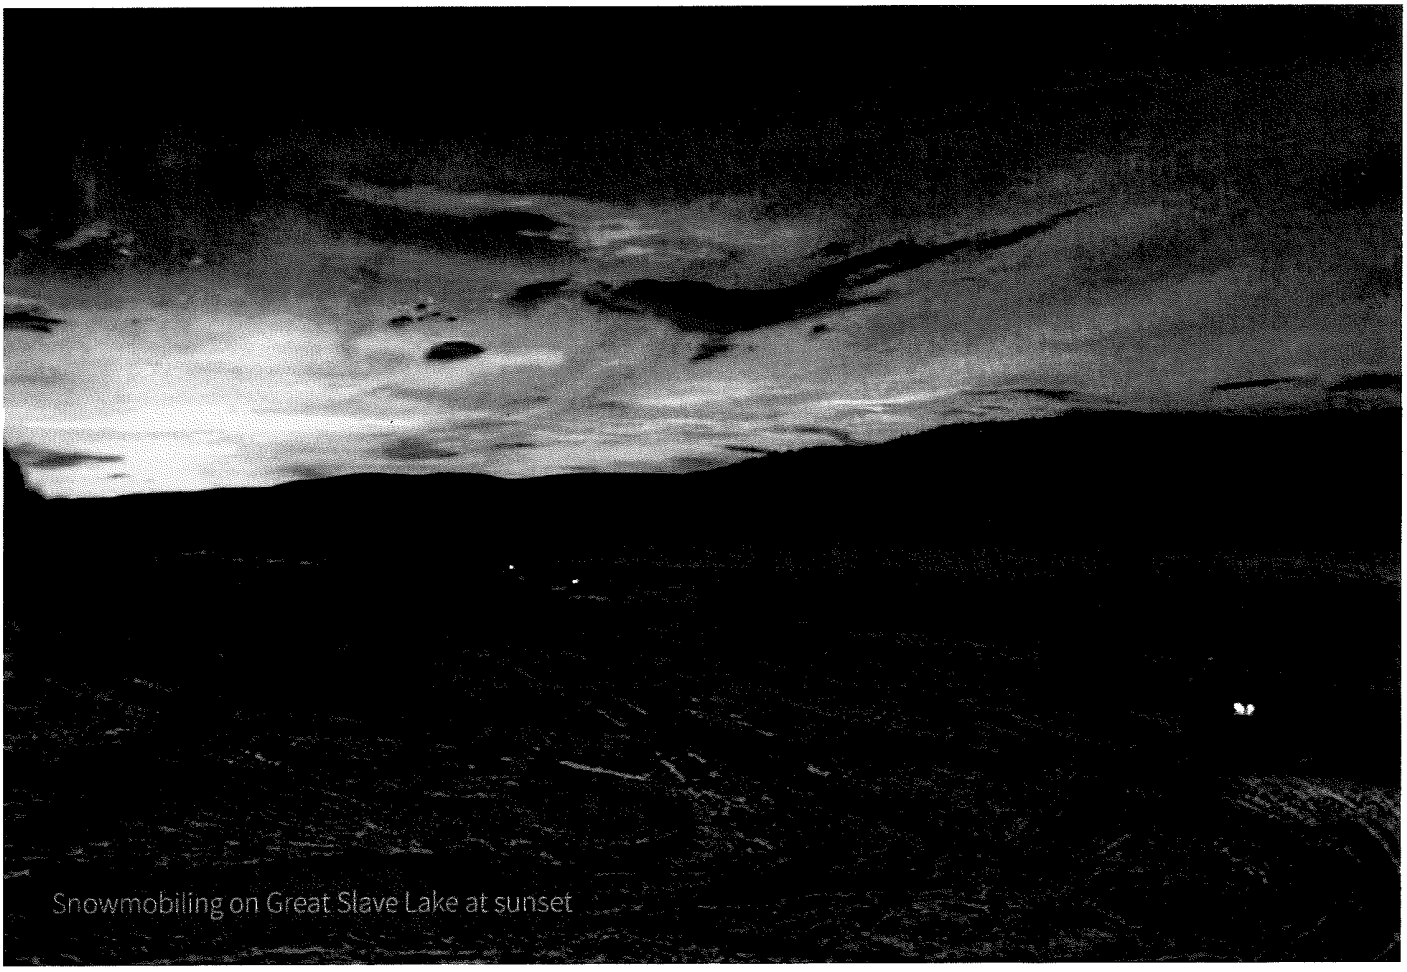
the lights to a lower electrical load for the majority of the time, there is an anticipated savings of both energy and cost. Currently Northland Utilities owns the lampposts and rents them to the City. The smart streetlights will reduce energy which should translate in a cost savings to citizens.

The introduction of sensors linked to the mesh network will also help the City to reduce costs. Although it's too early to forecast what those savings might be, there is evidence to suggest that city services would be improved by sensors, and those cost savings could be reinvested to improve municipal service delivery. A few promising applications are in the early detection of water leaks, improving the efficiency of trucked water schedules, solid waste removal efficiency increases and trucked sewer pump-out. There are considerable costs to water treatment, but in Yellowknife an additional cost is heating the water to 4 degrees Celcius to help limit freezing as the water spreads out around the system. A conservative assumption of a 10% reduction would equal over $20,000/yr saving and save 59 tonnes of CO2.

Another important positive impact though will be to improve the long term growth of the tourism industry. In 2017, aurora tourism brought in $57 million to the Yellowknife economy. But the Aurora tourist economy is cyclical and there is more and more competition for lucrative aurora tourism visits. By taking a Smart Cities approach, installing smart lighting that makes Yellowknife's Extraordinary skies more visible, and providing beacon technology and other tourism products in the home language of aurora tourists, the City of Yellowknife will set itself apart from the competition and ensure a stronger tourism product and boost in revenues. Finally, the City is very excited to transform Yellowknife by putting the pieces in place for cold weather innovation in the Smart City realm. An innovation based knowledge economy will promote entrepreneurial and business opportunities, add a growing sector to the economy, reinvigorate the downtown, and make Yellowknife into a unique laboratory for Smart Cities innovation in a northern setting.

Another opportunity for potential is with ties to academia. The City is well positioned to improve partnerships with academia and the Smart Cities framework would be a big area of potential growth, as would the proposal to bring a Polytechnical University to Yellowknife, and how that campus could be grown from scratch as a Smart Campus. These ideas have not been fleshed out in this proposal but the City is eagerly anticipating opportunities to leverage the Smart Cities challenge into a new and burgeoning growth area in the City.

Approximately $25,000 was budgetted for the pilot project of which half was dedicated to initial capital costs and the remaining for lights and installation. The installation of eight lights works out to approximately $1,500 per light.



The $5M award would provide us with the opportunity to scale up the project and expand through most areas of town, with a particular focus on residential neighbourhoods. Budgets, capacity and feedback would be continually considered to ensure that the project is in line with City goals and expectations of the Smart Cities funding requirements.

A more robust financial analysis will be linked to the updating of the City IT hub once recommendations brought forth by the IT Strategic Plan have been vetted by Administration and stakeholders.

As the City pushes the envelope for a more connected and innovated North, Administration will ensure that innovation and risk is balanced with financial accountabilty and continual verification to ensure that deliverables are relevant and that expectations are manageable.

CHAPTER 9

IMPLEMENTATION PHASE REQUIREMENTS

In this chapter the City of Yellowknife intends to show how it will meet requirements of applicable federal, territorial and municipal reporting and policy requirements.

DUTY TO CONSULT WITH INDIGENOUS GROUPS

The Duty to Consult with and accommodate Indigenous Peoples is required when the Crown contemplates actions or decisions that may impact treaty rights. Being a northern city with a close relationship with the Yellowknives Dene First Nation (YKDFN) with whom the City shares a border and with whom we count many shared citizens, it is critical that consultation and collaboration are consistent with the high ideals of both the Crown and the City.

To this end the City of Yellowknife is enthusiastic and proud to have YKDFN as partners in this project. YKDFN will participate in the governance of the project as part of the Smart City Committee and the community of N'dilo and Dettah will share opportunities to participate in the outcomes of the Smart City project.

The City has taken clear steps to include the YKDFN in the finalist stage of the proposal through the design charette and sharing the proposal for review with YKDFN. As a key partner YKDFN will play a key role in designing the strategies and outcomes as part of the Smart City Committee, and we anticipate showcasing YKDFN and Yellowknife history and culture in the engagement portion of the Smart Cities Implementation.

COMMUNITY EMPLOYMENT BENEFIT

Yellowknife's Smart Cities Challenge project intends to support employment opportunities for youth, Indigenous elders, artists, recent immigrants, youth and small-sized and medium-sized businesses and social enterprises. By having targeted workshops, technology based challenges, projects and contracts through the research and engagement budget, it is hoped that creative tools and engagement opportunities will encourage participation of targeted groups to build excitement and opportunities for inclusion into a Smart City. Participation will be tracked and specific engagement sessions and opportunities will be included .

Putting in place the conditions for innovation to flourish will allow for a rise in circular economy, green jobs and social innovation to take place. Turning Yellowknife into the Tourism Capital of the North will benefit all of Yellowknife and YKDFN, and the City will promote opportunities for cultural tourism. Yellowknife as a northern hub for innovation and a Smart City will set about the groundwork for a surge in small scale entrepreneurship, innovation and the knowledge economy.

Executive Summary

Canada is trying to create a smart technology future. Biigtigong Nishnaabeg First Nation is trying to revitalize their indigenous language and culture while preparing their K-12 students for the smart technology future.

By utilizing open source software and results-oriented approaches to facilitate effective online learning, effective online acquisition of their endangered Nishnaabe language, and revitalization of their culture - all as an enhancement to their brick-and-mortar K-12 curriculum delivery model, Biigtigong Nishnaabeg are transforming their youth into better-educated, more employable, better-grounded, and more holistically Nishnaabe people.

The graduates of their K-12 curriculum will be able to nearly-completely understand their Nishnaabe language (which is a first-step on the way to becoming a speaker of *any* human language), will have been educated on the interface of the their Nishnaabe worldview with the STEM subject perspectives, will have had increased involvement in real-world traditional Nishnaabe activities in the territory of the Biigtigong Nishnaabeg, will have experienced increased relationship-building with all community members especially in the context of those traditional activities, will be able to code, to build and control robots, and will have been educated in the entire exam preparation curriculum of a general-accepted best-starting point certification to enter the IT working world.

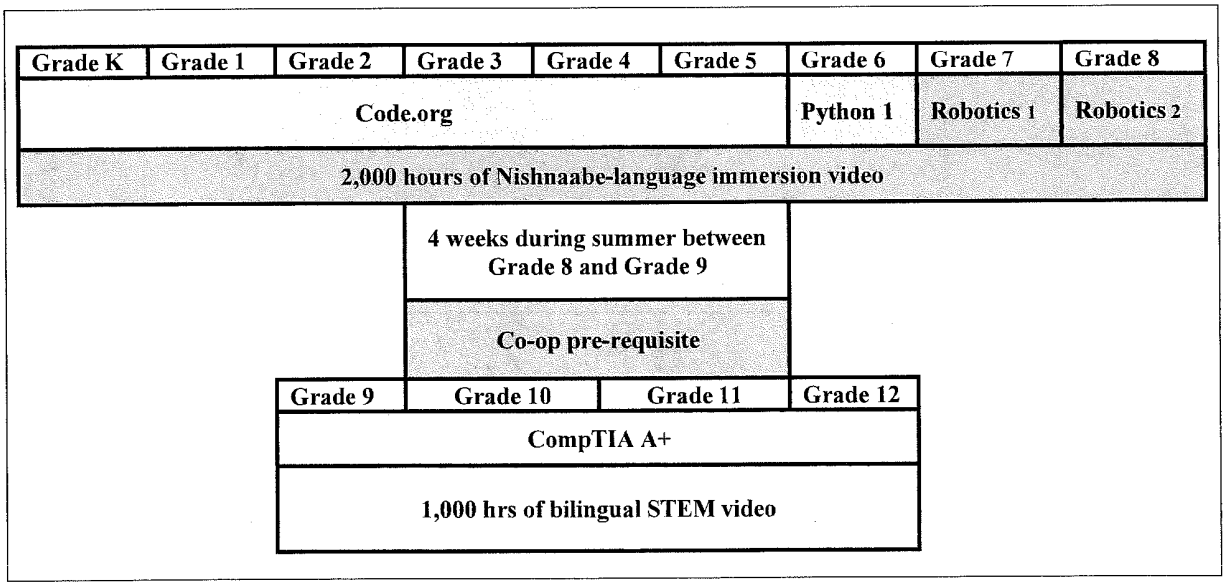
Chapter 1: Vision

Challenge Statement Vision

Our Challenge Statement reads:



> *By means of active, cross-generational, technology-empowered, real-world participation in the intergenerational transfer of traditional Nishnaabe knowledge through the medium of our language, and the bilingual delivery of modern K-12 STEM knowledge, our community will transform our youth into better-educated, more-employable, better-grounded, and more holistically Nishnaabe people.*

Please see Figure 1-1 for a graphical representation of the "bilingual delivery of modern K-12 STEM knowledge" which we propose in our Challenge Statement.

Outcomes Produced by Carrying Out Our Vision

Our final proposal will carry out the vision of our Challenge Statement and will produce the outcomes laid out in our application.

Figure 1-1: Our bilingual delivery of modern K-12 STEM knowledge. These proposed augmentations to our current K-12 curriculum are partially rolled-out during implementation year 1*, and fully rolled-out at the start of implementation year 2.

** For a rollout schedule of each year of implementation, please see Appendix B.*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Our final proposal seeks to achieve the four outcomes listed in our Challenge Statement:

(1) **youth who are "better-educated"** due to
   a. their having successfully completed a greater number of K-12 STEM subjects post-proposal implementation than they successfully completed pre-proposal implementation; and
   b. their increased preparedness for college and university as a result of their having successfully completed a greater number of K-12 STEM subjects post-proposal implementation than they successfully completed pre-proposal implementation;

This outcome is measurable via these progress indicators:
- Increase in number of K-12 STEM courses successfully completed by K-12 students, beyond what is currently offered in our K-12 curriculum
- Decrease in percentage of K-12 students needing remedial help in STEM subject areas

(2) **youth who are "more-employable"** in current jobs, as well as in yet-to-be-known types of STEM-related jobs, which require knowledge / expertise in the K-12 STEM subject areas;

This outcome is measurable via these progress indicators:
- Increase in number of K-12 STEM courses successfully completed by K-12 students, beyond what is currently offered in our K-12 curriculum
- Increase in number of K-12 students who have at least a basic ability to code

(3) **youth who are "better-grounded" in their Nishnaabe identity** due to
   a. their knowledge of our core aadsookaanan; and
   b. their increased participation in our community's traditional Nishnaabe activities;

This outcome is measurable via these progress indicators:
- Increase in number of K-12 students who know the key concepts expressed in each of our core aadsookaanan
- Increase in number of traditional Nishnaabe activities in which each K-12 student, on average, participates per year

(4) **youth who are "more holistically Nishnaabe"** due to
   a. their ability to nearly-completely understand our spoken Nishnaabe language; and
   b. their increased participation in our community's traditional Nishnaabe activities; and
   c. their knowledge of the roles of our Nishnaabe worldview in modern technological society

This outcome is measurable via these progress indicators:
- Number of hours of Nishnaabe language acquired by graduating eighth-graders is at least 2,000 hours
- Increase in number of traditional Nishnaabe activities in which each K-12 student, on average, participates per year
- Number of hours of Nishnaabe-language STEM video successfully completed by graduating high school seniors is at least 1,000 hours

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The way in which our final proposal carries out the vision of the Challenge Statement, achieving our four outcomes, is via the following six activities/projects:

(1) **"active participation"**

We mean active in contrast to passive, where active participation includes engaged Khan Academy-style Growth Mindset blended learning pedagogical approaches – approaches which take into account the recent discoveries on how humans beings more effectively learn knowledge in online and hybrid (online and brick-and-mortar, combined) environments; calls to real-world action on our online, mobile-enabled platform (particularly on the eLearning, eAcquisition, and meetup forum functionalities of the platform), online forums, and online community discussions; real-world, hands-on activities undertaken and completed in a group setting, our youth wrapped in the embrace of the community network; strong encouragement to attend community events, with those community events effectively and articulately made known to all community members via our online forums and discussions.

This activity/project achieves the following outcomes:

- **youth who are "more holistically Nishnaabe."** Community-engagement is a foundational component of our Nishnaabe way of living. Actively participating, not just in social activities – which are, indeed, foundationally important to community vibrancy and individual flourishing – but also being actively engaged in our own learning – both formal and informal – is a key to success in whatever role a Nishnaabe individual plays in the community. Actively participating in the whole of the Nishnaabe community is an imperatively important requisite for one's wellness as a Nishnaabe person.
- **youth who are "better-grounded" in their Nishnaabe identity.** Our Nishnaabe people cannot be only *knowledgeable* of our social norms and ways of being. This knowledge must be *implemented* in one's life in order for one to be a whole Nishnaabe person. Similarly, much knowledge can be obtained through the very act of active participation in one's community. Knowledge and active participation are thus connected. Active participation leads to knowledge. Knowledge, in turn, leads to active participation. In order for a Nishnaabe person, then, to be more knowledgeable – better-grounded – in being Nishnaabe, active participation in the Nishnaabe community is required.

(2) **"cross-generational participation"**

Cross-generational participation means not just youth/students, but community members from the entire span of ages, from all generations.

This activity/project achieves the following outcomes:

- **youth who are "more holistically Nishnaabe."** Similar to the reasons given in the above section on the active participation requisite for one's being holistically Nishnaabe, all sectors of our Nishnaabe community must have a space and a place to participate. Each age group brings a diverse set of experiences, gifts, and knowledge to our collective Nishnaabe community, and to the overall wholeness of each of the individuals within the community. The participation of everyone, from all generations, is required for each of us to be holistically Nishnaabe.
- **youth who are "better-grounded" in their Nishnaabe identity.** We Nishnaabe people believe that everyone – no matter one's age – is a teacher and a contributor to the collective's knowledgebase. Encouraging and ensuring the participation of all generations

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

provides a maximally diverse dataset of experience as knowledge, made available to and learnable by each and every Nishnaabe community member who participates in community events. This cross-generational participation leads thusly to better-grounded Nishnaabe community members.

(3) **"technology-empowered participation"**

Technology-empowered participation refers to engagement with the eLearning and eAcquisition functionalities of the Open edX platform; engagement in Open edX's meetup discussion forums for traditional Nishnaabe activities; online platform discoverability of friends'/relatives' locations and currently-happening traditional activities in order to encourage students to, in like manner, take part in those made-discoverable activities.

This activity/project achieves the following outcomes:

- **youth who are "better-educated."** Knowing not just about technology, but being – and being comfortable – in a technology-oriented mindset, versed in the social expectations and norms of this modern way of interacting with our technological world is prerequisite knowledge and an imperatively important education to have. Just being able to navigate this brave new world of technology is a plus on one's curriculum vitae, and our proposal's implementation will yield for our Nishnaabe youth exactly that: a better education through the experience of successfully participating in this new technology as a means to better one's self educationally.
- **youth who are "more employable."** The technology-empowered participatory tools – the rules of online community engagement – that will benefit our Nishnaabe youth are, in many cases, the precise job skills required to even be considered for a job interview. Online forum etiquette, respecting boundaries of online relationships, being responsive to and responsible for timely replies to online community engagement requests and relationships, and a host of other modern technological communication social norms – the very skills and education that our proposal will instill in our Nishnaabe youth – are what will help prepare our Nishnaabe youth to be effectively and productively employed in today's – and the future's – job market.

(4) **"real-world participation"**

Smart technology is an enabling factor, a factor which enables real-world participation – not just online participation, but participation in the real, material world. The world of touchable human beings, hugs, babies, tears, family, and love. Our proposal intends to implement this technology to facilitate and encourage participation in real-world community events.

This activity/project achieves the following outcomes:

- **youth who are "more holistically Nishnaabe."** Being Nishnaabe means being community-oriented. Participating and being an active, contributing part of the lives of those whom we are networked within our territory is a requirement of our communal approach to effective and productive existence on this earth. Participating in the real world, the material world, of our Nishnaabe community is thus a requirement of being a whole Nishnaabe.
- **youth who are "better-grounded" in their Nishnaabe identity.** Being better grounded means being better educated. And being better educated happens, in part, by being around

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

the educated and knowledgeable ones. For Nishnaabe people, all activities are a teaching opportunity – and thus a learning opportunity. Being out and about in the community leads naturally to discussions with people more knowledgeable than us, which in turn leads to becoming more knowledgeable ourselves – more educated, and thus better grounded.

(5) **"intergenerational transfer of traditional Nishnaabe knowledge through the medium of our language"**

Our proposal aims to produce 2,000 hours of Nishnaabe-language immersion video, the content of which will be our core aadsookaanan (our sacred stories, our philosophical foundations, the building blocks of our worldview). Our aadsookaanan are, in part, the imperatively important intergenerational knowledge which has been passed on – in story form – for countless generations. The acquisition – language *acquisition* (subconscious) in contrast to language *learning* (cognitive) – of 2,000 hours of a target language yields an individual who can nearly-completely comprehend that target language. The target language in this case is our Nishnaabe language, and it is with this 2,000 hours of immersion video of our aadsookaanan that we intend to create understanders of our Nishnaabe language – understanders who can then go on to successfully complete 1,000 hours of STEM subject non-immersion video (i.e., what we usually refer to in this proposal as 'bilingual STEM video'), the audio of which is delivered in our Nishnaabe language.

This activity/project achieves the following outcomes:

- **youth who are "more holistically Nishnaabe."** Being a whole Nishnaabe requires that one be a speaker of one's Nishnaabe language. While this proposal is not big enough to facilitate that particular outcome, becoming an understander of our Nishnaabe language is, indeed, attainable within the timeframe of this proposal. And, since we are aiming for "more" holistically Nishnaabe, becoming an understander of our Nishnaabe language fits the bill quite nicely. Two points here: (1) being able to understand one's indigenous/heritage language, for a member of any culture, seems obviously contributory to one's being more holistically of that culture and identity; and (2) walking around in the world with a headful of knowledge that got into one's head via a foreign language does not make for a very "holistically Nishnaabe" person. While knowledge and education are important in their own right, it is more holistic for that knowledge and education to have entered one's head in the medium of one's own indigenous/heritage language. So, our youth being able to understand our Nishnaabe language which in turn makes possible their learning content of a modern K-12 STEM curriculum delivered in the medium of our Nishnaabe language is a powerful contributor to their becoming more holistically Nishnaabe.
- **youth who are "better-grounded" in their Nishnaabe identity.** Knowing about one's cultural identity is self-evidently important to one's wholeness. But, knowing the main tenets of the core philosophies of one's culture is absolutely key to one's being well versed in the oral/written stories/literature of one's culture – especially when one considers the importance of learning this information through the medium of one's language. Learning the main ideas expressed in our Nishnaabe aadsookaanan, through the medium of our Nishnaabe language, produces Nishnaabe youth who are more knowledgeable of, thus better-grounded in, their Nishnaabe identity.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

(6) "bilingual delivery of modern K-12 STEM knowledge"

This activity/project refers to the combination of our English-language K-12 STEM curriculum and the 1,000 hours of bilingual (Nishnaabe-language and English-language) STEM video. Please see Figure 1-1 for a graphical representation of this post-augmented curriculum. Our bilingual STEM video will, in part, teach our grade 9-12 students about the role of our Nishnaabe worldview in modern technological society. In particular, our bilingual STEM video will show that there is no conflict in the explanations provided by modern-day STEM and our Nishnaabe worldview. More specifically, our bilingual STEM video will enlighten our students about the relationship between the teachings of our aadsookaanan (which we can refer to with more culturally-neutral terminology as 'allegorical narrative,' or simply 'mythology') and STEM: the role of science is to explain/show/teach what *is*; the role of mythology is to explain/show/teach *why* (metaphysically why) something is.

For example, the scientific explanation of lightning and thunder (that lightning is a huge electrical discharge that flows between clouds, from a cloud to air, or from a cloud to the ground; and that thunder is in turn caused by lightning), and our Nishnaabe worldview explanation of this same phenomenon (that thunder beings are engaged in an eternal battle with the great underwater lynx; an allegory for the eternal battle between good and bad). Only in modern times have these two traditions (i.e., mythology and science) been viewed by some as 'in conflict,' or 'in competition.' Historically, however, throughout the world's indigenous societies, at least, mythology has made science more culturally fitting – not tried to compete with, nor replace the role of, science.

Mythology has *not*, historically, tried to do the work of the STEM fields. Mythology and STEM have, historically, been partners in explaining the world around us in a culturally-appropriate – and usually quite poetic – manner. In similar fashion, this is the function of our bilingual STEM video, and the role of our bilingual delivery of modern K-12 STEM knowledge, in general: to explain the scientific, material world around us in a culturally-appropriate - and usually poetic – manner. This activity/project achieves the following outcomes:

- **youth who are "better-educated."** The need of this generation of K-12 students for a solid STEM subject area education is undeniable. One need only browse the course descriptions or syllabi of almost any college/university curriculum to find the very long list of requisite technology, math, science, programming knowledge for those majors and academic program paths. Providing our youth with thirteen years of a modern, K-12 STEM curriculum will provide them with the tools, knowledge, and mindset to succeed in the increasingly demanding curriculum of this modern technologically-driven world.
- **youth who are "more employable."** For reasons similar to the ones given in the above paragraph, our youth who have successfully completed our bilingual, modern K-12 STEM curriculum will not only be better prepared for college and university. The college and university curriculums are being designed, in part, to produce graduates who are more employable in this technologically-driven world and job market. Our youth, having completed such solid preparation as provided for them by our K-12 STEM curriculum, will thus be more employable. And, not only after college/university; but, also in the high-school graduate job market, as well.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- **youth who are "more holistically Nishnaabe."** One's having been educated in a particular subject area is an accomplishment on its own. Having been educated in a particular subject area in the medium of one's indigenous/heritage language, with that education couched in the worldview and perspective of one's mythology and culture, is an even greater accomplishment; and, an accomplishment contributing greatly to one's wholeness as a member of that language community.

The achievement of our six activities/projects, and their consequent four outcomes, are enabled by the creation of an online, mobile-enabled platform able to carry out the following three functions. We have chosen the Open edX platform for this purpose. (While we originally envisioned having three separate platforms/applications for each of the three functions, we have, during the finalist phase, opted to wrap all three of these functions into one 'Learning Management System' (LMS) platform, namely Open edX.) Open edX is open source software and facilitates the production of materials to be made available under a Creative Commons license. The three functions being fulfilled by the Open edX platform are:

(1) **eLearning.** Mobile-enabled eLearning functionality is built into Open edX with open source technologies and languages, enabling interoperable, scalable, and replicable results by any other community or organization choosing to implement a similar platform. eLearning functionality will facilitate the collection of real-time data on all aspects of community-based, online, collaborative learning, and the storage of that data in an open source database backend enabling other departments and organizations within our Biigtigong Nishnaabeg community to seamlessy access and utilize this data.

(2) **eAcquistion.** Mobile-enabled eAcquisition functionality will be nearly identical to our eLearning functionality, but will have the added responsibility of enabling the effective acquisition of our Nishnaabe language. As our community makes a strong distinction between language *learning* (a conscious, cognitive process) and language *acquisition* (which occurs subconsciously), we need to keep these two functionalities independent of each other so that each one's unique pedagogical approach can be implemented effectively.

(3) **meetup forum.** Mobile-enabled meetup forum functionality will serve as the central 'online gathering' place which will facilitate the bridging and interfacing of the digital world with the material, real world. All community members will have access to each other via this online gathering place. This functionality within Open edX is where our youth who are hoping to attend a particular traditional Nishnaabe activity can express their interest to do so. Other community members then have the ability to invite our youth along to that event. Likewise, community members who are planning an activity can now express their intentions in the meetup forum functionality of Open edX thereby providing additional options for our youth to take part in while remaining in the embrace of the real-world community network.

Data: Outcomes are Reflective of True Needs of Community

Our outcomes are reflective of the community needs. We conducted extensive community engagement sessions throughout the development stage of our proposal. These sessions were aimed at specific stakeholders and the community at large, including our off-reserve members. Through presentations, discussions, surveys, small group meetings, family meetings, luncheons, social events, we successfully engaged a large number of our community. 221 unique members attended at least one of our engagement sessions and 121 individuals completed our extensive community survey. Chapter 6 provides the findings from our engagement sessions and how community input improved our proposal.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Outcomes are Ambitious and Achievable

Firstly, there exist extremely high unemployment rates for our youth, independent of industry. When we consider only the STEM fields, these unemployment rates for our youth are absurdly high. Our proposal will help to alleviate this.

Secondly, this proposal will move Nishnaabe people from being mainly passive consumers of technology to being active, effective STEM-educated administrators, managers, and users of data and connected technology who are able to achieve meaningful outcomes for themselves, their community, and other communities.

Thirdly, our outcomes are ambitious because we, similar to other Nishnaabe/indigenous communities, have only one high-proficiency first-speaker of our dialect. A survivor of the Canadian Indian residential school system, she is 82 years old. We have only another two medium proficiency first-speakers of our dialect. They are both in their 70s. When they leave, so will our dialect.

So, over the last five years, we have been hurriedly working with a high-proficiency second-language speaker of a related dialect. He has spent the last five years working with our elders to reconstruct our dialect. (Our Biigtigong dialect's noun declension charts, verb conjugation charts, and dictionary are all currently available on our language website, biigtigong.com, under a Creative Commons license). He is now able to 'grammar bridge' into our Biigtigong dialect from the dialect which he originally acquired; he is thus able to speak and write in our Biigtigong dialect. It is his Nishnaabe-language audio which will be heard on all 3,000 hours of video which our proposal aims to produce.

It is important for us to note here that the method which he used to become a speaker of the Nishnaabe language – he began acquiring the Nishnaabe language almost 20 years ago when he was in his 30s – is the very method of second language acquisition that we're using in our proposal to transform our Biigtigong youth into understanders of our dialect.

Whether we consider the Royal Commission on Aboriginal Peoples, the work of the Truth and Reconciliation Commission, the United Nations Declaration on the Rights of Indigenous Peoples, or that the United Nations General Assembly has declared 2019 the International Year of Indigenous Languages (IYIL2019), we have before us – "us" being Canada and we Biigtigong Nishnaabeg – an ambitious *opportunity*, indeed. An opportunity to move forward. Together. As partners. Collaboratively, we can produce the means by which Nishnaabe people can *forever* be able to become understanders (on their way to becoming speakers) of the Nishnaabe language. That's pretty ambitious.

Our outcomes are achievable because a community such as ours, Biigtigong Nishnaabeg, who has for many, many generations been healing, repairing, reconstructing, and unendingly facilitating the education and holistic Nishnaabe being of each and every one of our community members, as a collective unit, as a community, is quite the solid foundation on which to implement this proposal. The outcomes sought by this proposal are quite achievable, indeed.

Outcomes are Meaningful for the Community and Residents

Our proposal has been met with overwhelming support from our community since the very start of our Smart Cities journey. Biigtigong Nishnaabeg has been working on the revitalization of our language and aadsookaanan many years before we started work on this Smart Cities Challenge. Our Smart Cities final proposal further facilitates profoundly meaningful goals of the community which were set in motion decades ago.

support long-term project

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Our chief, Duncan Michano, has, for many years, shared with a great number of people his vision of educating our youth in the ways of physics, engineering, quantum mechanics, computer science, and coding. There has been a marked increase in the community's excitement around these conversations in the last four or five years in particular. Especially for our young Nishnaabe people. (For example, we already have elementary school-age kids in our community who have gone off to earn a certificate in LEGO Robotics and Programming offered by the Digital Media Academy at University of Toronto.)
Our children and youth have always been the center of our Nishnaabe society. They are, in a very real way, our future. They carry our entire ancient past, and our ongoing present, into the unknown, the future. It is difficult for our community to imagine something *more* meaningful than the betterment of our youth in this modern technological society while helping them to carry with them, as they move forward into the future, our Nishnaabe language and our Nishnaabe worldview.
The outcomes of our final proposal are, *indeed*, meaningful for our community and our residents.

Our Proposal is Well-Suited to a Smart Cities Approach

Our proposal is very well-suited to a smart cities approach.

Smart Cities Approach Principle: Openness

By making our language accessible for the first time through an online platform that can be accessible by anyone at anytime. We will also provide a model for integrating immersion education and STEM education into a standard curriculum. K-12 STEM learning can augment immersion-based cultural learning and immersion-based cultural learning can augment K-12 STEM learning.

By preserving as *open* data, a subset of our language in a certain format (i.e., in the format of *understandable* language which is able to produce understanders of our language after 2,000 hours of viewing), we not only facilitate the survival and thriving of our language into the future, we are also providing a model for other First Nation communities – as well as other communities and groups – to do the same. This initiative will strengthen the relationship between residents and government and public organizations and will help to fulfill Canada's goal of reconciliation with First Nation communities.

Smart Cities Approach Principle: Integration

Currently, our language and aadsookaanan are at risk of being lost. Through the use of connected technology, and by recording this data – including much of our raw cultural data being preserved/made-available on Open edX – we are ensuring that our community knowledge is maintained for our Biigtigong Nishnaabeg generations to come, for the benefit of Canadians, and for the benefit of the world. By this democratization of cultural knowledge, we are thus breaking down silos that exist even in our traditional societal structures. Similarly, modern-day administrative and learning management roles of K-12 teachers, of parents, of elders, and of governmental leadership, are also all further facilitated by the increase in frictionless availability of data made possible via the removal of data silos.

Smart Cities Approach Principle: Transferability

We have provided an open source, standardised, and transparent approach to integrating immersion-based cultural education and STEM education into any school curriculum - all of the videos we are producing can be overdubbed in any other language. The approach to building community capacity, through embracing language, culture and STEM can be replicated across the country regardless of a community's size or resources.

This approach is not limited to one language only. The language in question could also be Cree, Mohawk, French, or Italian, for example. There may be a need across the board - in perhaps most, or even all,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

cultures - to augment STEM learning with language-based cultural education; a need to combine, merge, and interface the digital connections with physical community. In our approach in this proposal, the meetup facilitation functionality of Open edX achieves this. Our proposal moves us into the future by embracing and continuing to facilitate the merging of the digital-world and the real-world in order to create a *truly* smart city that uses data, digital connection, and an online platform to enable intergenerational transfer of knowledge – both traditional language and STEM knowledge and education – education to create better-educated, more employable, better-grounded, and more holistically Nishnaabe(in our case) people.

Our approach is suitable for communities of any size, any location, any level of resources, and is easily replicable and scalable. We see our proposal as an ideal 'onboarding' approach for any community – almost regardless of access to technology-trained staff – to a more STEM-infused culturally-based/appropriate/infused community. Implementing the bleeding-edge STEM technologies – as a first step - is not, in our opinion, viable for many communities.

The approach we are taking – and advocating for – in our final proposal is not unlike the strategy of early-years Netflix as that company disrupted the DVD-rental industry. Netflix's secret weapon in their successful venture? The post office! Not the most modern of 'technology,' to say the least. While Netflix, of course, employed a host of other approaches and tactics, beyond its utilization of the post office, the company's achieved outcomes are still remarkable given the common 'technology' they employed. We view our smart cities final proposal in a similar light. We have deliberately chosen to deliver *bleeding-edge, four-star quality* outcomes by utilizing *common* smart technology, instead of delivering *common* outcomes by utilizing *bleeding-edge, four-star quality* smart technology. We believe that this approach will maximize the replicability of our approach - and the spread of smart technology - across Canada.

Our proposal is an onboarding approach to smart cities. Not every community has the resources, staff, equipment, Wi-Fi access, etc. to implement cutting-edge smart technology. There is a need to build STEM *knowledge* first, through the method developed in our proposal. What good are sensors and data collection if we do not have the knowledge and appropriate cultural lenses to extrapolate meaning from them? Creating a digitally-literate population is, in our opinion, absolutely essential to ensuring long-lasting smart cities - not just a fad technology that is used for a short period of time.

Lasting and impactful community change, through STEM education, and reconnection with culture through language, along with the use of common, newbie-friendly smart technology is of key importance in the overall strategy of facilitating transferability. Our approach to integrating STEM education into a K-12 curriculum is, indeed, transferable; it can be implemented in any school across the country.

Smart Cities Approach Principle: Collaboration

This technology will enable cross-generational and cross-cultural collaboration as we build a future of digitally-literate and more culturally whole youth who will lead the smart cities of tomorrow across Canada.

Progress During Finalist Phase

Progress toward our outcomes has already been achieved during the finalist phase. We:

- organized and facilitated community consultation events, each with a particular community sector focus
- implemented some changes in organization structure: established teams, roles and responsibilities, etc.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- begun several pilot projects: story writing; aadsookaanan reconstruction; and Waawaa video production
- utilized community surveys to determine several baselines
- set up a framework for data collection and baseline measurement of progress
- produced prototypes of immersion video overdubbed with audio of Biigtigong's dialect
- developed some tools to assess staff training needs
- researched approaches to and formalized a framework for the reconstruction of our aadsookaanan
- successfully piloted Makey Makey, Scratch, and Code.org at our elementary school
- formalized our partnerships
- continue our community engagement sessions with our off-reserve and on-reserve members
- pilot with our elementary school staff and students a sampling of online classes
- further develop the interfacing of our Nishnaabe approach to learning and the Growth Mindset Approach
- continue 'Waawaa' immersion video production, evaluation, and instructor professional development

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 2: Performance Measurements

Strategy

An outcome-based performance approach is a results-based management tool that can be used to guide the selection, development and ongoing use of performance measures. For this project, this strategy will be adopted, which will enable the project team to continuously monitor and assess the results of programs as well as make informed decisions and take appropriate mitigation actions should they be required. A success outcome-based performance measurement strategy will also provide effective and relevant departmental reporting on the program and ensure that credible and reliable performance data is being collected to effectively support evaluation.

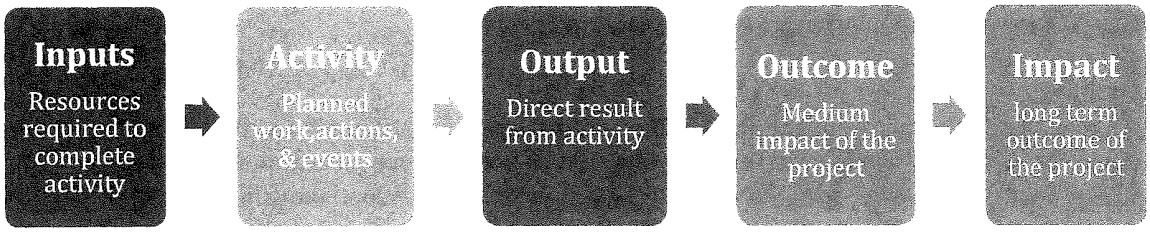
Approach

The key to achieving the desired outcomes of this project is to set clearly defined goals which are achievable for the timeline of this project. This will involve defining metrics that can be set to clearly measure the project's success, as well as to identifying any deviations which can then be quickly remedied. The metrics to be used for this project will follow the SMART methodology for goal setting, as defined below:

1. The set outcomes of this project are ***Specific***
   The desired outcomes for this project are clear, well defined and based upon the specific requirements for the completion of this project.

2. The set outcomes of this project are ***Measurable***
   Metrics have been developed to measure the progress of this project. The project team will use these metrics to assess levels of project completion and identify any deviations.

3. The set outcomes of this project are ***Achievable***
   The set outcomes of this project were developed by assessing and interpreting relevant data and by receiving input from various experts in relevant fields.



4. The set outcomes of this project are ***Relevant***
   The defined outcomes of this project are essential for the overall success of the project and were developed by pinpointing the specific needs of the project and by having discussions and input from stakeholders.

5. The set outcomes of this project are ***Time-Bound***
   The outcomes of the project have set target dates for completion based upon required inputs, activities and outputs.

Logic Model for Performance Measurement

A basic logic model will also be used to understand the process of measuring each metrics' impact throughout the project. As shown below performance measures can be depicted linearly, however, it is important to note that for each input and relative activity there will be short, medium and long-term results.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

As part of developing our measurement approach, the project team completed a resource assessment which has resulted in the identification and classification of the project's inputs. The project team has also developed an implementation plan for the activities required to achieve the desired outcomes and impacts. Each of these activities has an associated immediate output which will then result in the desired outcomes and impacts that are essentially the goals of our project. Further details on the aforementioned activities (resource assessment, implementation planning, and objective/outcome setting) are included in the Project Management Plan, presented in Chapter 3. The project specific components of the above logic model are summarized in the following sections:

Inputs:

Project Inputs can be defined as financial and non-financial resources used to complete project activities, produce outputs and achieve outcomes. Our project inputs include, but are not limited to, the following:

- Project team members (Chief and Council, Elders, Subject Matter Experts, Project Manager)
- Teaching Staff
- Procured software and technology (i.e. code.org curriculum, Open edX platform, etc.)
- Financial Contributions

Activities:

Project activities can be defined as the planned work, actions, and events that our project team will undertake to produce one or more outputs. The activities to be undertaken as part of this project include:

- Record written aadsookaanan (sacred stories)
- Produce Waawaa video
- Overdub videos in second language (Nishnabeweemen)
- Produce STEM videos
- Implement K-12 curriculum augmentation
- Upload all data and materials on Open edX

Outputs:

Outputs can be described as the direct result of the planned activities.

- Record of aadsookaanan (sacred stories)
- 2,000 hrs of immersion video
- 1,000 hrs of STEM video
- STEM curriculum framework and materials

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Digitized publicly accessible version of the above.

Outcomes:

Outcomes can be described as the medium-term impact of the project.

- Increase in number of K-12 STEM courses successfully completed by K-12 students,
- Decrease in percentage of K-12 students needing remedial help in STEM subject areas
- Increase in number of K-12 students who have at least a basic ability to code
- Increase in number of K-12 students who know the key concepts expressed in each of our core aadsookaanan
- Increased annual participation rate in number of traditional Nishnaabe activities for K-12 Students
- Minimum 2,000 hours of Nishnaabe language acquired by graduating eighth-graders
- Minimum 1,000 hours of Nishnaabe-language STEM video successfully completed by graduating high school seniors

3k hrs / 9 yrs (K-8)
= 222 hrs/yr
= ~~fff~~
~ 1-1.5 hrs/day
in a 200 day school year.

Impact:

Impacts can be described as the long-term outcome of the project. For the Biigtigong Nishnaabeg Smart Cities project this includes impacts to our community as well as to society as whole, as described below:

Community Impact:

- Youth who are "better-educated"
- Youth who are "more-employable"
- Youth who are "better-grounded" in their Nishnaabe identity
- Youth who are "more holistically Nishnaabe"

Social Impact:

- Preserved language
- Preserved cultural teachings
- Model for connecting STEM, and traditional/cultural learning
- Onboarding approach to creating Smart Cities regardless of current resources or capacity.

Indicators & Milestones:

Key Performance Indicators (KPIs) allow project managers to gauge whether the planned activities have been successful. This is measured by how well they have been able to meet the objectives of the project. The four (4) main objectives for the project have been outlined in Chapter 3. The completion of the activities outlined in the implementation plan for this project should satisfy the objectives of the project and should bring tangible value added to the community and society as a whole.

It is important to have both qualitative and quantitative indicators for tracking, measuring and evaluating performance, to capture the holistic perspective of the project goals. It is also important

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

to select a reasonable number of indicators to ensure that performance measurements are met and accomplished, while not over specifying and removing opportunities that may evolve throughout the project lifecycle.

Quantitative Key Performance Indicators (KPI):

The following section outlines some of the KPIs identified for the performance measurement process of our project. This section details the KPI, the data source and associated responsible resource. The table following this section summarizes this information in the context of associated outputs, outcomes, and target completion dates.

1. Number of aadsookaanan lessons created
2. Number of hours of video produced
3. Number of courses for which curriculum is implemented

The above KPIs are designed to track performance with respect to the outputs for this project. Data will be provided in the form of a summary report to be submitted by the SMEs to the project manager who will then report to the advisory committee on a biannual basis.

4. Number of K-12 STEM courses successfully completed by K-12 students
5. Percentage of K-12 students needing remedial help in STEM subject areas
6. Number of K-12 students who have at least a basic ability to code
7. Number of K-12 students who know the key concepts expressed in each of our core aadsookaanan
8. Annual participation rate in number of traditional Nishnaabe activities for K-12 Students

Qualitative Key Performance Indicators:

1. Teacher feedback and opinions
2. Student feedback and opinions

Other Key Performance Indicators

In addition to the specific KPIs that the project team has identified for tracking performance on specific project outputs and outcome, all outputs will also be evaluated through implementation of financial- and schedule-based KPIs. Financial- and Schedule-based KPIs for reporting on outcomes are less reliable and therefore these KPIs will only be associated with the following project outputs:

1. Estimated Budget vs. Actual Expenditures (Financial)
2. Target Completion Date vs. Actual Completion Date (Schedule)

Source of Data and Reporting Role and Responsibilities

With respect to tracking the Key Performance Indicators listed above, much of the data required including; participation rates, hours of aadsookaanan and STEM video developed, student grades etc. can be collected directly from the open-source online Open edX platform. Clear and concise

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

reporting of the Key Performance Indicators will also be a vital component when measuring the progress made throughout this project.

Since teaching staff will be responsible for the direct oversight of student's engagement with the curriculum (i.e. Grading), they will play a large role in assessing and reporting on the performance of students and the quality of educational materials developed. Reporting of these performance indicators will then be communicated to the project team for further analysis.
The project team will be responsible for tracking their internal performance, regarding budgeting and scheduling.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Program Outputs and Outcomes	Indicator	Data Source	Frequency	Baseline	Target	Date to Achieve Target	Data Collection Resource
Output 1 Record of aadsookaanan (sacred stories)	# of aadsookannan lessons created	Report from Elders and Project Team	Bi-annually	0	50	August 2024	SMEs – Elders &Project Manager
Output #2 – Immersion Video	# of hours of video	Report from Video Production Team	Bi-Annually	0	2,000 hrs	August 2024	SMEs - Video Production Team & Project Manager
Output #3 – Billingual STEM Video	# of hours of video	Report from Video Production Team	Bi-Annually	0	1,000hrs	August 2024	SMEs - Video Production Team & Project Manager
Output 4 - STEM curriculum framework and materials for k-12	# of courses for which curriculum is implemented	Teaching Staff and SMEs	Bi-Annually	No Grades	Grades K-12	August 2024	Teaching Staff
Outcome 1: Youth who are "better-educated"	• # of K-12 STEM courses successfully completed by K-12 students • % of K-12 students needing remedial help in STEM subject areas • Teacher opinion (qualitative) • Student opinion (qualitative)	Summary Report from Teaching Staff	Bi-Annually	None	Increase	August 2024	Teaching Staff
Outcome 2: Youth who are "more-employable"	• # of K-12 STEM courses successfully completed by K-12 students • # of K-12 students who have at least a basic ability to code • Teacher opinion (qualitative) • Student opinion (qualitative)	Summary Report from Teaching Staff	Bi-Annually	None	Increase	August 2024	Teaching Staff
Outcome 3: Youth who are "better-grounded" in their Nishnaabe identity	• # of K-12 students who know the key concepts expressed in each of our core aadsookaanan • Annual participation rate in number of traditional Nishnaabe activities for K-12 Students • Teacher opinion (qualitative) • Student opinion (qualitative)	Summary Report from Teaching Staff	Bi-Annually	None	Increase Reach and obtain Positive Opinion Feedback	August 2024	Teaching Staff
Outcome 4: Youth who are "more holistically Nishnaabe"	• Minimum 2,000 hours of Nishnaabe language acquired by graduating eighth-graders • Annual participation rate in number of traditional Nishnaabe activities for K-12 Students • Minimum 1,000 hours of Nishnaabe-language STEM video successfully completed by graduating high school seniors • Teacher opinion (qualitative) • Student opinion (qualitative)	Summary Report from Teaching Staff	Bi-Annually	None	Increase Reach and obtain Positive Opinion Feedback	August 2024	Teaching Staff

*All outcomes will also be subject to the financial and schedule based KPIs as described in this chapter and the proposal in general.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Payment Schedule

Understanding that the intent is to develop an outcome-based contribution agreement with Infrastructure Canada, where payments will be triggered by the successful achievement of progress toward outcomes, we have developed a payment schedule that is simple, manageable and associated with the completion of milestones as outlined in detail in Chapter 8.

Risk Management

Identifying risks that may be presented throughout the project lifecycle is an essential component of project management as it allows the project team to proactively establish mitigation strategies to effectively minimize the impact of the risk on the project before it occurs. The table below summarizes a list of potential risks related to the above Key Performance Indicators, as well as the associated mitigation strategies that will be implemented to ensure that the delivery of this content remains effective, up to date, and on schedule.

Risks	Mitigation Strategies
Lag in completing activities could negatively impact project outcomes	Project implementation plan includes Ramp-Up strategy to capitalize on efficiencies in activities
Lack of Student Participation	Incorporation of Immersion and STEM education into existing curriculum provides double-duty lessons to ensure student involvement
Difficulty with Curriculum Implementation	Ramp-up capabilities of Code.org (for example) means that students can be exposed to coding in Grade 5 only, and still proceed to Python in Grade 6, and Robotics in Grades 7 and 8. In other words, the first few years of K-5 curriculum implementation has a significant buffer to include all experience and skill levels. With respect to Grade 6 and above, and experience or previous coding exposure is an improvement on the current curriculum. By the end of the 5-year implementation period, it is expected that any obstacle associated with curriculum implementation will be overcome.
Resources (Human or Technological) are no longer available	Only a few language speakers and Elders can produce aadsookaanan. This highlights the critical nature of this project. The likelihood of any human resources no longer being available is very low, but the impact if this is the case would be significant.
Curriculum becomes outdated	Reliance will be placed on existing websites for STEM education (i.e. code.org). As these are established organizations, that are constantly updating and revising content to better engage youth and other users in this field, there is little chance that this curriculum will become dated. However, SMEs will continuously monitor content and explore alternatives should the desired content become outdated or unavailable.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 3: Project Management Plan

Introduction

A Project Management Plan (PMP) is used to manage the implementation of a project through the formal documentation of any actions necessary to define, prepare, integrate and coordinate the various project activities. The PMP defines how the project will be executed, monitored, controlled, and closed. Project Management is an iterative process and as such, the PMP acts as a living document, which is progressively elaborated upon throughout the course of a project. As part of the finalist stage, our project team has developed a Project Management Plan (PMP) for the implementation phase of the project that includes the following:

1. Project scope, scheduling, sequencing, and dependencies
2. Resource assessment, including human, material, and financial (e.g. workforce capacity, infrastructure readiness, and related initiatives already underway) that are sufficient and appropriate to the achievement of outcomes
3. Strategies for: Risk identification and appropriate mitigation
    a. Procurement, including alignment with technology and partnership requirements
    b. Stakeholders, including analysis of impact and influence
    c. Communications, including strategies that promote community involvement and transparency and tailor to diverse stakeholders and projects
4. Monitoring, controlling, and reporting strategies and checkpoints for contingencies and course corrections, if necessary
5. Approach to sustaining projects beyond the lifecycle of the Challenge.

The following chapter summarizes our team's Project Management Plan, with reference to the appropriate chapter of the proposal that will provide supplementary information. When proceeding with the project, the information contained within this proposal will be restructured to serve as the various project management materials needed to guide the project team through the implementation of the project and beyond.

Project Scope, Scheduling, Sequencing & Dependencies

The scope of our project includes the development of 2,000 hours of Nishnaabe-language immersion videos, the content of which will be our core aadsookaanan (our sacred stories, our philosophical foundations, the building blocks of our Nishnaabe worldview). It is intended that this will create understanders of our Nishnaabe language who can then go on to successfully complete an additional 1,000 hours of STEM educational video, the audio of which is delivered in our Nishnaabe language. It is worth reiterating that the model being developed can be used for any other language or culture, the idea is to blend STEM education with tradition, to create leaders of tomorrow with a strong connection to their traditions and cultures. For example, the WaaWaa videos can be overdubbed in any language and be just as useful. It is our belief that this is truly a Canadian approach to developing Smart Cities.

This project will move Nishnaabe people from being mainly passive consumers of technology to being active, effective STEM-educated administrators, managers, and users of data who are able to achieve meaningful outcomes for themselves, their community, and other communities. Upon completing high school, our youth will have received more than 2,000 hours of mobile-enabled,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

online Nishnaabe-language immersion instruction in all of our core aadsookaanan (our sacred stories, our philosophical foundations, the building blocks of our Nishnaabe worldview).

Additionally, our youth will be nearly-completely able to comprehend spoken Nishnaabemwin, will have attained a basic proficiency in coding and robotics, and will possess a strong foundation in mathematics and science. All STEM subject videos and courses will be available under a creative commons license, in both Nishnaabemwin and in English. All of this education will occur in a blended-learning environment with a strong real-world participation component built into the program. The eLearning functionality of our community's open source, mobile-enabled, Learning Management System (LMS), Open edX, facilitates the learning of the STEM subjects. And, the eAcquisition functionality of Open edX facilitates the acquisition of our Nishnaabe language. The entire educational experience is tied together with the meetup forum functionality of Open edX serving as a bridge between the digital, online world and the material, real world. Our youth are strongly encouraged and empowered to participate not only in online communities, but in the traditional Nishnaabe activities going on in the real-world community thereby bridging the gap between the online and real world. Based on this scope of work, the following project management plan has been developed to guide the project team through the implementation phase and beyond. This planning template can also be utilized by other communities when adopting our onboarding approach to a smart city.

It should be noted that this PMP is based on our approach to develop a smart city through the integrated delivery of our culture, language and STEM education; however, other communities that choose to replicate this approach will be able to tailor their project to reflect their culture and language. The products and outcomes of our project, including templates, videos, and curriculum will be made readily available in an open source and transparent format, to be accessed by any community wishing to replicate our approach to developing a smart city.

Project Objectives:

As previously mentioned, our project seeks to achieve the four (4) objectives or outcomes, listed in our Challenge Statement. These objectives are summarized below but are presented in more detail in Chapter One (1), Vision.

Objectives and Measurable Outcomes:

Objectives		Progress Indicator/Measurable Outcome
1.	Youth who are "better-educated"	• Increase in number of K-12 STEM courses successfully completed by K-12 students, • Decrease in percentage of K-12 students needing remedial help in STEM subject areas
2.	Youth who are "more-employable"	• Increase in number of K-12 STEM courses successfully completed by K-12 students, • Increase in number of K-12 students who have at least a basic ability to code
3.	Youth who are "better-grounded" in their Nishnaabe identity	• Increase in number of K-12 students who know the key concepts expressed in each of our core aadsookaanan

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

		• Increased annual participation rate in number of traditional Nishnaabe activities for K-12 Students
4.	Youth who are "more holistically Nishnaabe"	• Minimum 2,000 hours of Nishnaabe language acquired by graduating eighth-graders • Increased annual participation rate in number of traditional Nishnaabe activities for K-12 Students • Minimum 1,000 hours of Nishnaabe-language STEM video successfully completed by graduating high school seniors

Scheduling, Sequencing and Dependencies:

To ensure smooth project delivery, project management tools must be implemented. These tools allow the Project Team to understand each task at hand and the relationship, or interdependencies, that they share in reaching project completion. Dependencies show relationships between successive tasks and outline what tasks must be completed prior to beginning another. Using dependencies enables the Project Team to establish a critical path for the project; highlighting key events that must be met to drive the project to completion. This critical path will be depicted visually in the form of a Gantt chart.

Often dependencies result from working with different internal and external stakeholders and, as a result, it is important to establish dependencies before project commencement. As dependencies increase the risk associated with project roll-out, a number of tools and techniques can be initiated to mitigate the effects that they may have.

As a starting point, internal and external dependencies have been considered to determine associated levels of risk. Please refer to subsequent sections and chapters for descriptions of associated risks. Likewise, the project implementation plans for all project components, presented in Appendix A & B, also show dependencies between activities. The Project Team have been, and will continue to be, assigned to specific tasks and respective dependencies. As the project moves forward, it is likely that further dependencies and subtasks will take form. To ensure the timeline is not affected by these changes, Bi-Monthly Project Team meetings will take place to proactively coordinate around these obstacles and re-establish the critical path. These meetings will be identified in the project schedule.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project Components:

There are four main parts of this project, all to be hosted on the Open edX learning management system:

1) E-Learning, K-12 curriculum augmentations
2) Meetup forum real-world connections
3) eAcquisition, 2,000 hours of immersion video
4) Bilingual STEM video - 1,000 hours of STEM course video

1) E-Learning, K-12 curriculum augmentations

With respect to the augmentations to the existing curriculum, the project team has developed a detailed implementation plan to complete the following:

1) Implement code.org curriculum in grades k-5
2) Implement python curriculum in grade 6
3) Implement Robotics curriculum in grades 7 and 8
4) Implement CompTIA A+ curriculum in grades 9-12

The project team will rely on existing and proven curriculum for the implementation of the k-12 augmentations. Teachers will be required to incorporate these curriculum augmentations as part of their existing lesson planning process. All curriculum will be implemented via blended learning and growth mindset approaches.

In terms of the implementation schedule, the selected curriculum of code.org (for example), was selected as it provided "ramp up capabilities" meaning that kids being introduced to this curriculum for the first time in grade 5 will be able to complete "ramp up lessons" given that they did not have exposure to the K-4 curriculum. Similar, the 5-year implementation schedule for all other grades and curriculums will follow as similar approach, where necessary.

Please refer to Appendix B for additional information regarding our project implementation process, timelines and outputs for eLearning, K-12 curriculum augmentations project components.

2) Meetup forum real-world connections

The Meet-up functionality of the Open edX platform will enable students and community members to not only connect with the digital community, but also the real-world community, as well as the land and traditional activities. This mobile-enabled meetup forum functionality, provided by Open edX, will serve as the central 'online gathering' place which will facilitate the bridging and interfacing of the digital world with the material, real world. All community members will have access to each other via this online gathering place. This functionality is provided directly within Open edX and will provide our youth the opportunity to express their desire to attend a particular traditional Nishnaabe activity. Likewise, community members who are planning an activity will be able to express their intentions in the meetup forum functionality of Open edX, thereby providing additional options for our youth to take part in while remaining in the embrace of the real-world community network. As this is a function of the Open edX Platform, implementation

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

will be relatively simple, requiring the development and provision of instructions to participants and encouraging participation, as part of our overall implementation strategy.

3) eAcquisition and 4) Bilingual STEM course video

With respect to the eAcquisition immersion video and STEM course videos, the project team has developed a detailed Implementation Plan to complete the following:

- Reconstruct and write our core aadsookaanan
- Produce Waawaa video (2,000 hrs)
- Overdub Waawaa video and/or produce Nishnaabe-language immersion video (live-action or 2D-animated)
- Produce bilingual (Nishnaabe-language and English-language) STEM video (1,000 hours)

Please refer to Appendix A for additional information regarding our project implementation process, timelines and outputs for the eAcquisition and Bilingual STEM Course Video project components.

To summarize, the approach taken in terms of the production of the Waawaa video and Nishnaabe language immersion video and bilingual STEM videos has been to intentionally ramp up production over the course of the 5-year project implementation. The reason for this is to allow for review and critique of the first round of videos to allow the project team to adjust course and make any improvements, as deemed necessary. Likewise, it is anticipated that the production of Waawaa videos will become more effective over the course of the project implementation plan, and therefore our team will be able to increase output over the duration of the project.

Based on our pilot studies we have identified that the level of effort to produce one hour of Waawaa video (not including overdubbing) can vary significantly. We have developed our scheduling and implementation plan with sufficient buffer and a ramp up timelines to mitigate this scheduling risks.

Implementation Plans – Strategy

These implementation plans have been developed through reliance on the Project Sponsor and Subject Matter Experts. Project Participants shall follow the implementation plan and schedule. The efficacy of the implementation strategy will be reviewed at each Bi-annual Advisory Team meeting. Should significant issues be encountered during implementation, the project participants shall notify the project manager who can call an ad-hoc advisory team meeting to review the plan and make any necessary course corrections.

Gantt Chart

A detailed Gantt Chart outlining each stage of the project, and all project participants and stakeholders, will be revisited and updated throughout the project lifecycle to ensure smooth transitions between project phases. A Gantt Chart is a PM tool that can be used to summarize critical stages of the project, dependencies and anticipated duration of tasks, as well as providing an effective resource for tracking progress throughout the project lifecycle. Gantt Charts show the progression and duration of tasks while also showing dependencies of different events within the project. This schedule will be reviewed with the Project Team before project commencement and regularly reviewed and revised as necessary to avoid schedule slippage, reduce redundancy in effort, and expedite successful project delivery.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Resource Assessment

As part of the Project Management Plan, it is necessary to assess the availability and capacity of resources to ensure they are sufficient to achieve outcomes of the project. Biigtigong Nishnaabeg has been developing our internal resources over several years, which has enabled us to be in a position where we can achieve the goals and outcomes of this proposed project. The resources identified as required to complete this project include:

- Human resources with expertise in areas of language, technology, culture (elders), finances, education
- Technological/material resources
- Capacity building and related initiatives
- Financial resources

Human Resources

Human resource management is key when implementing a project as this dictates the connection between the available workforce and the ability of a project's strategies, objectives and goals to be achieved. The best practice for human resource management can be understood through the following six steps;

1. Develop and Revisit project objectives
2. Assess existing capabilities and capacities
3. Estimate future HR requirements
4. Determine job and resource requirement
5. Implement a Human Resource Management Plan
6. Evaluation and corrective action

This non-linear process will be implemented by our team in completing the project and each phase can be revisited as needed, and at minimum at our Bi-Annual meetings.

The Human Resource Management Plan will be used to provide guidance on how team members will be defined, staffed, managed, and eventually released throughout the project lifecycle. Each member of the team will be assessed based on the following:

- **Role** – function assumed by person on project.
- **Authority** – right to apply resources, make decisions, sign approvals, etc.
- **Responsibility** – duties of work on project team
- **Competency** - skill and capability required to complete assigned activities.

One tool that will be developed is a Responsibility Assignment Matrix (RAM). This method of project management assigns specific actions to each member of the team. Organizing the responsibilities of the team members in a RAM will allow for more organization and can be used to identify a gap in the project team's ability to complete tasks.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project Roles & Responsibilities

We have secured the necessary human resources for the successful development and implementation of this project. Biigtigong Nishnaabeg has a strong talent pool and exceptional human resources committed to this project. Broadly this includes

- Community leadership (Chief and council)
- Subject Matter experts
    - (in areas of language, culture and STEM)
- Technical staff
- Administrative support (finalizing)

Current key human resources are identified in the table below:

Role	Participant(s)	Responsibilities
Project Sponsor	Chief & Council	• Represent community • Provide project oversight and guidance • Review/approve some project elements
Subject Matter Experts	• Language consultant • Elders • Industry Partners • Teachers	• Provide language expertise • Provide cultural expertise • Provide Curriculum Expertise
Advisory Committee	Community and Industry Leaders	• Approves major funding and resource allocation strategies • Authorizes significant changes • Resolves conflicts and issues • Provides clear direction to the Project Manager • Review project deliverables and milestones • Identify risks and mitigation strategies
Project Manager	Band Administration	• Manages project in accordance to the project plan • Coordination with Advisory Committee • Supervises consultants and SMEs • Provide overall project direction • Direct/lead team members toward project objectives • Handles problem resolution • Manages the project budget
Project Participants, incl. technical staff and admin support	• Elders • Teachers • Language consultant • Video production team • Others to be identified by SC project Advisory committee	• Communicate project goals, status and progress throughout the project to other participants, and project manager. • Review and approve project deliverables and accountable for milestones • Creates or helps create work products (videos, written materials, curriculum). • Coordinates participation of individuals, teams and stakeholders • Provide knowledge and recommendations • Evaluate outcomes and provide input on key performance indicators • Helps identify and mitigate project risks • Assure quality of products that will meet the project goals and objectives • Achieve milestones on time and on schedule

Other roles and responsibilities are described in relevant sections of this proposal, including Chapter 5 which provides the roles and responsibilities of the governance structure for Biigtigong Nishnaabeg First Nation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Infrastructure/Material Resources:

The infrastructure required for this initiative includes the eLearning, eAcquisition, and meetup forum functionalities of the Open edX platform. This online platform will be the primary method of delivering language and STEM training to the target audience. Other technologies/software include Code.org, Tynker.com, Lego.com, CompTIA A+ Exam preparation materials and curriculum, etc. Additional information related to technology resources are included in Chapter 4 of this proposal and will be available to the project team as part of the Project Management Plan.

Capacity Building and Related Initiatives

As part of the Project Management Plan, it is important for the project team to have a solid understanding of existing and ongoing initiatives that may influence the Smart Cities project. The project team has identified three (3) existing projects of particular importance to this project, and that should be monitored as part of the project management process. Project leads from each of the below initiatives are already identified as key stakeholders as part of the Smart Cities process and therefore will continue to be consulted over the course of the project implementation, and beyond, as outlined in our engagement plan presented in Chapter 6.

- **Language Project:** ongoing project to capture and preserve the Nishnaabe language and more specifically the Biigtigong dialect.
- **Curriculum Development:** ongoing project to emphasize cultural and land-based learning activities for K-8 students.
- **New School Project** The community has identified continued education, job readiness and skills training and development as a high priority. Biigtigong Nishnaabeg is currently in the process of designing a new elementary school and Business Training and Education Complex. These facilities can be used to promote this program and facilitate participation by youth and young professional. By having this easy access to the target audience this will ensure that the program is adopted.

Financial Resources

This project will rely on the financial resources provided by the community, other participants and Infrastructure Canada, as presented in Chapter 8.

Strategies for: Risk identification and appropriate mitigation

With any given project there is the potential of risk throughout its lifespan. Risks can be any influence which affects the success of a project (i.e. in terms of budget or schedule). Therefore, risk management is an essential process of identifying, analyzing and responding to these influences that may occur, to ensure the project stays on track. Specifically, risk management involves identifying categorizing, prioritizing and planning for risks, with risks being identified as anything that could potentially impact the success of the project (deadlines, quality, or budget etc.). Throughout this project, risk management will be approached as an iterative and proactive process.

The project team will revisit the Risk Management Strategy throughout the course of the project as needed to identify and monitor the potential risks during each phase of the project. Once a Risk Management Strategy has been finalized, deviation from the agreed upon schedule/budget/scope of work will be identified and promptly communicated amongst the project team so that corrective actions can be taken in a timely manner. It is the intent there will be regular project meetings held to monitor the progress made and to identify any potential risks.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The initial Risk Assessment has resulted in the identification of initial project risks, and these are presented throughout our proposal. Key Risks and mitigation strategies are summarized in the table below (Additional risks are identified throughout our proposal):

Risk	Likelihood	Impact	Risk Management Approach/Mitigating Actions
Low Student Participation	Medium	Medium	• Program is designed to be interactive and hands on approach • Meaningful outcomes • Onboarding and recruiting strategies • Incentives – i.e. Summer Student Employment • Community celebrations • Good co-op placements • Offer program neighboring First Nation • Develop on-line resources for scalable and replicable
Technology, software and curriculum becomes outdated	Low-High	Medium	• Over time (long-term) the chosen technology and curriculum may become outdated. Responsibility of project team (including SMEs) to continuously identify alternatives. • Designed curriculum based on building blocks, so that the principles of STEM curriculum will not change, • Teachers to continue to revisit teaching lessons and curriculum through existing processes.
Nishnaabemwin audio overdub cost is too high	Medium	High	• Audio-video editing software & related training • Establish work flow procedures and accountabilities • Set up a review & monitoring system • Establish best-practices • Consider use of a first-speaker as a consultant • Research animation and other technological options • Focus priorities and on core competencies
Extreme high cost of uploading and downloading video	High	High	• ISP (PRDC) is providing free on-site services to assist in the offloading, downloading and uploading of video
Expensive video backup system; cloud service unreliable for now	Medium	High	• Develop safe and reasonably costed manual backup system • ISP (PRDC) is setting up a free back up system on their servers
Loss of $100,000 financial contribution from Chief & Council	Low	Medium	• Examine projects and make adjustments (cuts) where necessary • Ensure efficiency and effectiveness of projects • Provide and show value for the $100,000 donation – produce results • Apply for other funding and financial contributions
Change in partners/3rd party involvement or withdrawal.	Low	High	• Build Relationships • Formal agreements • Identify alternative strategies • Continually monitor risk
Admission of new partners.	High	Medium	• Admission mechanisms

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

			• Needs based; team approval process • References – due diligence
Conflict of Interest	Low	Medium	• Build strong communication • Maximum transparency • Implement Conflict of Interest Policy
Potential inequalities in partners' resources and expertise determine their relative influence in the partnership's decision making.	Medium	Medium	• Focus on consensus-based decision making • Address in formal agreements • Build relationships • Access to dispute resolution process • Involve experts on Executive Board
Poorly defined shared vision and objectives.	Low	Medium	• Develop shared vision with clearly defined objectives • Link corporate objectives/organizational objectives to the project objectives • Training and Education sessions • Annual and Bi-Annual reviews
performance targets not met in a satisfactory or timely way.	Low	High	• Develop an agreed upon Performance Management framework • Conflict management/resolution procedures • Encourage joint ownership of problems & solutions • Relationship building
Failure to engage key stakeholders in meaningful ways.	Low	Medium	• Awareness & education of engagement strategy • Communication strategy • Performance measurements inclusion • Evaluation strategy
Failure to comply with relevant laws and regulations.	Low	Low- High	• Identification & education of laws & regulations • Dispute resolution process • Develop safeguards throughout project
Partners/3rd party - Lack of understanding of local culture.	Medium	Medium	• Cultural awareness training • Provide explanations – no assumptions • Dispute resolution
Financial risks No strategic approach to issues of risk, costs and benefits	Medium	Medium	• Define and agree with approach to dealing with costs and benefits of the • Continuous monitoring & reporting • Utilize Finance Department & Finance Committee
Loss of autonomy	Low	High	• Rigorous selection of partners • Clear agreements
Lack of capacity, skills, knowledge and experience	Medium	High	• External Recruitment Plan • Local training & development plan • Outsourcing and Contracting Options • Secondments
Insufficient internal & external communication.	Low	Medium	• Establish communication plan & review • Regular meetings • Structured reports • Use of collaboration tools

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The goal of our risk assessment process is to identify, characterize, prioritize and document a mitigation approach relative to those risks which can be identified prior to the start of the project. The Risk Assessment will be continuously monitored and updated throughout the life of the project and will be communicated with appropriate stakeholder as per our engagement plan, presented in Chapter 6.

Since mitigation approaches must be agreed upon by project leadership (based on the assessed impact of the risk, the project's ability to accept the risk, and the feasibility of mitigating the risk), it is necessary to allocate time during each Advisory Team meeting, dedicated to identifying new risks and discussing mitigation strategies.

Procurement, including alignment with technology and partnership requirements

Our procurement strategy will follow our internal policies and procedures which mandate minimum requirements for service delivery, contract terms, First Nation involvement, etc. For this project the majority of procurement requirements have been established through development of this proposal and are the approach is relatively uncomplex in that they are with preestablished service and software providers, products and partners.

Stakeholder identification, including analysis of impact and influence

A stakeholder refers to any individual, organization or group of people with an interest in the project or the ability to affect its outcome. All stakeholders therefore have a vested interest in the successful outcome of a project. From previous engagement experiences on other projects, we understand the importance of including the diverse groups that will be impacted and/or could impact the project. We understand that this journey, especially the reclamation of our language and aadsookaanan, will potentially stir emotions resulting from historical impacts from cultural genocide. We further understand, that it is necessary to walk through these hurts together in order to move forward, heal and reclaim our culture and identity. This proposal required the input of everyone, as it provided another opportunity to build stronger individuals, families, community and a Nation.

In identifying our stakeholders, we considered those who would be immediately impacted and those impacted according to our 7th generation principle (See Chapter 5). Various target groups have been identified and strategies established to facilitate meaningful engagement. As we move forward from development to implementation, we remain committed to developing effective engagement processes that build upon best-practices while creating new and innovative ways of engagement with the project stakeholders. Furthermore, expectation, assumptions and potential risks for each stakeholder will be identified through this engagement. Having an understanding of what is considered the most important outcome for the project amongst the different stakeholders allows project managers to tailor their approach to align with and meet stakeholders needs. Please refer to Chapters 5 and 6 of the proposal for additional details on our stakeholder management process.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Communication Strategies

Having the support and involvement of all stakeholders will add value to the project, not only through meaningful participation but to also allow for open dialogue and feedback throughout the project. The community engagement strategies completed to date for this project have focused on using our cultural practices to empower youth and community members in a meaningful way.

Throughout the implementation stages of this project a number of these strategies, including community meetings, reporting, surveys, working groups and traditional ceremonies, will be utilized to ensure the continued involvement of the stakeholders at each stage of the project. Most importantly, knowledge sharing and discussions with community members, particularly elders, will be integral to better understanding our traditional Nishnaabe language.

Engagement events (i.e. working groups, community meetings) will be advertised to community members and the general public through the appropriate channels, including but not limited to social media, newsletters and event bulletin boards. A full Engagement Plan for the project can be found in Chapter 6.

Monitoring, controlling, and reporting strategies

Monitor and Control Project Work is the process of tracking, reviewing, and reporting the progress to meet the performance objectives defined in the Project Management Plan. The key benefit of this process is that it allows stakeholders to understand the current state of the project, work completed, budget, schedule, and scope forecasts.

Each member of the project team will be responsible for monitoring the schedule and tasks completed under their supervision. Thus, information sharing and regular communication amongst the project team will be a key component for success.

Should the project team be unable to complete tasks in the allotted timeframe, corrective measures will be implemented immediately, to ensure the project continues without significant delay. Corrective actions may include more frequent project update meetings/conference calls which will allow the project team to collaboratively adjust the internal schedule of the project to ensure all tasks can be completed.

Bi-annual and annual reporting will be conducted and presented to stakeholders throughout the duration of this project, as per the communication and engagement strategy. Bi-Annual reports will coincide with the financial reporting aspect discussed further in Chapter 8.

In terms of reporting to be received from Teachers, reporting to the project team will be completed in the form of summarized and anonymized data, following an agree to template. Reporting to parents and students will follow the exiting process governing their current reporting practices (i.e. report cards).

Approach to sustaining projects beyond the lifecycle of the Challenge

Our project is designed to be implemented over the course of 5 years, with official project initiation beginning September 2019 and implementation ending in August 2024. That being said, significant resources are already in place, and much effort has been expended in developing this

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

proposal, which will allow us to hit the ground running. Notably, this project does not have an "end" to its lifecycle, instead the project intends to implement the curriculum which can then continue indefinitely. Of course, there will be the need to continuously review, adjust and enhance the approach and curriculum content, especially in terms of STEM education, but the entire idea of this project is to provide long lasting change to our community which can then be replicated and implemented by any community across Canada or the world.

As previously mentioned, our approach to creating a smart city is an onboarding strategy that would provide long lasting effective change to communities, through empowering youth (and others), through cross-generational transfer of cultural knowledge as well as the much-needed STEM knowledge required to ensure active participation in a smart technology driven economy.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 4: Technology

Introduction

Technology in Biigtigong's on-reserve elementary school and on-reserve high school will help revitalize language and culture, will enhance student learning, will provide students with modern bilingual STEM education, will strengthen students' real-world connections to our Biigtigong territory and to other community members, will improve the efficiency and productivity of teaching staff, and will facilitate communication among students, teaching staff, parents, and elders.

The Vision for Technology

Technology is being utilized firstly as a foundation of our entire proposal – the delivery of the Learning Management System – namely Open edX. Open edX, in turn, then serves as the platform atop which our K-8 students will be acquiring their Nishnaabe language – via 2,000 of immersion video instruction, the content of which is our aadsookaanan (our sacred stories, our philosophical foundations, the basic building blocks of our Nishnaabe worldview). Our aadsookaanan will be reconstructed and written, over the five-year period of this proposal - the aadsookaanan reconstruction process assisted, as well, by technology. Additionally, our students in both elementary school and high school will also have STEM education delivered to them on the Open edX platform in a blended-learning environment (i.e., brick-and-mortar instruction augmented with an online component), by augmenting our current K-12 curriculum with the following:

- For our grades K-5 students, the Computer Science Fundamentals curriculum of Code.org.
- For our grade 6 students, a coding course using the Python programming language.
- For our grades 7 and 8 students, two courses in LEGO Robotics utilizing an expanded, projects-based version of the LEGO MINDSTORMS EV3 Curriculum.
- And, for our high school students, the full curriculum of the CompTIA A+ information technology exam preparation.

Additionally, for our high school students, they will receive, through the medium of our Nishnaabe language, STEM course instruction via 1,000 hours of STEM course videos (available in both the Nishnaabe-language and the English-language.) Professional development will be provided throughout the five-year period for all staff to ensure that culture-based technology is used to transform learning and language acquisition opportunities for all students.

Community informationals will be delivered throughout the five-year period for all community members – especially parents of students – to maintain their informed technology-related decision making.

Plan Duration

The duration of the Plan will be five years (September 2019 through August 2024). The Plan will be reviewed and updated bi-annually. The focus of this technology plan is the curriculum augmentations, community informational, and professional development components.

Stakeholders

The stakeholders to this technology plan include the whole community – including students, teachers, administrators, parents, information technology staff, and elected leaders.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

K-12 Curriculum Augmentation

We are building a modern bilingual K-12 STEM curriculum by augmenting our current K-12 curriculum. This chapter will focus on those planned-for K-12 curriculum augmentations.

Technology Plan Vision and K-12 Curriculum Augmentation Rollout by Year

Vision for Technology and K-12 Augmentation

Our vision for technology is the curriculum represented graphically in Chapter 1's Figure 1-1, delivered via the Open edX platform.

Rollout by Year

The yearly rollouts below support the Vision for Technology and K-12 Augmentation. These rollouts begin with an exit goal that states what we expect twelfth grade students graduating from our school to know and be able to do and is followed by yearly rollouts of technology Types 1 and 2 for students and staff who will support learning in our classes and our overall instructional program. These rollouts are intended to guide the implementation of technology across our K-12 curriculum, professional development of teaching staff, educate the community on the relevant technologies, deliver bilingual K-12 STEM knowledge, and support the reconstruction and revitalization of our Nishnaabe language and aadsookaanan (sacred stories).

Exit Goal: Students graduating from Biigtigong's high school (whom have also graduated from Biigtigong's elementary school) will be able to code in an introductory text-based programming language (Python), will be able to assemble and control robots using a text-based programming language (ROBOTC, a language similar in structure to the C programming language), will have successfully completed the exam preparation curriculum for both parts of the CompTIA A+ exam (exam #220-1001, and exam #220-1002), will be able to nearly-completely understand their Nishnaabe language, and will know all of their core aadsookaanan.

Yearly Rollouts of Type 1 Technology:

Year 1 (Sep. 2019 – Aug. 2020)

- We begin using Appsembler, our chosen SaaS-provider of the Open edX platform, to deliver our augmented K-12 curriculum.

Years 2 through 5 (Sep. 2020 – Aug. 2024)

- We continue using Appsembler, our chosen SaaS-provider of the Open edX platform, to deliver our augmented K-12 curriculum.

Yearly Rollouts of Type 2 Technologies:

Type 2: Technologies utilized in our K-12 curriculum

For the rollout schedules of the technologies utilized in our K-12 curriculum, please see Appendix B and Appendix C for each of the five years of this proposal.

Detailed curriculum documents can be found here:

- Code.org – Computer Science Fundamentals curriculum: https://code.org/curriculum/docs/csf/CSF_Curriculum_Guide_2018_smaller.pdf
- Python 1 – Tynker.com's 'Python 101' course curriculum: https://www.tynker.com/school/coding-curriculum/scope-sequence

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Robotics 1 and 2 curriculum – LEGO MINDSTORMS EV3 curriculum: https://education.lego.com/en-us/downloads/mindstorms-ev3/curriculum
- CompTIA A+ exam preparation curriculum:
    - Exam #220-1001: https://www.certblaster.com/wp-content/uploads/2018/07/A-plus-220-1001-pdf-Exam-Objectives.pdf
    - Exam #220-1002: https://www.certblaster.com/wp-content/uploads/2018/07/A-plus-220-1002-pdf-Exam-Objectives-1.pdf

Type 2: Technologies utilized in the reconstruction and writing of our core aadsookaanan
In the interest of effective use of space here in this proposal, these technologies will be utilized on an as-needed basis to write our aadsookaanan. These technologies will be utilized throughout all five years of the the five-year period.

Type 2: Technologies utilized in the production and provision of our three types of video
In the interest of effective use of space here in this proposal, these technologies will be utilized on an as-needed basis to record, overdub, animate, and edit our video. These technologies will be utilized throughout all five years of the the five-year period.

Yearly Rollouts of Professional Development and Community Education:

Year 1 (Sep. 2019 – Aug. 2020)

- We begin delivering technology-related professional development to K-12 staff.
- We begin delivering technology-related informationals to community members – especially to parents of students.

Years 2 through 5 (Sep. 2020 – Aug. 2024)

- We continue delivering technology-related professional development to K-12 staff.
- We continue delivering technology-related informationals to community members – especially to parents of students.

Details about the Technologies

In addition to our existing technology, there are two main types of technology needed to implement our proposal. The first type comprises the constituent technologies of our Learning Management System (LMS), Open edX. Broadly speaking, Open edX is *the* technology which houses the entire blended-learning experience which we're planning to deliver with our proposal. The second category comprises all other technologies which enable that experience to occur. This second category includes the technologies utilized in our augmented K-12 curriculum; the technologies used in the reconstruction and the writing of our core aadsookaanan; and the technologies employed in the production and provision of our three types of video: Waawaa immersion video, Nishnaabe-language immersion video, and bilingual (Nishnaabe-language and English-language) STEM video.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Current Technologies

Current Hardware

Apple iPads *(Student Usage)*	60
Apple iPads *(Teacher Usage)*	5
Apple MacBook Pro laptops *(Student Usage)*	34
Apple MacBook Pro laptops *(Teacher Usage)*	10
Windows desktop PCs *(Student Usage)*	22
Windows desktop PCs *(Teacher Usage)*	4
Apple iMac desktop computers *(Teacher Usage)*	1
Promethean ActivBoard Touches	6
Digital SLR Cameras	2
Digital Cameras/Recording Devices	2

Current Software

Video Editing	Windows Movie Maker, iMovie, Adobe Premiere Pro
Photo Editing	Adobe Photoshop
Office Productivity	For Windows: - Word, PowerPoint, Excel, Publisher, OneNote, Outlook For macOS: - Pages, Keynote, Numbers, Notes

Type 1 Required Technologies

Technologies utilized to deliver our Learning Management System (LMS)

- Open edX platform (open source - GNU Affero General Public License)
    - Open edX iOS mobile app (open source - Apache License)
    - Open edX Android mobile app (open source - Apache License)
    - Written in Python (open source - Python Software Foundation License (PSFL) [a BSD-style, permissive free software license which is compatible with the GNU General Public License (GPL)].)
    - Built on Django (open source - Django's BSD license)
    - Utilizes PostgreSQL relational database (open source - PostgreSQL License [a liberal Open Source license, similar to the BSD or MIT licenses])
- Khan Academy API (free proprietary)
- Appsembler (proprietary SaaS-provider of Open edX)
- Customizations by Biigtigong Nishnaabeg to Open edX platform (open source - GNU Affero General Public License)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Type 2 Required Technologies

Technologies utilized in our K-12 curriculum

- Code.org (open source - Apache License)
- Khan Academy (free proprietary)
- Python - (open source - Python Software Foundation License (PSFL) [a BSD-style, permissive free software license which is compatible with the GNU General Public License (GPL)].)
- LEGO MINDSTORMS EV3 Software (free proprietary)
- LEGO MINDSTORMS EV3 Robot Kit (proprietary)

Technologies utilized in the reconstruction and writing of our core aadsookaanan

- LibreOffice desktop office productivity software (open source - Mozilla Public License Version 2.0)
- ONLYOFFICE desktop office productivity software (open source - AGPLv3)
- MariaDB relational database (open source - GNU GPL v2.0)
- HeidiSQL free and open source administration tool for the MariaDB relational database (open source - GNU GPL v2.0)

Technologies utilized in the production and provision of our three types of video

- Storywriting and screenwriting software (Mariner Persona, Write Brothers Dramatica Pro, Movie Magic Screenwriter)
- Storyboard software (Moviestorm Filmmaker, Power Production's Storyboard Artist Studio, Storymind StoryWeaver)
- Office productivity software (LibreOffice, ONLY OFFICE)
- Digital Pen (Epic Pen)
- Drawing Tablet (Wacom drawing tablet)
- Mocap-capable 2D animation software (Adobe Creative Cloud - Character Animator)
- Webcam (to interface with mocap-enabled 2D-animation software)
- Microphone and accessories (for recording audio with which to overdub the video)
- Riggable 2D-character creation (Adobe Creative Cloud - Illustrator, and Photoshop)
- 3D modelling software (for the creation of assets for the animatics in the 2D-space 'digital flip chart' immersion instruction by the 2D-animated character) (Sketchup Pro)
- Screen recording software (TechSmith Camtasia)
- Video-editing software (Adobe Creative Cloud - Premiere Pro)
- Audio-editing software (Adobe Creative Cloud - Audition)
- SFTP (Secure File Transfer Protocol) client (WinSCP)
- SSH (Secure Shell) and Telnet client (PuTTY)
- Video player software (VLC Player)

Relevant Applications Elsewhere

These technologies are applicable and useful in governance (especially for effectively engaging community member in all facets of community life), new council member initiation, training of new staff, ongoing professional development of current staff, general community informationals, and bringing the entire organization online.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Results of Testing and/or Piloting in the Finalist Phase

We achieved fun and excellent results throughout the finalist phase in all of our pilot projects. Our biggest challenge, as we mentioned in Toronto at our November Jury Check-In, was easing the fears of the teachers and inspiring them with hope for new possibilities concerning their lack of technical expertise in the areas of Technology and Engineering. Coding, in particular, seems to have unnerved the staff of our elementary school the most. Our Elementary School's professional development sessions with the teaching staff, their testing and piloting of the technologies in the classroom and the community, including actual blended-learning classroom sessions using Khan Academy and Code.org, building and controlling Lego robots, and employing block-based programming to control circuit boards using Scratch and Makey Makey, transformed these moments of doubt into empowering moments of possibilities (in our teaching staff's own words!).

Approach to Future-Proofing the Technologies

Firstly, most all of our software applications which are not open source have 'safety-net' open source equivalents. This is how we're safeguarding against vendor-generated proprietary constraints and obsolescence while simultaneously enabling transferability and scalability. Our few proprietary choices here allow us to go faster and thus be more efficient and effective with our time due to the fact that we have personnel with considerable experience in the proprietary versions of these software applications. Should, however, any of the vendors of these proprietary software applications which we're using do something which disallows us to continue effectively using their software, we can quickly and near-frictionlessly switch over to the respective open source equivalent software application with little to no interruption in our workflow.

Secondly, while we are certainly onboarding youth into the smart cities future. We're *also* onboarding K-12 teachers and staff, as well as community members in general. The continuing professional development of teaching staff, and the ongoing informing of the community will produce for us a workforce that is able to implement and operate the technologies and systems going forward into the smart future.

Adoption of Architectures, Guidelines, and Initiatives

Had we chosen to install Open edX's software on servers other than Appsembler's, we would have indeed had an an architecture adoption challenge to contend with. Because we are attempting to make this proposal's approach to moving into the smart future as newbie-friendly as possible, we have chosen to simply use Appsembler as our SaaS (Software as a Service) provider of the Open edX platform. The architecture issue thus goes away as we have only a web-based interface to Appsembler to contend with. A very newbie-friendly approach, indeed.

The guidelines that concern us here are the blended-learning guidelines. We are not advocating for an 'online' school. What we are advocating is enhancing brick-and-mortar curriculum delivery with some online options. The guidelines for attaining this hybrid approach is what we are referring to when we use the term 'blended-learning.'

Similarly, the initiative which concerns us here is the Growth Mindset as implemented by Khan Academy. The Growth Mindset can be many things to people. Fir us, we once again, take a newbie-friendly approach. The Growth Mindset in its minimalist form is not allowing students to progress in their curriculum studies without first mastering the content in their current stage of learning. For example, a student receiving an 85% in a math quiz, for example, is made to redo the quiz until that student receives a perfect score. This is a fundamental approach of Khan Academy, and one which we wish to emulate

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

on our online quizzes using randomized tests with a large database of possible questions for our students. These randomized tests are what we are referring to in our Type 1 Required Technologies section by Customizations by Biigtigong Nishnaabeg to Open edX platform. These are simple JavaScript scripts placed on the front-end webpages of our students quiz pages on Open edX that create a Khan Academy-like testing experience, rendering it what we are referring to as a Growth Mindset Approach to learning.

Interoperability

- Open edX with Appsembler's API (Application Programming Interface) make the platform interoperable with any other technology one could reasonably choose to interface with.
- Using Khan Academy's API (Application Programming Interface) for Khan Academy courses which we'll be offering inside of Open edX makes this customized aspect of Open edX interoperable with nearly any other technology.
- Existing community systems and services are currently not networked. Open edX will be the platform with which Biigtigong Nishnaabeg begins to connect these community systems and services.

Replicability and Scalability

Because we have chosen a foundational platform which is fully open source (Open edX), which we're augmenting with curriculum components (e.g., code.org) and learning-facilitation aids (e.g., Khan Academy) which, too, are nearly all open source and free of charge, our proposal - nearly in its entirety - is replicable in any community one might wish to bring it to.

As we've stated earlier, in the cases where we have chosen to use a proprietary technology – for example, LEGO, which does not operate in the open source ecosystem – we have been careful to make sure that there are near-equivalent open source options - in this case, Raspberry Pi, which does operate in the open source ecosystem – for that technology.

Additionally, as we state several times throughout our proposal, we are offering an onboarding approach to communities that may not have access to bleeding-edge technology, nor perhaps to bleeding-edge technology's administering engineers, programmers, or operators. It is our hope that by keeping the technology requirements of our proposal to a minimum, making our approach as replicable and scalable as is reasonably possible, and still delivering a smart technology approach, we can thereby help facilitate the spread, and long-term acceptance and flourishing of, smart cities throughout Canada.

Roles and Responsibilities of Technology Partners

Technology partners:

- Software and hardware partners
    - Roles and responsibilities are clearly delineated and articulated in the software licensing agreements of each of the technologies.
- Pic River Development Corporation (PRDC) - *Internet Service Provider (ISP)*
    - Most importantly, PRDC's role is to provide for our Waawaa immersion video producers a place in which to offload their video each week. Without this important role being played by this ISP partner, our video producers are forced to use Dropbox or something similar to upload their video instead of being able to simply offload it. This is not an ideal option as piloted upload times during the finalist phase had been exorbitantly and prohibitively high. Offloading all of their video each week onto the servers at PRDC's office is an extremely time-efficient way to get their video to our Nishnaabe-language overdubber.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Technology Accessibility and Usability for Uptake and Acceptance

Community informationals, especially for students and parents of students, will facilitate the community's uptake of Type 1 and Type 2 technologies.

Identification of Risks

Technology – Risks and Mitigation Strategies			
Risk	Likelihood	Impact	Mitigation Strategy
Limitations as a result of internet connections.	Medium	High	• Selective over software – set standards & assessment • Minimize use of cloud computing
Video uploading and downloading time is lengthy and irregular.	High	High	• Agreement with the ISP (PRDC) • PRDC to provider server space for video storage • PRDC will upload video to their servers
Lose control over data	Medium	High	• Establish local control policy & provider/partnership assessment process • Thorough planning over data collection & data management • Formal agreements for control • Establish monitoring system
Resistance from all levels – students, parents, staff	Medium	Medium	• Conduct education sessions • Professional development • Good communication systems • Regular reporting • Set up support systems • Provide performance summaries
Risks related to the increased access to sensitive information	Medium	High	• Secure computers, servers and wireless networks • Use anti-virus and anti-spyware protection, and firewalls • Regularly update software to the latest versions • Use data backups that include off-site or remote storage • Secure your passwords • Train staff in IT policies and procedures
Cyber-threats including malware	Low	High	• Security software, user training, and policies and procedures in order to safeguard our systems, networks, and information.
Commercial software providers are now integrating their products with social media sites, making risk mitigation very difficult.	Medium	Medium	• Try to avoid providers who integrate their products with social media. • Formal agreements to address issue
Failed Internal Processes – the failure of internal processes to perform as needed or expected. This comes from poor process design or execution, or faulty process controls.	Low	Medium	• Technology development team to develop processes • Stringent review process and reporting • Communication of internal processes • Education
Lack of technical competence	High	Medium	• Recruiting plans

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

			• Internal building of capacity – short and long term • Use of experts • Outsourcing
Financial Costs too high	Medium	Medium	• Good planning and cost estimates • Budget reviews • Alternative revenue sources • Internal program reviews – looking for efficiencies

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 5: Governance

Introduction

Biigtigong Nishnaabeg have always governed ourselves in accordance with our traditional laws, customs, language, traditions, values, processes and structures. Over the years these have changed, mostly as a direct result of the impacts of colonization, where systems in direct contradiction of our cultural ways were imposed upon us. In response to centuries of culture and language loss and disconnection from our social and philosophical systems, we are committed to rebuild our contemporary governance systems that reflect our Nishnaabe culture.

Culture lies at the heart of governance. It forms the foundation and fosters the collectivism of a people through a shared sense of values, beliefs, meaning, knowledge systems, rules, purpose and vision. Through this shared culture, acquired over generations of our people, we are connected beyond the confines of our organization and the projects we create and implement. Our organization and project governance systems are an extension of and reflection of our Nishnaabe way of existing as individuals and as a collective.

The governance plan set out herein seeks to align cultural our Nishnaabe cultural practices and beliefs with modern practices, to facilitate a process that supports the implementation of the project and increases the success of achieving our outcomes. The governance structure has been established under the authority of Chief and Council. The structure was carefully designed to ensure it effectively facilitates the successful implementation of the proposal and the attained of the respective outcomes. It is based on Biigtigong's best practices and in alignment of its long-term vision in respect to governance.

According to the Project Management Institute (PMI), project governance is the elements and strategies that make a project successful. It is based upon the tailored needs of the community. The governance framework and strategies for this project are tailored to the community, rigorous, transparent, and will deliver value for money. The project team will ensure that the governance framework is implemented throughout the project and adjusted if deemed necessary.

Our Governance Structure

Biigtigong Community:

We are ultimately responsible to the members and residents of Biigtigong Nishnaabeg, including our ancestors and the seven generations to come. The people are the foundation of our governance structures. We are building upon a strong sense of community and a commitment to the vision for our children. Our governance structures and engagement strategies facilitates and builds strong connections with our community. Our Smart Cities Governance Plan makes community involvement and engagement a priority. We will create new opportunities for their involvement and build upon the existing systems. We ensure structures are in place to include our community throughout the lifecycles of projects and our long-term strategies. We are accountable to our members and their involvement is critical to ensuring we achieve our outcomes.

Chief and Council:

As the formal elected leadership of Biigtigong, this governing body is ultimately responsible for the overall affairs of the First Nation. Council has established governance systems that provide the necessary support and parameters for effective project governance systems. Our political and administrative functions are clearly defined and separated. Elected leadership is responsible for strategy and providing

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

the systems, laws, policies, and other resources, to support successful implementation of projects. The governance model adopted for the Smart Cities project follows, aligns and enhances Biigtigong's Governance systems.

The Chief and Council through the authority of Biigtigong's Constitution will establish an Executive Board to oversee the Smart Cities Proposal. Additionally, two committees will be set up to support the proposal and the attainment of the outcomes. Both committees will play an integral role in achieving our outcomes and in creating high levels of accountability and involvement of our community. The following provides a brief overview of these three entities.

SC Executive Board

This board has been mandated as the governing body to oversee the implementation of our Smart Cities proposal. They will provide strategic direction to ensure the proposal continuously meets the needs of the community and achieves the identified outcomes. The Board will deliberate, make decisions, advise, provide strategic oversight, and to serve as the primary "advocate" for all the Smart Cities initiatives.

The Board is also responsible for the key business issues associated with the project. This includes approving the budgetary strategy, monitoring risks, quality and timelines, making policy, defining outcomes and deliverables, assessing change requests.

The Board will oversee the activities of the Aadsookaanan Reconstruction Committee and the Clan Engagement Committee. Both Committees were established to mitigate potential risks and create new opportunities. The Board will supervise and work the Smart Cities Project Lead throughout the project.

The Board reports directly to the Chief and Council and is subject to the regulations set out in the Terms of Reference for the Board and the Regulations Governing Committees. The Board and Council will collectively innovate on improving the reporting systems, promoting transparency, accountability and stakeholder engagement.

Due to the strategic importance of the proposal to the future of the community, the Chief will sit as the representative of the elected leadership. The Board will also be comprised of our CEO, Education Director and two youth. To increase success and mitigate risks, our Board will also include experts from the following fields: Nishnaabemwin (Language), Science, Technology, Engineering and Mathematics. We have five experts who have committed to sit on this Board.

Aadsookaanan Reconstruction Committee

This Committee will be part of the governance arm and will report directly to the SC Executive Board. Comprised of elders, traditional knowledge holders, and language carriers, youth and parents, this team will be responsible to assist in the reconstruction of our sacred stories, our Aadsookaanan.

Their primary role will be to provide guidance and direction to the technical and research group. They will have decision-making authority to approve the core aadsookaanan and forward the stories to the Immersion Team for video production. The Committee will also assist in mitigating risks that exist or may come to be. The primary risk management strategy includes engaging with the community and providing information and education.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The Committee will operate according to its Terms of Reference and Biigtigong's Regulations Governing Committees. Following our cultural protocols governing elders and the transfer of knowledge is foundational to our governance plan.

Clan Engagement Committee

Engagement with all of our stakeholders is a critical factor to achieving our outcomes. In order to achieve high levels of meaningful engagement, we will employ our traditional clan system for this purpose. Each clan will select 2 representatives to sit on the Clan Engagement Committee. Clan leaders are responsible to report directly back to their respective clans, following the protocols established by the clans. Clan leaders hold the responsibility for two-way communication and reporting. This system allows for diverse engagement and facilitates deeper discussions and collaboration.

Inside the structure of the clan system are protocols that speak to the roles and responsibilities of individuals and the clans. Accountability, disclosure and transparency are inherent to the system. It also addresses ethics, communication, and codes of behavior, decision-making methods and dispute resolution. From an organizational perspective, the Clan Engagement Committee will report directly to and work closely with the SC Executive Board. The team will operate according its Terms of Reference and Biigtigong's Regulations Governing Committees.

Linkages with Existing Committees:

We will utilize existing governance structures to support the implementation of our proposal.

Youth Council

Our governance model will facilitate linkages between the SC Executive Board and our Youth Council, via the Board's two youth representatives. The Youth Council is an existing Committee that represents the interests of the youth and facilitates their involvement in the growth and development of their community. We will utilize this relationship to improve our connections with our youth and ensure we are meeting their needs.

Education Committee

The Education Committee is mandated as an advisory function in support of the Education Department. It is a primary means for parental involvement in education. We will utilize these resources, via the Education Director, to support the proposal's implementation, specifically within the Education Department. This provides another link to the stakeholders and ensures alignment with the Education strategy.

Finance and Audit Committee

The Finance and Audit Committee is responsible to review and make recommendations to Council on the financial administration matters of the Nation. The Finance and Audit Committee assists Council in fulfilling its oversight responsibilities for the financial reporting process, the system of Internal Control, the audit process, and the process for monitoring compliance with laws and regulations and the code of conduct.

The Executive Board will comply with the initiatives of the Finance and Audit Committee and the Director of Finance to ensure financial accountability and transparency. Biigtigong's Financial and Administrative Policies and Procedures govern the financial and human resource management of the project.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project Implementation Governance Systems

Some of the Smart Cities projects fall under the mandate of existing Departments. These projects shall become the responsibility of various Departments, such as, Education and will be administered in accordance with the existing governance and management systems of the First Nation. There are institutionalized and established systems that define roles and responsibilities, personnel matters, finance, performance management and evaluation, dispute resolution, risk management, reporting responsibilities, lines of authority and lines of command.

Senior Management Team

Inside of this system is an established Senior Management Team comprised of all Department and Service Directors. This body acts as the central coordinating entity for the First Nation that facilitates a holistic approach. A member of this team will be appointed to the SC Executive Board to ensure continuity, alignment and accountability. This individual will also act as a liaison between the Senior Management Team and the Smart Cities Executive Board. Respective Directors will obtain direction and provide input via this process and take the necessary steps for implementation within their departments.

Education Department

Our Education Department will be responsible for the implementation of the core components of our proposal, including the K-12 STEM program, Nishnaabemwin Immersion and the Meet-Up App. An organization review was conducted to determine the requirements for the integration of the new programs. Governance systems that define staffing requirements, organizational and reporting structures, roles and responsibilities, performance management, training and development, risk mitigation strategies, and financial requirements for the Smart Cities implementation are established. The education staff was involved throughout the entire review and development phase.

The implementation of the education components of the proposal will be under the direction and supervision of the Education Director. The Director will report on the activities and status of the projects to the Executive Board and the Project Lead. The reporting structure is designed to be flexible to allow for adaptive approaches to respond to changing needs. The Education Director will also provide updates and facilitate necessary action and support with the Senior Management Team.

Economic Development Department

This Department will be responsible for the implementation and management of our Youth-owned Student IT Business, the co-op placements and summer employment. Our team will work collectively with this department to create an innovative pathway for our high school students, providing an academic foundation supported by real-world work experiences. Our economic development department will build relationships with STEM based industries to assist in the co-op placements and summer employment. Our co-op program will be governed by the Ontario Ministry of Education standards and our own internal policies. Special considerations for individuals enrolled in the CompTIA A+ program will be built into our Summer Student Employment Policy, to support their path throughout high school.

Smart Cities Inter-departmental Program Committee

As part of our governance structure we will create an inter-departmental program committee, comprised of front line staff that are directly responsible to deliver specific programs. This team will consist of the SC Project Coordinator, Immersion Lead, STEM Lead, Co-op Lead, Meet-up App Lead and the Economic Development Manager. This group will work to strengthen collaboration across the team and integration of projects. They will review activity reports, monitor progress and outcomes, discuss administrative concerns, identify training needs, coordinate project management, identify risks and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

solutions and create substantial working relationships. The Committee will report to the Education Director. The Education Direction will bring all appropriate matters to the attention of the Senior Management Team and/or Executive Board.

Governance Principles

We will utilize our traditional governance principles, as set out in our Aadsookaanan, as embedded in our language and ceremonies, as practiced within our operations and commit to gaining a greater understanding of our traditional ways and establishing more effective and legitimate governance systems. Our principles support processes that are consensus oriented, participatory and inclusive, transparent, accountable, long-term considerations, responsive to change, flat and non-hierarchical, and based on relationships. We will adhere to the governance principles identified in Biigtigong's Constitution, laws, policies, procedures, informal protocols and cultural practices.

Decision-making

Our cultural practices utilize a consensus-based decision-making model. As an approach to fostering collaboration, consensus-based decision-making provides every individual equal access and responsibility to the process. This model facilitates improved decisions due to the stakeholders claiming responsibility by providing input in keeping with the best interests of the seven generations to come. It fosters increased interpersonal connections and relationships, resulting in greater sense of cohesion and commitment to the goals and vision. Utilizing our cultural practices and embedding our values inside of our governance system enhances the project and its successful implementation.

Part of our decision-making model includes mechanisms to deal with conflicts and disputes. We utilize a restorative justice model as our dispute resolution process. Based on cultural values our systems aim to restore harmony, balance and build relationships. We will utilize Biigtigong's processes to address potential conflicts with or amongst our stakeholders.

Human Resource Management

Human Resource management is coordinated by Biigtigong's Finance and Administration Department. Policies and procedures are in place to govern hiring and recruiting, training and development, travel, honoraria, salary, compensation, performance appraisals, employee benefits, health and safety, contracts, confidentiality, code of ethics, conflict of interest, dispute resolution, employee relations and well-being. This centralized system promotes fairness, consistency, transparency and accountability. All staffing and awarding of contracts associated with the Smart Cities proposal will be subject to the existing policies of the First Nation.

Change Management

Our culture acknowledges the world is in constant flux and change; we are in a perpetual state of responding to this change. The concepts of renewal and transformation are inherent to how we interact with the inter-connected world. These beliefs are reflected in our governance systems. We adopt a learning environment that fosters change and utilize iterative management practices to ensure on-going alignment between our outcomes and the needs of our stakeholders. We offer employee assistance programs to assist in change management. Additionally, our Social Services Team provides supports to assist individuals, families and teams, with any issues that arise as a result of change. We also rely on our cultural ceremonial practices to assist in our change management efforts.

Risk Management

Our goal is to create an organization culture where risk identification and management become part of everyday life. Although it is important to conduct a risk assessment at the onset of a project, it is equally

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

important to ensure risk management activities are performed, recorded and monitored throughout the lifecycle of the project. Our risk management strategies aim to accomplish this.

For this project, we will utilize a framework that provides for a process for risk identification, risk analysis, risk response planning, monitoring, controlling and reporting. For each major risk that is to be mitigated or that is accepted, a course of action will be outlined for the event that the risk does materialize in order to minimize its impact. Monitoring and reporting mechanisms will be built into all levels of governance and project implementation. Ultimately, the risk management plan is the responsibility of the Executive Board.

Communication Plan

Communication is the key to a successful project. Our communication plan identifies key stakeholder and avenue for the delivery of pertinent information. Information will be delivered to all stakeholders in a timely fashion. Our engagement plan provides more details on how we plan to build strong communication with our stakeholders.

Control Process

The project team will continuously monitor the project against established timeline and metrics. This will ensure that the project is in accordance will budget and timeline and that deviations are remedied. Our internal systems of control are well defined and tested. We have made some adjustments to ensure our Smart Cities implementation is done so successfully.

Partnerships

Introduction

The goals of our Smart Cities proposal are ambitious and require a collaborative approach to make them achievable. Partnership opportunities exist across many sectors and include individuals, businesses, education institutions, governments and community organizations. Partnerships are a strategic process and our approach to partnerships begins at home by creating a solid foundation that we can build upon. We want Smart Cities to live beyond the life of the proposal and become part of how Biigtigong exists.

Our Internal Partnerships

The impacts of our proposal outcomes will create substantial change that extends past the individual students and into the social and economic fabric of the community. Preparing our children for the digital world also includes preparing our organizations and community. This is why our membership is best served by aligning our different departments and related organizations. These alliances require deep interpersonal connections and appropriate structures and systems in order to yield the highest benefits.

Our internal partnerships are living systems that evolve progressively in response to the changing environment and the needs of our membership. Building upon and utilizing our internal resources and developing our capacity are necessary to achieve long-term sustainability. Collaboration between our service departments and community owned organizations are critical to achieving success.

Our focus, the central point of everything, is our children and this is what brings us together and keeps us together. The elders always remind us that it is our responsibility to keep our children in the center of everything. Sharing a common vision and purpose is what binds successful partnerships. Our Smart Cities proposal is attached to and supports Biigtigong's bigger vision of Nation building.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Biigtigong's Service Departments

Our Smart Cities proposal development team, which consisted of two members of the Senior Management Team and the Chief, approached the proposal implementation phase as a collective effort of our entire team. The goals of the proposal align with the overall goals of the organization, making it easy to establish collaboration and project partnerships. We entered into collaboration agreements with our service departments. The purpose of these agreements is to demonstrate that the proposal is supported by the entire organization.

Our internal partnerships are governed by the structures, regulations, practices and historical relationships that exist within the organization. We have established and proven frameworks that we utilize for our projects. These frameworks address general project management requirements, such as, managing risks, finances and resources, quality assurance and performance management, human resource and capacity development, reporting and accountability and team development. Our implementation plan is build upon our assessment of our internal capacities, readiness and resources.

To ensure success, our implementation plan allocates specific tasks to respective departments who have a related mandate. For example, our Sustainable Development Department who is responsible for economic development, employment and training, will be responsible for the establishment of the high school reBOOT IT business, co-op placements and summer employment. While our education department will be responsible for the academic portions of the co-op high school program. Such partnerships allow us to extend the reach of our project goals and build the foundations for long-term sustainability.

The community retains control over sensitive and personal data. We already have established policies and systems that manage and control data collection. We do not want to re-invent systems but rather utilize existing resources and help make necessary improvements where we can.

The initial commitments from our service departments are identified in the collaboration agreements attached. These will be continuously reviewed, monitored and developed to ensure the best possible strategies are collectively in implemented to better serve our membership. Our Smart Cities proposal has provided another rallying point to collectively strategize in bringing together our efforts to innovate and make meaningful lasting change and improvements.

Our External Partnerships

Two of our main external partnerships are with independent, but related entities of Biigtigong. Pic River Development Corporation is the Internet Service Provider in the community and will provide services for the off-ramping, uploading, downloading and backup storage of our videos at no cost. They also made a financial commitment to support the project implementation. Anishinabek Employment and Training Services is an entity that provides employment support and training services on behalf of 9 First Nations. A three-year financial contribution has been made to assist in the development of the CompTIA A+ and reBOOT co-op education program and the summer student employment portion. Biigtigong has existing agreements with both entities that defines the relationship, mandate, governance structures and other areas. The risks associated with these partnerships are extremely low and mitigation strategies to address the risks are already in place.

Biigtigong has many business partners and professional relationships. Part of our business strategy is to develop mutually beneficial partnerships that create value. We seek to be a 'partner of choice' and have a history of successful partnerships. Letters of support from some of our business partners are attached to this proposal. We have not entered into any formal partnership agreements but we will explore the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

options when needed. At which time we will enter into formal agreements that define the details of the partnership.

Our Service Partnerships

Our Smart Cities team has enlisted the help of two organizations who bring value to achieving our set outcomes. Memorandums of Understanding have been signed with ICTC and reBOOT Canada and provide the details of the partnership. Both entities are assisting us with the implementation of our K-12 STEM programs. Our projects share common visions and provide services that complement each other and provide a good fit. We have developed excellent working relationships and have created a common path and are equally excited to embark on our journey together.

Anishinabek Education System

23 First Nations are part of an education self-government agreement with Canada and Ontario, forming the Anishinabek Education System. The participating First Nations under the Anishinabek Education System will enact education laws that govern the Anishinabek Education System and the delivery of programs and services. Each participating First Nation has law-making power and authority over education from JK to Grade 12 on reserve. Participating First Nations will also establish and maintain system-wide education standards that support the transfer of Anishinabek students between the Anishinabek Education System schools and the provincial education system schools.

AES is in its development stage and in the process of getting established and operational. The Board has provided a letter of support of our proposal and we will explore options on how our proposal implementation can assist the other 22 First Nations. AES is an opportunity for First Nations to collectively work together to address the education needs of our children. We expect that as AES develops that we will create innovative approaches to improving the lives of our children.

Summary of Partnership Agreements

Source	Type	Notes
Internal Collaborative Partnerships		
Children & Family Learning Centre	Collaborative Service Agreement	Biigtigong Service Department
Health & Social Services	Collaborative Service Agreement	Biigtigong Service Department
Sustainable Development	Collaborative Service Agreement	Biigtigong Service Department
Capital-Housing	Collaborative Service Agreement	Biigtigong Service Department
Finance & Administration	Collaborative Service Agreement	Biigtigong Service Department
Education	Collaborative Service Agreement	Biigtigong Service Department
Service Partnership Agreements		
Pic River Development Corporation	Memorandum of Understanding	Biigtigong Non-Profit Corporation
reBOOT Canada	Memorandum of Understanding	New Partner
Information And Communications Technology Council (ICTC)	Letter of Support Memorandum of Understanding (waiting on approval)	New Partner
Anishinabek Employment and Training Services (serves 9 First Nations)	Letter of Support – financial commitment	Aboriginal Skills Employment and Training Strategy
Industry Support		
S. Burnett & Associates	Letter of Support	Business Relationship/Partner
Anishinabek Education Services (23 First Nations)	Letter of support	Anishinabek Nation Education self-government agreement
Nishnawbe-Aski Development Fund (NADF)	Letter of Support	Business Relationship/Partner
AV Terrace Bay Woodlands	Letter of Support	Business Relationship/Partner
Barrick Hemlo	Letter of Support	Business Relationship/Partner
BDO	Letter of Support	Business Relationship/Partner

Ontario Waterpower Association	Letter of Support	Business Relationship/Partner
Royal Bank of Canada	Letter of Support	Business Relationship/Partner
TBT Engineering	Letter of Support	Business Relationship/Partner
** Evidence and details of partnerships are included in the Appendices.		

Governance & Partnership Risks and Mitigation Strategies

Risk	Likelihood	Impact	Risk Management Approach/Mitigating Actions
Change in partners' involvement or withdrawal.	Low	High	• Build Relationships • Formal agreements • Identify alternative strategies • Continually monitor risk
Admission of new partners.	High	Medium	• Admission mechanisms • Needs based; team approval process • References – due diligence
Conflict of Interest	Low	Medium	• Build strong communication among the partners • Maximum transparency • Implement Conflict of Interest Policy
Potential inequalities in partners' resources and expertise determine their relative influence in the partnership's decision making.	Medium	Medium	• Focus on consensus based decision making • Address in formal agreements • Build relationships • Access to dispute resolution process • Involve experts on Executive Board
Poorly defined shared vision and objectives.	Low	Medium	• Develop shared vision with clearly defined objectives • Link corporate objectives/organizational objectives to the project objectives • Training and Education sessions • Annual reviews
Partners do not meet performance targets in a satisfactory or timely way.	Low	High	• Develop an agreed upon Performance Management framework • Conflict management/resolution procedures • Encourage joint ownership of problems & solutions • Relationship building
Failure to engage key stakeholders in meaningful ways.	Low	Medium	• Awareness & education of engagement strategy • Communication strategy • Performance measurements inclusion • Evaluation strategy

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Failure of partner to comply with relevant laws and regulations.	Low	Low	• Identification & education of laws & regulations • Dispute resolution process • Develop safeguards throughout project
Lack of understanding with local culture.	Medium	Medium	• Cultural awareness training • Provide explanations – no assumptions • Dispute resolution
Financial risks No strategic approach to issues of risk, costs and benefits	Medium	Medium	• Define and agree with approach to dealing with costs and benefits of the partnership. • Continuous monitoring & reporting • Utilize Finance Department & Finance Committee
Loss of autonomy	Low	High	• Rigorous selection of partners • Clear agreements
Lack of capacity, skills, knowledge and experience	Medium	High	• External Recruitment Plan • Local training & development plan • Outsourcing and Contracting Options
Poor internal & external communication.	Low	Medium	• Establish communication plan & review • Regular meetings • Structured reports • Use of collaboration tools

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 6: Community Engagement Plan

Part 1: Our Approach to Engagement

Our engagement plan is built upon our fundamental belief as Nishnaabeg that everything is inter-related and inter-connected. We view the world as being in constant motion, made up of complex networks and long-term sustaining relationships. We understand the importance of developing and maintaining relationships and the goal of keeping balance and harmony. As a relationship based system, the principle of inclusion is foundational to how we live our lives. Hence, our approach to engagement is inherently inclusive in nature and facilitates high degrees of community participation in meaningful ways.

Our engagement plan, not only facilitates the involvement of our stakeholders, but it does so in a manner that supports the revitalization of our traditional ways in a modern world. Our engagement plan facilitates the coming together for a common vision and purpose. It supports the continuous development as individuals and as a community, as it affirms our common values, builds trust, strengthens relationships, fosters responsibility and accountability and facilitates community ownership.

Purpose of Engagement:

The overall purpose of engagement is to create opportunities for our children, youth, parents, grandparents, aunts, uncles and all Biigtigong members, to embrace their responsibility for the well being of our community and future generations and become actively involved in creating a better world.

Engagement Objectives:

1. To empower those affected by this proposal to be involved in the decision-making process and the creation of solutions to challenges and opportunities that are specific to stakeholder needs.
2. To ensure the engagement processes are meaningful and seek out real contributions that influence the project design and implementation.
3. To facilitate a learning environment, where the transfer of knowledge and skills encompasses everyone who is impacted by the project.
4. To utilize cultural practices to ensure successful engagement and facilitate community pride.
5. To document and share our experiences with engagement, in order to assist in making this project more scalable and replicable.

Engagement Principles:

The following guiding principles form the basis of our engagement process and approach to ensure high-quality collaboration and meaningful active participation.

1. **7th Generation Principle:** We are responsible for the seven generations to come and to the seven generations that came before us. We will move forward embracing our past and future generations and remember the long-term impacts of our decisions.
2. **All my Relations**: Our way of life is centered on the belief that we are all related and connected. Every decision impacts everything. We will seek out holistic approaches that honour all life and our complex networks.
3. **Relationships:** Developing and maintaining relationships with all life is central to our Nishnaabe way of being, bringing rights, obligations and responsibilities that extend beyond self. We act accordingly, always striving for a state balance and harmony, as we work collectively towards our vision
4. **Renewal and Transformation:** The notions of renewal and embracing change are inherent in our worldview, as we view the world as in a state of constant flux and change. We will utilize

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

approaches that respond to continuous change and implement on-going evaluation to ensure we are meeting our goals and the needs of the community.

5. **Process Focused:** Comprised of approximately 70% verbs, the importance of process and actions are embedded in our language. Our approaches will be action-orientated, focusing not only on achieving results, but also on the journey and lessons that our journeys bring.
6. **Natural Laws:** We learn about what our behaviour should be by observing Mother Earth and respecting the natural laws.

Stakeholder Identification

This proposal will change the essence of the social fabric of the community. From previous engagement experiences on other projects, we understand the importance of including the diverse groups that will be impacted and/or could impact the project. We understand that this journey, especially the reclamation of our language and aadsookaanan, will potentially stir emotions resulting from historical impacts from cultural genocide. We further understand, that it is necessary to walk through these hurts together in order to move forward, heal and reclaim our culture and identity. This proposal required the input of everyone, as it provided another opportunity to build stronger individuals, families, community and a Nation.

In identifying our stakeholders, we considered those who would be immediately impacted and those impacted according to our 7th generation principle. Various target groups were identified and strategies established to facilitate meaningful engagement. Evaluations of these approaches were conducted and necessary changes were implemented and/or noted to improve outcomes. As we move forward from development to implementation, we remain committed to developing effective engagement processes that build upon best-practices while creating new and innovative ways of engagement.

Part II: Our Engagement To Date

Efforts to ensure participation amongst the diverse groups within the community have provided valuable insights that have significantly improved the final proposal. Our engagement processes to date have resulted in obtaining a clearer understanding of the challenges and opportunities that exist or could potentially exist throughout the life of the proposal implementation stage and beyond. It facilitated the development of creative mitigation risk strategies and creative means to grab the opportunities. Our engagement process has led to an excitement; it has provided a central rallying point. The following provides a list of primary stakeholders engaged to date, the methods used for engagement and the insights gained from the engagement that shaped our proposal.

Formal Leadership

Engagement with our elected leadership has reiterated their long-term commitment to the goals and the expected outcomes of this proposal. Council echoed the need to build everything in a manner that will lead to long-term sustainability. In order to ensure long-term success, the spirit of the proposal must become part of the DNA of the entire organization and community. Due to the nature and outcomes of the proposal, the entire organization and community, must strategically align resources in the collective pursuit of our vision.

Council understood the need to build STEM knowledge in order for the community to participate in the rapidly changing world. Additionally, that the creation of children who understand their traditional language, for the first time in centuries, will profoundly change the fabric of the community and our institutions. Council also restated their excitement that our proposal will impact people beyond our

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

community. Direction was provided to our Senior Management Team to ensure our strategies align and support the specific goals and outcomes of the Smart Cities proposal.

Our Senior Management Team is constantly creating, evaluating and reimaging our vision, our strategies, successes and failures, in our efforts to build our Nation. Working towards a common vision, our education, health, social services, lands and resources, governance, economic development, housing, and public works team, collectively and strategically aim to address the needs of our community. Our engagement with Senior Managers allowed us to work towards a common vision and develop mutually supportive and attainable goals.

Language and aadsookaanan reconstruction and revitalization is an organization wide goal and will impact our existing service delivery models. For example, upon the completion of the aadsookaanan reconstruction work, our Social and Health Department, will utilize this work to reconstruct our rites of passage and develop a service model based on the rites of passage. Another example is the re-visioning of our dispute resolution policy and the alignment with the ancient teachings contained in our aadsookaanan. A review of our Human Resource Strategy will be conducted in light of the availability of immersion video that will create understanders.

As for STEM, our departments will be providing support, in terms of placements, special speakers, student co-op work opportunities, and STEM related summer employment. Our Senior Management Team are committed to creating the necessary supports, as per the findings of our on-going evaluation and project implementation, to ensure successful attainment of our goals.

The primary engagement tool we utilized with leadership was holding face-to-face meetings both collectively and individually. This method was selected in order to facilitate critical thinking and extensive discussion. Leadership was also represented at all of our other stakeholder engagement sessions. On-going engagement with this particular group is of extreme importance to the success and continuation and growth of our Smart Cities proposal.

Continued engagement will occur through the existing structures that will facilitate on-going connections between the proposal implementation team and the leadership. Senior Management will be responsible to engage their respective staff members. Regular meetings will occur throughout the life of the project, in addition to regular reporting and evaluation. The governing team responsible for the Smart Cities project will have a representative from Council and Senior Management appointed to ensure successful implementation and alignment of goals.

Biigtigong Aadsookaanan Group and Elders

Our elders and traditional knowledge holders are considered major stakeholders in this project. Following our cultural protocols, these groups have been involved in the planning and development of our proposal, including our initial application. Our approach to engagement with our elders usually occurred in informal settings, not in a boardroom. We respected their approach in transferring knowledge and providing direction through the use of stories and personal accounts of life experiences. Individuals from this particular group have directly experienced the affects of residential and day school systems. They are able to speak first hand regarding the loss of language, the loss of their stories and methods of transferring cultural knowledge and the trials this has caused in their lives and those of their family. They are motivated to create opportunities to reconcile the impacts from this part of our history.

Through our engagement processes, these stakeholders provided strong support for the use of technology in the creation of understanders of Nishnaabemwin (our language) and the transfer of traditional

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

knowledge contained in our Aadsookaanan (sacred stories). Many understood the power of technology due to their involvement in our language reconstruction and documentation project. From first hand experience, they saw the data that everyone contributed and the research data, along with technology, successfully aid in reconstructing our language. Most of our elders and knowledge keepers realize that language revitalization in our community is impossible without the use of technology. Additionally, they felt that making our language and stories available on-line, was the best means to reach our youth. With only one proficient speaker left in our community, taking the data available through our language and making this accessible for everyone, forever, and utilizing immersion, on-line, provided hope and reconciliation.

They also asserted the importance of having our youth and our elders/knowledge keepers interact in real-life experiences. Our elders reminded us that our way of life is tied inherently to the land and more to a specific place. In order for us to transform our youth into better-educated, more-employable, better-grounded and more holistically Nishnaabe, we must keep them connected to their territory and the teachings that can only come from intimate relationships with the trees, birds, fish, wind, rain, rocks and every part of existence. They stressed the importance of our land-based curriculum and the need to build their relationships with Mother Earth.

The primary engagement tool used to obtain input from this target group was the use of face-to-face informal meetings. We followed cultural protocols, with the passing of tobacco and observed the traditional methods of knowledge transmission. We smudged, sang, feasted, told stories, laughed, cried, talked, listened, remembered our ancestors, sat in silence, and together made decisions in the best interest of seven generations.

Our elders and traditional knowledge will continue to play an integral part of our Smart Cities proposal implementation. The role our elders play in our world is very explicit as defined by our cultural protocols. We are responsible to acknowledge their role and facilitate the inter-generational transfer of knowledge, in a culturally appropriate manner. Our proposal sets out formal and informal on-going space for the involvement of our elders and knowledge keepers. Cultural norms dictate that we are accountable to our elders and as just this guarantees that they will be meaningfully involved in this proposal.

Biigtigong Youth

Our youth are the center of this proposal and are the main beneficiaries and reasons for this proposal. Part of our engagement strategy for this group, included the examination of results and other engagement sessions held by other community projects. We utilized this information to augment the information we obtained through our engagement sessions.

Through surveys and personal interviews with our youth, they expressed the need to be better prepared for the technological world. Additionally, they felt it was important that having a strong sense of their Nishnaabe identity was essential to their success. Not having been exposed to their traditional language and what it contains, our youth do not understand the profound sense of loss that our culture has suffered or the depth of the benefits one can receive from acquiring their language. Our initial application failed to identify this as a potential drawback to achieving our outcomes. This is addressed in our final proposal by creating a series of videos that provides an inside look at the philosophy embedded in the language and how it expresses our unique worldview. It is our intention that these videos, along with teachings from our elders, will provide our youth and other community members with the motivation to begin their language acquisition journey.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

We engaged the youth through some of their established groups. Additionally, we hosted special events at their local high school, sponsored community events, conducted a youth survey, and talked to them in various public functions and locations. Several new initiatives are currently underway with our departments that aim to increase youth involvement. Our Smart Cities team have provided input into the establishment of these new initiatives and will utilise these structures to increase youth engagement. They new approaches are youth-driven.

Parents

Projects aimed at our children will be more successful with the support of their parents. Our parental engagement findings showed an overall support of the proposal. Parents understood the importance of preparing our children and youth for the technological world. Additionally, they acknowledged the importance of language, culture and land to identity and how this was important to living good lives.

One of the biggest impacts resulting from our consultations with parents was their personal fear in not having knowledge of STEM or the language. This translated into building into our proposal strategies to help educate our parents and provide resources on how they can support their children's language acquisition and STEM learning journeys. Including supports for parents has now become an important addition to our proposal. We will incorporate strategies that facilitate family learning. Overall, the parents were excited about the new possibilities for their children and several thought perhaps they should go back to kindergarten.

Parents understood that this proposal would produce understanders of the language. They wanted reassurance that the resources necessary to move from being an understander to becoming a speaker will be available. Our 2019 survey and 2006 survey clearly state that language revitalization is a community priority and creating speakers is our ultimate goal.

We utilized surveys, community meetings, and small group discussions, as the means to obtain parental engagement. Our education staff took opportunities inside their system to engage the parents and introduce them to STEM. We have strengthened our strategies to encourage and empower our parents as they support their children's education journey. Continued parental engagement throughout the proposal implementation is important to achieving the outcomes for our children.

Biigtigong Education Staff

Biigtigong has a well-established, creative and results-driven Education team. Their participation in the development of the proposal has been important and has resulted in substantial contributions to ensuring the successful implementation of our proposal. They have identified solutions to potential problems and have substantially improved the quality of the proposal.

They have been extensively involved throughout the entire process, from visioning, to curriculum reviews and development, education philosophy and pedagogy reviews, assessment and evaluation development, privacy and data, student needs and support, student learning styles, immersion video production, professional development and capacity building, co-operative education models and re-imaging a new education model. The application of the resources developed through this proposal will be subject to the rules and regulations of the Education Department. The education department will maintain responsibility for the monitoring of individual student assessments and the overall education mandate.

Through pilot projects and professional development initiatives, the staff had the opportunity to facilitate student learning in the area of technology and engineering. This was particularly challenging, as the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

teachers had little to no knowledge of either fields or experience using on-line resources in these fields. This work resulted in wonderful lessons but the most important take away is the creation of a team excited to take on the world of technology, engineering and language acquisition. Our education department and our Smart Cities team has developed a training strategy to support teachers with STEM, language and and blended learning education.

One of the major changes resulting from the engagement with the education staff relates directly to our initial goals in the secondary school program. The staff highlighted the limitations of secondary level courses as it related to our initial vision. As a result, we had to go back to the drawing board and find other ways to implement our vision. This turned out to be such a wonderful problem, which initially seemed insurmountable. This led to the development of a much more supported and comprehensive high-school program. It now provides high-school credits, real technology and engineering co-ops, summer internships and employment, youth owned and run business, career support and mentorship.

Our engagement with our education staff has been extensive and will continue to be so. We have utilized surveys, focus group discussions, small group discussions, pilot projects, training sessions, staff meetings, on-line resources, collaborative tools, and cultural events to engage our education team. We have created an organizational culture that supports and empowers our staff. The success of our Smart Cities proposal is increased by meaningful engagement and empowerment of our Education team.

Off-Reserve Members

The Smart Cities proposal provides an opportunity to strengthen the community bonds between on-reserve and off-reserve members. Through our on-line platform, off-reserve members will have the opportunity to access important community data relating to their language and aadsookaanan. Additionally, they will have access to any programs developed by the community that support STEM on-line. The meet-up-app will also help facilitate opportunities to return home to their traditional territory and participate in person with the community.

Our off-reserve members indicated support for the proposal goals and were excited about the opportunity to acquire their language from the comforts of their home. Engagement results reiterated the need to more effectively utilize technology to build stronger relationships and inclusion of off-reserve members into the building of our Nation.

Our engagement with off-reserve members included a survey, a meeting in Thunder Bay, availability of live-streamed community meetings, conference call meetings and web-site information. Our plan moving forward includes strategies to increase off-reserve participation and engagement.

Community Members at-large

Various engagement activities were held for the general population. These events included, luncheon talks, large community presentations, small group sessions, social events, survey, live-streamed community meetings, newsletters, web sites, email and social media. We received tremendous support for the project through the high levels of participation in the engagement sessions. Our general sessions were well attended and our survey return rate was high. The responses shaped our proposal by confirming we are on the right path and the community is behind the goals set forth in our proposal. Community support is very important to the successful implementation of our proposal. It does take a whole community to raise a child.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

STEM Professionals and Academia

In order to ensure our proposal is academically feasible and provides a solid foundation for entry into related post-secondary programs or employment fields, we engaged various STEM professionals from the business and academic sectors. The information and insights provided by this group has significantly impacted our proposal. They played instrumental roles in selecting the curriculum and developing a sequencing of skills and knowledge. Their expertise provided us with the guidance to develop a high level K-12 STEM program, with ambitious and achievable goals. Their continued involvement in the project will ensure our programs meet the needs of our students and the ever-changing needs of the industry.

Engagement Tools

A variety of methods were used during the proposal development stage to achieve high participation rates amongst the stakeholders. Upon the completion of stakeholder analysis, where a careful review of the potential risks, interests and benefits were identified, engagement strategies were designed to suit the specifics of each group. Engagement tools were purposely selected and customized for each of our stakeholder groups. In addition to selecting appropriate tools, the presentation itself was customized for the specific audiences.

Individuals who had experience working with each of the stakeholder groups were invited to assist in the design and the development of a best-suited approach to the consultations. Involving these individuals increased our efforts of engagement to produce meaningful results and strong community buy-in and support. A list of tools used is attached as Appendix Z.

Summary of Engagement to-date

Our engagement plans to date has resulted in the successful participation from our residents and the diverse stakeholders of the project. We believe our processes were meaningful and facilitated honest and open discussions. As a community, we explored the potential barriers and risks to our success and found creative solutions to address them. We embraced the opportunities and strategically developed a difficult but implementable proposal that will make profound impacts forever. We understand the importance of engagement and make this foundational to how we build our Nation.

Part III: Engagement During Implementation

We are building upon the successes of our engagement during the final proposal development phase. Our plans for engagement during the implementation stage are aimed to foster high levels of community engagement from the diverse stakeholders. The engagement processes are intended to ensure the needs of the community are being met and the program meets its expected outcomes. The engagement process will foster community development, inclusion and provide a rallying point for members to make meaningful contributions to helping transform our youth into better educated, more employable, better grounded and more holistically Nishnaabe people.

Formal Leadership

The following will be implemented to ensure meaningful and continued engagement with our formal leaders to support the attainment of the proposal outcomes:

1. Smart Cities Executive Board: The Chief and Council and the Senior Management Team will each have a representative on the Smart Cities Executive Board. Each will be coordinate engagement with their respective group.
2. Senior Management Team: An Executive Board representative will participate in quarterly meetings.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

3. Bi-monthly report: A video report will be made available to provide education, accountability and foster engagement on the project.
4. Annual Report: Produce and annual report to Council, Senior Management and Community.
5. Ceremony: Elders will be invited to an annual ceremony where we honour the goals of our proposal and ask for help and guidance from our ancestors.

Elders

The following will be implemented to ensure meaningful and continued engagement with our elders to support the attainment of the proposal outcomes:

1. Aadsookaanan Working Group: This group is comprised of elders, language carriers, traditional knowledge holders, youth, parents and technical personnel. They will work collectively with the aadsookaanan research and reconstruction team. They will act as the advisory body and assist in the decision-making process regarding aadsookaanan reconstruction. Additionally, they will report to the Executive Board who is responsible for the overall proposal. This group will remain in affect for the entire implementation stage and will meet no less than quarterly and more frequently when required. The group will coordinate community engagement sessions regarding the aadsookaanan project to keep the community informed and involved.
2. 50+ Elders Group, TEK Working Group, Place-Name Reclamation Working Group: Bi-annual engagement events will be held specifically with each of these existing community elder groups.
3. Pop-Up Engagement Sessions: We will host at minimum one pop-up Smart Cities fun and informative pop-up engagement session. These sessions will be held in support of existing annual community events, such as, moose-camp, addictions awareness week, fish-camp.
4. Ceremony: Elders will be invited to an annual ceremony where we honour the goals of our proposal and ask for help and guidance from our ancestors.
5. Bi-monthly Report: A video report will be made available to provide education, accountability and foster engagement on the project.
6. Annual Report: Produce and annual report to Council, Senior Management and Community.

Biigtigong Youth

The following will be implemented to ensure meaningful and continued engagement with our youth to support the attainment of the proposal outcomes:

1. Executive Board Seats: Two seats on the Executive Board will be reserved for youth representation. The seats will hold the same responsibility and influence as all other seats on the committee. The youth representatives will be responsible for coordinating the youth engagement strategies.
2. Biigtigong Youth Council: We will utilize the Youth Council to assist in the coordination of joint initiatives aimed at youth engagement.
3. In-school Engagement: We will host one in-school engagement session per semester.
4. Pop-Up Engagement Sessions: We will host at minimum one pop-up Smart Cities fun and informative pop-up engagement session. These sessions will be held in support of existing annual community events, such as, moose-camp, addictions awareness week, fish-camp.
5. Formal Evaluation: Our youth will be involved in the evaluation of the proposal activities and in the development of strategies to strengthen the program.
6. Celebration of Achievements: A celebration of student achievements as they r elated to the outcomes of this project will be planned each year.
7. Bi-monthly report: A video report will be made available to provide education, accountability and foster engagement on the project.
8. Annual Report: Produce and annual report to Council, Senior Management and Community.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Parents

The following will be implemented to ensure meaningful and continued engagement with our parents to support the attainment of the proposal outcomes:

1. Education Committee: An Executive Board member will work with the Education Committee to engage and inform parents.
2. Child and Family Learning Centre Parent Committee: An Executive Board member will attend 1 parent meeting per year, or as requested.
3. Existing In-School Parent Engagement Activities: Parents will be engaged through parent-teacher interviews, open-houses, progress reports, on-line media and other in-school engagement processes.
4. Parent and Student Cohort Support Program: A special program will be set up for the parents and students for the 2019 cohort moving into the CompTIA A+ program. This program will provide various support services for the duration of the program. Parents will have an opportunity to help adapt the program in order to better serve youth success.
5. On-line workshops for parents: A series of on-line interactive workshops will be held for parents to help them engage in the learning journey of their children.
6. Formal Evaluation: Our parents will be involved in the evaluation of the proposal activities and in the development of strategies to strengthen the program
7. Bi-monthly report: A video report will be made available to provide education, accountability and foster engagement on the project.
8. Annual Report: Produce and annual report to Council, Senior Management and Community.
9. Pop-up Engagement Session: We will host at minimum one pop-up Smart Cities fun and informative pop-up engagement session. These sessions will be held in support of existing annual community events, such as, moose-camp, addictions awareness week, fish-camp.

Off-reserve Members

The following will be implemented to ensure meaningful and continued engagement with our off-reserve members to support the attainment of the proposal outcomes:

1. Off-reserve meetings: A minimum of one in person meeting will occur with off-reserve members.
2. Live-stream video: All community meetings will be live-streamed to encourage off-reserve members.
3. Webinars: 2 Webinars will be held annually for post-secondary students and off-reserve members.
4. Formal Evaluation: Our youth will be involved in the evaluation of the proposal activities and in the development of strategies to strengthen the program
5. Bi-monthly report: A video report will be made available to provide education, accountability and foster engagement on the project.
6. Annual Report: Produce and annual report to Council, Senior Management and Community.

Community at large

The following will be implemented to ensure meaningful and continued engagement with our community to support the attainment of the proposal outcomes:

1. Community Meeting: A minimum of one in person meeting will occur with on-reserve members.
2. Live-stream video: All community meetings will be live-streamed to encourage off-reserve members.
3. Nishnaabe Clan System: A new engagement system based on our clan system will be introduced for the first time. This is an extensive engagement process that is designed to include all sectors of the community. This system will be used as one of our primary methods of community engagement.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

4. Formal Evaluation: Our youth will be involved in the evaluation of the proposal activities and in the development of strategies to strengthen the program
5. Bi-monthly report: A video report will be made available to provide education, accountability and foster engagement on the project.
6. Annual Report: Produce and annual report to Council, Senior Management and Community.

Nishnaabe Clan System

Reconstruction and reclamation of our ancient Nishnaabe ways is a central to our vision. In keeping with the spirit of our vision, we intend to utilize our traditional clan system as the primary method to our engagement strategy. The clan system is built upon principles that are foundational to our world-view and philosophical understanding of our world. These principles capture cultural values, such as, non-hierarchical structures, cooperation, collaboration, reciprocity, communal living and promotes the importance of relationships.

Our clan systems are reflective our cultural structures that emerges from our relationships with the land and a naturalistic cosmology. We look to the natural world and the laws that exist on the Earth, as our guiding principles for the development of our systems and structures. Our clan systems consist of seven primary clans: Loon, Crane, Fish, Bird, Bear, Marten and Deer, each having several sub-clans. Each clan has adopted a spirit animal as their totem and this animal is a symbol of how the members of each clan should conduct themselves and relate to the world.

This system organizes work and establishes responsibilities of individuals and the collective. Each clan holds specific duties and responsibilities to take care of the physical, mental, emotional and spiritual needs of the community. Some of these responsibilities include, philosophy, law making, decision-making and enforcement, governance, learning and teaching, communication, economics, trade, defense, child rearing, providing, conflict resolution, and strategy. The clan teachings are agreements that govern how individuals and families take care of each other and the community as a whole.

We are choosing to implement our clan system for the first time within a modern context. We will utilize the clan structure and protocols for the purpose of community engagement. Each clan will appoint a representative to the main clan body. The main body will work with the Executive Board, to determine the most effective and productive strategies to empower and engage our residents. Each clan leader reports directly to his/her clan and the clan determines how they will involve the members of their clan in the process. Clans determine their own internal methods of communication and decision-making. Individual clan decisions are brought back to the main clan and our consensus decision-making model and dispute resolution models will govern the process. This is the basis of our engagement plan.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Risks and Mitigation Strategies

Our approach to risk and how we determine and mitigate or avoid risk is discussed in Chapter 3. This table summarizes the risks associated with community engagement and the risk management approach and mitigating actions to be taken.

Risk	Likelihood	Impact	Risk Management Approach/Mitigating Actions
Lack of Support of the proposal	Low	High	• Establish meaningful process • Be accountable & report • Provide education
Loss of faith and trust if there is no consistent follow-up by staff.	Low	High	• Establish measureable goals. • Plan for short term achievements • Set achievable action plans • Be accountable and transparent
Unrealistic stakeholder expectations and demands.	Medium	Medium	• Be clear about the reasons for engagement • Clear and consistent communication • Provide education • Dispute resolution process
Lack of interest	Medium	Medium	• Select group appropriate strategies • Know your audience • Ensure the activities are fun, social and specific to your audience
People made feel excluded	Low	Medium	• Use existing networks and structures • Provide several opportunities for people to have input • Ensure culturally appropriate methods • Customize approach to audience we
Limited knowledge on clan system	High	Medium	• Utilize knowledge holders in community • Conduct research • Bring in elders who know about clans • Training • Ceremony
Triggers trauma – direct and inter-generational	Medium	High	• Create awareness of possibility – share previous examples/similar stories • Include ceremony • Social Services support programs • Cultural Coordinator support programs
Don't meet outcomes	Low	High	• Set up good planning • Realistic outcomes – needs based – measurable • Set up reporting and accountability • Supportive budget, governance systems, management system
People are not aware of what's going on	Medium	Medium	• Communications plan • Use various approaches to inform people • Be creative – go to them
Lack of time	Medium	Medium	• Live stream meetings • Use BiigtigongX • Provide information to them – video, tv, print, car, phone • Make it interesting, fun and useful

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 7: Privacy

Introduction

Privacy is of the utmost importance to our leadership, project team and community as a whole. Given that this project entails a blended learning environment of both online and real-world opportunities this project will result in the generation of new data from users creating accounts on the Open edX platform. As such, it is critical that this project be developed and implemented with significant consideration given to privacy and data security. The following chapter outlines our data management plan.

Preliminary Privacy Impact Assessment (PIA)

Given that this project involves the collection of some personal data, it is necessary to complete a Privacy Impact Assessment (PIA). In preparing this proposal, the project team has completed a preliminary privacy impact assessment through reliance on applicable regulations and our internal governance strategy and through incorporating feedback from the Office of the Privacy Commissioner of Canada. The PIA is submitted under separate cover.

The Preliminary PIA covers all proposed activities under the SMART Cities project, including how data will be sourced and accessed through the Open edX platform. Considerations have also been made for: Data Storage, Data Access, Data Retention and Data Disposal required throughout the lifespan of this project. The project team will continue to assess the project's privacy risks and impact to determine if there is a need to update the privacy analysis and/or the PIA report. This ongoing assessment is an essential part of identifying and mitigating new issues and changes impacting privacy that may arise during the implementation phases.

This Chapter of the Smart cities Challenge includes much of the information includes in the preliminary PIA, as well as additional details as specified.

Compliance with Applicable regulations.

The following table outlines the result of our compliance analysis:

Policy Process Statement	Process and Compliance measures
Purpose of the collection of personal information	This project involves creating a blended learning environment with both online and real-world components. The nature of an online learning environment results in the collection of minimal personal information to create an account, name, user name and password. Additionally, certain functionalities of the Open edX platform, such as the meetup application or time spent watching videos, will also generate data on a user's location and behavior patterns. Another source of data is the videos, stories, overdubbing etc. that will be created for the language immersion education and STEM bilingual courses portion of the project. This data will be stored on the Open edX platform as well as in a redundant hard-copy format (ie, transcripts, tapes etc) to ensure data is not lost. There are no additional privacy concerns associated with storing physical copies of the educational materials. All information identified is absolutely necessary for participating in the project and/or for monitoring the success of the project

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Source of personal information/ Accuracy	Initial data will be provided directly by users to generate their profile and then data will be tracked using their Open edX account. For example, it will be necessary to track users time spent watching video to provide assurance that the student has completed the necessary videos for completing the curriculum requirements. Given that the curriculum will be developed in a blended learning environment (brick and mortar and online) this will only include the collection of data related to activities completed in the Open edX platform. Activities completed within the brick and mortar school will continue to be tracked by teaching staff under existing processes. Qualitative data will also be collected by teachers for users to inform feedback on the project, monitoring, evaluation and control purposes. Personal information will be collected directly from the Open edX platform by teaching staff only. Collection of data from teaching staff will be required and is appropriate given the context of this project. Given that information is provided directly by the user through the online platform, we do not anticipate any major inaccuracies. Likewise, the anonymized and summarized data to be provided by teaching staff is subject to their current process which ensure accuracy and privacy of student information.
Accountability and Openness	The project team is accountable for the data collection, management and safeguarding results from this project. The project team has intentionally minimized the amount of personal information to be collected through use of Open edX platform, as users will only need to provide their name, user name and password to create an account. Likewise, we will implement a process that enables students and their legal guardians to provide informed consent to participate in this voluntary process, thus ensuring they understand what information will be collected, why, and who will have access to it.
Manner of collection of personal information	The data to be collected is minimal and relatively not intrusive. It is similar (if not identical) to the information already being collected and managed by the school system. Similarly, the information collected via the Open edX platform is typical for any online platform. Use of the meet up application is voluntary, and any users will be provided a privacy statement to agree to prior to using this forum (i.e. authorizing sharing of user location data)
Limiting Use, disclosure and Retention	Teaching staff are already subject to policies and codes of conduct that govern how they treat personal information, through to physical or technical controls that protect the information. Safeguards that will be into place include physical security; IT security; staff training; policies, confidentiality clauses in contracts with external providers etc. Information, such as language videos, transcripts etc. are to be stored indefinitely as these are important records of our language and traditional teaching that we are attempting to preserve as part of this project. Personal information will only be used for the purpose it was collected for, and as described. The personal information collected for the students will only be retained until graduation. Following successful graduation, all student data will be removed from the server and student accounts will be disabled.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

	The collection, use, retention and disclosure of personal data, and particularly student data, should always be limited to what is necessary to fulfil authorized purposes. Reducing the risk posed by the excessive collection of student data is a core principle that guides this project's data processing practices.
Access and correction to personal information	Users will be able to access the account information on the Open edX platform. Information collected by teachers will be subject to the policies and procedures currently in place in the school system. Information will be shared with students and parents through existing channels (i.e. report cards). Access logs will be implemented to track access to personal information. Teachers can correct their existing report card writing process based on information collected. For example, should a student choose not to use the meet up forum, the teacher would reflect the true involvement in traditional activities in that student's report card, regardless of the data output from Open edX. Requests for personal information to be corrected will be handled on a case by case basis. However, we do not anticipate any major concerns with meeting this principle as all information collected is basic in nature and expect most changes, if any would be minor in nature such as their name, username or password changes.
Accuracy etc. of personal information	Given that information is provided directly and automatically by the user through the online platform, we do not anticipate any major inaccuracies. Likewise the anonymized and summarized data to be provided by teaching staff is subject to their current process which ensure accuracy and privacy of student information. The process for anonymizing the data will involve the teaching staff providing the project team a summary report detailing quantitative data needed to provide details needed to track and report on performance indicators. This will include: • number of K-12 STEM courses successfully completed by K-12 students • number K-12 students needing remedial help in STEM subject areas • number of K-12 students who know the key concepts expressed in each of our core aadsookaanan • participation rate in number of traditional Nishnaabe activities for K-12 Students No personal or identifying information will be shared, nor will it be required, by the project team. The summarized data, omitting all personal information, is required by the project team to track, monitor and evaluate the implementation of the project, and to make course corrections when necessary. Qualitative data will also be collected for teachers to provide feedback on the project, for monitoring, evaluation and control purposes.
Data Disposal	Data stored on the Open edX platform will be expunged following a student's graduation.

Data Management process

This section outlines the types and methods of data collection, generation, analysis, storage, and preservation that reflects the entire data lifecycle in project design. The Data to be collected during this project is associated with the inputs and outputs, as described in our performance measurement strategy presented in Chapter 2.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Step 1: Gain informed Consent:

In order to ensure participants (and their legal guardians) make an informed decision when providing their consent to participate in the Open edX platform, a privacy seminar will be held at the community centre prior to program roll out. During this seminar, the project team will review the project and the content of this Privacy Impact Assessment to ensure participants (and their guardians) are knowledgeable of the inherent risks of participating in a partially-online learning platform. This seminar will overview what information will be collected and why, who will have access to this information once an account has been created and what agreements are in place (at that time) with all 3rd party providers. This seminar will also allow community members to voice their privacy concerns with respect to participating in an online environment. The project team will also present the policies and procedures developed thus far to mitigate any identified privacy risks and how any data breaches will be managed, as described within this document and further iterations of the PIA.

Should students, or their legal guardians, opt-out of the online-augmented (i.e., blended-learning) program, they will be given alternative means of participating in the k-12 curriculum at the brick and mortar school. It is important to note the participation in this Open edX platform is 100% voluntary and if not adopted will not diminish the learning of non-participates. Participants and their guardians will be provided a consent form outlining the privacy concerns and risks, for review and signature prior to enrolling in the Open edX platform.

Its should be noted that as outlined in the PIA, in an effort to mitigate risks, the project team will work with Technology/Software providers, including Open edX to enter into a contractual agreement which will ensure personal information is handled in a privacy-compliant manner, and restricts the third party's use of personal information for proposes outside the project scope. In all cases the user will be advised about any third party's privacy policies/statements when directed to a third-party site for additional links or resources, as part of informed consent process.

Step 2: Personal Information Data Collection

Users of the Open edX platform will be required to provide the following types of personal information. This information will then be use by teaching Staff to offer better service to participants.

- Account creation and login information, including user name and password *
- Location information - anytime the student interacts with Open edX platform, location data is generated **
- Patterns of behaviour (which educational video were watched and for how long)

*Students will not be asked to provide their address, date of birth or other identifying information for the purposes of setting up an account with Open edX. The intent of collecting a user name and password is only to allow a student to create an account and login to the Open edX platform and to enable teachers to track a student's progress.

**Due to the very nature of the internet anytime a person connects, the media that is being delivered to that person is tracked using a particular 'IP address.' Location data is then deduced from that IP address. There is no reasonable (or perhaps possible) way to interact with the internet without generating location data. Total location privacy is not possible within the current

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

organization of the internet since IP addressing is a foundational part of the internet. As such we can only attempt to maximize our privacy online - while accepting that our location will always be exposed.

Step 3: Data Analysis

Information to be collected will include the name/user name of the student and the amount of time a student spends watching a video, as well as any participation in any traditional activities as tracked through the meetup forum functionality. Similarly, should students identify participation in traditional activities through the meetup forum functionality of Open edX, this will generate location data.

No additional information will be provided regarding the student's performance in other school programs. Again, this is a voluntary blended-learning environment (online and/or brick & mortar, but not online only) and therefore the intent is to not replace what is currently being done at the school level. All collection of student data will be limited to what is needed for educational purposes.

Teaching staff are the only project resources who will have access to the student specific data. No other project team member will have access to individual student specific information. No information will be made public. Teachers require access to student specific data as it is needed ensure a student has completed the required curriculum. Behaviour data is also required to make teachers aware of how long a student struggled with a particular math problem, or how many times the student rewatched a video, and which sections of the video were rewatched, for example. This is one of the main benefits of using a blended-learning approach as this "behavioural pattern" data is what helps our teachers teach more effectively.

Teachers will not provide information about a student to Open edX nor to Appsembler. The flow of information is from student to Open edX to teacher, which is then provided back to the student in the form of a report card and to the project team in the form of aggregated summary data for performance measurement tracking only. In other words. Teachers will summarize the data and submit to the project team for performance monitoring and process improvements. I

With respect to information collected by 3rd parties, this will all be as per the contractual agreement. All terms of these agreements and risks to privacy resulting form 3rd party platforms and software will be communicated to users (and guardians) as part of the informed consent process.

Step 4: Store and Dispose of Data

Minimal student data will be stored on Open edX platform, over the course of their school. Data stored by teachers (i.e. in the form of records and report cards) is governed by their existing policies and procedures. With respect to input data such as the videos, stories, overdubbing etc. that will be created for the language immersion education and STEM bilingual courses portion of the project. This data will be stored on the Open edX platform as well as in a redundant hard-copy format (ie, transcripts, tapes etc) to ensure data is not lost. There are no additional privacy concerns associated with storing physical copies of the educational materials.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

All information identified is absolutely necessary for implementing the project, participating in the project and/or for monitoring the success of the project. Student Data stored on the Open edX platform will be expunged following a student's graduation.

Other Uses

There are no plans for and transmission, and plans for re-use, re-distribution, derivative production, archiving, student personal data. All other data, including videos, are to be made publicly available.

Open and Big Data Strategies

Only once this framework is expanded to different communities with different objectives will the use of big data be necessary to track the different uses and functions of this curriculum. At this point, open data will be used to report progress, engagement, best practices, etc. This information will not pertain to specific individuals, but specific user bases as whole. For example, data may summarize user rates, and immersion progress of a specific community, but not specific students of that community.

Privacy Risks and Mitigating Strategies

Risks and Mitigation Strategies are discussed throughout this chapter (and others). Three key risks are summarized in the table below:

Risk	Mitigating Strategy
Use of information by 3rd parties	The project team will work with Technology/Software providers, including Open edX to enter into a contractual agreement which will ensure personal information is handled in a privacy-compliant manner, and restricts the third party's use of personal information for proposes outside the project scope. In all cases the user will be advised about any third party's privacy policies/statements when directed to a third-party site for additional links or resources, as part of informed consent process.
Security Breach	The project team will develop and implement a breach response policy and protocol that addresses privacy and security risks for both the online and offline platform/storage methods. Information custodians, namely Teaching staff, Chief and council, and the database administrator must immediately contact the Database administer and Privacy Officer, informing him of the following: • the nature of the breach; • the information that was exposed; • to whom it was exposed; and • for how long it was exposed. The Information Custodian will work with the Privacy Officer who will advise whether notice to affected individuals and the Office of the Information and Privacy Commissioner of Ontario (IPC) is required. If such notice required, the Privacy Officer will work with the information custodian to meet the needs of the IPC.
3rd party software/technology becomes outdated	Reliance will be placed on existing websites for STEM education (i.e. code.org). As these are established organizations, that are constantly updating and revising content to better engage youth and other users in this field, there is some chance that this 3rd party software at some point may become dated. However, SMEs will continuously monitor content and explore alternatives should the desired content become outdated or unavailable

Chapter 8 - Financial Management Plan

Introduction

Biigtigong has a responsibility to its citizens to accurately account for public funds, to manage its finances effectively and efficiency, and to plan to provide quality needs-based services. As a government we are responsible for implementing effective systems of public financial management and for utilizing these systems to safeguard public assets. The effective management of public finances is fundamental to the development and growth of the community.

Financial management is a critical prerequisite for success. It is an integrated process that brings together strategic planning, budgeting, accounting, reporting, controls, procurement, auditing, policy and people with the goal of managing resources strategically to achieve the project's outcomes. Effective financial management includes planning, organizing, directing and controlling the financial activities to support the organization's goals.

Authority

Biigtigong's Constitution assigns Chief and Council the responsibility to effectively and efficiently manage and control public funds. They have the authority to establish institutions and appropriate legislation, polices and procedures, with supporting governance structures, to govern the financial matters of the First Nation. The Constitution recognizes the leadership's responsibility for accountability, transparency and results.

Financial Management Objectives

Biigtigong's financial management objectives are as follows:

- To enable the delivery of quality services to our membership that are geared to meet their needs.
- To make effective and efficient use of the available resources.
- Be accountable to our membership and other stakeholders.
- Prepare for long-term sustainability.
- Manage risks.

Sustainability and Diversification

The goals of our Smart Cities proposal are aligned and part of Biigtigong's bigger and longer-term vision. As such, it is not considered an independent project, with a start and end date. Our five-year implementation stage is designed to develop the necessary resources and capacities to ensure long-term sustainability of the program goals and objectives. As we begin our implementation, collaborative efforts with our internal departments on specific aspects of our proposal are setting the stage for long-term sustainability and integration.

Governance Structure

Establishing appropriate governance structures that support and facilitate the delivery of our programs and services to our membership is part of an effective financial management plan. Chapter 5 describes the governance structures.

Responsibilities

Establishing clear roles and responsibilities and ensuring a shared understanding of these roles are important to sound financial management. Financial management roles and responsibilities are defined in the financial polices. In addition, these are reiterated in the details of job descriptions, department

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

mandates and terms of references for committees and boards. All of these are in place for the Smart Cities proposal implementation.

The Chief and Council's primary responsibility is to establish appropriate laws and policies to govern the sound financial management of finances. Management is responsible for the implementation of these laws and policies and ensuring adequate procedures and systems are in place for support. Management is responsible for communicating the expectation and duties to staff. Staff and operating personnel are responsible for carrying out the internal control activities set forth my management.

Transparency

Creating a culture of transparency throughout the organization is one of the foundations of sound financial management. Developing principles of careful budgeting, reporting and auditing, combined with internal controls and transparency ensures a robust system of financial management.

The following provides some measures that Council has taken to provide transparency:

- Open Council meetings; public access to by-laws, minutes and reports.
- Council publishes the annual approved budget and financial statements.
- We have expanded our Internet and social media presence including some online services.
- Feedback and complaint mechanism are in place.
- Procurement policy is comprehensive and regulates the procurement of goods and services, including human resources.
- Conflict of Interest policy guides the disclosure and management of conflicts of interest.
- Codes of Conduct are established for members of Council, management, staff, committee members and the membership.
- Public access to information is guided by policy.
- Extensive community engagement culture; continuous opportunity for community to be involved in the decision-making processes.

Our Smart Cities team will adhere to the regulations and expectations established by Council via their formal and informal policies. Our team is committed to building an open and transparent relationship with all of our stakeholders. Transparency is of special importance to our team, as we are making new paths and facilitating a significant change at the community level and establishing trust is important. We will create opportunities to be transparent and ensure our organizational culture and systems support transparency.

Rigorous Internal Controls

Internal controls ensure that the organization is in compliance with laws and regulations and protects assets against theft and misappropriation. In general, segregation of financial duties to provide a set of checks and balances, proper authorization of expenditures, physical control of assets, and maintenance of records and documents supporting financial activities are the foundation of an adequate control environment. Sound financial management also requires regular reconciliation and review to ensure that activities reported in the organization's accounting records are crosschecked against the supporting documents.

Internal control is all of the policies and procedures management uses to achieve the following goals:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Safeguard assets - well-designed internal controls protect assets from misappropriation of public funds, accidental loss or loss from fraud.
- Ensure the reliability and integrity of financial information. Internal controls ensure that management has accurate, timely and complete information, including accounting records, in order to plan, monitor and report business operations.
- Ensure compliance - Internal controls help to ensure the First Nation is in compliance with the many federal and local laws and regulations affecting the operations of our business.
- Promote efficient and effective operations - Internal controls provide an environment in which managers and staff can maximize the efficiency and effectiveness of their operations.
- Accomplishment of goals and objectives - Internal controls system provide a mechanism for management to monitor the achievement of operational goals and objectives.

Our finance policy and operating procedures identify the internal controls that are mandatory for all operations. These controls are regularly reviewed and adjusted accordingly in our efforts for continuous improvement. Our Finance and Audit Committee, in conjunction with our Senior Management Team, provide Council with recommendations for improvement. The implementation of our Smart Cities proposal will be subject to the internal controls and procedures as established by our financial management systems.

Finance Policy Manual

Our finance policy manual is the central means to communicate the financial controls and responsibilities. In order to successfully mange a project a coherent set of accounting procedures and standards are required. Our finance policy manual addresses the following matters:

- Delegated and Assigned Responsibility
- Planning and Budgeting
- Tangible Capital Assets
- Investments
- Procurement
- Payroll
- Benefits
- Travel and Training
- Loans, Guarantees and Indemnities
- Expenditures and Payables
- Borrowing/Debt
- Financial Reporting
- Insurance
- Records Management and Retention
- Risk Management
- Information Technology
- External Audit

Financial Management Software

Biigtigong utilizes a financial management software program named Xyntax, specifically designed to meet the financial needs of First Nations. The software manages all accounting procedures of the organization, such as, cash flow management, general ledger, expenses, payments, assets, income and purchasing. It efficiently manages all financial administrative processes. The software is customizable to suit the specific needs of our organization. The staff who will be assigned the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

responsibility of financial management are familiar with and have extensive experience with the financial management software that will be used for the Smart Cities project. The software will also allow for specific project codes that could coincide with the identified outcomes and milestones.

Accounting Methodologies

Biigtigong utilizes project based accounting. Project accounting tracks all the financial components of a project. It provides access to more accurate and timely information when making decisions. It allows for an actual-to-budget analysis. Project accounting provides for more accurate accounting of project job costs. It provides for a more credible audit process and facilitates better control over projects. Project accounting also can help gauge the team's workload capacities.

Accrual basis accounting

Biigtigong uses accrual basis accounting methods. Under the accrual basis, revenues and expenses are recorded when they are earned, regardless of when the money is actually received or paid. Accrual basis provides a more realistic idea of income and expenses during a period of time. This method requires a careful monitoring of cash flow.

Generally Accepted Accounting Principles (GAAP)

Biigtigong complies with the Generally Accepted Accounting Principles. GAAP is a collection of commonly followed accounting rules and standards for financial reporting. GAAP compliance makes the financial reporting process transparent and standardizes assumptions, terminology, definitions and methods. The purpose of GAAP is to ensure financial reporting is transparent and consistent from one organization to another.

Financial Reporting

We adhere to a regular internal reporting system to ensure we are meeting our financial goals and objectives. Program Directors follow a strict regiment to review financial reports monthly and complete a series of financial tasks. Central to effective decision-making and having the ability to take corrective actions is having access to accurate and timely financial data.

Financial reporting requirements stem from a variety of sources, and financial reports serve many purposes. For example, they serve as tools for use by managers to control their departments and to monitor the extent to which management's objectives are being achieved. They also provide information to external parties on an organization's financial operations and compliance with a variety of requirements. Our Smart Cities management team will adhere to the reporting requirements as defined by Biigtigong and our funding agencies. We will ensure stakeholders have access to timely and accurate reports to allow for good decision making.

For the purpose of our proposal, our reporting system will have to be customized to accommodate the meeting of milestones, as per the contribution agreement. The SC Executive Board will provide regular written reports to the Director of Finance regarding the status of achieving the milestones. These reports will be developed based on the performance reports received from the project implementation staff. These reports will provide the necessary information needed to be the reporting requirements of Infrastructure Canada.

Human Resource Management

Human resource management is a critical success factor for the First Nation and it directly determines the business outputs. Human resource development and management play an important role in the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

overall financial management of our operations. We aim to maximize employee performance and create a supportive organizational culture to facilitate this.

Human Resource Planning

Through effective job analysis and design, we created positions with job descriptions and specifications to meet the needs of the organization and project implementation. The following chart summarizes our human resource requirements to implement our Smart Cities proposal. The majority of the budget will be allocated to human resources, making human resource management especially important to our financial management plan.

Human Resource Requirements – Smart Cities Proposal					
Position	Reporting to	Status	Time Period	Salary Grid Classification	Salary Range
Governance					
Proposal Lead	Executive Board	½ time	5 year	SM2	84,864-95,472
Project Coordinator	Proposal Lead	Full time	5 year	PS3	41,457 -54,092
STEM Implementation					
SC Education Lead	Education Director	Full time	5 year	T2.2	55,500 -81,600
CompTIA A+ Lead	SC Education Lead	Full time	5 year	T2.2	55,500 -81,600
Co-op & Business Coordinator	Economic Development Manager	Full time	5 year	PS3	41,457 -54,092
reBOOT Coordinator	Economic Development Manager	Full time	5 year	EA2	29,766 -38,839
WaaWaa Immersion Video Production					
Immersion Lead	SC Education Lead	Full time	5 year	T2.2	55,500 -81,600
WaaWaa Instructor	Immersion Lead	2 -½ time	5 year	ECE2.2	37,756-49,263
Nishnaabemwin					
Audio Overdub	Proposal Lead	Full time	5 year	Contract	85,000
Bilingual STEM	Proposal Lead	Part time	5 year	Contract	12,500 – 55,000
Meet-up Function					
Meet-up Coordinator	SC Education Lead	Full time	5 year	PS1	37,669-49,149
Technology					
BiigtigongX Administration	Project Coordinator	Part time	5 year	Monthly contract	1,200
Database Administration	Project Coordinator	Part time	5 year	Monthly contract	500

Human Resource Management Tools

Biigtigong uses the following tools to assist in our efforts to maximize employee performance and meet our operational goals and outcomes:

1. Hiring Policies: Provides process to hire, interview, recruit, and determine if you will need to implement training or development for potential or current employees.
2. Termination Policies: Provides process to deal with termination or voluntary resignations.
3. Job Descriptions: Establish clear roles and responsibilities and qualifications.
4. Employee Performance reviews: Provides mechanisms to conduct performance reviews and evaluations of staff.
5. Employee Handbook: Provides a snapshot of our policy guide.
6. Health and Safety Policy: Provides health and safety standards and procedures.
7. Discrimination/Sexual Harassment Policies: Process on how complaints and investigations will be handled.
8. Detailed Policies: Regulations regarding benefits, such as, vacation, holiday, personal, and sick pay, company benefits, salaries, etc.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9. Required Policies: Required policies are anything that the federal, provincial or local governments require (WSIB, EI, CPP).
10. Specific Policies: Confidentially Policy, Social Media Policy, Cultural Leave Policy.

The Budget Process

The budget process is one of the most important components of successful financial management. The budget process extends beyond the preparation of a document that appropriates funds. Budgeting is strategic nature, encompassing multi-year financial and operating plans that allocate resources on the basis of identified goals. It serves as the performance benchmark for all financial decisions. A budget ensures that an organization can fund its commitments, meet its financial and program objectives and control spending. It allows for measurement of performance and the identification of potential problems. The budget is the overall financial framework.

The development of Biigtigong's Smart Cities budget was done in accordance with the budget policies of the First Nation. The budget was also developed in consideration of the expectations as identified in the Smart Cities Finalist Guide. Our budget supports the implementation of our proposal and the achievement of our goals.

Biigtigong's Annual Planning and Budgeting Schedule

Task	Individual Responsible	Timeline
Annual planning kickoff meeting to present major budget policies, multi-year financial plan direction and guidelines for the strategic plan.	Director of Finance, Senior Management Team, Finance & Audit Committee	3rd week in November
Update Tangible Capital Assets.	Senior Management, Director of Finance	1st week in December
Each Department prepares a thorough analysis & projection of all expenses for the budget yr.	Senior Management Team	2nd week in January
Consolidate all draft budgets including capital budget into one master budget;	Director of Finance	4th week in January
Multi-year plan and strategic plan developed or updated.	Senior Management, Director of Finance	1st week in February
Senior management reviews draft budgets, multi-year plan, and strategic plan.	Senior Management, Director of Finance	2nd week in February
Present budget, multi-year plan, and strategic plan to Finance & Audit Committee for review, discussion, and modification.	Director of Finance, Senior Management Team, Finance & Audit Committee	3rd week in February
Incorporate Finance & Audit Committee changes to any of Planning Documents	Director of Finance, Senior Management Team, Finance & Audit Committee	1st week in March
Inform the membership or involve the membership in consideration of the annual budget and the multi-year financial plan.	Director of Finance, Senior Management Team, Finance & Audit Committee, Council	3rd week in December
Council reviews & approves budget/multi-year plan/strategic plan based on recommendation from the Finance and Audit Committee.	Council, Finance & Audit Committee	3rd week in March
Distribute approved budget and strategic plan to Department Heads and any other appropriate staff and community.	Director of Finance	3rd week in April
Inform membership of approved budgets.	Director of Finance, Senior Management Team, Finance & Audit Committee, Council	3rd week in May
On going monitoring, reporting and reviews.	Director of Finance, Senior Management Team, Finance & Audit Committee, Council	Throughout the year

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Major Budget Considerations

Strategic Plan Integrations

An effective financial management system needs to support the organization's strategic plan and vice versa. It is part of a network of systems bound together to provide high-level services to our membership in order to meet their needs. Sound financial management is critical to the success of long term strategic planning and short term operational planning. Biigtigong has well-established strategic planning processes. Financial management and budgeting systems are designed to facilitate project implementation.

Human Resource Requirements

Once the human resource needs were identified and job specifications determined, the positions were reviewed in relation to our salary grid and policy. The review was to ensure positions are properly categorized according to the criteria established in the policy. Each new staffing position resulting from the Smart Cities proposal has been categorized and is subject to the salary range provided within the grid. Estimates for mandatory employer related costs were incorporated into the budgets.

Contracts will be awarded for the Nishnaabemwin audio overdub work. This will be done in accordance to Biigtigong's procurement policies. The following charts summarize the range of production times to produce 1 hour of video. We conducted some WaaWaa pilots tests and our results varied due to the individual making the video, the content of the video, familiarity of the content, video recording, prop preparation and location. These variables have been considered in our estimations of producing WaaWaa video and overdubbed WaaWaa video. We assume that we will produce video quicker once we have a workflow and some experience in production. We have identified mitigation strategies to address the risks associated with video production.

NISHNAABEMWIN AUDIO OVERDUB PRODUCTION TIME ESTIMATIONS					
Hours of video to be produced each year	**100 Year 1**	**350 Year 2**	**450 Year 3**	**550 Year 4**	**550 Year 5**
Ratio 6:1 (hours)	600	2,100	2,600	3,109	3,100
Ratio 5:1 (hours)	500	1,750	2,250	2,750	2,750
Ratio 4:1 (hours)	400	1,400	1,800	2,200	2,200
Ratio 3:1 (hours)	300	1,050	1,350	1,650	1,650

Salary Range: $85,000

WAAWAA IMMERSION VIDEO PRODUCTION TIME ESTIMATIONS					
Hours of video to be produced each year	**200 Year 1**	**400 Year 2**	**400 Year 3**	**500 Year 4**	**500 Year 5**
Ratio 6:1 (hours)	1,200	2,400	2,400	3,000	3,000
Ratio 5:1 (hours)	1,000	2,000	2,000	2,500	2,500
Ratio 4:1 (hours)	800	1,600	1,600	2,000	2,000
Ratio 3:1 (hours)	600	1,200	1,200	1,500	1,500

Salary Range: $37,756 - $49,263

BILINGUAL STEM VIDEO PRODUCTION TIME ESTIMATIONS					
Hours of video to be produced each year	**50 Year 1**	**175 Year 2**	**225 Year 3**	**275 Year 4**	**275 Year 5**
Ratio 5:1 (hours)	250	875	1,125	1,375	1,375
Ratio 4:1 (hours)	200	700	900	1,100	1,100
Ratio 3:1 (hours)	150	525	675	825	825
Ratio 2:1 (hours)	100	350	450	550	550

Salary Range: $50/hour

In our pilot video production exercises various problems arose that were immediately mitigated on the spot. Our goal is to make high quality understandable immersion video. However, we need to do this within a reasonable amount of time and efficiently. We implemented some different strategies and found

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

improvements in production time. We will have to closely monitor the production of video and continuously look for ways to better streamline the production. Our project based accounting software will assist us in tracking hours of production and providing us with more accurate numbers to make decisions.

Board and Committee Costs

Expenses related to the operations of our 2 committees and the Executive Board has been incorporated into the budget. Expense categories included honorarium, travel and training, in accordance to Biigtigong's policy and the scheduled meeting and/or training times.

Technology Costs

Expenses related to the administration and management of BiigtigongX, our on-line platform, including the costs of Appsembler and the database has been included in the proposal. We carefully examined the option to utilize Appsembler as our main administrator versus hiring a full time person. The decision was made to use Appsembler due to lack of qualified resources in the community and the pricing was cheaper than hiring a full time staff. Expenses for some education licenses, supplies and equipment are included.

Training

Annual training dollars has been allocated to each year. Training and capacity building at the local level is of primary importance. Building internal capacity for the purpose of long-term sustainability is always one of our ways to achieve our goals. Our training will be very specific to the needs of the projects. We will implement a training video series, which demonstrates our experience and best-practices from implementation.

Community Engagement Costs

We included a budget for the community engagement expenses. Part of these expenses includes for some meetings off reserve. Engagement activities will support the implementation of our engagement strategy, as outlined in Chapter 6.

Revenue

Biigtigong has committed $100,000 a year to support the language revitalization efforts. We have not identified any other revenue sources, other than Infrastructure Canada. We are committed to looking for additional sources of revenue, should our proposal be selected. Although revenue is not being transferred directly to the Smart Cities accounts, other organization Departments are making contributions to the project implementation. These contributions are listed further down in this chapter.

Budget and Project Milestones

Our budget was developed to facilitate the implementation of our proposal and the attainment of our outcomes. An accompanying detailed listing of milestones that will trigger payments supports the budget. The milestones are broken down according to fiscal quarters per fiscal year. Further details regarding the milestones and the specific outcomes and indicators are discussed in Chapter 2. We feel the milestones identified are measurable and achievable and provide a sound basis to determine the release of payments. We will continually monitor and evaluate our entire process and making the necessary adjustments to ensure we are meeting the goals of our project. As part of our commitment to transparency and accountability, we will keep all of our stakeholders aware of our progress in attaining our outcomes and celebrating our milestones. It is our intention to ensure our community celebrates the achievement of our milestones; these celebrations are important, especially in the beginning of new projects that are not traditional in nature.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Cash flow and Project Milestones

We developed cash flow statements based on the budget and the project needs. Our expenditures are posted to specific periods that correspond with the actual project activities. Our revenue streams, at this time, only have two sources – Biigtigong Chief and Council ($100,000 annually) and Infrastructure Canada (1 million annually). We propose an initial $250,000 from Infrastructure Canada be released in July, another $500,000 in December and the remaining $250,000 in April. These release periods are supported by the identification of specific milestones.

Our cash flow projections indicate a few months where there is a negative net cash flow from operating activities. The negative cash flow resulting from the proposed cash release periods has been carefully examined in relation to the cash flow requirements of the entire organization. These numbers have been amalgamated into the organization's combined budget. Our Director of Finance and the Finance Committee make decisions regarding the cash needs of the organization. The negative net cash flow resulting from this project is not a problem in the bigger management of our cash flow requirements. As our milestones are identified by fiscal quarters, we are flexible in determining the actual cash release dates. However, we believe we can manage our affairs with the cash flow projections provided herein.

Monitoring and Controlling the Budget

All departments are required to regularly monitor actual activity to planned activity and control their expenditure to ensure that it is in line with available funds. If required, appropriate corrective action should be taken to resolve significant differences between actual and planned activity. Our finance policy and procedures outline the required steps to monitor and control the budget. The Program Lead will be responsible for the monitoring and controlling of the budget. Regular reporting to the SC Executive Board will ensure accountability, along with reporting to Chief and Council.

Measuring Performance and Outcomes

Budgeting supports the implementation and achievement of project outcomes and goals. Chapter 2 of our proposal outlines our approach to performance measurement. It is important that our outcomes are clearly stated and that the indictors accurately measure our outcomes. Clear communication and reporting systems between the SC Project Lead, the implementation teams and the Finance Department are important to the overall management of the program.

Community Engagement

We will adhere to the reporting requirements set out by Chief and Council and the Senior Management Team as per the policies of the First Nation. However, we are committed to enhance the level of engagement for this proposal and are implementing a new (but ancient) method of engagement – our traditional clan system. We are going to use this more intimate relationship based method to engage our membership. We will utilize this system to provide financial and performance information to our membership. Since this is a new initiative, we will be implementing systems to track, evaluate and adjust the process immediately, as part of its development process. We are trying to find creative approaches to providing our citizens the opportunities to increase their knowledge and become active players in building their families, community, Nation and the world.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Contributions

Our approach to amplifying the impact and reach of our Smart Cities proposal is ensuring there exists alignment with the overall vision and goals of the First Nation. Our strategy is not necessarily geared at leveraging revenues but rather developing and adjusting our programs to ensure long-term sustainability of our Smart Cities projects. The five year implementation period will allow us to develop resources, capacity and systems that will be integrated into the regular programs be provide.

Annual Funding:

$100,000 is currently allocated to the language revitalization via a ten-year commitment made by Chief and Council. This funding will be directly transferred to the Smart Cities account to assist with the language efforts.

Program Support:

Departments within our organization have directed resources within their respective departments to support of the Smart Cities proposal. These resources will remain in the existing structure and management systems of the First Nation. However, they have been assigned to assist in the implementation of the Smart Cities proposal. We have a culture and the systems to support inter-departmental collaboration on shared vision, shared problems and shared approaches. These contributions amplify the impact and reach of our projects.

Department	Contribution	Purpose
Child & Family Learning Centre	1 FT Staff Position, salary and MERC	Language Revitalization
Child & Family Learning Centre	STEM based professional development for ECE teachers	STEM Implementation
Health & Social Services	Inter-generational trauma support and recovery services	Language Revitalization
Health & Social Services	Bilingual Health Promotions & Signage	Language Revitalization
Sustainable Development	Nishnaabe place-name reclamation project	Language Revitalization
Sustainable Development	Local Oral History Project	Aadsookaanan and language immersion stories
Sustainable Development	Supervision & management by the Economic Development Manager	High School reBOOT and CompTIA A+ Co-op program implementation
Sustainable Development	Summer Student Supervisor	High School summer student reBOOT and CompTIA A+ program
Sustainable Development	Summer Student Employment Positions for CompTIA A+ and reBOOT support	High School summer student reBOOT and CompTIA A+ program
Education	1 FT Staff Position, salary and MERC	Language Revitalization
Education	Education staff will be implementing the K-12 STEM and Nishnaabemwin Immersion	K-12 STEM Bilingual STEM video Nishnaabemwin Immersion
Education	Professional Development geared to support STEM, Blended Learning and Growth Mind Set	K-12 STEM Nishnaabemwin Immersion
Education	Coordination of Land-based learning activities & the Meet up program	Meet-up app Real-world connections
Education	Student program equipment & supplies	K-12 STEM
Education	Summer Student Coding Camp & Co-op Prerequisite delivery	K-12 STEM

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

All Departments	CompTIA & reBOOT co-op placement and summer student employment support	K-12 STEM
Other – Related Entities		
Pic River Development Corporation	$20,000 Computer Donation to the school (possible annual donation) IT Support, cloud file transfer	K-12 STEM
Anishinabek Employment & Training	Summer Student Employment and Training Contribution - $50,000 for 3 years. Access to other services via proposal	High School summer student reBOOT and CompTIA A+ program

Report on the use of the Finalist Grant

We identified a series of priority tasks that were required in order to further develop our final proposal. The finalist grant was used to complete these tasks. The following provides a summary of these tasks.

1. **Develop an On-line Education Model:** Our team conducted extensive research on on-line education models. Based on our research and an examination of our student needs, consideration of our resources and review of our education philosophy, we determined that a Blended Learning Model was most appropriate for us. Blended learning is an approach to learning that combines face-to-face and online learning experiences. The combination of the in-person and online elements create a richer learning experience. We are not creating an on-line education model, but rather a hybrid model, that makes the best of on-line and the brick and mortar model.

   We also examined various education pedagogies relating to on-line education. We adopted the Growth Mind Set Approach, a learning theory developed by Dr. Carol Dweck. It revolves around the belief that you can improve intelligence, ability and performance, as the mindset is malleable. Unlike a fixed mindset, where the belief is that they are either 'smart' or 'dumb', the Growth Mind Set advocates that abilities can be developed.

   Additionally, we reviewed the Blended Learning approach to education and the Growth Mind Set philosophy in relation to our traditional Nishnaabe practices relating to learning. We believe that the three approaches can work collectively to provide the best learning experience for our children and families. Some initial training with our education staff was conducted and they were involved in the decision-making process regarding the approaches and methods of learning to be implemented in this project. The community was engaged in discussions and presentations on the Growth Mind Set and Blended Learning approaches to learning.

2. **Research eLearning, eAcquisition and "Meet-Up" and open-source platforms:** Based on our identified needs and the consideration to make our project scale and replicable, we selected open edX, a learning management system. Our platform to house the eLearning, eAcquisition and the Meet Up forum, will be called BiigtiongX.

3. **STEM Curriculum Development:** We employed our teaching staff and experts in the STEM field to design and develop K-12 STEM curriculum. Our current leads in our math and science programs conducted a mapping exercise, looking at how the on-line curriculum as presented by Khan Academy matches with the Ontario Provincial Curriculum. We developed a strategy on how to augment and enhance our current math and science programs with on-line resources.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

After extensive research across many sectors, consideration of needs and the availability of resources, we determined a pathway to allow us to meet our needs. We identified the skills, knowledge and abilities we wanted to develop in our students and then determined the resources that we would employ to facilitate this learning. Our technology and engineering components of our proposal will utilize a variety of on-line resources with classroom teacher support; this is laid out in chapters 1 and 2. Assessment and evaluation processes to measure student success are included in the curriculum.

4. **Reconstruction of Core Aadsookaanan:** Much of the work during the finalist stage was identifying the risks associated with putting our aadsookaanan on-line and the potential disconnect from the real world. Time with our elders and knowledge holders helped develop a model that mitigates any potential risks and embraces the possibilities of cultural revitalization of our sacred stories in this modern time. Additionally, our initial research provided evidence that their exists significant amount of primary research from the community that would facilitate legitimacy in our reconstruction work. A draft framework and work plan has been developed.

5. **Language Immersion Video Development:** Our immersion model is based on research and best practices in the creation of speakers. In addition to the research, we have been fortunate to witness this model being successful with an individual, who happens to be now working on our language revitalization plan. We spent time with potential immersion instructors providing them with the knowledge and tools to make immersion video. Our training produced three amazing WaaWaa Immersion Instructors. These immersion instructors produced a variety of videos, which were tested internally for understandability and for teaching purposes. We have a team of trained WaaWaa instructors who are ready to produce highly comprehensible immersion video.

   We also showcased 4 videos at a community night to demonstrate our immersion video. We purposely selected videos that we thought would bring laughter to our audience; we wanted a roll out that brought laughter and hope. These videos were successful in demonstrating our product. The audiences that viewed our video reported that they understood the story and it's meaning was successfully conveyed. This provided additional verification that our model will work; we still have to take a few moments to breathe, as we will be creating generations of understanders of our language, something that has not been done in centuries. It truly is empowering.

   We spent some time looking at the world of animation, specifically 2-D animation. Utilizing this option comes with a huge learning curve; however, we want to continue exploring the option and determine its feasibility.

6. **Language Audio Overdubs on STEM Material:** Our consultations with our elders and individuals knowledgeable in STEM, has provided good direction in our efforts to produce bilingual STEM video. We discussed ways to integrate STEM, our Aadsookaanan, the meanings within our language and our traditional knowledge. This video will not be immersion video. However, the material will be accessible in English to be utilized by today's students. This video will also assist in helping raise the language proficiency of community's understanders and speakers of the language.

7. **Data Collection:** Considerable time was spent determining what data was actually needed to support the measurement of our outcomes. Our education system already has a process for the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

collection, protection and distribution of student data. We will continue to protect the data of our children and have the school be the central entity for the student data.

8. **Community Education and Engagement:** Engaging the community on this initiative was a wonderful community building experience. It was exciting and everyone was engaged, a bit fearful of change but willing to embrace change for the betterment of our children. Part of meaningful engagement is providing education and facilitating a learning experience. Our community members have a basic knowledge base of things like, second language acquisition, blended learning, growth mind set, programming languages, technology and engineering. With education comes meaningful engagement and support.

   We conducted community wide and focus group surveys and lots of engagement activities. We had support during our application process but we have gained so much more than support during this phase. Our community, our staff and our leadership see the absolute importance of our proposal. We have real community buy-in; they are engaged partners.

9. **Elder and Knowledge Carrier Protocols:** We respected the cultural protocols in place for our time with our elders and knowledge carriers. Teachings were shared regarding cultural protocols regarding the transfer of knowledge and the social environment in which these may occur. Discussions occurred over the impacts, both positive and negative, of the digital world and the transfer of our cultural knowledge. A solid relationship has been built with our elders and knowledge keepers. Their involvement remains critical to the success of our project.

10. **Project Management Software and Collaboration Tools:** We utilized Slack for our collaboration work. Project management software was not looked into, as there already exists effective in-house systems of management.

11. **Training/Travel:** We conducted a training needs assessment to determine the gaps regarding the delivery of the new services being proposed. Some initial training was provided to our classroom teaching staff, along with pilot projects that implemented the teaching of technology and engineering. Training was also provided to other staff members connected to the project implementation. We conducted immersion education training for our WaaWaa instructors. On-going training will be built into the proposal in order to build the capacity at the community level to ensure long-term sustainability.

12. **Governance and Administration:** A staff member was assigned to coordinate the project. Governance and administrative systems to effectively and efficiently support the project are set up. We built upon the existing structures and policies of the First Nation while creating some innovative approaches to governance. Our clan system of governance will be used for engagement and consultation with the community. Some financial resources were spent on software, hardware and other supplies. Detailed financial analysis of the project was completed.

13. **How-to-Manuals:** Our education staff will be documenting some best practices as a result of project implementation. The staff acknowledged their fears in teaching subject matters where they had limited knowledge and skills. In response to this fear, they decided to document their journey and provide encouragement and tips for others facing similar challenges.

Sub-total		226,600
Administration Fee	8%	20,000
Total		246,600

Financial Risks and Mitigation Strategies

Our approach to risk management is identified in Chapter 3. Risk management is an on-going task and is not something that happens at a particular time in the project's lifecycle. We have carefully examined a comprehensive list of risks throughout the development of this proposal. We have successfully mitigated and/or avoided some potentially significant risks. In our belief, this has led to a much better and more realistically implementable project. We continue to be aware of the likelihood and potential impacts of the risks in front of us. We will respond accordingly.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The biggest risk of all is the loss of Nishnaabemwin – not only from the hearts and spirit of our children, our families, our communities and Nations, but from the world. Once the Nishnaabe language is lost from here, it is lost forever. Immersion is the mitigating action towards the loss of Nishnaabemwin in Biigtigong. We have done considerable research in how to create speakers and immersion is our answer. We have also been fortunate to witness first hand the results of this method. We saw a young man, who was adopted out and never raised in his community, with his family, with his people, with his culture, his language, find his way home – researched and taught a first speaker how to pass on her language and today he is a fluent speaker of Nishnaabemwin. This is the method that we will use to make our video. It's amazing to think that our language can once again be passed on in our homes, our schools – actually, pretty much anywhere. It's just going to be done in another way because of the emergency state of our language.

Financial Risks and Mitigation Strategies			
Risk	**Likelihood**	**Impact**	**Risk Management Approach/Mitigating Actions**
Cost to make WaaWaa Immersion Video is too high	Medium	High	• Provide on-going training • On-going Immersion Instructor Recruitment • Establish work flow procedures and accountabilities • Set up a review & monitoring system • Establish best-practices • Provide stories and video content ideas • Provide employee support and encouragement
Nishnaabemwin audio overdub cost is too high	Medium	High	• Audio-video editing software & related training • Establish work flow procedures and accountabilities • Set up a review & monitoring system • Establish best-practices • Consider use of a first speaker as a consultant • Research animation and other technological options • Focus priorities and on core competencies
Extreme high cost of uploading and downloading video	High	High	• ISP (PRDC) is providing free on-site services to assist in the offloading, downloading and uploading of video
Expensive video backup system; cloud service unreliable for now	Medium	High	• Develop safe and reasonably costed manual backup system • ISP (PRDC) is setting up a free back up system on their servers
Loss of $100,000 financial contribution from Chief & Council	Low	Medium	• Examine projects and make adjustments (cuts) where necessary • Ensure efficiency and effectiveness of projects • Provide and show value for the $100,000 donation – produce results • Apply for other funding and financial contributions
Project variances – deficits/cost-over runs	Low	High	• Good financial planning (strategy, budgets, short and long term) • Measurable outcomes • Regular monitoring and reporting and adjustments • Follow Biigtigong's Finance Policy and Procedures (everything is addressed in detail) • Executive Board involvement
Delay on completion milestones dates	Low	Medium	• Good planning – measurable and attainable • Utilize project function options on accounting software • Sound management and supervision processes • Implement on-going evaluation and corrective measures process • Communication – Executive Board, Director of Finance
Cash Flow challenges	Low	Medium	• Good planning – measurable outcomes, milestones and results • Good management and supervision processes to meet outcomes • Provide accurate and timely information to Director of Finance • Ensure reporting requirements are followed • Follow Biigtigong's Finance Policies and Procedures
Partnerships are costly	Low	High	• Build internal capacity and take on responsibility at the community level • No long-term financial dependency on partners • Financially creative – no duplicate of services, efficiencies, mutually beneficial

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

			• Develop detailed agreements, if necessary
Low Student Participation	Medium	Medium	• Program is designed to be interactive and hands on approach • Meaningful outcomes • Onboarding and recruiting strategies • Incentives – i.e. Summer Student Employment • Community celebrations • Good co-op placements • Offer program neighboring First Nation • Develop on-line resources for scalable and replicable
Miscommunication between departments that are working on projects.	Low	Medium	• Written communication and protocols • Utilize real time collaboration tools • Regular meetings – with set agendas • Dispute resolution process • Clear roles and responsibilities
Inaccurate or incomplete project results due to the failure to identify and/or document specific project activities.	Low	Medium	• Clear performance measurements to be set • Determine indicators and measurement tools • Set deadlines and standards • Set up deadlines and activities inside of accounting software • Reporting standards • Performance standards for employees
Uneven workflow issues that decrease employee productivity	Low	High	• Accurate and thorough job analysis process • On-going monitoring and evaluation • Utilize iterative management approaches • Develop good relationships – open communication • Promote organizational culture

Operating Budgets and Cashflows

The five (5) Year Operating Budget and five (5) Year Cashflows are presented on the subsequent pages.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 9: Implementation Phase Requirements

Introduction

Biigtigong Nishnaabeg is committed to meeting the applicable municipal, provincial and federal reporting and legislative and policy requirements should we be selected as a winner.

Duty to Consult with Indigenous Groups

Biigtigong is a First Nation community and therefor the Duty to consult with indigenous groups does not apply. However, with that being said, we want to acknowledge that Biigtigong Nishnaabeg has policy regarding Duty to consult. This document outlines how Biigtigong Nishnaabeg expects to be approached regarding activities within their traditional territory. This guideline establishes Biigtigong's expectations, policies and practices for governments and others to follow when consulting with them. Our Smart Cities Team reviewed this policy as we were developing our engagement strategy with the community. We wanted to build upon best practices established in the community and develop a solid engagement strategy.

Modern Treaty Obligations

With the exception of six First Nations, Biigtigong being one, the area First Nations are signatories to the Robinson-Superior Treaty of 1850. There are no modern treaties in the Biigtigong Nishnaabeg traditional territory or shared territory with surrounding First Nations.

Canada's Community Employment Benefit (CEB)

Projects supported by the Investing in Canada Infrastructure Program provide an opportunity to promote increased employment opportunities for a broader array of Canadians. The Smart Cities Challenge requires the finalist to identify employment and/or procurement opportunities for at least three of the targeted groups and how Biigtigong intends to report upon CEB requirements, should we become a winner.

To meet these requirements Biigtigong has selected the following 3 target groups: Indigenous peoples, woman and youth. The main beneficiary of our Smart Cities proposal is Canada's Indigenous youth. Our projects are specifically aimed at this group with the ultimate goal of making them more educated and more employable. We will include woman as a specific category that we will also target. We will ensure our indicators for success specifically capture data on these 3 identified groups, in terms of their participation in our projects. We anticipate that 90% of our participants will come from one of these groups.

Additionally, we will utilize our procurement strategies and direct our hiring towards these 3 groups. We expect that at least 80% of our work force for this project will be Indigenous, a youth or a woman. It will be very easy to meet these targets and to track the relevant supporting data.

Reporting on the CEB Requirements

As per the CEB requirements, we will report annually on the progress made. Should we be selected as a winner, we will develop a detailed strategy that also defines our reporting requirements. CEB requires some specific information and we will accommodate this requirement. For example, we need to track the number of hours worked by the target population and/or the value of contracts awarded to the target groups. Our accounting software allows us to easily track this information.

A qualitative narrative that describes the progress made is also required. The narrative will provide information on both the successes and challenges experienced in meeting our targets. We understand

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

that this information will help in developing Canada's strategies to offer more diversified employment and procurement opportunities.

We will develop specific reporting mechanisms to support any requirements or conditions of being a selected a winner. We have experience establishing targets, monitoring progress and being flexible to respond to isses.

Risks and Mitigating Strategies

Risk	Likelihood	Impact	Mitigating Strategies
Woman at home with no child care	Medium	Medium	• Provide childcare support at the daycare • Work with other supports in the community
Work readiness levels are low amongst participants	Medium	Medium	• Community programs exist that provide assistance in this area – use these • Long-term strategies
Youth experiencing social and emotional issues	High	High	• Social Service support programs • Cultural support programs • Life skills component built in • Use of elders in the programs • Utilizing land-based learning program
Lack of parent support	Low	Medium	• Provide information and education to the parent • Offer home-visits • Engaging and non-judgmental approaches • Utilize existing relationships
Lack of formal education and skill set to do some specific tasks	High	Low	• In the short-term we will have to recruit from outside the population • Develop long-term capacity development to attain education and experience
Current procurement policy may not support goals	Low	Low	• Review policy & recommend changes • Conduct education on updated policy
Political leadership lack of understanding of the project procurement goals	Low	Medium	• Address in person at a council meeting • Provide research and education • Regular reporting and communication
Lack of financial resources to implement training programs	Low	High	• Council has already made a commitment to direct some resources to summer employment • Develop funding proposals
Data security and protection of personal information	Low	High	• Data and Privacy Policy • PIA completion • Communications & education • Disclosure and Transparency strategy

Executive Summary

Canada is trying to create a smart technology future. Biigtigong Nishnaabeg First Nation is trying to revitalize their indigenous language and culture while preparing their K-12 students for the smart technology future.

By utilizing open source software and results-oriented approaches to facilitate effective online learning, effective online acquisition of their endangered Nishnaabe language, and revitalization of their culture - all as an enhancement to their brick-and-mortar K-12 curriculum delivery model, Biigtigong Nishnaabeg are transforming their youth into better-educated, more employable, better-grounded, and more holistically Nishnaabe people.

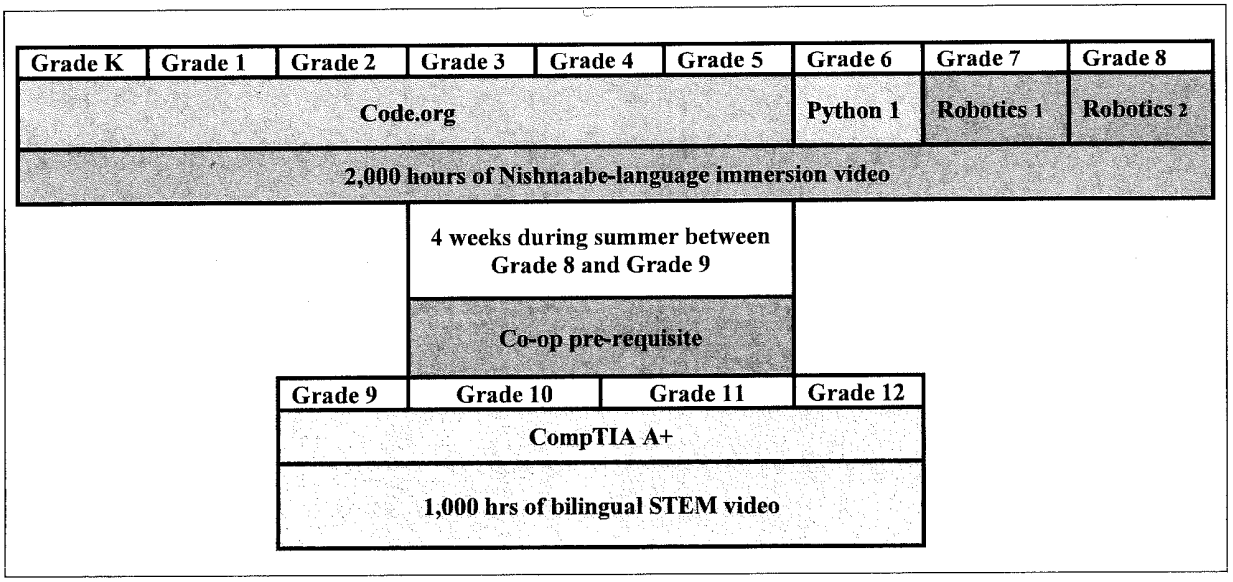
The graduates of their K-12 curriculum will be able to nearly-completely understand their Nishnaabe language (which is a first-step on the way to becoming a speaker of *any* human language), will have been educated on the interface of the their Nishnaabe worldview with the STEM subject perspectives, will have had increased involvement in real-world traditional Nishnaabe activities in the territory of the Biigtigong Nishnaabeg, will have experienced increased relationship-building with all community members especially in the context of those traditional activities, will be able to code, to build and control robots, and will have been educated in the entire exam preparation curriculum of a general-accepted best-starting point certification to enter the IT working world.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 1: Vision

Challenge Statement Vision

Our Challenge Statement reads:



> *By means of active, cross-generational, technology-empowered, real-world participation in the intergenerational transfer of traditional Nishnaabe knowledge through the medium of our language, and the bilingual delivery of modern K-12 STEM knowledge, our community will transform our youth into better-educated, more-employable, better-grounded, and more holistically Nishnaabe people.*

Please see Figure 1-1 for a graphical representation of the "bilingual delivery of modern K-12 STEM knowledge" which we propose in our Challenge Statement.

Outcomes Produced by Carrying Out Our Vision

Our final proposal will carry out the vision of our Challenge Statement and will produce the outcomes laid out in our application.

Figure 1-1: Our bilingual delivery of modern K-12 STEM knowledge. These proposed augmentations to our current K-12 curriculum are partially rolled-out during implementation year 1*, and fully rolled-out at the start of implementation year 2.

** For a rollout schedule of each year of implementation, please see Appendix B.*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Our final proposal seeks to achieve the four outcomes listed in our Challenge Statement:

(1) **youth who are "better-educated"** due to
   a. their having successfully completed a greater number of K-12 STEM subjects post-proposal implementation than they successfully completed pre-proposal implementation; and
   b. their increased preparedness for college and university as a result of their having successfully completed a greater number of K-12 STEM subjects post-proposal implementation than they successfully completed pre-proposal implementation;

This outcome is measurable via these progress indicators:
- Increase in number of K-12 STEM courses successfully completed by K-12 students, beyond what is currently offered in our K-12 curriculum
- Decrease in percentage of K-12 students needing remedial help in STEM subject areas

(2) **youth who are "more-employable"** in current jobs, as well as in yet-to-be-known types of STEM-related jobs, which require knowledge / expertise in the K-12 STEM subject areas;

This outcome is measurable via these progress indicators:
- Increase in number of K-12 STEM courses successfully completed by K-12 students, beyond what is currently offered in our K-12 curriculum
- Increase in number of K-12 students who have at least a basic ability to code

(3) **youth who are "better-grounded" in their Nishnaabe identity** due to
   a. their knowledge of our core aadsookaanan; and
   b. their increased participation in our community's traditional Nishnaabe activities;

This outcome is measurable via these progress indicators:
- Increase in number of K-12 students who know the key concepts expressed in each of our core aadsookaanan
- Increase in number of traditional Nishnaabe activities in which each K-12 student, on average, participates per year

(4) **youth who are "more holistically Nishnaabe"** due to
   a. their ability to nearly-completely understand our spoken Nishnaabe language; and
   b. their increased participation in our community's traditional Nishnaabe activities; and
   c. their knowledge of the roles of our Nishnaabe worldview in modern technological society

This outcome is measurable via these progress indicators:
- Number of hours of Nishnaabe language acquired by graduating eighth-graders is at least 2,000 hours
- Increase in number of traditional Nishnaabe activities in which each K-12 student, on average, participates per year
- Number of hours of Nishnaabe-language STEM video successfully completed by graduating high school seniors is at least 1,000 hours

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The way in which our final proposal carries out the vision of the Challenge Statement, achieving our four outcomes, is via the following six activities/projects:

(1) **"active participation"**

We mean active in contrast to passive, where active participation includes engaged Khan Academy-style Growth Mindset blended learning pedagogical approaches – approaches which take into account the recent discoveries on how humans beings more effectively learn knowledge in online and hybrid (online and brick-and-mortar, combined) environments; calls to real-world action on our online, mobile-enabled platform (particularly on the eLearning, eAcquisition, and meetup forum functionalities of the platform), online forums, and online community discussions; real-world, hands-on activities undertaken and completed in a group setting, our youth wrapped in the embrace of the community network; strong encouragement to attend community events, with those community events effectively and articulately made known to all community members via our online forums and discussions.

This activity/project achieves the following outcomes:

- **youth who are "more holistically Nishnaabe."** Community-engagement is a foundational component of our Nishnaabe way of living. Actively participating, not just in social activities – which are, indeed, foundationally important to community vibrancy and individual flourishing – but also being actively engaged in our own learning – both formal and informal – is a key to success in whatever role a Nishnaabe individual plays in the community. Actively participating in the whole of the Nishnaabe community is an imperatively important requisite for one's wellness as a Nishnaabe person.
- **youth who are "better-grounded" in their Nishnaabe identity.** Our Nishnaabe people cannot be only *knowledgeable* of our social norms and ways of being. This knowledge must be *implemented* in one's life in order for one to be a whole Nishnaabe person. Similarly, much knowledge can be obtained through the very act of active participation in one's community. Knowledge and active participation are thus connected. Active participation leads to knowledge. Knowledge, in turn, leads to active participation. In order for a Nishnaabe person, then, to be more knowledgeable – better-grounded – in being Nishnaabe, active participation in the Nishnaabe community is required.

(2) **"cross-generational participation"**

Cross-generational participation means not just youth/students, but community members from the entire span of ages, from all generations.

This activity/project achieves the following outcomes:

- **youth who are "more holistically Nishnaabe."** Similar to the reasons given in the above section on the active participation requisite for one's being holistically Nishnaabe, all sectors of our Nishnaabe community must have a space and a place to participate. Each age group brings a diverse set of experiences, gifts, and knowledge to our collective Nishnaabe community, and to the overall wholeness of each of the individuals within the community. The participation of everyone, from all generations, is required for each of us to be holistically Nishnaabe.
- **youth who are "better-grounded" in their Nishnaabe identity.** We Nishnaabe people believe that everyone – no matter one's age – is a teacher and a contributor to the collective's knowledgebase. Encouraging and ensuring the participation of all generations

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

provides a maximally diverse dataset of experience as knowledge, made available to and learnable by each and every Nishnaabe community member who participates in community events. This cross-generational participation leads thusly to better-grounded Nishnaabe community members.

(3) **"technology-empowered participation"**

Technology-empowered participation refers to engagement with the eLearning and eAcquisition functionalities of the Open edX platform; engagement in Open edX's meetup discussion forums for traditional Nishnaabe activities; online platform discoverability of friends'/relatives' locations and currently-happening traditional activities in order to encourage students to, in like manner, take part in those made-discoverable activities.

This activity/project achieves the following outcomes:

- **youth who are "better-educated."** Knowing not just about technology, but being – and being comfortable – in a technology-oriented mindset, versed in the social expectations and norms of this modern way of interacting with our technological world is prerequisite knowledge and an imperatively important education to have. Just being able to navigate this brave new world of technology is a plus on one's curriculum vitae, and our proposal's implementation will yield for our Nishnaabe youth exactly that: a better education through the experience of successfully participating in this new technology as a means to better one's self educationally.
- **youth who are "more employable."** The technology-empowered participatory tools – the rules of online community engagement – that will benefit our Nishnaabe youth are, in many cases, the precise job skills required to even be considered for a job interview. Online forum etiquette, respecting boundaries of online relationships, being responsive to and responsible for timely replies to online community engagement requests and relationships, and a host of other modern technological communication social norms – the very skills and education that our proposal will instill in our Nishnaabe youth – are what will help prepare our Nishnaabe youth to be effectively and productively employed in today's – and the future's – job market.

(4) **"real-world participation"**

Smart technology is an enabling factor, a factor which enables real-world participation – not just online participation, but participation in the real, material world. The world of touchable human beings, hugs, babies, tears, family, and love. Our proposal intends to implement this technology to facilitate and encourage participation in real-world community events.

This activity/project achieves the following outcomes:

- **youth who are "more holistically Nishnaabe."** Being Nishnaabe means being community-oriented. Participating and being an active, contributing part of the lives of those whom we are networked within our territory is a requirement of our communal approach to effective and productive existence on this earth. Participating in the real world, the material world, of our Nishnaabe community is thus a requirement of being a whole Nishnaabe.
- **youth who are "better-grounded" in their Nishnaabe identity.** Being better grounded means being better educated. And being better educated happens, in part, by being around

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

the educated and knowledgeable ones. For Nishnaabe people, all activities are a teaching opportunity – and thus a learning opportunity. Being out and about in the community leads naturally to discussions with people more knowledgeable than us, which in turn leads to becoming more knowledgeable ourselves – more educated, and thus better grounded.

(5) **"intergenerational transfer of traditional Nishnaabe knowledge through the medium of our language"**

Our proposal aims to produce 2,000 hours of Nishnaabe-language immersion video, the content of which will be our core aadsookaanan (our sacred stories, our philosophical foundations, the building blocks of our worldview). Our aadsookaanan are, in part, the imperatively important intergenerational knowledge which has been passed on – in story form – for countless generations. The acquisition – language *acquisition* (subconscious) in contrast to language *learning* (cognitive) – of 2,000 hours of a target language yields an individual who can nearly-completely comprehend that target language. The target language in this case is our Nishnaabe language, and it is with this 2,000 hours of immersion video of our aadsookaanan that we intend to create understanders of our Nishnaabe language – understanders who can then go on to successfully complete 1,000 hours of STEM subject non-immersion video (i.e., what we usually refer to in this proposal as 'bilingual STEM video'), the audio of which is delivered in our Nishnaabe language.

This activity/project achieves the following outcomes:

- **youth who are "more holistically Nishnaabe."** Being a whole Nishnaabe requires that one be a speaker of one's Nishnaabe language. While this proposal is not big enough to facilitate that particular outcome, becoming an understander of our Nishnaabe language is, indeed, attainable within the timeframe of this proposal. And, since we are aiming for "more" holistically Nishnaabe, becoming an understander of our Nishnaabe language fits the bill quite nicely. Two points here: (1) being able to understand one's indigenous/heritage language, for a member of any culture, seems obviously contributory to one's being more holistically of that culture and identity; and (2) walking around in the world with a headful of knowledge that got into one's head via a foreign language does not make for a very "holistically Nishnaabe" person. While knowledge and education are important in their own right, it is more holistic for that knowledge and education to have entered one's head in the medium of one's own indigenous/heritage language. So, our youth being able to understand our Nishnaabe language which in turn makes possible their learning content of a modern K-12 STEM curriculum delivered in the medium of our Nishnaabe language is a powerful contributor to their becoming more holistically Nishnaabe.
- **youth who are "better-grounded" in their Nishnaabe identity.** Knowing about one's cultural identity is self-evidently important to one's wholeness. But, knowing the main tenets of the core philosophies of one's culture is absolutely key to one's being well versed in the oral/written stories/literature of one's culture – especially when one considers the importance of learning this information through the medium of one's language. Learning the main ideas expressed in our Nishnaabe aadsookaanan, through the medium of our Nishnaabe language, produces Nishnaabe youth who are more knowledgeable of, thus better-grounded in, their Nishnaabe identity.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

(6) "bilingual delivery of modern K-12 STEM knowledge"

This activity/project refers to the combination of our English-language K-12 STEM curriculum and the 1,000 hours of bilingual (Nishnaabe-language and English-language) STEM video. Please see Figure 1-1 for a graphical representation of this post-augmented curriculum. Our bilingual STEM video will, in part, teach our grade 9-12 students about the role of our Nishnaabe worldview in modern technological society. In particular, our bilingual STEM video will show that there is no conflict in the explanations provided by modern-day STEM and our Nishnaabe worldview. More specifically, our bilingual STEM video will enlighten our students about the relationship between the teachings of our aadsookaanan (which we can refer to with more culturally-neutral terminology as 'allegorical narrative,' or simply 'mythology') and STEM: the role of science is to explain/show/teach what *is*; the role of mythology is to explain/show/teach *why* (metaphysically why) something is.

For example, the scientific explanation of lightning and thunder (that lightning is a huge electrical discharge that flows between clouds, from a cloud to air, or from a cloud to the ground; and that thunder is in turn caused by lightning), and our Nishnaabe worldview explanation of this same phenomenon (that thunder beings are engaged in an eternal battle with the great underwater lynx; an allegory for the eternal battle between good and bad). Only in modern times have these two traditions (i.e., mythology and science) been viewed by some as 'in conflict,' or 'in competition.' Historically, however, throughout the world's indigenous societies, at least, mythology has made science more culturally fitting – not tried to compete with, nor replace the role of, science.

Mythology has *not*, historically, tried to do the work of the STEM fields. Mythology and STEM have, historically, been partners in explaining the world around us in a culturally-appropriate – and usually quite poetic – manner. In similar fashion, this is the function of our bilingual STEM video, and the role of our bilingual delivery of modern K-12 STEM knowledge, in general: to explain the scientific, material world around us in a culturally-appropriate - and usually poetic – manner. This activity/project achieves the following outcomes:

- **youth who are "better-educated."** The need of this generation of K-12 students for a solid STEM subject area education is undeniable. One need only browse the course descriptions or syllabi of almost any college/university curriculum to find the very long list of requisite technology, math, science, programming knowledge for those majors and academic program paths. Providing our youth with thirteen years of a modern, K-12 STEM curriculum will provide them with the tools, knowledge, and mindset to succeed in the increasingly demanding curriculum of this modern technologically-driven world.
- **youth who are "more employable."** For reasons similar to the ones given in the above paragraph, our youth who have successfully completed our bilingual, modern K-12 STEM curriculum will not only be better prepared for college and university. The college and university curriculums are being designed, in part, to produce graduates who are more employable in this technologically-driven world and job market. Our youth, having completed such solid preparation as provided for them by our K-12 STEM curriculum, will thus be more employable. And, not only after college/university; but, also in the high-school graduate job market, as well.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- **youth who are "more holistically Nishnaabe."** One's having been educated in a particular subject area is an accomplishment on its own. Having been educated in a particular subject area in the medium of one's indigenous/heritage language, with that education couched in the worldview and perspective of one's mythology and culture, is an even greater accomplishment; and, an accomplishment contributing greatly to one's wholeness as a member of that language community.

The achievement of our six activities/projects, and their consequent four outcomes, are enabled by the creation of an online, mobile-enabled platform able to carry out the following three functions. We have chosen the Open edX platform for this purpose. (While we originally envisioned having three separate platforms/applications for each of the three functions, we have, during the finalist phase, opted to wrap all three of these functions into one 'Learning Management System' (LMS) platform, namely Open edX.) Open edX is open source software and facilitates the production of materials to be made available under a Creative Commons license. The three functions being fulfilled by the Open edX platform are:

(1) **eLearning.** Mobile-enabled eLearning functionality is built into Open edX with open source technologies and languages, enabling interoperable, scalable, and replicable results by any other community or organization choosing to implement a similar platform. eLearning functionality will facilitate the collection of real-time data on all aspects of community-based, online, collaborative learning, and the storage of that data in an open source database backend enabling other departments and organizations within our Biigtigong Nishnaabeg community to seamlessy access and utilize this data.

(2) **eAcquistion.** Mobile-enabled eAcquisition functionality will be nearly identical to our eLearning functionality, but will have the added responsibility of enabling the effective acquisition of our Nishnaabe language. As our community makes a strong distinction between language *learning* (a conscious, cognitive process) and language *acquisition* (which occurs subconsciously), we need to keep these two functionalities independent of each other so that each one's unique pedagogical approach can be implemented effectively.

(3) **meetup forum.** Mobile-enabled meetup forum functionality will serve as the central 'online gathering' place which will facilitate the bridging and interfacing of the digital world with the material, real world. All community members will have access to each other via this online gathering place. This functionality within Open edX is where our youth who are hoping to attend a particular traditional Nishnaabe activity can express their interest to do so. Other community members then have the ability to invite our youth along to that event. Likewise, community members who are planning an activity can now express their intentions in the meetup forum functionality of Open edX thereby providing additional options for our youth to take part in while remaining in the embrace of the real-world community network.

Data: Outcomes are Reflective of True Needs of Community

Our outcomes are reflective of the community needs. We conducted extensive community engagement sessions throughout the development stage of our proposal. These sessions were aimed at specific stakeholders and the community at large, including our off-reserve members. Through presentations, discussions, surveys, small group meetings, family meetings, luncheons, social events, we successfully engaged a large number of our community. 221 unique members attended at least one of our engagement sessions and 121 individuals completed our extensive community survey. Chapter 6 provides the findings from our engagement sessions and how community input improved our proposal.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Outcomes are Ambitious and Achievable

Firstly, there exist extremely high unemployment rates for our youth, independent of industry. When we consider only the STEM fields, these unemployment rates for our youth are absurdly high. Our proposal will help to alleviate this.

Secondly, this proposal will move Nishnaabe people from being mainly passive consumers of technology to being active, effective STEM-educated administrators, managers, and users of data and connected technology who are able to achieve meaningful outcomes for themselves, their community, and other communities.

Thirdly, our outcomes are ambitious because we, similar to other Nishnaabe/indigenous communities, have only one high-proficiency first-speaker of our dialect. A survivor of the Canadian Indian residential school system, she is 82 years old. We have only another two medium proficiency first-speakers of our dialect. They are both in their 70s. When they leave, so will our dialect.

So, over the last five years, we have been hurriedly working with a high-proficiency second-language speaker of a related dialect. He has spent the last five years working with our elders to reconstruct our dialect. (Our Biigtigong dialect's noun declension charts, verb conjugation charts, and dictionary are all currently available on our language website, biigtigong.com, under a Creative Commons license). He is now able to 'grammar bridge' into our Biigtigong dialect from the dialect which he originally acquired; he is thus able to speak and write in our Biigtigong dialect. It is his Nishnaabe-language audio which will be heard on all 3,000 hours of video which our proposal aims to produce.

It is important for us to note here that the method which he used to become a speaker of the Nishnaabe language – he began acquiring the Nishnaabe language almost 20 years ago when he was in his 30s – is the very method of second language acquisition that we're using in our proposal to transform our Biigtigong youth into understanders of our dialect.

Whether we consider the Royal Commission on Aboriginal Peoples, the work of the Truth and Reconciliation Commission, the United Nations Declaration on the Rights of Indigenous Peoples, or that the United Nations General Assembly has declared 2019 the International Year of Indigenous Languages (IYIL2019), we have before us – "us" being Canada and we Biigtigong Nishnaabeg – an ambitious *opportunity*, indeed. An opportunity to move forward. Together. As partners. Collaboratively, we can produce the means by which Nishnaabe people can *forever* be able to become understanders (on their way to becoming speakers) of the Nishnaabe language. That's pretty ambitious.

Our outcomes are achievable because a community such as ours, Biigtigong Nishnaabeg, who has for many, many generations been healing, repairing, reconstructing, and unendingly facilitating the education and holistic Nishnaabe being of each and every one of our community members, as a collective unit, as a community, is quite the solid foundation on which to implement this proposal. The outcomes sought by this proposal are quite achievable, indeed.

Outcomes are Meaningful for the Community and Residents

Our proposal has been met with overwhelming support from our community since the very start of our Smart Cities journey. Biigtigong Nishnaabeg has been working on the revitalization of our language and aadsookaanan many years before we started work on this Smart Cities Challenge. Our Smart Cities final proposal further facilitates profoundly meaningful goals of the community which were set in motion decades ago.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Our chief, Duncan Michano, has, for many years, shared with a great number of people his vision of educating our youth in the ways of physics, engineering, quantum mechanics, computer science, and coding. There has been a marked increase in the community's excitement around these conversations in the last four or five years in particular. Especially for our young Nishnaabe people. (For example, we already have elementary school-age kids in our community who have gone off to earn a certificate in LEGO Robotics and Programming offered by the Digital Media Academy at University of Toronto.)
Our children and youth have always been the center of our Nishnaabe society. They are, in a very real way, our future. They carry our entire ancient past, and our ongoing present, into the unknown, the future. It is difficult for our community to imagine something *more* meaningful than the betterment of our youth in this modern technological society while helping them to carry with them, as they move forward into the future, our Nishnaabe language and our Nishnaabe worldview.
The outcomes of our final proposal are, *indeed*, meaningful for our community and our residents.

Our Proposal is Well-Suited to a Smart Cities Approach
Our proposal is very well-suited to a smart cities approach.

Smart Cities Approach Principle: Openness
By making our language accessible for the first time through an online platform that can be accessible by anyone at anytime. We will also provide a model for integrating immersion education and STEM education into a standard curriculum. K-12 STEM learning can augment immersion-based cultural learning and immersion-based cultural learning can augment K-12 STEM learning.

By preserving as *open* data, a subset of our language in a certain format (i.e., in the format of *understandable* language which is able to produce understanders of our language after 2,000 hours of viewing), we not only facilitate the survival and thriving of our language into the future, we are also providing a model for other First Nation communities – as well as other communities and groups – to do the same. This initiative will strengthen the relationship between residents and government and public organizations and will help to fulfill Canada's goal of reconciliation with First Nation communities.

Smart Cities Approach Principle: Integration
Currently, our language and aadsookaanan are at risk of being lost. Through the use of connected technology, and by recording this data – including much of our raw cultural data being preserved/made-available on Open edX – we are ensuring that our community knowledge is maintained for our Biigtigong Nishnaabeg generations to come, for the benefit of Canadians, and for the benefit of the world. By this democratization of cultural knowledge, we are thus breaking down silos that exist even in our traditional societal structures. Similarly, modern-day administrative and learning management roles of K-12 teachers, of parents, of elders, and of governmental leadership, are also all further facilitated by the increase in frictionless availability of data made possible via the removal of data silos.

Smart Cities Approach Principle: Transferability
We have provided an open source, standardised, and transparent approach to integrating immersion-based cultural education and STEM education into any school curriculum - all of the videos we are producing can be overdubbed in any other language. The approach to building community capacity, through embracing language, culture and STEM can be replicated across the country regardless of a community's size or resources.

This approach is not limited to one language only. The language in question could also be Cree, Mohawk, French, or Italian, for example. There may be a need across the board - in perhaps most, or even all,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

cultures - to augment STEM learning with language-based cultural education; a need to combine, merge, and interface the digital connections with physical community. In our approach in this proposal, the meetup facilitation functionality of Open edX achieves this. Our proposal moves us into the future by embracing and continuing to facilitate the merging of the digital-world and the real-world in order to create a *truly* smart city that uses data, digital connection, and an online platform to enable intergenerational transfer of knowledge – both traditional language and STEM knowledge and education – education to create better-educated, more employable, better-grounded, and more holistically Nishnaabe(in our case) people.

Our approach is suitable for communities of any size, any location, any level of resources, and is easily replicable and scalable. We see our proposal as an ideal 'onboarding' approach for any community – almost regardless of access to technology-trained staff – to a more STEM-infused culturally-based/appropriate/infused community. Implementing the bleeding-edge STEM technologies – as a first step - is not, in our opinion, viable for many communities.

The approach we are taking – and advocating for – in our final proposal is not unlike the strategy of early-years Netflix as that company disrupted the DVD-rental industry. Netflix's secret weapon in their successful venture? The post office! Not the most modern of 'technology,' to say the least. While Netflix, of course, employed a host of other approaches and tactics, beyond its utilization of the post office, the company's achieved outcomes are still remarkable given the common 'technology' they employed. We view our smart cities final proposal in a similar light. We have deliberately chosen to deliver *bleeding-edge, four-star quality* outcomes by utilizing *common* smart technology, instead of delivering *common* outcomes by utilizing *bleeding-edge, four-star quality* smart technology. We believe that this approach will maximize the replicability of our approach - and the spread of smart technology - across Canada.

Our proposal is an onboarding approach to smart cities. Not every community has the resources, staff, equipment, Wi-Fi access, etc. to implement cutting-edge smart technology. There is a need to build STEM *knowledge* first, through the method developed in our proposal. What good are sensors and data collection if we do not have the knowledge and appropriate cultural lenses to extrapolate meaning from them? Creating a digitally-literate population is, in our opinion, absolutely essential to ensuring long-lasting smart cities - not just a fad technology that is used for a short period of time.

Lasting and impactful community change, through STEM education, and reconnection with culture through language, along with the use of common, newbie-friendly smart technology is of key importance in the overall strategy of facilitating transferability. Our approach to integrating STEM education into a K-12 curriculum is, indeed, transferable; it can be implemented in any school across the country.

Smart Cities Approach Principle: Collaboration

This technology will enable cross-generational and cross-cultural collaboration as we build a future of digitally-literate and more culturally whole youth who will lead the smart cities of tomorrow across Canada.

Progress During Finalist Phase

Progress toward our outcomes has already been achieved during the finalist phase. We:

- organized and facilitated community consultation events, each with a particular community sector focus
- implemented some changes in organization structure: established teams, roles and responsibilities, etc.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- begun several pilot projects: story writing; aadsookaanan reconstruction; and Waawaa video production
- utilized community surveys to determine several baselines
- set up a framework for data collection and baseline measurement of progress
- produced prototypes of immersion video overdubbed with audio of Biigtigong's dialect
- developed some tools to assess staff training needs
- researched approaches to and formalized a framework for the reconstruction of our aadsookaanan
- successfully piloted Makey Makey, Scratch, and Code.org at our elementary school
- formalized our partnerships
- continue our community engagement sessions with our off-reserve and on-reserve members
- pilot with our elementary school staff and students a sampling of online classes
- further develop the interfacing of our Nishnaabe approach to learning and the Growth Mindset Approach
- continue 'Waawaa' immersion video production, evaluation, and instructor professional development

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 2: Performance Measurements

Strategy

An outcome-based performance approach is a results-based management tool that can be used to guide the selection, development and ongoing use of performance measures. For this project, this strategy will be adopted, which will enable the project team to continuously monitor and assess the results of programs as well as make informed decisions and take appropriate mitigation actions should they be required. A success outcome-based performance measurement strategy will also provide effective and relevant departmental reporting on the program and ensure that credible and reliable performance data is being collected to effectively support evaluation.

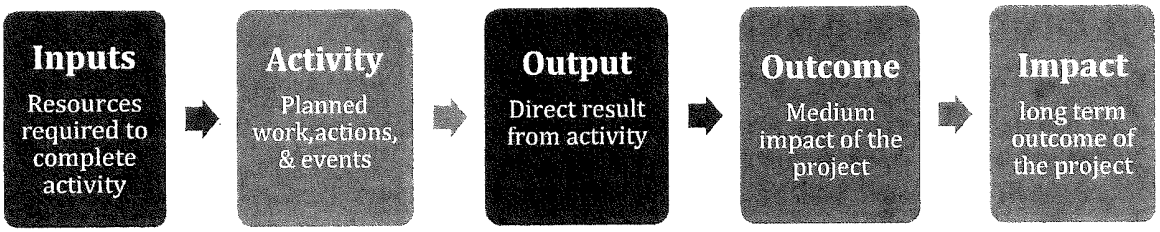
Approach

The key to achieving the desired outcomes of this project is to set clearly defined goals which are achievable for the timeline of this project. This will involve defining metrics that can be set to clearly measure the project's success, as well as to identifying any deviations which can then be quickly remedied. The metrics to be used for this project will follow the SMART methodology for goal setting, as defined below:

1. The set outcomes of this project are ***Specific***
   The desired outcomes for this project are clear, well defined and based upon the specific requirements for the completion of this project.

2. The set outcomes of this project are ***Measurable***
   Metrics have been developed to measure the progress of this project. The project team will use these metrics to assess levels of project completion and identify any deviations.

3. The set outcomes of this project are ***Achievable***
   The set outcomes of this project were developed by assessing and interpreting relevant data and by receiving input from various experts in relevant fields.



4. The set outcomes of this project are ***Relevant***
   The defined outcomes of this project are essential for the overall success of the project and were developed by pinpointing the specific needs of the project and by having discussions and input from stakeholders.

5. The set outcomes of this project are ***Time-Bound***
   The outcomes of the project have set target dates for completion based upon required inputs, activities and outputs.

Logic Model for Performance Measurement

A basic logic model will also be used to understand the process of measuring each metrics' impact throughout the project. As shown below performance measures can be depicted linearly, however, it is important to note that for each input and relative activity there will be short, medium and long-term results.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

As part of developing our measurement approach, the project team completed a resource assessment which has resulted in the identification and classification of the project's inputs. The project team has also developed an implementation plan for the activities required to achieve the desired outcomes and impacts. Each of these activities has an associated immediate output which will then result in the desired outcomes and impacts that are essentially the goals of our project. Further details on the aforementioned activities (resource assessment, implementation planning, and objective/outcome setting) are included in the Project Management Plan, presented in Chapter 3. The project specific components of the above logic model are summarized in the following sections:

Inputs:

Project Inputs can be defined as financial and non-financial resources used to complete project activities, produce outputs and achieve outcomes. Our project inputs include, but are not limited to, the following:

- Project team members (Chief and Council, Elders, Subject Matter Experts, Project Manager)
- Teaching Staff
- Procured software and technology (i.e. code.org curriculum, Open edX platform, etc.)
- Financial Contributions

Activities:

Project activities can be defined as the planned work, actions, and events that our project team will undertake to produce one or more outputs. The activities to be undertaken as part of this project include:

- Record written aadsookaanan (sacred stories)
- Produce Waawaa video
- Overdub videos in second language (Nishnabeweemen)
- Produce STEM videos
- Implement K-12 curriculum augmentation
- Upload all data and materials on Open edX

Outputs:

Outputs can be described as the direct result of the planned activities.

- Record of aadsookaanan (sacred stories)
- 2,000 hrs of immersion video
- 1,000 hrs of STEM video
- STEM curriculum framework and materials

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Digitized publicly accessible version of the above.

Outcomes:

Outcomes can be described as the medium-term impact of the project.

- Increase in number of K-12 STEM courses successfully completed by K-12 students,
- Decrease in percentage of K-12 students needing remedial help in STEM subject areas
- Increase in number of K-12 students who have at least a basic ability to code
- Increase in number of K-12 students who know the key concepts expressed in each of our core aadsookaanan
- Increased annual participation rate in number of traditional Nishnaabe activities for K-12 Students
- Minimum 2,000 hours of Nishnaabe language acquired by graduating eighth-graders
- Minimum 1,000 hours of Nishnaabe-language STEM video successfully completed by graduating high school seniors

Impact:

Impacts can be described as the long-term outcome of the project. For the Biigtigong Nishnaabeg Smart Cities project this includes impacts to our community as well as to society as whole, as described below:

Community Impact:

- Youth who are "better-educated"
- Youth who are "more-employable"
- Youth who are "better-grounded" in their Nishnaabe identity
- Youth who are "more holistically Nishnaabe"

Social Impact:

- Preserved language
- Preserved cultural teachings
- Model for connecting STEM, and traditional/cultural learning
- Onboarding approach to creating Smart Cities regardless of current resources or capacity.

Indicators & Milestones:

Key Performance Indicators (KPIs) allow project managers to gauge whether the planned activities have been successful. This is measured by how well they have been able to meet the objectives of the project. The four (4) main objectives for the project have been outlined in Chapter 3. The completion of the activities outlined in the implementation plan for this project should satisfy the objectives of the project and should bring tangible value added to the community and society as a whole.

It is important to have both qualitative and quantitative indicators for tracking, measuring and evaluating performance, to capture the holistic perspective of the project goals. It is also important

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

to select a reasonable number of indicators to ensure that performance measurements are met and accomplished, while not over specifying and removing opportunities that may evolve throughout the project lifecycle.

Quantitative Key Performance Indicators (KPI):

The following section outlines some of the KPIs identified for the performance measurement process of our project. This section details the KPI, the data source and associated responsible resource. The table following this section summarizes this information in the context of associated outputs, outcomes, and target completion dates.

1. Number of aadsookaanan lessons created
2. Number of hours of video produced
3. Number of courses for which curriculum is implemented

The above KPIs are designed to track performance with respect to the outputs for this project. Data will be provided in the form of a summary report to be submitted by the SMEs to the project manager who will then report to the advisory committee on a biannual basis.

4. Number of K-12 STEM courses successfully completed by K-12 students
5. Percentage of K-12 students needing remedial help in STEM subject areas
6. Number of K-12 students who have at least a basic ability to code
7. Number of K-12 students who know the key concepts expressed in each of our core aadsookaanan
8. Annual participation rate in number of traditional Nishnaabe activities for K-12 Students

Qualitative Key Performance Indicators:

1. Teacher feedback and opinions
2. Student feedback and opinions

Other Key Performance Indicators

In addition to the specific KPIs that the project team has identified for tracking performance on specific project outputs and outcome, all outputs will also be evaluated through implementation of financial- and schedule-based KPIs. Financial- and Schedule-based KPIs for reporting on outcomes are less reliable and therefore these KPIs will only be associated with the following project outputs:

1. Estimated Budget vs. Actual Expenditures (Financial)
2. Target Completion Date vs. Actual Completion Date (Schedule)

Source of Data and Reporting Role and Responsibilities

With respect to tracking the Key Performance Indicators listed above, much of the data required including; participation rates, hours of aadsookaanan and STEM video developed, student grades etc. can be collected directly from the open-source online Open edX platform. Clear and concise

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

reporting of the Key Performance Indicators will also be a vital component when measuring the progress made throughout this project.

Since teaching staff will be responsible for the direct oversight of student's engagement with the curriculum (i.e. Grading), they will play a large role in assessing and reporting on the performance of students and the quality of educational materials developed. Reporting of these performance indicators will then be communicated to the project team for further analysis.
The project team will be responsible for tracking their internal performance, regarding budgeting and scheduling.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Program Outputs and Outcomes	Indicator	Data Source	Frequency	Baseline	Target	Date to Achieve Target	Data Collection Resource
Output 1 Record of aadsookaanan (sacred stories)	# of aadsookannan lessons created	Report from Elders and Project Team	Bi-annually	0	50	August 2024	SMEs – Elders &Project Manager
Output #2 – Immersion Video	# of hours of video	Report from Video Production Team	Bi-Annually	0	2,000 hrs	August 2024	SMEs - Video Production Team & Project Manager
Output #3 – Billingual STEM Video	# of hours of video	Report from Video Production Team	Bi-Annually	0	1,000hrs	August 2024	SMEs - Video Production Team & Project Manager
Output 4 - STEM curriculum framework and materials for k-12	# of courses for which curriculum is implemented	Teaching Staff and SMEs	Bi-Annually	No Grades	Grades K-12	August 2024	Teaching Staff
Outcome 1: Youth who are "better-educated"	• # of K-12 STEM courses successfully completed by K-12 students • % of K-12 students needing remedial help in STEM subject areas • Teacher opinion (qualitative) • Student opinion (qualitative)	Summary Report from Teaching Staff	Bi-Annually	None	Increase	August 2024	Teaching Staff
Outcome 2: Youth who are "more-employable"	• # of K-12 STEM courses successfully completed by K-12 students • # of K-12 students who have at least a basic ability to code • Teacher opinion (qualitative) • Student opinion (qualitative)	Summary Report from Teaching Staff	Bi-Annually	None	Increase	August 2024	Teaching Staff
Outcome 3: Youth who are "better-grounded" in their Nishnaabe identity	• # of K-12 students who know the key concepts expressed in each of our core aadsookaanan • Annual participation rate in number of traditional Nishnaabe activities for K-12 Students • Teacher opinion (qualitative) • Student opinion (qualitative)	Summary Report from Teaching Staff	Bi-Annually	None	Increase Reach and obtain Positive Opinion Feedback	August 2024	Teaching Staff
Outcome 4: Youth who are "more holistically Nishnaabe"	• Minimum 2,000 hours of Nishnaabe language acquired by graduating eighth-graders • Annual participation rate in number of traditional Nishnaabe activities for K-12 Students • Minimum 1,000 hours of Nishnaabe-language STEM video successfully completed by graduating high school seniors • Teacher opinion (qualitative) • Student opinion (qualitative)	Summary Report from Teaching Staff	Bi-Annually	None	Increase Reach and obtain Positive Opinion Feedback	August 2024	Teaching Staff

*All outcomes will also be subject to the financial and schedule based KPIs as described in this chapter and the proposal in general.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Payment Schedule

Understanding that the intent is to develop an outcome-based contribution agreement with Infrastructure Canada, where payments will be triggered by the successful achievement of progress toward outcomes, we have developed a payment schedule that is simple, manageable and associated with the completion of milestones as outlined in detail in Chapter 8.

Risk Management

Identifying risks that may be presented throughout the project lifecycle is an essential component of project management as it allows the project team to proactively establish mitigation strategies to effectively minimize the impact of the risk on the project before it occurs. The table below summarizes a list of potential risks related to the above Key Performance Indicators, as well as the associated mitigation strategies that will be implemented to ensure that the delivery of this content remains effective, up to date, and on schedule.

Risks	Mitigation Strategies
Lag in completing activities could negatively impact project outcomes	Project implementation plan includes Ramp-Up strategy to capitalize on efficiencies in activities
Lack of Student Participation	Incorporation of Immersion and STEM education into existing curriculum provides double-duty lessons to ensure student involvement
Difficulty with Curriculum Implementation	Ramp-up capabilities of Code.org (for example) means that students can be exposed to coding in Grade 5 only, and still proceed to Python in Grade 6, and Robotics in Grades 7 and 8. In other words, the first few years of K-5 curriculum implementation has a significant buffer to include all experience and skill levels. With respect to Grade 6 and above, and experience or previous coding exposure is an improvement on the current curriculum. By the end of the 5-year implementation period, it is expected that any obstacle associated with curriculum implementation will be overcome.
Resources (Human or Technological) are no longer available	Only a few language speakers and Elders can produce aadsookaanan. This highlights the critical nature of this project. The likelihood of any human resources no longer being available is very low, but the impact if this is the case would be significant.
Curriculum becomes outdated	Reliance will be placed on existing websites for STEM education (i.e. code.org). As these are established organizations, that are constantly updating and revising content to better engage youth and other users in this field, there is little chance that this curriculum will become dated. However, SMEs will continuously monitor content and explore alternatives should the desired content become outdated or unavailable.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 3: Project Management Plan

Introduction

A Project Management Plan (PMP) is used to manage the implementation of a project through the formal documentation of any actions necessary to define, prepare, integrate and coordinate the various project activities. The PMP defines how the project will be executed, monitored, controlled, and closed. Project Management is an iterative process and as such, the PMP acts as a living document, which is progressively elaborated upon throughout the course of a project. As part of the finalist stage, our project team has developed a Project Management Plan (PMP) for the implementation phase of the project that includes the following:

1. Project scope, scheduling, sequencing, and dependencies
2. Resource assessment, including human, material, and financial (e.g. workforce capacity, infrastructure readiness, and related initiatives already underway) that are sufficient and appropriate to the achievement of outcomes
3. Strategies for: Risk identification and appropriate mitigation
    a. Procurement, including alignment with technology and partnership requirements
    b. Stakeholders, including analysis of impact and influence
    c. Communications, including strategies that promote community involvement and transparency and tailor to diverse stakeholders and projects
4. Monitoring, controlling, and reporting strategies and checkpoints for contingencies and course corrections, if necessary
5. Approach to sustaining projects beyond the lifecycle of the Challenge.

The following chapter summarizes our team's Project Management Plan, with reference to the appropriate chapter of the proposal that will provide supplementary information. When proceeding with the project, the information contained within this proposal will be restructured to serve as the various project management materials needed to guide the project team through the implementation of the project and beyond.

Project Scope, Scheduling, Sequencing & Dependencies

The scope of our project includes the development of 2,000 hours of Nishnaabe-language immersion videos, the content of which will be our core aadsookaanan (our sacred stories, our philosophical foundations, the building blocks of our Nishnaabe worldview). It is intended that this will create understanders of our Nishnaabe language who can then go on to successfully complete an additional 1,000 hours of STEM educational video, the audio of which is delivered in our Nishnaabe language. It is worth reiterating that the model being developed can be used for any other language or culture, the idea is to blend STEM education with tradition, to create leaders of tomorrow with a strong connection to their traditions and cultures. For example, the WaaWaa videos can be overdubbed in any language and be just as useful. It is our belief that this is truly a Canadian approach to developing Smart Cities.

This project will move Nishnaabe people from being mainly passive consumers of technology to being active, effective STEM-educated administrators, managers, and users of data who are able to achieve meaningful outcomes for themselves, their community, and other communities. Upon completing high school, our youth will have received more than 2,000 hours of mobile-enabled,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

online Nishnaabe-language immersion instruction in all of our core aadsookaanan (our sacred stories, our philosophical foundations, the building blocks of our Nishnaabe worldview).

Additionally, our youth will be nearly-completely able to comprehend spoken Nishnaabemwin, will have attained a basic proficiency in coding and robotics, and will possess a strong foundation in mathematics and science. All STEM subject videos and courses will be available under a creative commons license, in both Nishnaabemwin and in English. All of this education will occur in a blended-learning environment with a strong real-world participation component built into the program. The eLearning functionality of our community's open source, mobile-enabled, Learning Management System (LMS), Open edX, facilitates the learning of the STEM subjects. And, the eAcquisition functionality of Open edX facilitates the acquisition of our Nishnaabe language. The entire educational experience is tied together with the meetup forum functionality of Open edX serving as a bridge between the digital, online world and the material, real world. Our youth are strongly encouraged and empowered to participate not only in online communities, but in the traditional Nishnaabe activities going on in the real-world community thereby bridging the gap between the online and real world. Based on this scope of work, the following project management plan has been developed to guide the project team through the implementation phase and beyond. This planning template can also be utilized by other communities when adopting our onboarding approach to a smart city.

It should be noted that this PMP is based on our approach to develop a smart city through the integrated delivery of our culture, language and STEM education; however, other communities that choose to replicate this approach will be able to tailor their project to reflect their culture and language. The products and outcomes of our project, including templates, videos, and curriculum will be made readily available in an open source and transparent format, to be accessed by any community wishing to replicate our approach to developing a smart city.

Project Objectives:

As previously mentioned, our project seeks to achieve the four (4) objectives or outcomes, listed in our Challenge Statement. These objectives are summarized below but are presented in more detail in Chapter One (1), Vision.

Objectives and Measurable Outcomes:

Objectives		Progress Indicator/Measurable Outcome
1.	Youth who are "better-educated"	• Increase in number of K-12 STEM courses successfully completed by K-12 students, • Decrease in percentage of K-12 students needing remedial help in STEM subject areas
2.	Youth who are "more-employable"	• Increase in number of K-12 STEM courses successfully completed by K-12 students, • Increase in number of K-12 students who have at least a basic ability to code
3.	Youth who are "better-grounded" in their Nishnaabe identity	• Increase in number of K-12 students who know the key concepts expressed in each of our core aadsookaanan

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

		• Increased annual participation rate in number of traditional Nishnaabe activities for K-12 Students
4.	Youth who are "more holistically Nishnaabe"	• Minimum 2,000 hours of Nishnaabe language acquired by graduating eighth-graders • Increased annual participation rate in number of traditional Nishnaabe activities for K-12 Students • Minimum 1,000 hours of Nishnaabe-language STEM video successfully completed by graduating high school seniors

Scheduling, Sequencing and Dependencies:

To ensure smooth project delivery, project management tools must be implemented. These tools allow the Project Team to understand each task at hand and the relationship, or interdependencies, that they share in reaching project completion. Dependencies show relationships between successive tasks and outline what tasks must be completed prior to beginning another. Using dependencies enables the Project Team to establish a critical path for the project; highlighting key events that must be met to drive the project to completion. This critical path will be depicted visually in the form of a Gantt chart.

Often dependencies result from working with different internal and external stakeholders and, as a result, it is important to establish dependencies before project commencement. As dependencies increase the risk associated with project roll-out, a number of tools and techniques can be initiated to mitigate the effects that they may have.

As a starting point, internal and external dependencies have been considered to determine associated levels of risk. Please refer to subsequent sections and chapters for descriptions of associated risks. Likewise, the project implementation plans for all project components, presented in Appendix A & B, also show dependencies between activities. The Project Team have been, and will continue to be, assigned to specific tasks and respective dependencies. As the project moves forward, it is likely that further dependencies and subtasks will take form. To ensure the timeline is not affected by these changes, Bi-Monthly Project Team meetings will take place to proactively coordinate around these obstacles and re-establish the critical path. These meetings will be identified in the project schedule.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project Components:

There are four main parts of this project, all to be hosted on the Open edX learning management system:

1) E-Learning, K-12 curriculum augmentations
2) Meetup forum real-world connections
3) eAcquisition, 2,000 hours of immersion video
4) Bilingual STEM video - 1,000 hours of STEM course video

1) E-Learning, K-12 curriculum augmentations

With respect to the augmentations to the existing curriculum, the project team has developed a detailed implementation plan to complete the following:

1) Implement code.org curriculum in grades k-5
2) Implement python curriculum in grade 6
3) Implement Robotics curriculum in grades 7 and 8
4) Implement CompTIA A+ curriculum in grades 9-12

The project team will rely on existing and proven curriculum for the implementation of the k-12 augmentations. Teachers will be required to incorporate these curriculum augmentations as part of their existing lesson planning process. All curriculum will be implemented via blended learning and growth mindset approaches.

In terms of the implementation schedule, the selected curriculum of code.org (for example), was selected as it provided "ramp up capabilities" meaning that kids being introduced to this curriculum for the first time in grade 5 will be able to complete "ramp up lessons" given that they did not have exposure to the K-4 curriculum. Similar, the 5-year implementation schedule for all other grades and curriculums will follow as similar approach, where necessary.

Please refer to Appendix B for additional information regarding our project implementation process, timelines and outputs for eLearning, K-12 curriculum augmentations project components.

2) Meetup forum real-world connections

The Meet-up functionality of the Open edX platform will enable students and community members to not only connect with the digital community, but also the real-world community, as well as the land and traditional activities. This mobile-enabled meetup forum functionality, provided by Open edX, will serve as the central 'online gathering' place which will facilitate the bridging and interfacing of the digital world with the material, real world. All community members will have access to each other via this online gathering place. This functionality is provided directly within Open edX and will provide our youth the opportunity to express their desire to attend a particular traditional Nishnaabe activity. Likewise, community members who are planning an activity will be able to express their intentions in the meetup forum functionality of Open edX, thereby providing additional options for our youth to take part in while remaining in the embrace of the real-world community network. As this is a function of the Open edX Platform, implementation

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

will be relatively simple, requiring the development and provision of instructions to participants and encouraging participation, as part of our overall implementation strategy.

3) eAcquisition and 4) Bilingual STEM course video

With respect to the eAcquisition immersion video and STEM course videos, the project team has developed a detailed Implementation Plan to complete the following:

- Reconstruct and write our core aadsookaanan
- Produce Waawaa video (2,000 hrs)
- Overdub Waawaa video and/or produce Nishnaabe-language immersion video (live-action or 2D-animated)
- Produce bilingual (Nishnaabe-language and English-language) STEM video (1,000 hours)

Please refer to Appendix A for additional information regarding our project implementation process, timelines and outputs for the eAcquisition and Bilingual STEM Course Video project components.

To summarize, the approach taken in terms of the production of the Waawaa video and Nishnaabe language immersion video and bilingual STEM videos has been to intentionally ramp up production over the course of the 5-year project implementation. The reason for this is to allow for review and critique of the first round of videos to allow the project team to adjust course and make any improvements, as deemed necessary. Likewise, it is anticipated that the production of Waawaa videos will become more effective over the course of the project implementation plan, and therefore our team will be able to increase output over the duration of the project.

Based on our pilot studies we have identified that the level of effort to produce one hour of Waawaa video (not including overdubbing) can vary significantly. We have developed our scheduling and implementation plan with sufficient buffer and a ramp up timelines to mitigate this scheduling risks.

Implementation Plans – Strategy

These implementation plans have been developed through reliance on the Project Sponsor and Subject Matter Experts. Project Participants shall follow the implementation plan and schedule. The efficacy of the implementation strategy will be reviewed at each Bi-annual Advisory Team meeting. Should significant issues be encountered during implementation, the project participants shall notify the project manager who can call an ad-hoc advisory team meeting to review the plan and make any necessary course corrections.

Gantt Chart

A detailed Gantt Chart outlining each stage of the project, and all project participants and stakeholders, will be revisited and updated throughout the project lifecycle to ensure smooth transitions between project phases. A Gantt Chart is a PM tool that can be used to summarize critical stages of the project, dependencies and anticipated duration of tasks, as well as providing an effective resource for tracking progress throughout the project lifecycle. Gantt Charts show the progression and duration of tasks while also showing dependencies of different events within the project. This schedule will be reviewed with the Project Team before project commencement and regularly reviewed and revised as necessary to avoid schedule slippage, reduce redundancy in effort, and expedite successful project delivery.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Resource Assessment

As part of the Project Management Plan, it is necessary to assess the availability and capacity of resources to ensure they are sufficient to achieve outcomes of the project. Biigtigong Nishnaabeg has been developing our internal resources over several years, which has enabled us to be in a position where we can achieve the goals and outcomes of this proposed project. The resources identified as required to complete this project include:

- Human resources with expertise in areas of language, technology, culture (elders), finances, education
- Technological/material resources
- Capacity building and related initiatives
- Financial resources

Human Resources

Human resource management is key when implementing a project as this dictates the connection between the available workforce and the ability of a project's strategies, objectives and goals to be achieved. The best practice for human resource management can be understood through the following six steps;

1. Develop and Revisit project objectives
2. Assess existing capabilities and capacities
3. Estimate future HR requirements
4. Determine job and resource requirement
5. Implement a Human Resource Management Plan
6. Evaluation and corrective action

This non-linear process will be implemented by our team in completing the project and each phase can be revisited as needed, and at minimum at our Bi-Annual meetings.

The Human Resource Management Plan will be used to provide guidance on how team members will be defined, staffed, managed, and eventually released throughout the project lifecycle. Each member of the team will be assessed based on the following:

- **Role** – function assumed by person on project.
- **Authority** – right to apply resources, make decisions, sign approvals, etc.
- **Responsibility** – duties of work on project team
- **Competency** - skill and capability required to complete assigned activities.

One tool that will be developed is a Responsibility Assignment Matrix (RAM). This method of project management assigns specific actions to each member of the team. Organizing the responsibilities of the team members in a RAM will allow for more organization and can be used to identify a gap in the project team's ability to complete tasks.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project Roles & Responsibilities

We have secured the necessary human resources for the successful development and implementation of this project. Biigtigong Nishnaabeg has a strong talent pool and exceptional human resources committed to this project. Broadly this includes

- Community leadership (Chief and council)
- Subject Matter experts
    - (in areas of language, culture and STEM)
- Technical staff
- Administrative support (finalizing)

Current key human resources are identified in the table below:

Role	Participant(s)	Responsibilities
Project Sponsor	Chief & Council	• Represent community • Provide project oversight and guidance • Review/approve some project elements
Subject Matter Experts	• Language consultant • Elders • Industry Partners • Teachers	• Provide language expertise • Provide cultural expertise • Provide Curriculum Expertise
Advisory Committee	Community and Industry Leaders	• Approves major funding and resource allocation strategies • Authorizes significant changes • Resolves conflicts and issues • Provides clear direction to the Project Manager • Review project deliverables and milestones • Identify risks and mitigation strategies
Project Manager	Band Administration	• Manages project in accordance to the project plan • Coordination with Advisory Committee • Supervises consultants and SMEs • Provide overall project direction • Direct/lead team members toward project objectives • Handles problem resolution • Manages the project budget
Project Participants, incl. technical staff and admin support	• Elders • Teachers • Language consultant • Video production team • Others to be identified by SC project Advisory committee	• Communicate project goals, status and progress throughout the project to other participants, and project manager. • Review and approve project deliverables and accountable for milestones • Creates or helps create work products (videos, written materials, curriculum). • Coordinates participation of individuals, teams and stakeholders • Provide knowledge and recommendations • Evaluate outcomes and provide input on key performance indicators • Helps identify and mitigate project risks • Assure quality of products that will meet the project goals and objectives • Achieve milestones on time and on schedule

Other roles and responsibilities are described in relevant sections of this proposal, including Chapter 5 which provides the roles and responsibilities of the governance structure for Biigtigong Nishnaabeg First Nation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Infrastructure/Material Resources:

The infrastructure required for this initiative includes the eLearning, eAcquisition, and meetup forum functionalities of the Open edX platform. This online platform will be the primary method of delivering language and STEM training to the target audience. Other technologies/software include Code.org, Tynker.com, Lego.com, CompTIA A+ Exam preparation materials and curriculum, etc. Additional information related to technology resources are included in Chapter 4 of this proposal and will be available to the project team as part of the Project Management Plan.

Capacity Building and Related Initiatives

As part of the Project Management Plan, it is important for the project team to have a solid understanding of existing and ongoing initiatives that may influence the Smart Cities project. The project team has identified three (3) existing projects of particular importance to this project, and that should be monitored as part of the project management process. Project leads from each of the below initiatives are already identified as key stakeholders as part of the Smart Cities process and therefore will continue to be consulted over the course of the project implementation, and beyond, as outlined in our engagement plan presented in Chapter 6.

- **Language Project:** ongoing project to capture and preserve the Nishnaabe language and more specifically the Biigtigong dialect.
- **Curriculum Development:** ongoing project to emphasize cultural and land-based learning activities for K-8 students.
- **New School Project** The community has identified continued education, job readiness and skills training and development as a high priority. Biigtigong Nishnaabeg is currently in the process of designing a new elementary school and Business Training and Education Complex. These facilities can be used to promote this program and facilitate participation by youth and young professional. By having this easy access to the target audience this will ensure that the program is adopted.

Financial Resources

This project will rely on the financial resources provided by the community, other participants and Infrastructure Canada, as presented in Chapter 8.

Strategies for: Risk identification and appropriate mitigation

With any given project there is the potential of risk throughout its lifespan. Risks can be any influence which affects the success of a project (i.e. in terms of budget or schedule). Therefore, risk management is an essential process of identifying, analyzing and responding to these influences that may occur, to ensure the project stays on track. Specifically, risk management involves identifying categorizing, prioritizing and planning for risks, with risks being identified as anything that could potentially impact the success of the project (deadlines, quality, or budget etc.). Throughout this project, risk management will be approached as an iterative and proactive process.

The project team will revisit the Risk Management Strategy throughout the course of the project as needed to identify and monitor the potential risks during each phase of the project. Once a Risk Management Strategy has been finalized, deviation from the agreed upon schedule/budget/scope of work will be identified and promptly communicated amongst the project team so that corrective actions can be taken in a timely manner. It is the intent there will be regular project meetings held to monitor the progress made and to identify any potential risks.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The initial Risk Assessment has resulted in the identification of initial project risks, and these are presented throughout our proposal. Key Risks and mitigation strategies are summarized in the table below (Additional risks are identified throughout our proposal):

Risk	Likelihood	Impact	Risk Management Approach/Mitigating Actions
Low Student Participation	Medium	Medium	• Program is designed to be interactive and hands on approach • Meaningful outcomes • Onboarding and recruiting strategies • Incentives – i.e. Summer Student Employment • Community celebrations • Good co-op placements • Offer program neighboring First Nation • Develop on-line resources for scalable and replicable
Technology, software and curriculum becomes outdated	Low-High	Medium	• Over time (long-term) the chosen technology and curriculum may become outdated. Responsibility of project team (including SMEs) to continuously identify alternatives. • Designed curriculum based on building blocks, so that the principles of STEM curriculum will not change, • Teachers to continue to revisit teaching lessons and curriculum through existing processes.
Nishnaabemwin audio overdub cost is too high	Medium	High	• Audio-video editing software & related training • Establish work flow procedures and accountabilities • Set up a review & monitoring system • Establish best-practices • Consider use of a first-speaker as a consultant • Research animation and other technological options • Focus priorities and on core competencies
Extreme high cost of uploading and downloading video	High	High	• ISP (PRDC) is providing free on-site services to assist in the offloading, downloading and uploading of video
Expensive video backup system; cloud service unreliable for now	Medium	High	• Develop safe and reasonably costed manual backup system • ISP (PRDC) is setting up a free back up system on their servers
Loss of $100,000 financial contribution from Chief & Council	Low	Medium	• Examine projects and make adjustments (cuts) where necessary • Ensure efficiency and effectiveness of projects • Provide and show value for the $100,000 donation – produce results • Apply for other funding and financial contributions
Change in partners/3rd party involvement or withdrawal.	Low	High	• Build Relationships • Formal agreements • Identify alternative strategies • Continually monitor risk
Admission of new partners.	High	Medium	• Admission mechanisms

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

			• Needs based; team approval process • References – due diligence
Conflict of Interest	Low	Medium	• Build strong communication • Maximum transparency • Implement Conflict of Interest Policy
Potential inequalities in partners' resources and expertise determine their relative influence in the partnership's decision making.	Medium	Medium	• Focus on consensus-based decision making • Address in formal agreements • Build relationships • Access to dispute resolution process • Involve experts on Executive Board
Poorly defined shared vision and objectives.	Low	Medium	• Develop shared vision with clearly defined objectives • Link corporate objectives/organizational objectives to the project objectives • Training and Education sessions • Annual and Bi-Annual reviews
performance targets not met in a satisfactory or timely way.	Low	High	• Develop an agreed upon Performance Management framework • Conflict management/resolution procedures • Encourage joint ownership of problems & solutions • Relationship building
Failure to engage key stakeholders in meaningful ways.	Low	Medium	• Awareness & education of engagement strategy • Communication strategy • Performance measurements inclusion • Evaluation strategy
Failure to comply with relevant laws and regulations.	Low	Low- High	• Identification & education of laws & regulations • Dispute resolution process • Develop safeguards throughout project
Partners/3rd party - Lack of understanding of local culture.	Medium	Medium	• Cultural awareness training • Provide explanations – no assumptions • Dispute resolution
Financial risks No strategic approach to issues of risk, costs and benefits	Medium	Medium	• Define and agree with approach to dealing with costs and benefits of the • Continuous monitoring & reporting • Utilize Finance Department & Finance Committee
Loss of autonomy	Low	High	• Rigorous selection of partners • Clear agreements
Lack of capacity, skills, knowledge and experience	Medium	High	• External Recruitment Plan • Local training & development plan • Outsourcing and Contracting Options • Secondments
Insufficient internal & external communication.	Low	Medium	• Establish communication plan & review • Regular meetings • Structured reports • Use of collaboration tools

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The goal of our risk assessment process is to identify, characterize, prioritize and document a mitigation approach relative to those risks which can be identified prior to the start of the project. The Risk Assessment will be continuously monitored and updated throughout the life of the project and will be communicated with appropriate stakeholder as per our engagement plan, presented in Chapter 6.

Since mitigation approaches must be agreed upon by project leadership (based on the assessed impact of the risk, the project's ability to accept the risk, and the feasibility of mitigating the risk), it is necessary to allocate time during each Advisory Team meeting, dedicated to identifying new risks and discussing mitigation strategies.

Procurement, including alignment with technology and partnership requirements

Our procurement strategy will follow our internal policies and procedures which mandate minimum requirements for service delivery, contract terms, First Nation involvement, etc. For this project the majority of procurement requirements have been established through development of this proposal and are the approach is relatively uncomplex in that they are with preestablished service and software providers, products and partners.

Stakeholder identification, including analysis of impact and influence

A stakeholder refers to any individual, organization or group of people with an interest in the project or the ability to affect its outcome. All stakeholders therefore have a vested interest in the successful outcome of a project. From previous engagement experiences on other projects, we understand the importance of including the diverse groups that will be impacted and/or could impact the project. We understand that this journey, especially the reclamation of our language and aadsookaanan, will potentially stir emotions resulting from historical impacts from cultural genocide. We further understand, that it is necessary to walk through these hurts together in order to move forward, heal and reclaim our culture and identity. This proposal required the input of everyone, as it provided another opportunity to build stronger individuals, families, community and a Nation.

In identifying our stakeholders, we considered those who would be immediately impacted and those impacted according to our 7th generation principle (See Chapter 5). Various target groups have been identified and strategies established to facilitate meaningful engagement. As we move forward from development to implementation, we remain committed to developing effective engagement processes that build upon best-practices while creating new and innovative ways of engagement with the project stakeholders. Furthermore, expectation, assumptions and potential risks for each stakeholder will be identified through this engagement. Having an understanding of what is considered the most important outcome for the project amongst the different stakeholders allows project managers to tailor their approach to align with and meet stakeholders needs. Please refer to Chapters 5 and 6 of the proposal for additional details on our stakeholder management process.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Communication Strategies

Having the support and involvement of all stakeholders will add value to the project, not only through meaningful participation but to also allow for open dialogue and feedback throughout the project. The community engagement strategies completed to date for this project have focused on using our cultural practices to empower youth and community members in a meaningful way.

Throughout the implementation stages of this project a number of these strategies, including community meetings, reporting, surveys, working groups and traditional ceremonies, will be utilized to ensure the continued involvement of the stakeholders at each stage of the project. Most importantly, knowledge sharing and discussions with community members, particularly elders, will be integral to better understanding our traditional Nishnaabe language.

Engagement events (i.e. working groups, community meetings) will be advertised to community members and the general public through the appropriate channels, including but not limited to social media, newsletters and event bulletin boards. A full Engagement Plan for the project can be found in Chapter 6.

Monitoring, controlling, and reporting strategies

Monitor and Control Project Work is the process of tracking, reviewing, and reporting the progress to meet the performance objectives defined in the Project Management Plan. The key benefit of this process is that it allows stakeholders to understand the current state of the project, work completed, budget, schedule, and scope forecasts.

Each member of the project team will be responsible for monitoring the schedule and tasks completed under their supervision. Thus, information sharing and regular communication amongst the project team will be a key component for success.

Should the project team be unable to complete tasks in the allotted timeframe, corrective measures will be implemented immediately, to ensure the project continues without significant delay. Corrective actions may include more frequent project update meetings/conference calls which will allow the project team to collaboratively adjust the internal schedule of the project to ensure all tasks can be completed.

Bi-annual and annual reporting will be conducted and presented to stakeholders throughout the duration of this project, as per the communication and engagement strategy. Bi-Annual reports will coincide with the financial reporting aspect discussed further in Chapter 8.

In terms of reporting to be received from Teachers, reporting to the project team will be completed in the form of summarized and anonymized data, following an agree to template. Reporting to parents and students will follow the exiting process governing their current reporting practices (i.e. report cards).

Approach to sustaining projects beyond the lifecycle of the Challenge

Our project is designed to be implemented over the course of 5 years, with official project initiation beginning September 2019 and implementation ending in August 2024. That being said, significant resources are already in place, and much effort has been expended in developing this

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

proposal, which will allow us to hit the ground running. Notably, this project does not have an "end" to its lifecycle, instead the project intends to implement the curriculum which can then continue indefinitely. Of course, there will be the need to continuously review, adjust and enhance the approach and curriculum content, especially in terms of STEM education, but the entire idea of this project is to provide long lasting change to our community which can then be replicated and implemented by any community across Canada or the world.

As previously mentioned, our approach to creating a smart city is an onboarding strategy that would provide long lasting effective change to communities, through empowering youth (and others), through cross-generational transfer of cultural knowledge as well as the much-needed STEM knowledge required to ensure active participation in a smart technology driven economy.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 4: Technology

Introduction

Technology in Biigtigong's on-reserve elementary school and on-reserve high school will help revitalize language and culture, will enhance student learning, will provide students with modern bilingual STEM education, will strengthen students' real-world connections to our Biigtigong territory and to other community members, will improve the efficiency and productivity of teaching staff, and will facilitate communication among students, teaching staff, parents, and elders.

The Vision for Technology

Technology is being utilized firstly as a foundation of our entire proposal – the delivery of the Learning Management System – namely Open edX. Open edX, in turn, then serves as the platform atop which our K-8 students will be acquiring their Nishnaabe language – via 2,000 of immersion video instruction, the content of which is our aadsookaanan (our sacred stories, our philosophical foundations, the basic building blocks of our Nishnaabe worldview). Our aadsookaanan will be reconstructed and written, over the five-year period of this proposal - the aadsookaanan reconstruction process assisted, as well, by technology. Additionally, our students in both elementary school and high school will also have STEM education delivered to them on the Open edX platform in a blended-learning environment (i.e., brick-and-mortar instruction augmented with an online component), by augmenting our current K-12 curriculum with the following:

- For our grades K-5 students, the Computer Science Fundamentals curriculum of Code.org.
- For our grade 6 students, a coding course using the Python programming language.
- For our grades 7 and 8 students, two courses in LEGO Robotics utilizing an expanded, projects-based version of the LEGO MINDSTORMS EV3 Curriculum.
- And, for our high school students, the full curriculum of the CompTIA A+ information technology exam preparation.

Additionally, for our high school students, they will receive, through the medium of our Nishnaabe language, STEM course instruction via 1,000 hours of STEM course videos (available in both the Nishnaabe-language and the English-language.) Professional development will be provided throughout the five-year period for all staff to ensure that culture-based technology is used to transform learning and language acquisition opportunities for all students.

Community informationals will be delivered throughout the five-year period for all community members – especially parents of students – to maintain their informed technology-related decision making.

Plan Duration

The duration of the Plan will be five years (September 2019 through August 2024). The Plan will be reviewed and updated bi-annually. The focus of this technology plan is the curriculum augmentations, community informational, and professional development components.

Stakeholders

The stakeholders to this technology plan include the whole community – including students, teachers, administrators, parents, information technology staff, and elected leaders.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

K-12 Curriculum Augmentation

We are building a modern bilingual K-12 STEM curriculum by augmenting our current K-12 curriculum. This chapter will focus on those planned-for K-12 curriculum augmentations.

Technology Plan Vision and K-12 Curriculum Augmentation Rollout by Year

Vision for Technology and K-12 Augmentation

Our vision for technology is the curriculum represented graphically in Chapter 1's Figure 1-1, delivered via the Open edX platform.

Rollout by Year

The yearly rollouts below support the Vision for Technology and K-12 Augmentation. These rollouts begin with an exit goal that states what we expect twelfth grade students graduating from our school to know and be able to do and is followed by yearly rollouts of technology Types 1 and 2 for students and staff who will support learning in our classes and our overall instructional program. These rollouts are intended to guide the implementation of technology across our K-12 curriculum, professional development of teaching staff, educate the community on the relevant technologies, deliver bilingual K-12 STEM knowledge, and support the reconstruction and revitalization of our Nishnaabe language and aadsookaanan (sacred stories).

Exit Goal: Students graduating from Biigtigong's high school (whom have also graduated from Biigtigong's elementary school) will be able to code in an introductory text-based programming language (Python), will be able to assemble and control robots using a text-based programming language (ROBOTC, a language similar in structure to the C programming language), will have successfully completed the exam preparation curriculum for both parts of the CompTIA A+ exam (exam #220-1001, and exam #220-1002), will be able to nearly-completely understand their Nishnaabe language, and will know all of their core aadsookaanan.

Yearly Rollouts of Type 1 Technology:

Year 1 (Sep. 2019 – Aug. 2020)

- We begin using Appsembler, our chosen SaaS-provider of the Open edX platform, to deliver our augmented K-12 curriculum.

Years 2 through 5 (Sep. 2020 – Aug. 2024)

- We continue using Appsembler, our chosen SaaS-provider of the Open edX platform, to deliver our augmented K-12 curriculum.

Yearly Rollouts of Type 2 Technologies:

Type 2: Technologies utilized in our K-12 curriculum

For the rollout schedules of the technologies utilized in our K-12 curriculum, please see Appendix B and Appendix C for each of the five years of this proposal.

Detailed curriculum documents can be found here:

- Code.org – Computer Science Fundamentals curriculum: https://code.org/curriculum/docs/csf/CSF_Curriculum_Guide_2018_smaller.pdf
- Python 1 – Tynker.com's 'Python 101' course curriculum: https://www.tynker.com/school/coding-curriculum/scope-sequence

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Robotics 1 and 2 curriculum – LEGO MINDSTORMS EV3 curriculum: https://education.lego.com/en-us/downloads/mindstorms-ev3/curriculum
- CompTIA A+ exam preparation curriculum:
    - Exam #220-1001: https://www.certblaster.com/wp-content/uploads/2018/07/A-plus-220-1001-pdf-Exam-Objectives.pdf
    - Exam #220-1002: https://www.certblaster.com/wp-content/uploads/2018/07/A-plus-220-1002-pdf-Exam-Objectives-1.pdf

Type 2: Technologies utilized in the reconstruction and writing of our core aadsookaanan
In the interest of effective use of space here in this proposal, these technologies will be utilized on an as-needed basis to write our aadsookaanan. These technologies will be utilized throughout all five years of the the five-year period.

Type 2: Technologies utilized in the production and provision of our three types of video
In the interest of effective use of space here in this proposal, these technologies will be utilized on an as-needed basis to record, overdub, animate, and edit our video. These technologies will be utilized throughout all five years of the the five-year period.

Yearly Rollouts of Professional Development and Community Education:

Year 1 (Sep. 2019 – Aug. 2020)
- We begin delivering technology-related professional development to K-12 staff.
- We begin delivering technology-related informationals to community members – especially to parents of students.

Years 2 through 5 (Sep. 2020 – Aug. 2024)
- We continue delivering technology-related professional development to K-12 staff.
- We continue delivering technology-related informationals to community members – especially to parents of students.

Details about the Technologies

In addition to our existing technology, there are two main types of technology needed to implement our proposal. The first type comprises the constituent technologies of our Learning Management System (LMS), Open edX. Broadly speaking, Open edX is *the* technology which houses the entire blended-learning experience which we're planning to deliver with our proposal. The second category comprises all other technologies which enable that experience to occur. This second category includes the technologies utilized in our augmented K-12 curriculum; the technologies used in the reconstruction and the writing of our core aadsookaanan; and the technologies employed in the production and provision of our three types of video: Waawaa immersion video, Nishnaabe-language immersion video, and bilingual (Nishnaabe-language and English-language) STEM video.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Current Technologies

Current Hardware

Apple iPads *(Student Usage)*	60
Apple iPads *(Teacher Usage)*	5
Apple MacBook Pro laptops *(Student Usage)*	34
Apple MacBook Pro laptops *(Teacher Usage)*	10
Windows desktop PCs *(Student Usage)*	22
Windows desktop PCs *(Teacher Usage)*	4
Apple iMac desktop computers *(Teacher Usage)*	1
Promethean ActivBoard Touches	6
Digital SLR Cameras	2
Digital Cameras/Recording Devices	2

Current Software

Video Editing	Windows Movie Maker, iMovie, Adobe Premiere Pro
Photo Editing	Adobe Photoshop
Office Productivity	For Windows: - Word, PowerPoint, Excel, Publisher, OneNote, Outlook For macOS: - Pages, Keynote, Numbers, Notes

Type 1 Required Technologies

Technologies utilized to deliver our Learning Management System (LMS)

- Open edX platform (open source - GNU Affero General Public License)
    - Open edX iOS mobile app (open source - Apache License)
    - Open edX Android mobile app (open source - Apache License)
    - Written in Python (open source - Python Software Foundation License (PSFL) [a BSD-style, permissive free software license which is compatible with the GNU General Public License (GPL)].)
    - Built on Django (open source - Django's BSD license)
    - Utilizes PostgreSQL relational database (open source - PostgreSQL License [a liberal Open Source license, similar to the BSD or MIT licenses])
- Khan Academy API (free proprietary)
- Appsembler (proprietary SaaS-provider of Open edX)
- Customizations by Biigtigong Nishnaabeg to Open edX platform (open source - GNU Affero General Public License)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Type 2 Required Technologies

Technologies utilized in our K-12 curriculum

- Code.org (open source - Apache License)
- Khan Academy (free proprietary)
- Python - (open source - Python Software Foundation License (PSFL) [a BSD-style, permissive free software license which is compatible with the GNU General Public License (GPL)].)
- LEGO MINDSTORMS EV3 Software (free proprietary)
- LEGO MINDSTORMS EV3 Robot Kit (proprietary)

Technologies utilized in the reconstruction and writing of our core aadsookaanan

- LibreOffice desktop office productivity software (open source - Mozilla Public License Version 2.0)
- ONLYOFFICE desktop office productivity software (open source - AGPLv3)
- MariaDB relational database (open source - GNU GPL v2.0)
- HeidiSQL free and open source administration tool for the MariaDB relational database (open source - GNU GPL v2.0)

Technologies utilized in the production and provision of our three types of video

- Storywriting and screenwriting software (Mariner Persona, Write Brothers Dramatica Pro, Movie Magic Screenwriter)
- Storyboard software (Moviestorm Filmmaker, Power Production's Storyboard Artist Studio, Storymind StoryWeaver)
- Office productivity software (LibreOffice, ONLY OFFICE)
- Digital Pen (Epic Pen)
- Drawing Tablet (Wacom drawing tablet)
- Mocap-capable 2D animation software (Adobe Creative Cloud - Character Animator)
- Webcam (to interface with mocap-enabled 2D-animation software)
- Microphone and accessories (for recording audio with which to overdub the video)
- Riggable 2D-character creation (Adobe Creative Cloud - Illustrator, and Photoshop)
- 3D modelling software (for the creation of assets for the animatics in the 2D-space 'digital flip chart' immersion instruction by the 2D-animated character) (Sketchup Pro)
- Screen recording software (TechSmith Camtasia)
- Video-editing software (Adobe Creative Cloud - Premiere Pro)
- Audio-editing software (Adobe Creative Cloud - Audition)
- SFTP (Secure File Transfer Protocol) client (WinSCP)
- SSH (Secure Shell) and Telnet client (PuTTY)
- Video player software (VLC Player)

Relevant Applications Elsewhere

These technologies are applicable and useful in governance (especially for effectively engaging community member in all facets of community life), new council member initiation, training of new staff, ongoing professional development of current staff, general community informationals, and bringing the entire organization online.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Results of Testing and/or Piloting in the Finalist Phase

We achieved fun and excellent results throughout the finalist phase in all of our pilot projects. Our biggest challenge, as we mentioned in Toronto at our November Jury Check-In, was easing the fears of the teachers and inspiring them with hope for new possibilities concerning their lack of technical expertise in the areas of Technology and Engineering. Coding, in particular, seems to have unnerved the staff of our elementary school the most. Our Elementary School's professional development sessions with the teaching staff, their testing and piloting of the technologies in the classroom and the community, including actual blended-learning classroom sessions using Khan Academy and Code.org, building and controlling Lego robots, and employing block-based programming to control circuit boards using Scratch and Makey Makey, transformed these moments of doubt into empowering moments of possibilities (in our teaching staff's own words!).

Approach to Future-Proofing the Technologies

Firstly, most all of our software applications which are not open source have 'safety-net' open source equivalents. This is how we're safeguarding against vendor-generated proprietary constraints and obsolescence while simultaneously enabling transferability and scalability. Our few proprietary choices here allow us to go faster and thus be more efficient and effective with our time due to the fact that we have personnel with considerable experience in the proprietary versions of these software applications. Should, however, any of the vendors of these proprietary software applications which we're using do something which disallows us to continue effectively using their software, we can quickly and near-frictionlessly switch over to the respective open source equivalent software application with little to no interruption in our workflow.

Secondly, while we are certainly onboarding youth into the smart cities future. We're *also* onboarding K-12 teachers and staff, as well as community members in general. The continuing professional development of teaching staff, and the ongoing informing of the community will produce for us a workforce that is able to implement and operate the technologies and systems going forward into the smart future.

Adoption of Architectures, Guidelines, and Initiatives

Had we chosen to install Open edX's software on servers other than Appsembler's, we would have indeed had an an architecture adoption challenge to contend with. Because we are attempting to make this proposal's approach to moving into the smart future as newbie-friendly as possible, we have chosen to simply use Appsembler as our SaaS (Software as a Service) provider of the Open edX platform. The architecture issue thus goes away as we have only a web-based interface to Appsembler to contend with. A very newbie-friendly approach, indeed.

The guidelines that concern us here are the blended-learning guidelines. We are not advocating for an 'online' school. What we are advocating is enhancing brick-and-mortar curriculum delivery with some online options. The guidelines for attaining this hybrid approach is what we are referring to when we use the term 'blended-learning.'

Similarly, the initiative which concerns us here is the Growth Mindset as implemented by Khan Academy. The Growth Mindset can be many things to people. Fir us, we once again, take a newbie-friendly approach. The Growth Mindset in its minimalist form is not allowing students to progress in their curriculum studies without first mastering the content in their current stage of learning. For example, a student receiving an 85% in a math quiz, for example, is made to redo the quiz until that student receives a perfect score. This is a fundamental approach of Khan Academy, and one which we wish to emulate

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

on our online quizzes using randomized tests with a large database of possible questions for our students. These randomized tests are what we are referring to in our Type 1 Required Technologies section by Customizations by Biigtigong Nishnaabeg to Open edX platform. These are simple JavaScript scripts placed on the front-end webpages of our students quiz pages on Open edX that create a Khan Academy-like testing experience, rendering it what we are referring to as a Growth Mindset Approach to learning.

Interoperability

- Open edX with Appsembler's API (Application Programming Interface) make the platform interoperable with any other technology one could reasonably choose to interface with.
- Using Khan Academy's API (Application Programming Interface) for Khan Academy courses which we'll be offering inside of Open edX makes this customized aspect of Open edX interoperable with nearly any other technology.
- Existing community systems and services are currently not networked. Open edX will be the platform with which Biigtigong Nishnaabeg begins to connect these community systems and services.

Replicability and Scalability

Because we have chosen a foundational platform which is fully open source (Open edX), which we're augmenting with curriculum components (e.g., code.org) and learning-facilitation aids (e.g., Khan Academy) which, too, are nearly all open source and free of charge, our proposal - nearly in its entirety - is replicable in any community one might wish to bring it to.

As we've stated earlier, in the cases where we have chosen to use a proprietary technology – for example, LEGO, which does not operate in the open source ecosystem – we have been careful to make sure that there are near-equivalent open source options - in this case, Raspberry Pi, which does operate in the open source ecosystem – for that technology.

Additionally, as we state several times throughout our proposal, we are offering an onboarding approach to communities that may not have access to bleeding-edge technology, nor perhaps to bleeding-edge technology's administering engineers, programmers, or operators. It is our hope that by keeping the technology requirements of our proposal to a minimum, making our approach as replicable and scalable as is reasonably possible, and still delivering a smart technology approach, we can thereby help facilitate the spread, and long-term acceptance and flourishing of, smart cities throughout Canada.

Roles and Responsibilities of Technology Partners

Technology partners:

- Software and hardware partners
    - Roles and responsibilities are clearly delineated and articulated in the software licensing agreements of each of the technologies.
- Pic River Development Corporation (PRDC) - *Internet Service Provider (ISP)*
    - Most importantly, PRDC's role is to provide for our Waawaa immersion video producers a place in which to offload their video each week. Without this important role being played by this ISP partner, our video producers are forced to use Dropbox or something similar to upload their video instead of being able to simply offload it. This is not an ideal option as piloted upload times during the finalist phase had been exorbitantly and prohibitively high. Offloading all of their video each week onto the servers at PRDC's office is an extremely time-efficient way to get their video to our Nishnaabe-language overdubber.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Technology Accessibility and Usability for Uptake and Acceptance

Community informationals, especially for students and parents of students, will facilitate the community's uptake of Type 1 and Type 2 technologies.

Identification of Risks

Technology – Risks and Mitigation Strategies			
Risk	Likelihood	Impact	Mitigation Strategy
Limitations as a result of internet connections.	Medium	High	• Selective over software – set standards & assessment • Minimize use of cloud computing
Video uploading and downloading time is lengthy and irregular.	High	High	• Agreement with the ISP (PRDC) • PRDC to provider server space for video storage • PRDC will upload video to their servers
Lose control over data	Medium	High	• Establish local control policy & provider/partnership assessment process • Thorough planning over data collection & data management • Formal agreements for control • Establish monitoring system
Resistance from all levels – students, parents, staff	Medium	Medium	• Conduct education sessions • Professional development • Good communication systems • Regular reporting • Set up support systems • Provide performance summaries
Risks related to the increased access to sensitive information	Medium	High	• Secure computers, servers and wireless networks • Use anti-virus and anti-spyware protection, and firewalls • Regularly update software to the latest versions • Use data backups that include off-site or remote storage • Secure your passwords • Train staff in IT policies and procedures
Cyber-threats including malware	Low	High	• Security software, user training, and policies and procedures in order to safeguard our systems, networks, and information.
Commercial software providers are now integrating their products with social media sites, making risk mitigation very difficult.	Medium	Medium	• Try to avoid providers who integrate their products with social media. • Formal agreements to address issue
Failed Internal Processes – the failure of internal processes to perform as needed or expected. This comes from poor process design or execution, or faulty process controls.	Low	Medium	• Technology development team to develop processes • Stringent review process and reporting • Communication of internal processes • Education
Lack of technical competence	High	Medium	• Recruiting plans

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

			• Internal building of capacity – short and long term • Use of experts • Outsourcing
Financial Costs too high	Medium	Medium	• Good planning and cost estimates • Budget reviews • Alternative revenue sources • Internal program reviews – looking for efficiencies

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 5: Governance

Introduction

Biigtigong Nishnaabeg have always governed ourselves in accordance with our traditional laws, customs, language, traditions, values, processes and structures. Over the years these have changed, mostly as a direct result of the impacts of colonization, where systems in direct contradiction of our cultural ways were imposed upon us. In response to centuries of culture and language loss and disconnection from our social and philosophical systems, we are committed to rebuild our contemporary governance systems that reflect our Nishnaabe culture.

Culture lies at the heart of governance. It forms the foundation and fosters the collectivism of a people through a shared sense of values, beliefs, meaning, knowledge systems, rules, purpose and vision. Through this shared culture, acquired over generations of our people, we are connected beyond the confines of our organization and the projects we create and implement. Our organization and project governance systems are an extension of and reflection of our Nishnaabe way of existing as individuals and as a collective.

The governance plan set out herein seeks to align cultural our Nishnaabe cultural practices and beliefs with modern practices, to facilitate a process that supports the implementation of the project and increases the success of achieving our outcomes. The governance structure has been established under the authority of Chief and Council. The structure was carefully designed to ensure it effectively facilitates the successful implementation of the proposal and the attained of the respective outcomes. It is based on Biigtigong's best practices and in alignment of its long-term vision in respect to governance.

According to the Project Management Institute (PMI), project governance is the elements and strategies that make a project successful. It is based upon the tailored needs of the community. The governance framework and strategies for this project are tailored to the community, rigorous, transparent, and will deliver value for money. The project team will ensure that the governance framework is implemented throughout the project and adjusted if deemed necessary.

Our Governance Structure

Biigtigong Community:

We are ultimately responsible to the members and residents of Biigtigong Nishnaabeg, including our ancestors and the seven generations to come. The people are the foundation of our governance structures. We are building upon a strong sense of community and a commitment to the vision for our children. Our governance structures and engagement strategies facilitates and builds strong connections with our community. Our Smart Cities Governance Plan makes community involvement and engagement a priority. We will create new opportunities for their involvement and build upon the existing systems. We ensure structures are in place to include our community throughout the lifecycles of projects and our long-term strategies. We are accountable to our members and their involvement is critical to ensuring we achieve our outcomes.

Chief and Council:

As the formal elected leadership of Biigtigong, this governing body is ultimately responsible for the overall affairs of the First Nation. Council has established governance systems that provide the necessary support and parameters for effective project governance systems. Our political and administrative functions are clearly defined and separated. Elected leadership is responsible for strategy and providing

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

the systems, laws, policies, and other resources, to support successful implementation of projects. The governance model adopted for the Smart Cities project follows, aligns and enhances Biigtigong's Governance systems.

The Chief and Council through the authority of Biigtigong's Constitution will establish an Executive Board to oversee the Smart Cities Proposal. Additionally, two committees will be set up to support the proposal and the attainment of the outcomes. Both committees will play an integral role in achieving our outcomes and in creating high levels of accountability and involvement of our community. The following provides a brief overview of these three entities.

SC Executive Board

This board has been mandated as the governing body to oversee the implementation of our Smart Cities proposal. They will provide strategic direction to ensure the proposal continuously meets the needs of the community and achieves the identified outcomes. The Board will deliberate, make decisions, advise, provide strategic oversight, and to serve as the primary "advocate" for all the Smart Cities initiatives.

The Board is also responsible for the key business issues associated with the project. This includes approving the budgetary strategy, monitoring risks, quality and timelines, making policy, defining outcomes and deliverables, assessing change requests.

The Board will oversee the activities of the Aadsookaanan Reconstruction Committee and the Clan Engagement Committee. Both Committees were established to mitigate potential risks and create new opportunities. The Board will supervise and work the Smart Cities Project Lead throughout the project.

The Board reports directly to the Chief and Council and is subject to the regulations set out in the Terms of Reference for the Board and the Regulations Governing Committees. The Board and Council will collectively innovate on improving the reporting systems, promoting transparency, accountability and stakeholder engagement.

Due to the strategic importance of the proposal to the future of the community, the Chief will sit as the representative of the elected leadership. The Board will also be comprised of our CEO, Education Director and two youth. To increase success and mitigate risks, our Board will also include experts from the following fields: Nishnaabemwin (Language), Science, Technology, Engineering and Mathematics. We have five experts who have committed to sit on this Board.

Aadsookaanan Reconstruction Committee

This Committee will be part of the governance arm and will report directly to the SC Executive Board. Comprised of elders, traditional knowledge holders, and language carriers, youth and parents, this team will be responsible to assist in the reconstruction of our sacred stories, our Aadsookaanan.

Their primary role will be to provide guidance and direction to the technical and research group. They will have decision-making authority to approve the core aadsookaanan and forward the stories to the Immersion Team for video production. The Committee will also assist in mitigating risks that exist or may come to be. The primary risk management strategy includes engaging with the community and providing information and education.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The Committee will operate according to its Terms of Reference and Biigtigong's Regulations Governing Committees. Following our cultural protocols governing elders and the transfer of knowledge is foundational to our governance plan.

Clan Engagement Committee

Engagement with all of our stakeholders is a critical factor to achieving our outcomes. In order to achieve high levels of meaningful engagement, we will employ our traditional clan system for this purpose. Each clan will select 2 representatives to sit on the Clan Engagement Committee. Clan leaders are responsible to report directly back to their respective clans, following the protocols established by the clans. Clan leaders hold the responsibility for two-way communication and reporting. This system allows for diverse engagement and facilitates deeper discussions and collaboration.

Inside the structure of the clan system are protocols that speak to the roles and responsibilities of individuals and the clans. Accountability, disclosure and transparency are inherent to the system. It also addresses ethics, communication, and codes of behavior, decision-making methods and dispute resolution. From an organizational perspective, the Clan Engagement Committee will report directly to and work closely with the SC Executive Board. The team will operate according its Terms of Reference and Biigtigong's Regulations Governing Committees.

Linkages with Existing Committees:

We will utilize existing governance structures to support the implementation of our proposal.

Youth Council

Our governance model will facilitate linkages between the SC Executive Board and our Youth Council, via the Board's two youth representatives. The Youth Council is an existing Committee that represents the interests of the youth and facilitates their involvement in the growth and development of their community. We will utilize this relationship to improve our connections with our youth and ensure we are meeting their needs.

Education Committee

The Education Committee is mandated as an advisory function in support of the Education Department. It is a primary means for parental involvement in education. We will utilize these resources, via the Education Director, to support the proposal's implementation, specifically within the Education Department. This provides another link to the stakeholders and ensures alignment with the Education strategy.

Finance and Audit Committee

The Finance and Audit Committee is responsible to review and make recommendations to Council on the financial administration matters of the Nation. The Finance and Audit Committee assists Council in fulfilling its oversight responsibilities for the financial reporting process, the system of Internal Control, the audit process, and the process for monitoring compliance with laws and regulations and the code of conduct.

The Executive Board will comply with the initiatives of the Finance and Audit Committee and the Director of Finance to ensure financial accountability and transparency. Biigtigong's Financial and Administrative Policies and Procedures govern the financial and human resource management of the project.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project Implementation Governance Systems

Some of the Smart Cities projects fall under the mandate of existing Departments. These projects shall become the responsibility of various Departments, such as, Education and will be administered in accordance with the existing governance and management systems of the First Nation. There are institutionalized and established systems that define roles and responsibilities, personnel matters, finance, performance management and evaluation, dispute resolution, risk management, reporting responsibilities, lines of authority and lines of command.

Senior Management Team

Inside of this system is an established Senior Management Team comprised of all Department and Service Directors. This body acts as the central coordinating entity for the First Nation that facilitates a holistic approach. A member of this team will be appointed to the SC Executive Board to ensure continuity, alignment and accountability. This individual will also act as a liaison between the Senior Management Team and the Smart Cities Executive Board. Respective Directors will obtain direction and provide input via this process and take the necessary steps for implementation within their departments.

Education Department

Our Education Department will be responsible for the implementation of the core components of our proposal, including the K-12 STEM program, Nishnaabemwin Immersion and the Meet-Up App. An organization review was conducted to determine the requirements for the integration of the new programs. Governance systems that define staffing requirements, organizational and reporting structures, roles and responsibilities, performance management, training and development, risk mitigation strategies, and financial requirements for the Smart Cities implementation are established. The education staff was involved throughout the entire review and development phase.

The implementation of the education components of the proposal will be under the direction and supervision of the Education Director. The Director will report on the activities and status of the projects to the Executive Board and the Project Lead. The reporting structure is designed to be flexible to allow for adaptive approaches to respond to changing needs. The Education Director will also provide updates and facilitate necessary action and support with the Senior Management Team.

Economic Development Department

This Department will be responsible for the implementation and management of our Youth-owned Student IT Business, the co-op placements and summer employment. Our team will work collectively with this department to create an innovative pathway for our high school students, providing an academic foundation supported by real-world work experiences. Our economic development department will build relationships with STEM based industries to assist in the co-op placements and summer employment. Our co-op program will be governed by the Ontario Ministry of Education standards and our own internal policies. Special considerations for individuals enrolled in the CompTIA A+ program will be built into our Summer Student Employment Policy, to support their path throughout high school.

Smart Cities Inter-departmental Program Committee

As part of our governance structure we will create an inter-departmental program committee, comprised of front line staff that are directly responsible to deliver specific programs. This team will consist of the SC Project Coordinator, Immersion Lead, STEM Lead, Co-op Lead, Meet-up App Lead and the Economic Development Manager. This group will work to strengthen collaboration across the team and integration of projects. They will review activity reports, monitor progress and outcomes, discuss administrative concerns, identify training needs, coordinate project management, identify risks and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

solutions and create substantial working relationships. The Committee will report to the Education Director. The Education Direction will bring all appropriate matters to the attention of the Senior Management Team and/or Executive Board.

Governance Principles

We will utilize our traditional governance principles, as set out in our Aadsookaanan, as embedded in our language and ceremonies, as practiced within our operations and commit to gaining a greater understanding of our traditional ways and establishing more effective and legitimate governance systems. Our principles support processes that are consensus oriented, participatory and inclusive, transparent, accountable, long-term considerations, responsive to change, flat and non-hierarchical, and based on relationships. We will adhere to the governance principles identified in Biigtigong's Constitution, laws, policies, procedures, informal protocols and cultural practices.

Decision-making

Our cultural practices utilize a consensus-based decision-making model. As an approach to fostering collaboration, consensus-based decision-making provides every individual equal access and responsibility to the process. This model facilitates improved decisions due to the stakeholders claiming responsibility by providing input in keeping with the best interests of the seven generations to come. It fosters increased interpersonal connections and relationships, resulting in greater sense of cohesion and commitment to the goals and vision. Utilizing our cultural practices and embedding our values inside of our governance system enhances the project and its successful implementation.

Part of our decision-making model includes mechanisms to deal with conflicts and disputes. We utilize a restorative justice model as our dispute resolution process. Based on cultural values our systems aim to restore harmony, balance and build relationships. We will utilize Biigtigong's processes to address potential conflicts with or amongst our stakeholders.

Human Resource Management

Human Resource management is coordinated by Biigtigong's Finance and Administration Department. Policies and procedures are in place to govern hiring and recruiting, training and development, travel, honoraria, salary, compensation, performance appraisals, employee benefits, health and safety, contracts, confidentiality, code of ethics, conflict of interest, dispute resolution, employee relations and well-being. This centralized system promotes fairness, consistency, transparency and accountability. All staffing and awarding of contracts associated with the Smart Cities proposal will be subject to the existing policies of the First Nation.

Change Management

Our culture acknowledges the world is in constant flux and change; we are in a perpetual state of responding to this change. The concepts of renewal and transformation are inherent to how we interact with the inter-connected world. These beliefs are reflected in our governance systems. We adopt a learning environment that fosters change and utilize iterative management practices to ensure on-going alignment between our outcomes and the needs of our stakeholders. We offer employee assistance programs to assist in change management. Additionally, our Social Services Team provides supports to assist individuals, families and teams, with any issues that arise as a result of change. We also rely on our cultural ceremonial practices to assist in our change management efforts.

Risk Management

Our goal is to create an organization culture where risk identification and management become part of everyday life. Although it is important to conduct a risk assessment at the onset of a project, it is equally

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

important to ensure risk management activities are performed, recorded and monitored throughout the lifecycle of the project. Our risk management strategies aim to accomplish this.

For this project, we will utilize a framework that provides for a process for risk identification, risk analysis, risk response planning, monitoring, controlling and reporting. For each major risk that is to be mitigated or that is accepted, a course of action will be outlined for the event that the risk does materialize in order to minimize its impact. Monitoring and reporting mechanisms will be built into all levels of governance and project implementation. Ultimately, the risk management plan is the responsibility of the Executive Board.

Communication Plan

Communication is the key to a successful project. Our communication plan identifies key stakeholder and avenue for the delivery of pertinent information. Information will be delivered to all stakeholders in a timely fashion. Our engagement plan provides more details on how we plan to build strong communication with our stakeholders.

Control Process

The project team will continuously monitor the project against established timeline and metrics. This will ensure that the project is in accordance will budget and timeline and that deviations are remedied. Our internal systems of control are well defined and tested. We have made some adjustments to ensure our Smart Cities implementation is done so successfully.

Partnerships

Introduction

The goals of our Smart Cities proposal are ambitious and require a collaborative approach to make them achievable. Partnership opportunities exist across many sectors and include individuals, businesses, education institutions, governments and community organizations. Partnerships are a strategic process and our approach to partnerships begins at home by creating a solid foundation that we can build upon. We want Smart Cities to live beyond the life of the proposal and become part of how Biigtigong exists.

Our Internal Partnerships

The impacts of our proposal outcomes will create substantial change that extends past the individual students and into the social and economic fabric of the community. Preparing our children for the digital world also includes preparing our organizations and community. This is why our membership is best served by aligning our different departments and related organizations. These alliances require deep interpersonal connections and appropriate structures and systems in order to yield the highest benefits.

Our internal partnerships are living systems that evolve progressively in response to the changing environment and the needs of our membership. Building upon and utilizing our internal resources and developing our capacity are necessary to achieve long-term sustainability. Collaboration between our service departments and community owned organizations are critical to achieving success.

Our focus, the central point of everything, is our children and this is what brings us together and keeps us together. The elders always remind us that it is our responsibility to keep our children in the center of everything. Sharing a common vision and purpose is what binds successful partnerships. Our Smart Cities proposal is attached to and supports Biigtigong's bigger vision of Nation building.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Biigtigong's Service Departments

Our Smart Cities proposal development team, which consisted of two members of the Senior Management Team and the Chief, approached the proposal implementation phase as a collective effort of our entire team. The goals of the proposal align with the overall goals of the organization, making it easy to establish collaboration and project partnerships. We entered into collaboration agreements with our service departments. The purpose of these agreements is to demonstrate that the proposal is supported by the entire organization.

Our internal partnerships are governed by the structures, regulations, practices and historical relationships that exist within the organization. We have established and proven frameworks that we utilize for our projects. These frameworks address general project management requirements, such as, managing risks, finances and resources, quality assurance and performance management, human resource and capacity development, reporting and accountability and team development. Our implementation plan is build upon our assessment of our internal capacities, readiness and resources.

To ensure success, our implementation plan allocates specific tasks to respective departments who have a related mandate. For example, our Sustainable Development Department who is responsible for economic development, employment and training, will be responsible for the establishment of the high school reBOOT IT business, co-op placements and summer employment. While our education department will be responsible for the academic portions of the co-op high school program. Such partnerships allow us to extend the reach of our project goals and build the foundations for long-term sustainability.

The community retains control over sensitive and personal data. We already have established policies and systems that manage and control data collection. We do not want to re-invent systems but rather utilize existing resources and help make necessary improvements where we can.

The initial commitments from our service departments are identified in the collaboration agreements attached. These will be continuously reviewed, monitored and developed to ensure the best possible strategies are collectively in implemented to better serve our membership. Our Smart Cities proposal has provided another rallying point to collectively strategize in bringing together our efforts to innovate and make meaningful lasting change and improvements.

Our External Partnerships

Two of our main external partnerships are with independent, but related entities of Biigtigong. Pic River Development Corporation is the Internet Service Provider in the community and will provide services for the off-ramping, uploading, downloading and backup storage of our videos at no cost. They also made a financial commitment to support the project implementation. Anishinabek Employment and Training Services is an entity that provides employment support and training services on behalf of 9 First Nations. A three-year financial contribution has been made to assist in the development of the CompTIA A+ and reBOOT co-op education program and the summer student employment portion. Biigtigong has existing agreements with both entities that defines the relationship, mandate, governance structures and other areas. The risks associated with these partnerships are extremely low and mitigation strategies to address the risks are already in place.

Biigtigong has many business partners and professional relationships. Part of our business strategy is to develop mutually beneficial partnerships that create value. We seek to be a 'partner of choice' and have a history of successful partnerships. Letters of support from some of our business partners are attached to this proposal. We have not entered into any formal partnership agreements but we will explore the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

options when needed. At which time we will enter into formal agreements that define the details of the partnership.

Our Service Partnerships

Our Smart Cities team has enlisted the help of two organizations who bring value to achieving our set outcomes. Memorandums of Understanding have been signed with ICTC and reBOOT Canada and provide the details of the partnership. Both entities are assisting us with the implementation of our K-12 STEM programs. Our projects share common visions and provide services that complement each other and provide a good fit. We have developed excellent working relationships and have created a common path and are equally excited to embark on our journey together.

Anishinabek Education System

23 First Nations are part of an education self-government agreement with Canada and Ontario, forming the Anishinabek Education System. The participating First Nations under the Anishinabek Education System will enact education laws that govern the Anishinabek Education System and the delivery of programs and services. Each participating First Nation has law-making power and authority over education from JK to Grade 12 on reserve. Participating First Nations will also establish and maintain system-wide education standards that support the transfer of Anishinabek students between the Anishinabek Education System schools and the provincial education system schools.

AES is in its development stage and in the process of getting established and operational. The Board has provided a letter of support of our proposal and we will explore options on how our proposal implementation can assist the other 22 First Nations. AES is an opportunity for First Nations to collectively work together to address the education needs of our children. We expect that as AES develops that we will create innovative approaches to improving the lives of our children.

Summary of Partnership Agreements

Source	Type	Notes
Internal Collaborative Partnerships		
Children & Family Learning Centre	Collaborative Service Agreement	Biigtigong Service Department
Health & Social Services	Collaborative Service Agreement	Biigtigong Service Department
Sustainable Development	Collaborative Service Agreement	Biigtigong Service Department

Governance & Partnership Risks and Mitigation Strategies

Risk	Likelihood	Impact	Risk Management Approach/Mitigating Actions
Change in partners' involvement or withdrawal.	Low	High	• Build Relationships • Formal agreements • Identify alternative strategies • Continually monitor risk
Admission of new partners.	High	Medium	• Admission mechanisms • Needs based; team approval process • References – due diligence
Conflict of Interest	Low	Medium	• Build strong communication among the partners • Maximum transparency • Implement Conflict of Interest Policy
Potential inequalities in partners' resources and expertise determine their relative influence in the partnership's decision making.	Medium	Medium	• Focus on consensus based decision making • Address in formal agreements • Build relationships • Access to dispute resolution process • Involve experts on Executive Board
Poorly defined shared vision and objectives.	Low	Medium	• Develop shared vision with clearly defined objectives • Link corporate objectives/organizational objectives to the project objectives • Training and Education sessions • Annual reviews
Partners do not meet performance targets in a satisfactory or timely way.	Low	High	• Develop an agreed upon Performance Management framework • Conflict management/resolution procedures • Encourage joint ownership of problems & solutions • Relationship building
Failure to engage key stakeholders in meaningful ways.	Low	Medium	• Awareness & education of engagement strategy • Communication strategy • Performance measurements inclusion • Evaluation strategy

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Failure of partner to comply with relevant laws and regulations.	Low	Low	• Identification & education of laws & regulations • Dispute resolution process • Develop safeguards throughout project
Lack of understanding with local culture.	Medium	Medium	• Cultural awareness training • Provide explanations – no assumptions • Dispute resolution
Financial risks No strategic approach to issues of risk, costs and benefits	Medium	Medium	• Define and agree with approach to dealing with costs and benefits of the partnership. • Continuous monitoring & reporting • Utilize Finance Department & Finance Committee
Loss of autonomy	Low	High	• Rigorous selection of partners • Clear agreements
Lack of capacity, skills, knowledge and experience	Medium	High	• External Recruitment Plan • Local training & development plan • Outsourcing and Contracting Options
Poor internal & external communication.	Low	Medium	• Establish communication plan & review • Regular meetings • Structured reports • Use of collaboration tools

Chapter 6: Community Engagement Plan

Part 1: Our Approach to Engagement

Our engagement plan is built upon our fundamental belief as Nishnaabeg that everything is inter-related and inter-connected. We view the world as being in constant motion, made up of complex networks and long-term sustaining relationships. We understand the importance of developing and maintaining relationships and the goal of keeping balance and harmony. As a relationship based system, the principle of inclusion is foundational to how we live our lives. Hence, our approach to engagement is inherently inclusive in nature and facilitates high degrees of community participation in meaningful ways.

Our engagement plan, not only facilitates the involvement of our stakeholders, but it does so in a manner that supports the revitalization of our traditional ways in a modern world. Our engagement plan facilitates the coming together for a common vision and purpose. It supports the continuous development as individuals and as a community, as it affirms our common values, builds trust, strengthens relationships, fosters responsibility and accountability and facilitates community ownership.

Purpose of Engagement:

The overall purpose of engagement is to create opportunities for our children, youth, parents, grandparents, aunts, uncles and all Biigtigong members, to embrace their responsibility for the well being of our community and future generations and become actively involved in creating a better world.

Engagement Objectives:

1. To empower those affected by this proposal to be involved in the decision-making process and the creation of solutions to challenges and opportunities that are specific to stakeholder needs.
2. To ensure the engagement processes are meaningful and seek out real contributions that influence the project design and implementation.
3. To facilitate a learning environment, where the transfer of knowledge and skills encompasses everyone who is impacted by the project.
4. To utilize cultural practices to ensure successful engagement and facilitate community pride.
5. To document and share our experiences with engagement, in order to assist in making this project more scalable and replicable.

Engagement Principles:

The following guiding principles form the basis of our engagement process and approach to ensure high-quality collaboration and meaningful active participation.

1. **7th Generation Principle:** We are responsible for the seven generations to come and to the seven generations that came before us. We will move forward embracing our past and future generations and remember the long-term impacts of our decisions.
2. **All my Relations**: Our way of life is centered on the belief that we are all related and connected. Every decision impacts everything. We will seek out holistic approaches that honour all life and our complex networks.
3. **Relationships:** Developing and maintaining relationships with all life is central to our Nishnaabe way of being, bringing rights, obligations and responsibilities that extend beyond self. We act accordingly, always striving for a state balance and harmony, as we work collectively towards our vision
4. **Renewal and Transformation:** The notions of renewal and embracing change are inherent in our worldview, as we view the world as in a state of constant flux and change. We will utilize

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

approaches that respond to continuous change and implement on-going evaluation to ensure we are meeting our goals and the needs of the community.

5. **Process Focused:** Comprised of approximately 70% verbs, the importance of process and actions are embedded in our language. Our approaches will be action-orientated, focusing not only on achieving results, but also on the journey and lessons that our journeys bring.
6. **Natural Laws:** We learn about what our behaviour should be by observing Mother Earth and respecting the natural laws.

Stakeholder Identification

This proposal will change the essence of the social fabric of the community. From previous engagement experiences on other projects, we understand the importance of including the diverse groups that will be impacted and/or could impact the project. We understand that this journey, especially the reclamation of our language and aadsookaanan, will potentially stir emotions resulting from historical impacts from cultural genocide. We further understand, that it is necessary to walk through these hurts together in order to move forward, heal and reclaim our culture and identity. This proposal required the input of everyone, as it provided another opportunity to build stronger individuals, families, community and a Nation.

In identifying our stakeholders, we considered those who would be immediately impacted and those impacted according to our 7th generation principle. Various target groups were identified and strategies established to facilitate meaningful engagement. Evaluations of these approaches were conducted and necessary changes were implemented and/or noted to improve outcomes. As we move forward from development to implementation, we remain committed to developing effective engagement processes that build upon best-practices while creating new and innovative ways of engagement.

Part II: Our Engagement To Date

Efforts to ensure participation amongst the diverse groups within the community have provided valuable insights that have significantly improved the final proposal. Our engagement processes to date have resulted in obtaining a clearer understanding of the challenges and opportunities that exist or could potentially exist throughout the life of the proposal implementation stage and beyond. It facilitated the development of creative mitigation risk strategies and creative means to grab the opportunities. Our engagement process has led to an excitement; it has provided a central rallying point. The following provides a list of primary stakeholders engaged to date, the methods used for engagement and the insights gained from the engagement that shaped our proposal.

Formal Leadership

Engagement with our elected leadership has reiterated their long-term commitment to the goals and the expected outcomes of this proposal. Council echoed the need to build everything in a manner that will lead to long-term sustainability. In order to ensure long-term success, the spirit of the proposal must become part of the DNA of the entire organization and community. Due to the nature and outcomes of the proposal, the entire organization and community, must strategically align resources in the collective pursuit of our vision.

Council understood the need to build STEM knowledge in order for the community to participate in the rapidly changing world. Additionally, that the creation of children who understand their traditional language, for the first time in centuries, will profoundly change the fabric of the community and our institutions. Council also restated their excitement that our proposal will impact people beyond our

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

community. Direction was provided to our Senior Management Team to ensure our strategies align and support the specific goals and outcomes of the Smart Cities proposal.

Our Senior Management Team is constantly creating, evaluating and reimaging our vision, our strategies, successes and failures, in our efforts to build our Nation. Working towards a common vision, our education, health, social services, lands and resources, governance, economic development, housing, and public works team, collectively and strategically aim to address the needs of our community. Our engagement with Senior Managers allowed us to work towards a common vision and develop mutually supportive and attainable goals.

Language and aadsookaanan reconstruction and revitalization is an organization wide goal and will impact our existing service delivery models. For example, upon the completion of the aadsookaanan reconstruction work, our Social and Health Department, will utilize this work to reconstruct our rites of passage and develop a service model based on the rites of passage. Another example is the re-visioning of our dispute resolution policy and the alignment with the ancient teachings contained in our aadsookaanan. A review of our Human Resource Strategy will be conducted in light of the availability of immersion video that will create understanders.

As for STEM, our departments will be providing support, in terms of placements, special speakers, student co-op work opportunities, and STEM related summer employment. Our Senior Management Team are committed to creating the necessary supports, as per the findings of our on-going evaluation and project implementation, to ensure successful attainment of our goals.

The primary engagement tool we utilized with leadership was holding face-to-face meetings both collectively and individually. This method was selected in order to facilitate critical thinking and extensive discussion. Leadership was also represented at all of our other stakeholder engagement sessions. On-going engagement with this particular group is of extreme importance to the success and continuation and growth of our Smart Cities proposal.

Continued engagement will occur through the existing structures that will facilitate on-going connections between the proposal implementation team and the leadership. Senior Management will be responsible to engage their respective staff members. Regular meetings will occur throughout the life of the project, in addition to regular reporting and evaluation. The governing team responsible for the Smart Cities project will have a representative from Council and Senior Management appointed to ensure successful implementation and alignment of goals.

Biigtigong Aadsookaanan Group and Elders

Our elders and traditional knowledge holders are considered major stakeholders in this project. Following our cultural protocols, these groups have been involved in the planning and development of our proposal, including our initial application. Our approach to engagement with our elders usually occurred in informal settings, not in a boardroom. We respected their approach in transferring knowledge and providing direction through the use of stories and personal accounts of life experiences. Individuals from this particular group have directly experienced the affects of residential and day school systems. They are able to speak first hand regarding the loss of language, the loss of their stories and methods of transferring cultural knowledge and the trials this has caused in their lives and those of their family. They are motivated to create opportunities to reconcile the impacts from this part of our history.

Through our engagement processes, these stakeholders provided strong support for the use of technology in the creation of understanders of Nishnaabemwin (our language) and the transfer of traditional

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

knowledge contained in our Aadsookaanan (sacred stories). Many understood the power of technology due to their involvement in our language reconstruction and documentation project. From first hand experience, they saw the data that everyone contributed and the research data, along with technology, successfully aid in reconstructing our language. Most of our elders and knowledge keepers realize that language revitalization in our community is impossible without the use of technology. Additionally, they felt that making our language and stories available on-line, was the best means to reach our youth. With only one proficient speaker left in our community, taking the data available through our language and making this accessible for everyone, forever, and utilizing immersion, on-line, provided hope and reconciliation.

They also asserted the importance of having our youth and our elders/knowledge keepers interact in real-life experiences. Our elders reminded us that our way of life is tied inherently to the land and more to a specific place. In order for us to transform our youth into better-educated, more-employable, better-grounded and more holistically Nishnaabe, we must keep them connected to their territory and the teachings that can only come from intimate relationships with the trees, birds, fish, wind, rain, rocks and every part of existence. They stressed the importance of our land-based curriculum and the need to build their relationships with Mother Earth.

The primary engagement tool used to obtain input from this target group was the use of face-to-face informal meetings. We followed cultural protocols, with the passing of tobacco and observed the traditional methods of knowledge transmission. We smudged, sang, feasted, told stories, laughed, cried, talked, listened, remembered our ancestors, sat in silence, and together made decisions in the best interest of seven generations.

Our elders and traditional knowledge will continue to play an integral part of our Smart Cities proposal implementation. The role our elders play in our world is very explicit as defined by our cultural protocols. We are responsible to acknowledge their role and facilitate the inter-generational transfer of knowledge, in a culturally appropriate manner. Our proposal sets out formal and informal on-going space for the involvement of our elders and knowledge keepers. Cultural norms dictate that we are accountable to our elders and as just this guarantees that they will be meaningfully involved in this proposal.

Biigtigong Youth

Our youth are the center of this proposal and are the main beneficiaries and reasons for this proposal. Part of our engagement strategy for this group, included the examination of results and other engagement sessions held by other community projects. We utilized this information to augment the information we obtained through our engagement sessions.

Through surveys and personal interviews with our youth, they expressed the need to be better prepared for the technological world. Additionally, they felt it was important that having a strong sense of their Nishnaabe identity was essential to their success. Not having been exposed to their traditional language and what it contains, our youth do not understand the profound sense of loss that our culture has suffered or the depth of the benefits one can receive from acquiring their language. Our initial application failed to identify this as a potential drawback to achieving our outcomes. This is addressed in our final proposal by creating a series of videos that provides an inside look at the philosophy embedded in the language and how it expresses our unique worldview. It is our intention that these videos, along with teachings from our elders, will provide our youth and other community members with the motivation to begin their language acquisition journey.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

We engaged the youth through some of their established groups. Additionally, we hosted special events at their local high school, sponsored community events, conducted a youth survey, and talked to them in various public functions and locations. Several new initiatives are currently underway with our departments that aim to increase youth involvement. Our Smart Cities team have provided input into the establishment of these new initiatives and will utilise these structures to increase youth engagement. They new approaches are youth-driven.

Parents

Projects aimed at our children will be more successful with the support of their parents. Our parental engagement findings showed an overall support of the proposal. Parents understood the importance of preparing our children and youth for the technological world. Additionally, they acknowledged the importance of language, culture and land to identity and how this was important to living good lives.

One of the biggest impacts resulting from our consultations with parents was their personal fear in not having knowledge of STEM or the language. This translated into building into our proposal strategies to help educate our parents and provide resources on how they can support their children's language acquisition and STEM learning journeys. Including supports for parents has now become an important addition to our proposal. We will incorporate strategies that facilitate family learning. Overall, the parents were excited about the new possibilities for their children and several thought perhaps they should go back to kindergarten.

Parents understood that this proposal would produce understanders of the language. They wanted reassurance that the resources necessary to move from being an understander to becoming a speaker will be available. Our 2019 survey and 2006 survey clearly state that language revitalization is a community priority and creating speakers is our ultimate goal.

We utilized surveys, community meetings, and small group discussions, as the means to obtain parental engagement. Our education staff took opportunities inside their system to engage the parents and introduce them to STEM. We have strengthened our strategies to encourage and empower our parents as they support their children's education journey. Continued parental engagement throughout the proposal implementation is important to achieving the outcomes for our children.

Biigtigong Education Staff

Biigtigong has a well-established, creative and results-driven Education team. Their participation in the development of the proposal has been important and has resulted in substantial contributions to ensuring the successful implementation of our proposal. They have identified solutions to potential problems and have substantially improved the quality of the proposal.

They have been extensively involved throughout the entire process, from visioning, to curriculum reviews and development, education philosophy and pedagogy reviews, assessment and evaluation development, privacy and data, student needs and support, student learning styles, immersion video production, professional development and capacity building, co-operative education models and re-imaging a new education model. The application of the resources developed through this proposal will be subject to the rules and regulations of the Education Department. The education department will maintain responsibility for the monitoring of individual student assessments and the overall education mandate.

Through pilot projects and professional development initiatives, the staff had the opportunity to facilitate student learning in the area of technology and engineering. This was particularly challenging, as the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

teachers had little to no knowledge of either fields or experience using on-line resources in these fields. This work resulted in wonderful lessons but the most important take away is the creation of a team excited to take on the world of technology, engineering and language acquisition. Our education department and our Smart Cities team has developed a training strategy to support teachers with STEM, language and and blended learning education.

One of the major changes resulting from the engagement with the education staff relates directly to our initial goals in the secondary school program. The staff highlighted the limitations of secondary level courses as it related to our initial vision. As a result, we had to go back to the drawing board and find other ways to implement our vision. This turned out to be such a wonderful problem, which initially seemed insurmountable. This led to the development of a much more supported and comprehensive high-school program. It now provides high-school credits, real technology and engineering co-ops, summer internships and employment, youth owned and run business, career support and mentorship.

Our engagement with our education staff has been extensive and will continue to be so. We have utilized surveys, focus group discussions, small group discussions, pilot projects, training sessions, staff meetings, on-line resources, collaborative tools, and cultural events to engage our education team. We have created an organizational culture that supports and empowers our staff. The success of our Smart Cities proposal is increased by meaningful engagement and empowerment of our Education team.

Off-Reserve Members

The Smart Cities proposal provides an opportunity to strengthen the community bonds between on-reserve and off-reserve members. Through our on-line platform, off-reserve members will have the opportunity to access important community data relating to their language and aadsookaanan. Additionally, they will have access to any programs developed by the community that support STEM on-line. The meet-up-app will also help facilitate opportunities to return home to their traditional territory and participate in person with the community.

Our off-reserve members indicated support for the proposal goals and were excited about the opportunity to acquire their language from the comforts of their home. Engagement results reiterated the need to more effectively utilize technology to build stronger relationships and inclusion of off-reserve members into the building of our Nation.

Our engagement with off-reserve members included a survey, a meeting in Thunder Bay, availability of live-streamed community meetings, conference call meetings and web-site information. Our plan moving forward includes strategies to increase off-reserve participation and engagement.

Community Members at-large

Various engagement activities were held for the general population. These events included, luncheon talks, large community presentations, small group sessions, social events, survey, live-streamed community meetings, newsletters, web sites, email and social media. We received tremendous support for the project through the high levels of participation in the engagement sessions. Our general sessions were well attended and our survey return rate was high. The responses shaped our proposal by confirming we are on the right path and the community is behind the goals set forth in our proposal. Community support is very important to the successful implementation of our proposal. It does take a whole community to raise a child.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

STEM Professionals and Academia

In order to ensure our proposal is academically feasible and provides a solid foundation for entry into related post-secondary programs or employment fields, we engaged various STEM professionals from the business and academic sectors. The information and insights provided by this group has significantly impacted our proposal. They played instrumental roles in selecting the curriculum and developing a sequencing of skills and knowledge. Their expertise provided us with the guidance to develop a high level K-12 STEM program, with ambitious and achievable goals. Their continued involvement in the project will ensure our programs meet the needs of our students and the ever-changing needs of the industry.

Engagement Tools

A variety of methods were used during the proposal development stage to achieve high participation rates amongst the stakeholders. Upon the completion of stakeholder analysis, where a careful review of the potential risks, interests and benefits were identified, engagement strategies were designed to suit the specifics of each group. Engagement tools were purposely selected and customized for each of our stakeholder groups. In addition to selecting appropriate tools, the presentation itself was customized for the specific audiences.

Individuals who had experience working with each of the stakeholder groups were invited to assist in the design and the development of a best-suited approach to the consultations. Involving these individuals increased our efforts of engagement to produce meaningful results and strong community buy-in and support. A list of tools used is attached as Appendix Z.

Summary of Engagement to-date

Our engagement plans to date has resulted in the successful participation from our residents and the diverse stakeholders of the project. We believe our processes were meaningful and facilitated honest and open discussions. As a community, we explored the potential barriers and risks to our success and found creative solutions to address them. We embraced the opportunities and strategically developed a difficult but implementable proposal that will make profound impacts forever. We understand the importance of engagement and make this foundational to how we build our Nation.

Part III: Engagement During Implementation

We are building upon the successes of our engagement during the final proposal development phase. Our plans for engagement during the implementation stage are aimed to foster high levels of community engagement from the diverse stakeholders. The engagement processes are intended to ensure the needs of the community are being met and the program meets its expected outcomes. The engagement process will foster community development, inclusion and provide a rallying point for members to make meaningful contributions to helping transform our youth into better educated, more employable, better grounded and more holistically Nishnaabe people.

Formal Leadership

The following will be implemented to ensure meaningful and continued engagement with our formal leaders to support the attainment of the proposal outcomes:

1. Smart Cities Executive Board: The Chief and Council and the Senior Management Team will each have a representative on the Smart Cities Executive Board. Each will be coordinate engagement with their respective group.
2. Senior Management Team: An Executive Board representative will participate in quarterly meetings.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

3. Bi-monthly report: A video report will be made available to provide education, accountability and foster engagement on the project.
4. Annual Report: Produce and annual report to Council, Senior Management and Community.
5. Ceremony: Elders will be invited to an annual ceremony where we honour the goals of our proposal and ask for help and guidance from our ancestors.

Elders

The following will be implemented to ensure meaningful and continued engagement with our elders to support the attainment of the proposal outcomes:

1. Aadsookaanan Working Group: This group is comprised of elders, language carriers, traditional knowledge holders, youth, parents and technical personnel. They will work collectively with the aadsookaanan research and reconstruction team. They will act as the advisory body and assist in the decision-making process regarding aadsookaanan reconstruction. Additionally, they will report to the Executive Board who is responsible for the overall proposal. This group will remain in affect for the entire implementation stage and will meet no less than quarterly and more frequently when required. The group will coordinate community engagement sessions regarding the aadsookaanan project to keep the community informed and involved.
2. 50+ Elders Group, TEK Working Group, Place-Name Reclamation Working Group: Bi-annual engagement events will be held specifically with each of these existing community elder groups.
3. Pop-Up Engagement Sessions: We will host at minimum one pop-up Smart Cities fun and informative pop-up engagement session. These sessions will be held in support of existing annual community events, such as, moose-camp, addictions awareness week, fish-camp.
4. Ceremony: Elders will be invited to an annual ceremony where we honour the goals of our proposal and ask for help and guidance from our ancestors.
5. Bi-monthly Report: A video report will be made available to provide education, accountability and foster engagement on the project.
6. Annual Report: Produce and annual report to Council, Senior Management and Community.

Biigtigong Youth

The following will be implemented to ensure meaningful and continued engagement with our youth to support the attainment of the proposal outcomes:

1. Executive Board Seats: Two seats on the Executive Board will be reserved for youth representation. The seats will hold the same responsibility and influence as all other seats on the committee. The youth representatives will be responsible for coordinating the youth engagement strategies.
2. Biigtigong Youth Council: We will utilize the Youth Council to assist in the coordination of joint initiatives aimed at youth engagement.
3. In-school Engagement: We will host one in-school engagement session per semester.
4. Pop-Up Engagement Sessions: We will host at minimum one pop-up Smart Cities fun and informative pop-up engagement session. These sessions will be held in support of existing annual community events, such as, moose-camp, addictions awareness week, fish-camp.
5. Formal Evaluation: Our youth will be involved in the evaluation of the proposal activities and in the development of strategies to strengthen the program.
6. Celebration of Achievements: A celebration of student achievements as they r elated to the outcomes of this project will be planned each year.
7. Bi-monthly report: A video report will be made available to provide education, accountability and foster engagement on the project.
8. Annual Report: Produce and annual report to Council, Senior Management and Community.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Parents

The following will be implemented to ensure meaningful and continued engagement with our parents to support the attainment of the proposal outcomes:

1. Education Committee: An Executive Board member will work with the Education Committee to engage and inform parents.
2. Child and Family Learning Centre Parent Committee: An Executive Board member will attend 1 parent meeting per year, or as requested.
3. Existing In-School Parent Engagement Activities: Parents will be engaged through parent-teacher interviews, open-houses, progress reports, on-line media and other in-school engagement processes.
4. Parent and Student Cohort Support Program: A special program will be set up for the parents and students for the 2019 cohort moving into the CompTIA A+ program. This program will provide various support services for the duration of the program. Parents will have an opportunity to help adapt the program in order to better serve youth success.
5. On-line workshops for parents: A series of on-line interactive workshops will be held for parents to help them engage in the learning journey of their children.
6. Formal Evaluation: Our parents will be involved in the evaluation of the proposal activities and in the development of strategies to strengthen the program
7. Bi-monthly report: A video report will be made available to provide education, accountability and foster engagement on the project.
8. Annual Report: Produce and annual report to Council, Senior Management and Community.
9. Pop-up Engagement Session: We will host at minimum one pop-up Smart Cities fun and informative pop-up engagement session. These sessions will be held in support of existing annual community events, such as, moose-camp, addictions awareness week, fish-camp.

Off-reserve Members

The following will be implemented to ensure meaningful and continued engagement with our off-reserve members to support the attainment of the proposal outcomes:

1. Off-reserve meetings: A minimum of one in person meeting will occur with off-reserve members.
2. Live-stream video: All community meetings will be live-streamed to encourage off-reserve members.
3. Webinars: 2 Webinars will be held annually for post-secondary students and off-reserve members.
4. Formal Evaluation: Our youth will be involved in the evaluation of the proposal activities and in the development of strategies to strengthen the program
5. Bi-monthly report: A video report will be made available to provide education, accountability and foster engagement on the project.
6. Annual Report: Produce and annual report to Council, Senior Management and Community.

Community at large

The following will be implemented to ensure meaningful and continued engagement with our community to support the attainment of the proposal outcomes:

1. Community Meeting: A minimum of one in person meeting will occur with on-reserve members.
2. Live-stream video: All community meetings will be live-streamed to encourage off-reserve members.
3. Nishnaabe Clan System: A new engagement system based on our clan system will be introduced for the first time. This is an extensive engagement process that is designed to include all sectors of the community. This system will be used as one of our primary methods of community engagement.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

4. Formal Evaluation: Our youth will be involved in the evaluation of the proposal activities and in the development of strategies to strengthen the program
5. Bi-monthly report: A video report will be made available to provide education, accountability and foster engagement on the project.
6. Annual Report: Produce and annual report to Council, Senior Management and Community.

Nishnaabe Clan System

Reconstruction and reclamation of our ancient Nishnaabe ways is a central to our vision. In keeping with the spirit of our vision, we intend to utilize our traditional clan system as the primary method to our engagement strategy. The clan system is built upon principles that are foundational to our world-view and philosophical understanding of our world. These principles capture cultural values, such as, non-hierarchical structures, cooperation, collaboration, reciprocity, communal living and promotes the importance of relationships.

Our clan systems are reflective our cultural structures that emerges from our relationships with the land and a naturalistic cosmology. We look to the natural world and the laws that exist on the Earth, as our guiding principles for the development of our systems and structures. Our clan systems consist of seven primary clans: Loon, Crane, Fish, Bird, Bear, Marten and Deer, each having several sub-clans. Each clan has adopted a spirit animal as their totem and this animal is a symbol of how the members of each clan should conduct themselves and relate to the world.

This system organizes work and establishes responsibilities of individuals and the collective. Each clan holds specific duties and responsibilities to take care of the physical, mental, emotional and spiritual needs of the community. Some of these responsibilities include, philosophy, law making, decision-making and enforcement, governance, learning and teaching, communication, economics, trade, defense, child rearing, providing, conflict resolution, and strategy. The clan teachings are agreements that govern how individuals and families take care of each other and the community as a whole.

We are choosing to implement our clan system for the first time within a modern context. We will utilize the clan structure and protocols for the purpose of community engagement. Each clan will appoint a representative to the main clan body. The main body will work with the Executive Board, to determine the most effective and productive strategies to empower and engage our residents. Each clan leader reports directly to his/her clan and the clan determines how they will involve the members of their clan in the process. Clans determine their own internal methods of communication and decision-making. Individual clan decisions are brought back to the main clan and our consensus decision-making model and dispute resolution models will govern the process. This is the basis of our engagement plan.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Risks and Mitigation Strategies

Our approach to risk and how we determine and mitigate or avoid risk is discussed in Chapter 3. This table summarizes the risks associated with community engagement and the risk management approach and mitigating actions to be taken.

Risk	Likelihood	Impact	Risk Management Approach/Mitigating Actions
Lack of Support of the proposal	Low	High	• Establish meaningful process • Be accountable & report • Provide education
Loss of faith and trust if there is no consistent follow-up by staff.	Low	High	• Establish measureable goals. • Plan for short term achievements • Set achievable action plans • Be accountable and transparent
Unrealistic stakeholder expectations and demands.	Medium	Medium	• Be clear about the reasons for engagement • Clear and consistent communication • Provide education • Dispute resolution process
Lack of interest	Medium	Medium	• Select group appropriate strategies • Know your audience • Ensure the activities are fun, social and specific to your audience
People made feel excluded	Low	Medium	• Use existing networks and structures • Provide several opportunities for people to have input • Ensure culturally appropriate methods • Customize approach to audience we
Limited knowledge on clan system	High	Medium	• Utilize knowledge holders in community • Conduct research • Bring in elders who know about clans • Training • Ceremony
Triggers trauma – direct and inter-generational	Medium	High	• Create awareness of possibility – share previous examples/similar stories • Include ceremony • Social Services support programs • Cultural Coordinator support programs
Don't meet outcomes	Low	High	• Set up good planning • Realistic outcomes – needs based – measurable • Set up reporting and accountability • Supportive budget, governance systems, management system
People are not aware of what's going on	Medium	Medium	• Communications plan • Use various approaches to inform people • Be creative – go to them
Lack of time	Medium	Medium	• Live stream meetings • Use BiigtigongX • Provide information to them – video, tv, print, car, phone • Make it interesting, fun and useful

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 7: Privacy

Introduction

Privacy is of the utmost importance to our leadership, project team and community as a whole. Given that this project entails a blended learning environment of both online and real-world opportunities this project will result in the generation of new data from users creating accounts on the Open edX platform. As such, it is critical that this project be developed and implemented with significant consideration given to privacy and data security. The following chapter outlines our data management plan.

Preliminary Privacy Impact Assessment (PIA)

Given that this project involves the collection of some personal data, it is necessary to complete a Privacy Impact Assessment (PIA). In preparing this proposal, the project team has completed a preliminary privacy impact assessment through reliance on applicable regulations and our internal governance strategy and through incorporating feedback from the Office of the Privacy Commissioner of Canada. The PIA is submitted under separate cover.

The Preliminary PIA covers all proposed activities under the SMART Cities project, including how data will be sourced and accessed through the Open edX platform. Considerations have also been made for: Data Storage, Data Access, Data Retention and Data Disposal required throughout the lifespan of this project. The project team will continue to assess the project's privacy risks and impact to determine if there is a need to update the privacy analysis and/or the PIA report. This ongoing assessment is an essential part of identifying and mitigating new issues and changes impacting privacy that may arise during the implementation phases.

This Chapter of the Smart cities Challenge includes much of the information includes in the preliminary PIA, as well as additional details as specified.

Compliance with Applicable regulations.

The following table outlines the result of our compliance analysis:

Policy Process Statement	Process and Compliance measures
Purpose of the collection of personal information	This project involves creating a blended learning environment with both online and real-world components. The nature of an online learning environment results in the collection of minimal personal information to create an account, name, user name and password. Additionally, certain functionalities of the Open edX platform, such as the meetup application or time spent watching videos, will also generate data on a user's location and behavior patterns. Another source of data is the videos, stories, overdubbing etc. that will be created for the language immersion education and STEM bilingual courses portion of the project. This data will be stored on the Open edX platform as well as in a redundant hard-copy format (ie, transcripts, tapes etc) to ensure data is not lost. There are no additional privacy concerns associated with storing physical copies of the educational materials. All information identified is absolutely necessary for participating in the project and/or for monitoring the success of the project

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Source of personal information/ Accuracy	Initial data will be provided directly by users to generate their profile and then data will be tracked using their Open edX account. For example, it will be necessary to track users time spent watching video to provide assurance that the student has completed the necessary videos for completing the curriculum requirements. Given that the curriculum will be developed in a blended learning environment (brick and mortar and online) this will only include the collection of data related to activities completed in the Open edX platform. Activities completed within the brick and mortar school will continue to be tracked by teaching staff under existing processes. Qualitative data will also be collected by teachers for users to inform feedback on the project, monitoring, evaluation and control purposes. Personal information will be collected directly from the Open edX platform by teaching staff only. Collection of data from teaching staff will be required and is appropriate given the context of this project. Given that information is provided directly by the user through the online platform, we do not anticipate any major inaccuracies. Likewise, the anonymized and summarized data to be provided by teaching staff is subject to their current process which ensure accuracy and privacy of student information.
Accountability and Openness	The project team is accountable for the data collection, management and safeguarding results from this project. The project team has intentionally minimized the amount of personal information to be collected through use of Open edX platform, as users will only need to provide their name, user name and password to create an account. Likewise, we will implement a process that enables students and their legal guardians to provide informed consent to participate in this voluntary process, thus ensuring they understand what information will be collected, why, and who will have access to it.
Manner of collection of personal information	The data to be collected is minimal and relatively not intrusive. It is similar (if not identical) to the information already being collected and managed by the school system. Similarly, the information collected via the Open edX platform is typical for any online platform. Use of the meet up application is voluntary, and any users will be provided a privacy statement to agree to prior to using this forum (i.e. authorizing sharing of user location data)
Limiting Use, disclosure and Retention	Teaching staff are already subject to policies and codes of conduct that govern how they treat personal information, through to physical or technical controls that protect the information. Safeguards that will be into place include physical security; IT security; staff training; policies, confidentiality clauses in contracts with external providers etc. Information, such as language videos, transcripts etc. are to be stored indefinitely as these are important records of our language and traditional teaching that we are attempting to preserve as part of this project. Personal information will only be used for the purpose it was collected for, and as described. The personal information collected for the students will only be retained until graduation. Following successful graduation, all student data will be removed from the server and student accounts will be disabled.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

	The collection, use, retention and disclosure of personal data, and particularly student data, should always be limited to what is necessary to fulfil authorized purposes. Reducing the risk posed by the excessive collection of student data is a core principle that guides this project's data processing practices.
Access and correction to personal information	Users will be able to access the account information on the Open edX platform. Information collected by teachers will be subject to the policies and procedures currently in place in the school system. Information will be shared with students and parents through existing channels (i.e. report cards). Access logs will be implemented to track access to personal information. Teachers can correct their existing report card writing process based on information collected. For example, should a student choose not to use the meet up forum, the teacher would reflect the true involvement in traditional activities in that student's report card, regardless of the data output from Open edX. Requests for personal information to be corrected will be handled on a case by case basis. However, we do not anticipate any major concerns with meeting this principle as all information collected is basic in nature and expect most changes, if any would be minor in nature such as their name, username or password changes.
Accuracy etc. of personal information	Given that information is provided directly and automatically by the user through the online platform, we do not anticipate any major inaccuracies. Likewise the anonymized and summarized data to be provided by teaching staff is subject to their current process which ensure accuracy and privacy of student information. The process for anonymizing the data will involve the teaching staff providing the project team a summary report detailing quantitative data needed to provide details needed to track and report on performance indicators. This will include: • number of K-12 STEM courses successfully completed by K-12 students • number K-12 students needing remedial help in STEM subject areas • number of K-12 students who know the key concepts expressed in each of our core aadsookaanan • participation rate in number of traditional Nishnaabe activities for K-12 Students No personal or identifying information will be shared, nor will it be required, by the project team. The summarized data, omitting all personal information, is required by the project team to track, monitor and evaluate the implementation of the project, and to make course corrections when necessary. Qualitative data will also be collected for teachers to provide feedback on the project, for monitoring, evaluation and control purposes.
Data Disposal	Data stored on the Open edX platform will be expunged following a student's graduation.

Data Management process

This section outlines the types and methods of data collection, generation, analysis, storage, and preservation that reflects the entire data lifecycle in project design. The Data to be collected during this project is associated with the inputs and outputs, as described in our performance measurement strategy presented in Chapter 2.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Step 1: Gain informed Consent:

In order to ensure participants (and their legal guardians) make an informed decision when providing their consent to participate in the Open edX platform, a privacy seminar will be held at the community centre prior to program roll out. During this seminar, the project team will review the project and the content of this Privacy Impact Assessment to ensure participants (and their guardians) are knowledgeable of the inherent risks of participating in a partially-online learning platform. This seminar will overview what information will be collected and why, who will have access to this information once an account has been created and what agreements are in place (at that time) with all 3rd party providers. This seminar will also allow community members to voice their privacy concerns with respect to participating in an online environment. The project team will also present the policies and procedures developed thus far to mitigate any identified privacy risks and how any data breaches will be managed, as described within this document and further iterations of the PIA.

Should students, or their legal guardians, opt-out of the online-augmented (i.e., blended-learning) program, they will be given alternative means of participating in the k-12 curriculum at the brick and mortar school. It is important to note the participation in this Open edX platform is 100% voluntary and if not adopted will not diminish the learning of non-participates. Participants and their guardians will be provided a consent form outlining the privacy concerns and risks, for review and signature prior to enrolling in the Open edX platform.

Its should be noted that as outlined in the PIA, in an effort to mitigate risks, the project team will work with Technology/Software providers, including Open edX to enter into a contractual agreement which will ensure personal information is handled in a privacy-compliant manner, and restricts the third party's use of personal information for proposes outside the project scope. In all cases the user will be advised about any third party's privacy policies/statements when directed to a third-party site for additional links or resources, as part of informed consent process.

Step 2: Personal Information Data Collection

Users of the Open edX platform will be required to provide the following types of personal information. This information will then be use by teaching Staff to offer better service to participants.

- Account creation and login information, including user name and password *
- Location information - anytime the student interacts with Open edX platform, location data is generated **
- Patterns of behaviour (which educational video were watched and for how long)

*Students will not be asked to provide their address, date of birth or other identifying information for the purposes of setting up an account with Open edX. The intent of collecting a user name and password is only to allow a student to create an account and login to the Open edX platform and to enable teachers to track a student's progress.

**Due to the very nature of the internet anytime a person connects, the media that is being delivered to that person is tracked using a particular 'IP address.' Location data is then deduced from that IP address. There is no reasonable (or perhaps possible) way to interact with the internet without generating location data. Total location privacy is not possible within the current

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

organization of the internet since IP addressing is a foundational part of the internet. As such we can only attempt to maximize our privacy online - while accepting that our location will always be exposed.

Step 3: Data Analysis

Information to be collected will include the name/user name of the student and the amount of time a student spends watching a video, as well as any participation in any traditional activities as tracked through the meetup forum functionality. Similarly, should students identify participation in traditional activities through the meetup forum functionality of Open edX, this will generate location data.

No additional information will be provided regarding the student's performance in other school programs. Again, this is a voluntary blended-learning environment (online and/or brick & mortar, but not online only) and therefore the intent is to not replace what is currently being done at the school level. All collection of student data will be limited to what is needed for educational purposes.

Teaching staff are the only project resources who will have access to the student specific data. No other project team member will have access to individual student specific information. No information will be made public. Teachers require access to student specific data as it is needed ensure a student has completed the required curriculum. Behaviour data is also required to make teachers aware of how long a student struggled with a particular math problem, or how many times the student rewatched a video, and which sections of the video were rewatched, for example. This is one of the main benefits of using a blended-learning approach as this "behavioural pattern" data is what helps our teachers teach more effectively.

Teachers will not provide information about a student to Open edX nor to Appsembler. The flow of information is from student to Open edX to teacher, which is then provided back to the student in the form of a report card and to the project team in the form of aggregated summary data for performance measurement tracking only. In other words. Teachers will summarize the data and submit to the project team for performance monitoring and process improvements. I

With respect to information collected by 3rd parties, this will all be as per the contractual agreement. All terms of these agreements and risks to privacy resulting form 3rd party platforms and software will be communicated to users (and guardians) as part of the informed consent process.

Step 4: Store and Dispose of Data

Minimal student data will be stored on Open edX platform, over the course of their school. Data stored by teachers (i.e. in the form of records and report cards) is governed by their existing policies and procedures. With respect to input data such as the videos, stories, overdubbing etc. that will be created for the language immersion education and STEM bilingual courses portion of the project. This data will be stored on the Open edX platform as well as in a redundant hard-copy format (ie, transcripts, tapes etc) to ensure data is not lost. There are no additional privacy concerns associated with storing physical copies of the educational materials.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

All information identified is absolutely necessary for implementing the project, participating in the project and/or for monitoring the success of the project. Student Data stored on the Open edX platform will be expunged following a student's graduation.

Other Uses

There are no plans for and transmission, and plans for re-use, re-distribution, derivative production, archiving, student personal data. All other data, including videos, are to be made publicly available.

Open and Big Data Strategies

Only once this framework is expanded to different communities with different objectives will the use of big data be necessary to track the different uses and functions of this curriculum. At this point, open data will be used to report progress, engagement, best practices, etc. This information will not pertain to specific individuals, but specific user bases as whole. For example, data may summarize user rates, and immersion progress of a specific community, but not specific students of that community.

Privacy Risks and Mitigating Strategies

Risks and Mitigation Strategies are discussed throughout this chapter (and others). Three key risks are summarized in the table below:

Risk	Mitigating Strategy
Use of information by 3rd parties	The project team will work with Technology/Software providers, including Open edX to enter into a contractual agreement which will ensure personal information is handled in a privacy-compliant manner, and restricts the third party's use of personal information for proposes outside the project scope. In all cases the user will be advised about any third party's privacy policies/statements when directed to a third-party site for additional links or resources, as part of informed consent process.
Security Breach	The project team will develop and implement a breach response policy and protocol that addresses privacy and security risks for both the online and offline platform/storage methods. Information custodians, namely Teaching staff, Chief and council, and the database administrator must immediately contact the Database administer and Privacy Officer, informing him of the following: • the nature of the breach; • the information that was exposed; • to whom it was exposed; and • for how long it was exposed. The Information Custodian will work with the Privacy Officer who will advise whether notice to affected individuals and the Office of the Information and Privacy Commissioner of Ontario (IPC) is required. If such notice required, the Privacy Officer will work with the information custodian to meet the needs of the IPC.
3rd party software/technology becomes outdated	Reliance will be placed on existing websites for STEM education (i.e. code.org). As these are established organizations, that are constantly updating and revising content to better engage youth and other users in this field, there is some chance that this 3rd party software at some point may become dated. However, SMEs will continuously monitor content and explore alternatives should the desired content become outdated or unavailable

Chapter 8 - Financial Management Plan

Introduction

Biigtigong has a responsibility to its citizens to accurately account for public funds, to manage its finances effectively and efficiency, and to plan to provide quality needs-based services. As a government we are responsible for implementing effective systems of public financial management and for utilizing these systems to safeguard public assets. The effective management of public finances is fundamental to the development and growth of the community.

Financial management is a critical prerequisite for success. It is an integrated process that brings together strategic planning, budgeting, accounting, reporting, controls, procurement, auditing, policy and people with the goal of managing resources strategically to achieve the project's outcomes. Effective financial management includes planning, organizing, directing and controlling the financial activities to support the organization's goals.

Authority

Biigtigong's Constitution assigns Chief and Council the responsibility to effectively and efficiently manage and control public funds. They have the authority to establish institutions and appropriate legislation, polices and procedures, with supporting governance structures, to govern the financial matters of the First Nation. The Constitution recognizes the leadership's responsibility for accountability, transparency and results.

Financial Management Objectives

Biigtigong's financial management objectives are as follows:

- To enable the delivery of quality services to our membership that are geared to meet their needs.
- To make effective and efficient use of the available resources.
- Be accountable to our membership and other stakeholders.
- Prepare for long-term sustainability.
- Manage risks.

Sustainability and Diversification

The goals of our Smart Cities proposal are aligned and part of Biigtigong's bigger and longer-term vision. As such, it is not considered an independent project, with a start and end date. Our five-year implementation stage is designed to develop the necessary resources and capacities to ensure long-term sustainability of the program goals and objectives. As we begin our implementation, collaborative efforts with our internal departments on specific aspects of our proposal are setting the stage for long-term sustainability and integration.

Governance Structure

Establishing appropriate governance structures that support and facilitate the delivery of our programs and services to our membership is part of an effective financial management plan. Chapter 5 describes the governance structures.

Responsibilities

Establishing clear roles and responsibilities and ensuring a shared understanding of these roles are important to sound financial management. Financial management roles and responsibilities are defined in the financial polices. In addition, these are reiterated in the details of job descriptions, department

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

mandates and terms of references for committees and boards. All of these are in place for the Smart Cities proposal implementation.

The Chief and Council's primary responsibility is to establish appropriate laws and policies to govern the sound financial management of finances. Management is responsible for the implementation of these laws and policies and ensuring adequate procedures and systems are in place for support. Management is responsible for communicating the expectation and duties to staff. Staff and operating personnel are responsible for carrying out the internal control activities set forth my management.

Transparency

Creating a culture of transparency throughout the organization is one of the foundations of sound financial management. Developing principles of careful budgeting, reporting and auditing, combined with internal controls and transparency ensures a robust system of financial management.

The following provides some measures that Council has taken to provide transparency:

- Open Council meetings; public access to by-laws, minutes and reports.
- Council publishes the annual approved budget and financial statements.
- We have expanded our Internet and social media presence including some online services.
- Feedback and complaint mechanism are in place.
- Procurement policy is comprehensive and regulates the procurement of goods and services, including human resources.
- Conflict of Interest policy guides the disclosure and management of conflicts of interest.
- Codes of Conduct are established for members of Council, management, staff, committee members and the membership.
- Public access to information is guided by policy.
- Extensive community engagement culture; continuous opportunity for community to be involved in the decision-making processes.

Our Smart Cities team will adhere to the regulations and expectations established by Council via their formal and informal policies. Our team is committed to building an open and transparent relationship with all of our stakeholders. Transparency is of special importance to our team, as we are making new paths and facilitating a significant change at the community level and establishing trust is important. We will create opportunities to be transparent and ensure our organizational culture and systems support transparency.

Rigorous Internal Controls

Internal controls ensure that the organization is in compliance with laws and regulations and protects assets against theft and misappropriation. In general, segregation of financial duties to provide a set of checks and balances, proper authorization of expenditures, physical control of assets, and maintenance of records and documents supporting financial activities are the foundation of an adequate control environment. Sound financial management also requires regular reconciliation and review to ensure that activities reported in the organization's accounting records are crosschecked against the supporting documents.

Internal control is all of the policies and procedures management uses to achieve the following goals:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Safeguard assets - well-designed internal controls protect assets from misappropriation of public funds, accidental loss or loss from fraud.
- Ensure the reliability and integrity of financial information. Internal controls ensure that management has accurate, timely and complete information, including accounting records, in order to plan, monitor and report business operations.
- Ensure compliance - Internal controls help to ensure the First Nation is in compliance with the many federal and local laws and regulations affecting the operations of our business.
- Promote efficient and effective operations - Internal controls provide an environment in which managers and staff can maximize the efficiency and effectiveness of their operations.
- Accomplishment of goals and objectives - Internal controls system provide a mechanism for management to monitor the achievement of operational goals and objectives.

Our finance policy and operating procedures identify the internal controls that are mandatory for all operations. These controls are regularly reviewed and adjusted accordingly in our efforts for continuous improvement. Our Finance and Audit Committee, in conjunction with our Senior Management Team, provide Council with recommendations for improvement. The implementation of our Smart Cities proposal will be subject to the internal controls and procedures as established by our financial management systems.

Finance Policy Manual

Our finance policy manual is the central means to communicate the financial controls and responsibilities. In order to successfully mange a project a coherent set of accounting procedures and standards are required. Our finance policy manual addresses the following matters:

- Delegated and Assigned Responsibility
- Planning and Budgeting
- Tangible Capital Assets
- Investments
- Procurement
- Payroll
- Benefits
- Travel and Training
- Loans, Guarantees and Indemnities
- Expenditures and Payables
- Borrowing/Debt
- Financial Reporting
- Insurance
- Records Management and Retention
- Risk Management
- Information Technology
- External Audit

Financial Management Software

Biigtigong utilizes a financial management software program named Xyntax, specifically designed to meet the financial needs of First Nations. The software manages all accounting procedures of the organization, such as, cash flow management, general ledger, expenses, payments, assets, income and purchasing. It efficiently manages all financial administrative processes. The software is customizable to suit the specific needs of our organization. The staff who will be assigned the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

responsibility of financial management are familiar with and have extensive experience with the financial management software that will be used for the Smart Cities project. The software will also allow for specific project codes that could coincide with the identified outcomes and milestones.

Accounting Methodologies

Biigtigong utilizes project based accounting. Project accounting tracks all the financial components of a project. It provides access to more accurate and timely information when making decisions. It allows for an actual-to-budget analysis. Project accounting provides for more accurate accounting of project job costs. It provides for a more credible audit process and facilitates better control over projects. Project accounting also can help gauge the team's workload capacities.

Accrual basis accounting

Biigtigong uses accrual basis accounting methods. Under the accrual basis, revenues and expenses are recorded when they are earned, regardless of when the money is actually received or paid. Accrual basis provides a more realistic idea of income and expenses during a period of time. This method requires a careful monitoring of cash flow.

Generally Accepted Accounting Principles (GAAP)

Biigtigong complies with the Generally Accepted Accounting Principles. GAAP is a collection of commonly followed accounting rules and standards for financial reporting. GAAP compliance makes the financial reporting process transparent and standardizes assumptions, terminology, definitions and methods. The purpose of GAAP is to ensure financial reporting is transparent and consistent from one organization to another.

Financial Reporting

We adhere to a regular internal reporting system to ensure we are meeting our financial goals and objectives. Program Directors follow a strict regiment to review financial reports monthly and complete a series of financial tasks. Central to effective decision-making and having the ability to take corrective actions is having access to accurate and timely financial data.

Financial reporting requirements stem from a variety of sources, and financial reports serve many purposes. For example, they serve as tools for use by managers to control their departments and to monitor the extent to which management's objectives are being achieved. They also provide information to external parties on an organization's financial operations and compliance with a variety of requirements. Our Smart Cities management team will adhere to the reporting requirements as defined by Biigtigong and our funding agencies. We will ensure stakeholders have access to timely and accurate reports to allow for good decision making.

For the purpose of our proposal, our reporting system will have to be customized to accommodate the meeting of milestones, as per the contribution agreement. The SC Executive Board will provide regular written reports to the Director of Finance regarding the status of achieving the milestones. These reports will be developed based on the performance reports received from the project implementation staff. These reports will provide the necessary information needed to be the reporting requirements of Infrastructure Canada.

Human Resource Management

Human resource management is a critical success factor for the First Nation and it directly determines the business outputs. Human resource development and management play an important role in the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

overall financial management of our operations. We aim to maximize employee performance and create a supportive organizational culture to facilitate this.

Human Resource Planning

Through effective job analysis and design, we created positions with job descriptions and specifications to meet the needs of the organization and project implementation. The following chart summarizes our human resource requirements to implement our Smart Cities proposal. The majority of the budget will be allocated to human resources, making human resource management especially important to our financial management plan.

Human Resource Requirements – Smart Cities Proposal					
Position	Reporting to	Status	Time Period	Salary Grid Classification	Salary Range
Governance					
Proposal Lead	Executive Board	½ time	5 year	SM2	84,864-95,472
Project Coordinator	Proposal Lead	Full time	5 year	PS3	41,457 -54,092
STEM Implementation					
SC Education Lead	Education Director	Full time	5 year	T2.2	55,500 -81,600
CompTIA A+ Lead	SC Education Lead	Full time	5 year	T2.2	55,500 -81,600
Co-op & Business Coordinator	Economic Development Manager	Full time	5 year	PS3	41,457 -54,092
reBOOT Coordinator	Economic Development Manager	Full time	5 year	EA2	29,766 -38,839
WaaWaa Immersion Video Production					
Immersion Lead	SC Education Lead	Full time	5 year	T2.2	55,500 -81,600
WaaWaa Instructor	Immersion Lead	2 -½ time	5 year	ECE2.2	37,756-49,263
Nishnaabemwin					
Audio Overdub	Proposal Lead	Full time	5 year	Contract	85,000
Bilingual STEM	Proposal Lead	Part time	5 year	Contract	12,500 – 55,000
Meet-up Function					
Meet-up Coordinator	SC Education Lead	Full time	5 year	PS1	37,669-49,149
Technology					
BiigtigongX Administration	Project Coordinator	Part time	5 year	Monthly contract	1,200
Database Administration	Project Coordinator	Part time	5 year	Monthly contract	500

Human Resource Management Tools

Biigtigong uses the following tools to assist in our efforts to maximize employee performance and meet our operational goals and outcomes:

1. Hiring Policies: Provides process to hire, interview, recruit, and determine if you will need to implement training or development for potential or current employees.
2. Termination Policies: Provides process to deal with termination or voluntary resignations.
3. Job Descriptions: Establish clear roles and responsibilities and qualifications.
4. Employee Performance reviews: Provides mechanisms to conduct performance reviews and evaluations of staff.
5. Employee Handbook: Provides a snapshot of our policy guide.
6. Health and Safety Policy: Provides health and safety standards and procedures.
7. Discrimination/Sexual Harassment Policies: Process on how complaints and investigations will be handled.
8. Detailed Policies: Regulations regarding benefits, such as, vacation, holiday, personal, and sick pay, company benefits, salaries, etc.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9. Required Policies: Required policies are anything that the federal, provincial or local governments require (WSIB, EI, CPP).
10. Specific Policies: Confidentially Policy, Social Media Policy, Cultural Leave Policy.

The Budget Process

The budget process is one of the most important components of successful financial management. The budget process extends beyond the preparation of a document that appropriates funds. Budgeting is strategic nature, encompassing multi-year financial and operating plans that allocate resources on the basis of identified goals. It serves as the performance benchmark for all financial decisions. A budget ensures that an organization can fund its commitments, meet its financial and program objectives and control spending. It allows for measurement of performance and the identification of potential problems. The budget is the overall financial framework.

The development of Biigtigong's Smart Cities budget was done in accordance with the budget policies of the First Nation. The budget was also developed in consideration of the expectations as identified in the Smart Cities Finalist Guide. Our budget supports the implementation of our proposal and the achievement of our goals.

Biigtigong's Annual Planning and Budgeting Schedule

Task	Individual Responsible	Timeline
Annual planning kickoff meeting to present major budget policies, multi-year financial plan direction and guidelines for the strategic plan.	Director of Finance, Senior Management Team, Finance & Audit Committee	3rd week in November
Update Tangible Capital Assets.	Senior Management, Director of Finance	1st week in December
Each Department prepares a thorough analysis & projection of all expenses for the budget yr.	Senior Management Team	2nd week in January
Consolidate all draft budgets including capital budget into one master budget;	Director of Finance	4th week in January
Multi-year plan and strategic plan developed or updated.	Senior Management, Director of Finance	1st week in February
Senior management reviews draft budgets, multi-year plan, and strategic plan.	Senior Management, Director of Finance	2nd week in February
Present budget, multi-year plan, and strategic plan to Finance & Audit Committee for review, discussion, and modification.	Director of Finance, Senior Management Team, Finance & Audit Committee	3rd week in February
Incorporate Finance & Audit Committee changes to any of Planning Documents	Director of Finance, Senior Management Team, Finance & Audit Committee	1st week in March
Inform the membership or involve the membership in consideration of the annual budget and the multi-year financial plan.	Director of Finance, Senior Management Team, Finance & Audit Committee, Council	3rd week in December
Council reviews & approves budget/multi-year plan/strategic plan based on recommendation from the Finance and Audit Committee.	Council, Finance & Audit Committee	3rd week in March
Distribute approved budget and strategic plan to Department Heads and any other appropriate staff and community.	Director of Finance	3rd week in April
Inform membership of approved budgets.	Director of Finance, Senior Management Team, Finance & Audit Committee, Council	3rd week in May
On going monitoring, reporting and reviews.	Director of Finance, Senior Management Team, Finance & Audit Committee, Council	Throughout the year

Chapter 9: Implementation Phase Requirements

Introduction

Biigtigong Nishnaabeg is committed to meeting the applicable municipal, provincial and federal reporting and legislative and policy requirements should we be selected as a winner.

Duty to Consult with Indigenous Groups

Biigtigong is a First Nation community and therefor the Duty to consult with indigenous groups does not apply. However, with that being said, we want to acknowledge that Biigtigong Nishnaabeg has policy regarding Duty to consult. This document outlines how Biigtigong Nishnaabeg expects to be approached regarding activities within their traditional territory. This guideline establishes Biigtigong's expectations, policies and practices for governments and others to follow when consulting with them. Our Smart Cities Team reviewed this policy as we were developing our engagement strategy with the community. We wanted to build upon best practices established in the community and develop a solid engagement strategy.

Modern Treaty Obligations

With the exception of six First Nations, Biigtigong being one, the area First Nations are signatories to the Robinson-Superior Treaty of 1850. There are no modern treaties in the Biigtigong Nishnaabeg traditional territory or shared territory with surrounding First Nations.

Canada's Community Employment Benefit (CEB)

Projects supported by the Investing in Canada Infrastructure Program provide an opportunity to promote increased employment opportunities for a broader array of Canadians. The Smart Cities Challenge requires the finalist to identify employment and/or procurement opportunities for at least three of the targeted groups and how Biigtigong intends to report upon CEB requirements, should we become a winner.

To meet these requirements Biigtigong has selected the following 3 target groups: Indigenous peoples, woman and youth. The main beneficiary of our Smart Cities proposal is Canada's Indigenous youth. Our projects are specifically aimed at this group with the ultimate goal of making them more educated and more employable. We will include woman as a specific category that we will also target. We will ensure our indicators for success specifically capture data on these 3 identified groups, in terms of their participation in our projects. We anticipate that 90% of our participants will come from one of these groups.

Additionally, we will utilize our procurement strategies and direct our hiring towards these 3 groups. We expect that at least 80% of our work force for this project will be Indigenous, a youth or a woman. It will be very easy to meet these targets and to track the relevant supporting data.

Reporting on the CEB Requirements

As per the CEB requirements, we will report annually on the progress made. Should we be selected as a winner, we will develop a detailed strategy that also defines our reporting requirements. CEB requires some specific information and we will accommodate this requirement. For example, we need to track the number of hours worked by the target population and/or the value of contracts awarded to the target groups. Our accounting software allows us to easily track this information.

A qualitative narrative that describes the progress made is also required. The narrative will provide information on both the successes and challenges experienced in meeting our targets. We understand

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

that this information will help in developing Canada's strategies to offer more diversified employment and procurement opportunities.

We will develop specific reporting mechanisms to support any requirements or conditions of being a selected a winner. We have experience establishing targets, monitoring progress and being flexible to respond to isses.

Risks and Mitigating Strategies

Risk	Likelihood	Impact	Mitigating Strategies
Woman at home with no child care	Medium	Medium	• Provide childcare support at the daycare • Work with other supports in the community
Work readiness levels are low amongst participants	Medium	Medium	• Community programs exist that provide assistance in this area – use these • Long-term strategies
Youth experiencing social and emotional issues	High	High	• Social Service support programs • Cultural support programs • Life skills component built in • Use of elders in the programs • Utilizing land-based learning program
Lack of parent support	Low	Medium	• Provide information and education to the parent • Offer home-visits • Engaging and non-judgmental approaches • Utilize existing relationships
Lack of formal education and skill set to do some specific tasks	High	Low	• In the short-term we will have to recruit from outside the population • Develop long-term capacity development to attain education and experience
Current procurement policy may not support goals	Low	Low	• Review policy & recommend changes • Conduct education on updated policy
Political leadership lack of understanding of the project procurement goals	Low	Medium	• Address in person at a council meeting • Provide research and education • Regular reporting and communication
Lack of financial resources to implement training programs	Low	High	• Council has already made a commitment to direct some resources to summer employment • Develop funding proposals
Data security and protection of personal information	Low	High	• Data and Privacy Policy • PIA completion • Communications & education • Disclosure and Transparency strategy

Executive Summary

Katinnganiq: Community, Connectivity and Digital Access for Life Promotion in Nunavut

Challenge Statement

> ***Our communities will implement protective and preventative measures to reduce the risk of suicide in Nunavut, which is ten times the national average, and increase the amount and accessibility of peer support networks, educational resources and creative outlets that promote positive Mental Health to all Nunavummiut.***

Chapter 1; Vision: This chapter outlines the vision for our proposal and provides the evidence for our vision as well as justification of the changes that were during the finalist phase.

Chapter 2: Governance: This chapter outlines the governance framework that will structure our proposal moving forward and provides a detailed description of its composition and how it will provide the platform for achieving outcomes.

Chapter 3; Performance Measurement: This Chapter articulates the goals as ultimate outcomes, identifies the inputs and activities in a logic model, shows the KPIs which will be used to measure progress, develops the specific outputs and outcomes for each activity.

Chapter 4: Project Management: This chapter outlines how the initiative would be implemented and managed. It will describes the several work streams, tasks and subtasks.

Chapter 5: Technologies: This chapter provides an outline and description of the different technology aspects that are part of this proposal

Chapter 6: Data and Privacy: This chapter provides a description of our approach to data and privacy for the implementation of this initiative

Chapter 7: Engagement: This chapter describes our outreach methodology and engagement activities that were undertaken during the finalist phase.

Chapter 8: Implementation: This chapter describes our plans for meeting legislative and policy requirements regarding the duty to consult with Indigenous groups, modern treaty obligations, and the Community Employment Benefits Plan.

Chapter 9: Financial: This chapter provides class B estimates for our budget costs, it outlines the general budget for this initiative, and reports on the finalist grant utilized.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 1: Vision

Our final proposal continues to be based on the challenge statement above, yet has departed from our initial proposal by redirecting our proposed activities using a ***life promotion*** approach to suicide prevention, which is "based on the belief that all young people are capable of finding their own path to a holistic and meaningful life"[1]. As defined by the *Together to Live* online toolkit developed by the Ontario Centre of Excellence for Child and Youth Mental Health:

> "life promotion efforts are holistic, strengths-based and empowerment-focused. They align seamlessly with recovery-oriented models of mental health care as they aim to honour young people's individuality and build their resilience through their personal strengths, available resources and relationships with those around them. Life promotion doesn't focus on reducing suicidality as much as it focuses on cultivating the strongest possible safeguards against it – namely young people's **sense of belonging, meaning, purpose and hope**. Life promotion also considers the influence of factors such as cultural heritage and values, community resources and support networks in shaping one's mental health"

As a result, **the *Katinnganiq: Community, Connectivity, and Digital Access for Life Promotion in Nunavut* proposal**, submitted on behalf of the 25 municipalities of Nunavut, is a multifaceted and collaborative effort to create both physical and digital spaces that address the digital divide in Nunavut, both in terms of access to improved broadband connectivity as well as in spaces to access to digital tools and literacy curriculum as important protective factors to risk of suicide. Our initiative offers opportunities for Nunavummiut to connect and share knowledge with each other through peer networks, learn skills through culturally responsive educational resources and extra-curricular activities, and to express themselves through creative outlets

[redacted] environments as pathways to mental wellness.

[redacted] 'hat our preliminary proposal began to articulate as a suicide prevention strategy [redacted] d of six distinct categories of activities (Makerspaces, the te(a)ch computer [redacted] ning curriculum, mesh networks, digital art therapies, mental health and wellness [redacted] ons, and the 211 Nunavut Application), we now see materializing as a more holistic [redacted] ing, built within a life promotion framework that understands community [redacted] ices as safe and nurturing social hubs that provide programs, tools, and resources that [redacted] art, culture, language, and technology; while maintaining mental health as its priority [redacted] ng individuals to find and engage with their own sense of belonging, meaning, purpose

Our proposal understands the concept of **mental wellness**, defined by the Alianait Inuit Specific Mental Wellness Framework, as "self-esteem and personal dignity flowing from the presence of a harmonious physical, emotional, mental and spiritual wellness and cultural identity"[2]. Additionally, the First Nations Mental Wellness Continuum Framework, developed jointly by the First Nations and Inuit Health Branch (FNIHB) of Health Canada, the Assembly of

[1] "What is Life Promotion?" *Together to Live*. N.p., n.d. Web. 18 Dec. 2018. <http://www.togethertolive.ca/what-life-promotion>

[2] *Alianait Inuit Mental Wellness Action Plan*. Alianait Inuit-specific Mental Wellness Task Group, 2007. Page 9. Web. 7 Jan. 2019. <https://www.itk.ca/wp-content/uploads/2009/12/Alianait-Inuit-Mental-Wellness-Action-Plan-2009.pdf>

First Nations (AFN), and Indigenous mental health leaders from various First Nations non-governmental organizations, defines mental wellness as:

> "a balance of the mental, physical, spiritual, and emotional. This balance is enriched as individuals have: **purpose** in their daily lives whether it is through education, employment, caregiving activities, or cultural ways of being and doing; **hope** for their future and those of their families that is grounded in a sense of identity, unique indigenous values, and having a belief in spirit; a sense of **belonging** and connectedness within their families, to community, and to culture; and finally a sense of **meaning** and an understanding of how their lives and those of their families and communities are part of creation and a rich history."[3]

In other words, throughout this proposal we utilize an understanding of mental wellness conceptualized in terms of a whole that balances spirit, emotion, mind, body and culture. As proposed by Dr. Jeffrey Ansloos, an Indigenous understanding of mental wellness contrasts with the standard definition of mental health held by the broader field of mental health practices in Canada; that despite "increasingly integrating culturally grounded approaches to healing within mental health services, [...] fails to consider how Indigenous knowledge may be epistemologically dissonant with mental health paradigms"[4]. Similarly, as proposed by Jennifer White and Christopher Mushquash, "Standard suicide prevention practices which make assumptions about sources of distress and are predicated on models of expert interventions and individualized treatments can sometimes be out of step with non-western, non-European cultural conceptualizations of mental health and well-being. Being culturally responsive means being attuned to local, historical, and sociopolitical influences on mental health and well being, and developing solutions that build on local strengths and address historical and contextual realities"[5].

For White and Mushquash, a transformative, life promotion approach based on Indigenous values, "is less about implementing discrete suicide prevention programs, and more about **creating the conditions for Indigenous children, youth, families and communities to flourish,** preserve their languages, reclaim their land, recover their cultural and spiritual practices, and exercise their sovereign rights to be self determining, [...] so that they can resiliently pursue lives of dignity, with purpose, hope, belonging, and meaning; and be enabled to realize their full potential"[6]. Similarly, the Wise Practices initiative states that "Comprehensive, culturally-based, community-based approaches to life promotion and suicide prevention are known to hold the most promise"[7].

In the same vein, our approach maintains an alignment with Inuit Tapiriit Kanatami's National Inuit Suicide Prevention Strategy (NISPS), *Inuusivut Anninaqtuq*, Nunavut's Suicide

Prevention Action Plan for 2017-2022 as well as with the First Nations Mental Wellness Continuum Framework, all of which are evidence-based holistic approaches which consider the entire lifespan of the individual with a special focus on nurturing healthy children[8] and creating a framework of support at the individual, family and community levels[9] while addressing the socio-economic conditions that affect the daily health and wellbeing of Nunavummiut[10] as the most impactful way to ensure that people are less likely to reach the point where they consider suicide[11].

These plans iterate on the importance of confronting social and economic inequities, childhood adversity, and mental distress, as well as historical and intergenerational trauma stemming from Canada's colonization of Inuit Nunangat[12] that create environments where risk for suicide multiplies[13]. For Inuit, creating equity "means eliminating unfair and avoidable differences in areas such as housing, education, and access to healthcare in ways that validate our language, culture and identity"[14]. As a result, these strategies outline a vision in which individuals, families, communities, organizations and governments work together to provide wide-reaching and meaningful services that are built on the values of *Inuit Qaujimajatuqangit*, the Inuit knowledge system and worldview, to prevent suicide and build healthy communities where children and youth can grow up in safe and nurturing environments[15]. Consequently, ITK places considerable emphasis on increasing protective factors and the development of resiliencies in youth through an "upstream" approach, which are those delivered early in life and continue to be protective into adulthood[16].

In responding to the above and maintaining a Smart Cities approach that leverages data and connected technology, our goal to promote life and positive mental health for young Nunavummiut is sought by increasing protective factors and contributing to social equity through community makerspaces that nurture wellbeing while addressing the digital divide in the North. As articulated in our challenge statement, we seek to increase the availability and accessibility of life promoting activities, resources and support systems like peer networks, educational initiatives and creative outlets to all Nunavummiut in the expanded field of data and technology - with a focus on building up community and individual strengths.

Makerspaces offer a gathering space for people to come together to be creative. In the past few decades, makerspaces have become a movement and a culture of individuals "using a mix of digital fabrication, open hardware, software hacking and traditional crafts to innovate

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

for themselves, underpinned by an ethos of openness and skill sharing rather than commercial benefit"[17]. Makerspaces are also grounded in a "DIY" culture which embraces creation and sustainability and promotes skill-building and self-directed learning. They grew popular in the United States and Canada in the 1960's and 1970's and were aligned with civic and social movements of the time. Makerspaces also encompass an ethos of "hacking", understood as a practice of taking an object with a specific use and repurposing it; or "hacktivism", which involves the subversive use of computer programs and networks.

In a deeper way, the concept of hacking as it refers to practices of innovation and adaptation have been deeply embedded in Inuit history and culture for millenia; responding to change and social upheavals with teamwork, creativity, and consensus building. What is commonly referred today as 21st century skills like critical thinking and problem solving, innovation, creativity, collaboration and communication[18] have been and continue to be the very principles built into the guiding Inuit values called *Inuit Qaujimajatuqangit* or "The Inuit Way of Knowing". These are:

(a) *Inuuqatigiitsiarniq* (respecting others, relationships and caring for people);
(b) *Tunnganarniq* (fostering good spirit by being open, welcoming and inclusive);
(c) *Pijitsirniq* (serving and providing for family or community, or both);
(d) *Aajiiqatigiinniq* (decision making through discussion and consensus);
(e) *Pilimmaksarniq/Pijariuqsarniq* (development of skills through practice, effort, action);
(f) *Piliriqatigiinniq or Ikajuqtigiinniq* (working together for a common cause);
(g) *Qanuqtuurniq* (being innovative and resourceful); and
(h) *Avatittinnik Kamatsiarniq* (respect/care for the land, animals and the environment).[19]

We consider Makerspaces as an organic extension of this history and philosophy. Our proposal intends to create spaces for education that support Inuit values and skills like collaboration, creativity, critical thinking and problem-solving, while emphasizing relationships to the land and the environment.

In the article "Making Community: The Wider Role of Makerspaces in Public Life", the authors identify four broad themes that outline the different roles Makerspaces play in the wider community: acting as social spaces, supporting wellbeing, serving the needs of the communities they are located in, and reaching out to excluded groups[20]. They understand the potential of makerspaces as third spaces, or multi-dimensional social spaces separate from the home and the workplace that play a critical role in public life[21]. As a result, these spaces can

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

have an explicit agenda beyond digital or physical fabrication, intent on creating positive change in a community[22].

Our model for Makerspaces in Nunavut is focused on building pathways to life promotion and mental wellness for youth firmly grounded in Indigenous values by nurturing creativity, fostering agency, and building positive relationships while engaging in the expanded field of technology at the intersection of art, culture, science and education. The idea that connected and accessible digital technologies and resources for Indigenous communities create opportunities for intergenerational knowledge transfer, language learning, renewal, and revitalization through multimodal forms as pathways to mental wellness has gained considerable traction in recent years.

A 2013 report titled "Promoting Positive Youth Development and Highlighting Resources for Living in Northwest Alaska Through Digital Storytelling" describes a three year project that used digital storytelling as a health promotion strategy within a Positive Youth Development (PYD) framework. In this project, Digital Storytelling comprised the creation of 3-5 minute videos by youth that reflected aspects of their own life experiences. They selected and generated photos, wrote and recorded first-person voice-over narration, and learned through hands-on computer tutorials how to assemble the materials into a finished digital story[23]. The report concludes that "the digital storytelling project offered young people a way to gain a sense of personal mastery and achievement, highlight positive aspects of themselves, their lives and their reasons for living, as well as offering them a venue for strengthening connections with people [...] Digital storytelling presents a promising approach to health promotion and primary prevention that can be used to bolster cultural and identity-based protective factors needed for ushering marginalized young people into healthy adulthood"[24]. Although in this case digital storytelling is mostly focused on audiovisual techniques and materials, a variety of programs and technologies can be used to tell stories in dynamic and interactive ways, including with coding and game developing software like Twine and Scratch.

In the article "Supporting Self-Determined Indigenous Innovations: Rethinking the Digital Divide", authors Jasmin Winter and Justine Boudreau make a case for the potential of makerspaces as important initiatives that open up both physical and digital environments to project Indigenous worldviews and ways of knowing into the future of technology[25]. Specifically, the authors outline a case study that describes the efforts of the community of Pimicikamak First Nation (Cross Lake, Manitoba), who, during a state of emergency declared in March 2016 due to increased numbers of death by suicide, reached out to the uOttawa Richard L'Abbe Makerspace and partnered with its sister organization Maker Mobile to develop a strategy to empower Cross Lake youth through community-driven making[26]. This strategy involved the development of one week summer camps

for youth that included curriculum on 3D modelling, 3D printing, coding, building structures on a budget, and making 3D printed jewelry, alongside the purchase of a 3D printer for the community - thus providing a source of engagement and a creative outlet for the community[27].

Another example of a community based initiative providing a STEAM (Science, Technology, Engineering, Art and Math) based model for exploration is *Wapikoni*, a Quebec-based mobile studio that travels to Aboriginal communities to provide workshops for youth that allow them to master digital tools by directing short films and musical works, through a methodology that develops self-esteem, skills and resilience[28]. Founded in 2003, their mission is to "combat isolation and suicide among First Nations youth while developing artistic, technical, social, and professional skills; broadcast films and various public awareness issues facing First Nations while enhancing a rich culture, too often overlooked; and contribute to the preservation of First Nations cultural heritage" [29]

Despite the temporary nature of these programs and the need for further study, the authors channel Dr. Julie Nagam's research in stating that "thinking about makerspaces in Indigenous communities should mean connecting contemporary Indigenous innovations to makerspace theories, and back to traditional Indigenous knowledge in a circular way that finds the common thread of community wellbeing"[30], while further adding that "as community spaces for innovation, makerspaces may serve as a point of discussion for how to encourage, for example, alternative pedagogies and educational practices to connect youth and elders to promote intergenerational knowledge transmission, [...] this could include building equipment for land-based education, hunting, and trapping, all the while encouraging language revitalization"[31]. Both of these examples are initiatives that draw on the strengths of Indigenous technology and innovation, grounded in their worldviews and methodologies, as pathways to mental wellness.

Our proposal builds on this evidence to focus on implementing permanent Makerspaces within each community in Nunavut as central community hubs for digital and STEAM-based activities that amplify Inuit Qaujimajatuqangit principles such as collaboration, creative problem-solving, and knowledge-sharing. At the same time, there is an opportunity to connect community makerspaces to each other and establish an important territorial network for innovation tied to life promotion.

We propose to centralize this network and provide the governance and project management framework for this initiative through the incorporation of a new organization, titled the Katinnganiq Makerspace Network, or KMN (which will be discussed in the Governance chapter).

Our goals are to improve wellness by teaching new skills, increasing self-confidence, improving sense of agency, fostering positive peer and adult relationships, connecting with culture and identity, and providing new creative outlets and nurturing spaces for all Nunavummiut. Curriculum, programs, and materials will prioritize and encourage the use of Inuktut to support language revitalization.

Defining Community Makerspaces and Programs

The purpose of the Makerspaces initiative is to enable and empower youth resilience to embrace the future with confidence, armed with new coping skills and tools, and supported by positive relationships. The central focus of Makerspaces is on 'protective factors', where youth will build a personal sense of belonging, meaning, purpose and hope through their participation in activities. This initiative will provide safe, nurturing, welcoming social hubs for Nunavummiut that:

- **Provide imaginative and engaging programs:** including recreational, extra-curricular learning and skills acquisition (leadership, technology, interpersonal), the arts (performance, visual, music), traditional cultural/ language activities, peer mentoring, Elder mentoring, and coaching.

- **Leverage digital connectivity** where youth have opportunities to connect within communities and across Nunavut's 25 hamlets, share knowledge with each other and express themselves through access to digital tools and technological know-how utilizing new telecommunications technology.

- **Integrate community support**, including wellness services, where youth can access social/community services delivered on a 'whole person' basis in Makerspaces.

The above categories include the following series of activities that have been adapted from what was preliminary proposed.

- **te(a)ch Curriculum, Digital Literacy and Capacity Building**

As it concerns digital literacy and capacity building, our preliminary proposal included the te(a)ch curriculum as a deliverable through workshops programmes within community makerspaces in addition to online and digital access. That is still very much the case. As mentioned in our preliminary application, the te(a)ch curriculum is a free K-12 computer science program designed for Northern and Arctic communities in Canada with digital content and materials that are culturally responsive to Inuit, First Nation, and Métis ways of knowing.

The te(a)ch curriculum meshes a core learning focus of computer science fundamentals with game design, animation, and physical activity grounded in cultural exploration. It is a program with benefits that extend well beyond simply teaching "how a computer thinks". The goal is to implement equitable practices in digital literacy initiatives and harness the strength of Indigenous knowledge and ways of being to build agency and ownership in the use of technology as a creative tool in informed, safe, and positive ways. As will be discussed more in the technology chapter, the online launch of this program will take place early in March 2019 - and can be found here by clicking here.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- **Digital Art and Arts and Crafts Programming**

Central to each makerspace is a foundation of arts and crafts programming that stimulate creativity and support each person's talents through skill-building and play. Each makerspace will have the curriculum and capacity for art and crafts based workshops that based in cultural practices and materials. As mentioned in our preliminary proposal, we wish to work on expanding digital art materials and curriculum to support self-expression and skill-building.

The infrastructure and environment of each makerspace will nurture play and experimentation where youth have the tools and knowledge to build and create their own experiences, in their own languages; with the Makerspace, its community network, and governing foundation having the staff and capacity to assist in the production and realization of youth-led projects.

- **Connectivity**

In our preliminary application we outlined the need to open up local communication portals for both youth and communities to connect to each other. Since becoming finalists of the Smart Cities Challenge, we have modified our original proposal from installing and maintaining mesh networks in every community to supporting initiatives like the Arctic Internet Exchange (expanded upon in the technology chapter), which have emerged as tangible avenues to improve connectivity in the North.

In the recent months, the connectivity landscape in Nunavut has shifted, and this change in our proposal has come out of research and consultation with our local networking partners Nunageek Solutions Inc and Nuvujaq into the implementation process of a mesh network within a community. The challenges identified for a hardware mesh (a mesh network with hardware nodes that creates a local area network) include the need for potentially thousands of nodes to create a successful mesh – in addition to making sure that every node has a power source and is installed, monitored and maintained properly – alongside a danger of falloff of nodes leading to area blackouts. As a project with massive logistics and a reduced capacity for IT and networking solutions in each community - the requirements for successful installation, monitoring and maintenance of mesh networks risks inflating and growing costs to the point of unsustainability.

However, in line with the values set out in this proposal, our approach will be to support capacity building and learning for individuals through makerspace programming and curriculum that addresses networking more generally (and mesh networks specifically if desired), alongside the appropriate tools for practice and prototyping – based on the expertise of networking partners Nunageek Solutions Inc and Nuvujaq.

Additionally, a digital platform for the Katinnganiq Makerspace Network (KMN) will be developed with a purpose to connect the community makerspaces and their members to each other to share knowledge, as well as to enable access to tools, resources and ongoing support for aid in building capacity among teachers and youth. This network and platform will support the exchange of ideas and knowledges between communities and individuals.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- e-Mental Health Initiatives

We recognize that in our preliminary application we proposed to develop several e-mental health initiatives. Currently, some of those are no longer part of this proposal. First is the wellness chat, or community chat application system with the aim of enhancing peer support groups and contribute to maintaining communications between individuals. The Kids Help Phone, which operates a 24-7 phone line for crisis and support, recently launched a free crisis text line for Nunavut, making its services more available. This is in addition to the online chat service they also provide. These developments make our proposed chat application seem redundant. Our intention is to collaborate with others and support different initiatives rather than duplicate work[32]. To complement local health resources like those offered by the Kids Help Phone, we expect each Makerspace to be a connection to local mental health resources through staff trained in ASIST (Applied Suicide Intervention Skills Training) and Trauma informed practice - as well as a direct connection to other resources offered by the Embrace Life Council and local counselling services.

With regards to gamified interventions, the previously proposed localization of the SPARX game is being pursued by York University in collaboration with Pinnguaq Association, yet the source code has recently become proprietary of a private business - licensed to York University for research purposes only. This means we have no ownership over the source code and disqualifying this feature as a viable option to develop within the context of the Smart Cities Challenge. However the potential to build a piece of (gamified) software with the aim to instill Inuit-specific health values for youth through a digital delivery mechanism is still an unprecedented and transformative initiative. Though it won't be integrated as a firm deliverable in the context of this proposal, we expect that by working with youth at community makerspaces, we will workshop the vision for this piece of software, and work collaboratively to develop it as a resource.

As a whole, this initiative employs an evidence-based approach that is built on the feedback we have received from Mayors and community members, as well as from discussion and consensus reached within the collaborating organizations leading this proposal. These processes and conversations are further discussed in Chapter 6: Engagement. Throughout the past few months, the Pinnguaq Association has, as part of this proposal, opened and operated a Makerspace in Iqaluit. The portfolio of the Iqaluit Makerspace programs and events can be found in Appendix A.

Our is an ambitious project, essentially requiring 25 different tailored approaches to makerspaces that respond to each community's strengths and resources, phased out through a 5-year period - attainable through our proposed governance and project management framework, and measured through a culturally safe evaluation framework. We will work with each community to identify the space available and the appropriate agency to implement and manage their makerspace, highlighting a collaborative and community-led approach.

We recognize this is a competition and that only 2 of 10 proposals will be selected as winners in our category. We wish to acknowledge the important work of our fellow finalists - whose initiatives represent important solutions and responses to the challenges faced in their communities. We do not pretend to state that any proposal is more important than another - as each one stands strong and is validated in its own context. What we present throughout this

[32] *We will however, continue working with youth we began relationships with to mentor and support their practice.*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

document is a strategy that, based on extensive evidence and consultation, will be best suited to support the communities of Nunavut to implement the system-level changes required to promote and sustain individual, family, and community wellbeing.

Chapter 2: Governance

To achieve its ambitions, the Katinnganiq Makerspace Network (KMN) initiative needs a governance framework based on key guiding principles. The following principles have been identified through community and stakeholder consultation:

Rooted in Inuit Culture

- The governance model must support the unique Inuit worldview derived from language and culture, spiritual practices and relationship with the land within each local cultural context.
- Governance institutions should be built on existing organizational structures and expertise – including government, not-for-profit (NFP), and even private - wherever possible to enable rapid community level project start-ups.
- Youth and Elder voices should be placed at the centre of relationships with stakeholders.

Community-centric approach

- The governance framework must reinforce a community-driven, community-owned approach in creating Makerspaces, with decision-making and delivery authority vested in local communities.
- Local communities must define their specific needs and develop their own customized approaches to programming based on a principles-based, values-driven operational framework that supports flexibility.
- Local governance arrangements need to evolve within the overall governance framework as local capacities are built.
- Communities must have control over any data or research that profiles their community – in terms of control how it will be used and who has access to it.

Platforms for sharing among communities

- Platforms and practices should enable learning and knowledge-sharing across all participating communities, including research and lessons learned in delivering effective programming.
- Capacity and practices should enable communities to derive the maximum potential from existing and new/forthcoming communications capacity and applications.
- Finally, technology introduction must adapt hardware and software to the unique needs and culture of Nunavut communities.

A **values statement** provides a common set of fundamental beliefs for all Makerspaces managers, partners, stakeholders and participants. The preliminary values statement under consideration is the following: *Our work will be guided by openness in adapting new technologies to our Inuit cultural traditions in ways that create safe spaces to build resilience,*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

strengthen their cultural and spiritual beliefs and nurture the innovation skills youth need for strong futures.

This values statement and the proposed governance model and framework are built on the unique foundations of governance in Nunavut - where Inuit societal values and principles (IQ) drive development at all levels. Building the self-reliance of people and communities is a government priority and this governance proposal reinforces this priority.

Improved broadband communications will be important to the success of the project and is integrated into the governance model. There is important recent additions in satellite capacity serving the North, and within 3 years the contemplated new satellite infrastructure that is being deployed. This initiative plans to be in the forefront of taking advantage of new telecoms network capacity to deliver its programs.

This technology includes the latest geostationary satellite and the forthcoming low earth orbiting (LEO) infrastructure. Concurrent with the deployment of Makerspaces in communities by this Challenge project will be the development of community data centres. Their operational governance is an important part of this Governance Chapter.

The Katinnganiq Makerspace Network

Governance Framework

A holistic, multi-level governance model is proposed to ensure that internal structures, functions, processes, rules and relationship behaviours are values and principles-driven and are aligned with the direction, strategy and policies supporting Makerspaces. The governance model is community context-driven and multi-disciplinary. Providing options to youth that steer them away from negative behaviours towards positive options for building their own futures and that of their communities require highly integrated efforts. The silos of traditional support approaches simply do not address the 'whole person' in the context of the community and its worldview.

Governance Structure – Territorial and Hamlet Levels

A new organization called **Katinnganiq Makerspace Network** (KMN) will be created as the umbrella organization to serve the 25 hamlets involved with this initiative. It will be formally established as a not-for-profit organization, incorporated under federal law, and charitable status registration will be sought.

Its charter will be to implement the Smart Cities Challenge award and provide the platform for the co-management of Makerspaces in each community. It will act as a capacity-building and coordination support network for the hamlet-based Makerspaces. Its mission will be to provide each local Makerspace in the KMN with the tools, resources and training to support a culture of innovation firmly rooted in Indigenous values.

A unique feature of the governance model is the distributed nature of power across the 25 local level municipalities. It is envisaged that the hamlet or a self-determining delivery organization will be identified in each community, possibly an existing organization to enable rapid start-up. A new local not-for-profit will be created if a suitable organization does not

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

exist. For the purposes of clarity, these local delivery organizations are referred to **KMN-L (for KMN-local).**

These organizations will be anchored by some formal indication of approval in principle by the local hamlet municipal authority, e.g. a resolution passed by the hamlet municipality. Then, the local Makerspaces delivery organization and the territory-wide KMN will enter into a formal agreement stipulating services to be provided and conditions to be met.

Thus, the structure will effectively be a 'bottom-up' governance model where the local delivery organization – each KMN-L - will be responsible and accountable for local activity. The delivery organization's governing body would be appropriately mandated; if a new organization is created, a new board of directors (and executive director) would be selected from local leaders in the hamlet[33]. The hamlet level NFP entity – KMN-L - will thereby become the "owners" and leaders of the initiative at the local level. Leadership will need to be carefully selected to lead the initiative and emerging leaders supported. Leadership in small communities is stretched, and individuals wear many hats.

The symbiotic relationship between the KMN and the KMN-L is to be a careful balance between them, each playing their respective roles under separate boards. The KMN will seek to harmonize efforts overall and share experiences through common management frameworks and support tools. The KMN will provide model KMN-L governance and business practices, financial and accounting systems, as well as training offerings and HR systems and the like. With improved connectivity and familiarity with communications platforms, sharing opportunities will be enhanced within local Makerspaces (KMN-Ls) as well as across hamlets.

KMN's Governing Board

The Katinnganiq Makerspace Network *governing board* membership will be between 9-15 members and directors will be appointed for four years[34].[1] The KMN board will include local community representatives and some Makerspace executive directors of local delivery organizations, i.e. the KMN-Ls. The development of Makerspaces and KMN-Ls in each community will come on stream over time as communities develop capacity. That should fill some of the KMN board positions. Once there are several Makerspaces, rotating delegates from the executive directors of hamlets will serve for fixed terms and will be drawn from the growing pool of KMN-L executive directors.

---

[33] *It would be good governance for the locally elected hamlet council members not to be on the board of the local Makerspace authority, but in smaller communities with fewer board candidates, it may not be practical to exclude them.*

[34] *It is also proposed that the following Katinnganiq Board Committees shall be constituted - the Executive Committee, a Strategic Planning and Policy Committee, a Technology Adaptation Committee and a Development and Finance Committee. A board auditor will be appointed, supported by internal audit under the Development and Finance Committee. The board governance function will be carried out by the Executive Committee.*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

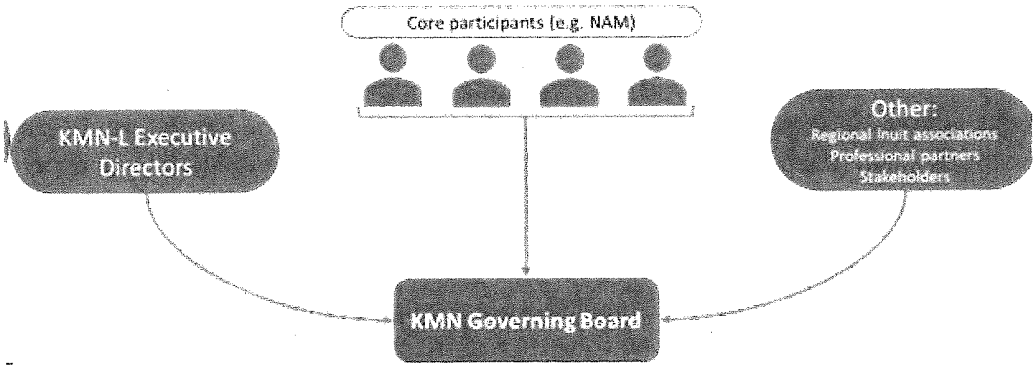

Figure 1: Constituents of the KMN Governing Board

Other members would be drawn from Territorial organizations and key stakeholder groups, e.g., professional, supplier and training organizations[35].[1] Regional Inuit associations and the Nunavut Association of Municipalities (NAM) can play representational roles. It is important that board members will be leaders and activists for Makerspaces within their communities and in doing so, will ensure strong connections between communities and KMN.

The board would likely meet face-to-face at least once per year, co-scheduled with the annual gatherings of all the municipal members of the Nunavut Association of Municipalities (NAM). While the board would govern the KMN, it could present annual progress reports to the NAM as to ensure good communication with hamlet governments as an important part of community engagement. The board will operate through communications platforms for other meetings. As shown below, the development of connectivity in response to third party investment in facilities is an important complementary part of the KMN initiatives.

The *board Chair* will be the point for accountability to and liaison with government(s) at all levels on all aspects of the Territory-wide relationship.

It is proposed that a transitional founding board of the 4 core organizations plus an independent interim chair be put in place for six months to one year while incorporation is secured. This start-up measure will ensure rapid building of the KMN governance structure and organization and provide for orderly recruitment of new board members as their key task, in accordance with the articles of incorporation.

Founding members personally will step aside as permanent members, at least in the board's first term or unless invited back by the permanent board. In future, the board chair will be selected by the permanent board members and officers from among its members. Similarly, an interim executive director should be appointed by the transitional board, leaving open the permanent board's prerogative to select its own executive director.

It should be noted that the Nunavut talent pool is small, and individuals serve in numerous ways in their communities. Issues of conflict of interest will require ongoing vigilance. Early policies need to be put in place to ensure integrity of the board and clarity on its duties to the corporation.

The *board's role* is to set the vision, mission and mandate for Katinnganiq. It will set the macro strategic direction, policies and priorities. It will provide planning and resource allocation

[35] *As a matter of good governance, Government of Nunavut representatives would not be candidates for board positions to represent the GN. However, nothing would prohibit them to be asked to serve on the board as private citizens.*

frameworks and allocate resources to communities. The board will develop guidance for engagement and relationships between Katinnganiq Makerspace Network (KMN) and the hamlet-based KMN-L NFPs.

The board will act as *trustee and administrator* for Smart Cities Challenge source of funds. It will commit to dispersing the funds to local municipalities via the incorporated not-for profit KMN-Ls – or to whatever community organization is to take responsibility for the KMN-L according to local circumstances. Transfer of funds would be as per an agreed formula (beginning with community governance readiness, and taking social indicators into account, e.g., number of youths, social conditions like delinquency rates, etc.). It sets out a system of quality assurance, monitoring and evaluation and reporting by hamlet-based KMN-Ls on their projects/programs.

As discussed in the *Performance Indicators* section, the board will monitor the performance of the KMN organization and hold the Executive Director (ED) accountable for overall performance and compliance on meeting the milestones and accountabilities established for reporting to Infrastructure Canada.

The KMN's binding agreements with the KMN-Ls (i.e., the local level Makerspaces) will include, inter alia, rents, salaries, purchasing and sourcing materials/supplies for the spaces. These agreements will include the operation of the telecommunications platforms, applications software, and computer hardware.

The board will be a visible and vocal advocate in Canada and elsewhere for identifying other sources of funds and partnerships, public and private, to secure sustainability for Makerspaces.

Essential to this relationship is the above initial statement of principles and values that will guide all relationship management relating to Makerspaces. They will empower communities with the flexibility needed to operate within these principles and are derived from and connect to *Inuit Qaujimajatuqangit*.

Advisory Board

The Katinnganiq board will appoint an Advisory Board (AB) to provide counsel on issues, assist in positioning the organization in their networks, and expanding the board of directors' circle of advice to non-Territorial residents. It will be composed of experts/researchers in the fields of behaviour and mental health, social measurement, youth programming, etc.

The advisory board is also a formal way to expand the community engagement network by engaging local community representatives, communications infrastructure specialists, youth, parents, and Elders. Government of Nunavut representative(s) will be invited to participate to facilitate harmonization between Katinnganiq and government policies and programs.

The AB chair and members will be nominated by the KMN board of directors for terms of 3 years. Issues may be referred to the AB, independent reports requested, and strategic insight solicited from it. It will set its own agendas and meeting times. It will be invited periodically to brief the KMN board on issues. It could be invited to provide environmental scanning as part of strategic planning. As an advisory board is discretionary, the number of members and meetings financed will be decided later by the KMN board of directors.

Executive Director of KMN

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The Katinnganiq ED will be selected by and reports to the board on implementing its strategy and supporting the board on all matters. The ED should be independent of core organizations and any interested party. However, for the initial founding period, one of the core organizers could be contracted to supply an ED, provided he/she reports to the board.

After the start-up period, a permanent ED will be appointed by the board with the caution that the ED's independence must withstand public scrutiny. However, the core organizations could still be contracted to supply needed expertise, if these contracts are on an arms-length basis. It is important for good governance that any form of self-dealing conflicts of interest are not allowed to grow, even if only through perception. See graphic below that illustrates the basic KMN structure.

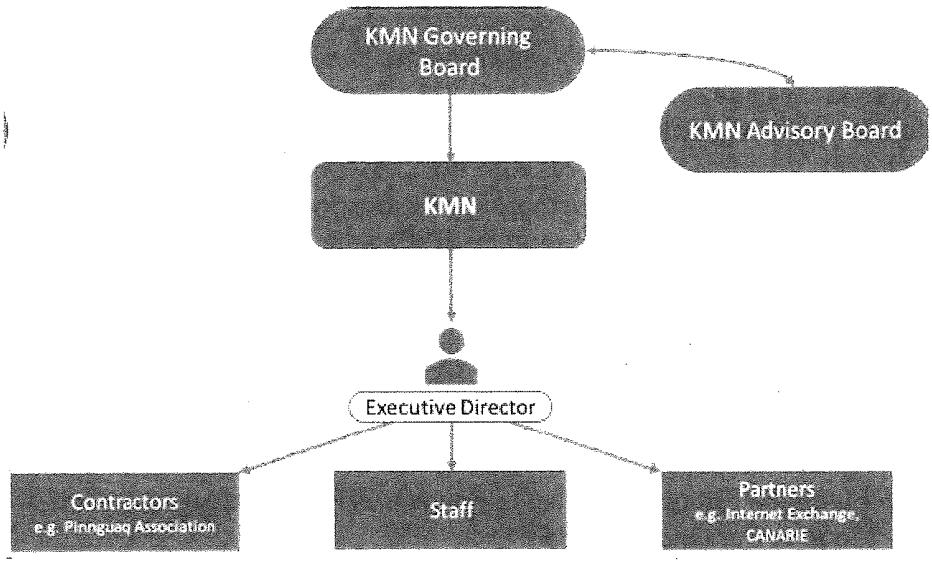

Figure 2: KMN Governance Structure

The board chair will enter into a formal MOU with the ED that lays out all duties and functions, roles and responsibilities, financial reporting and accountability requirements, annual business plan requirements, communications and issues management protocol, shared services, as well as privacy, conflict of interest, records management, audit and evaluation, and risk management. It will also contain terms of employment, compensation, liability and insurance provisions, etc.

It is the responsibility of the ED to lead the overall initiative and prepare reports for funders on the results of all work undertaken. In addition to supporting the board on the above, the ED is responsible for a research program, in conjunction with communities, to ensure that decisions can be taken based on evidence.

The ED advocates for **high bandwidth connectivity** and applications, and the training required for the communities to be equipped by resource people who can operate and maintain the expected data centres that will parallel the creation of community Makerspaces. The ED will work closely with other NFP service organizations and together will help develop capacity at the community level to operate local data centres and other technical infrastructure to fully enable the Makerspaces (the KMN-Ls).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The ED will support territorial authorities as requested (e.g., Arctic College) responsible for connecting the Makerspaces in communities to the CANARIE network (see Technology Chapter). Agreements with NURN, which would be the territorial signatory to any registration with CANARIE, would trigger further investment in broadband facilities to Inuit communities – which would enable more cross community communication as well as interacting with the non-Nunavut world.

The ED **develops and delivers education and learning resources** to support communities in such areas as technology use and development, financial management (bookkeeping), general management and administration, teacher training and curriculum delivery, and leadership development. Training workshops and learning curriculum will be essential to help build capacity for making good use of the KMN support in learning materials, resources, start-up structures, equipment.

Promotion and public communications will be important to broad public awareness of Makerspaces. Such initiatives could include annual or biannual fairs or showcases that showcase youth makerspace group projects.

KMN-Ls as the Local Delivery Organizations

Effective delivery arrangements will be required to realize the ambition of KMN, and they are an essential part of the governance framework. The respective roles and responsibilities of local governments, partners and stakeholders in building this bold new multi-disciplinary, cross-functional model will be clearly set out for the 25 geographically dispersed hamlet communities and Katinnganiq Makerspace Network.

The KMN will develop the frameworks, tools, processes and mechanisms, resources to support a culture of innovation that is firmly rooted in Inuit values. This governance framework includes a similar management framework structured for the needs of the hamlet-based KMN-L level results. Accountability and reporting requirements are central even though each KMN-L partner has its own mandate and accountabilities, culture and internal imperatives and capacities. This means that flexibility is required for individual site innovations, while operating under a common vision, mission, values and ethics and operating principles (see Project Management section).

At the local hamlet level, there will very likely be a variety of not-for-profit organizations who will enter into formal delivery partnerships with KMN and the KMN-L. By community consensus, the KMN-L delivery organization will be organized in the best way to deliver effective local Makerspaces. The expected governance structure is pictured in the graphic below, while Appendix 1 provides an example of the variety of community organizations that already exist in a typical medium sized community.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

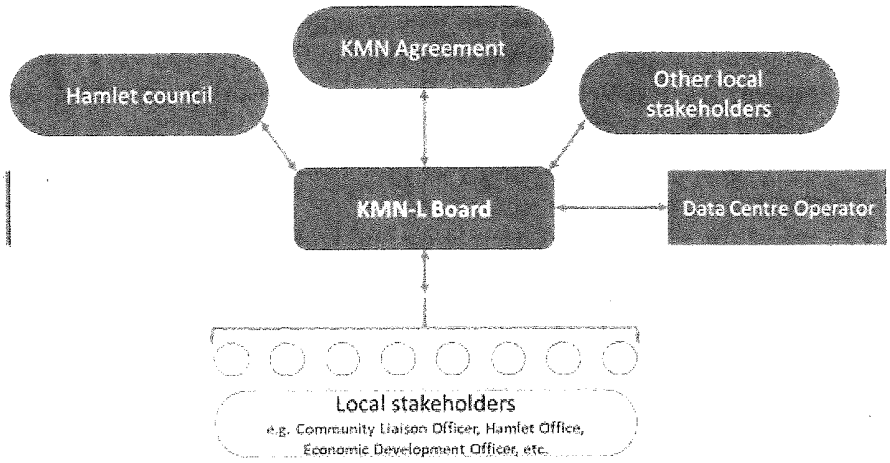

Figure 3:KMN-L Governance Structure

The Program Tools and Processes – KMN will develop tools to assist sites in developing and implementing Makerspace programs and projects. The purpose is to provide generic tools that can be adapted to local conditions and cultures:

- Broad Makerspaces guiding principles, a statement of common values and set of operating principles (to empower local sites with as much program flexibility as possible)
- Program policies and design frameworks
- Fundraising strategies and techniques (modules on achieving sustainability and value for money)
- Operations manual – including baseline operating procedures and sample Makerspace management and administrative structures/ functional responsibilities and arrangements charts, relationship management maps, personnel management including recruitment and development strategies/ generic job descriptions
- Planning, reporting and performance management systems including measurement metrics.
- A menu of generic programs and modules for communities to select from
- Training, development and delivery of programs
- Research and best practices
- Network equipment maintenance, procurement, and replacement contracting templates and procedures
- Agreements and contracting procedures for outside suppliers and NFP donations and services

Local leadership will need to be carefully selected to command the respect and moral authority needed for the initiative to succeed. Emerging leaders themselves will need to be supported by other local stakeholders as well as KMN. Small communities are stretched, and individuals wear many hats. As much as possible, therefore, KMN will work with local institutions and encourage collaboration to ensure the limited capacity in each community will

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

become part of the Makerspaces – and their companion communications and computer troubleshooting, infrastructure maintenance.

The Katinnganiq Makerspace Network Partners and Stakeholders

Partners and stakeholders play essential roles in the governance model. The governance model recognizes that dynamic participation of local communities, as both partners (contributors of resources) and stakeholders (benefitting individuals, groups, organizations) is essential to the legitimacy and well-functioning of the governance model and outcomes of this initiative. Partners will play formal institutional relationship roles within Makerspaces as they will bring their home organizational insights to the board and Makerspace projects. Stakeholders provide the community opinion and insight as participants in consultations, as volunteers and as participants to steer Makerspaces to address local needs and concerns.

Roles and responsibilities of Core Katinnganiq Partner Organizations

Nunavut Association of Municipalities (NAM) – The group provides a single voice for mayors and municipal administrators of the territory's 25 communities. NAM will facilitate coordination with each community's involvement and help manage KMN's activities through its board position. NAM's day to day relationships with local communities will be indispensable in the communications to and from the local hamlet councils.

The Pinnguaq Association – Pinnguaq is a not-for-profit organization whose mission is to embrace and use technology as a means of unifying and enabling Nunavummiut and Indigenous people in Canada. It has established the Iqaluit Makerspace and developed key program components expected to be adopted by the local Makerspaces, e.g. the Te(a)ch curriculum. Pinnguaq will provide on an arms-length contractual basis support for the activities under the direction of the ED - who will be hired by the board. Pinnguaq's contracted services will embrace technology, training, and organization of the activities to be adopted by the Nunavut communities.

The **Isaksimagit Inuusirmi Katujjiqatigiit Embrace Life Council** – is a non-profit suicide prevention organization based in Iqaluit. The Embrace Life Council will provide the strategic direction for the development of the proposal in relation to the identified objectives and the need to grow the protective factors that reduce the inclination for youth to harm themselves. It will establish protocols for providing services to the communities, which will be offset by payments to compensate the Embrace Life Council for its services at rates established by the board.

Qaujigiartiit Health Research Centre (QHRC) - The goal of QHRC is to enable health research to be conducted locally, by Nunavummiut, and with communities in a supportive, safe, culturally-sensitive and ethical environment. It also promotes the inclusion of both Inuit Qaujimajatuqangit and western ways of knowing and understanding wellness to address health concerns, create healthy environments, and improve the health of Nunavummiut. The QHRC will continue its research and development of mental wellness resources from a trauma-informed perspective and will offer its services to help structure programs and an evaluation framework of KMN activities.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Relationships with Key Stakeholders and Partners

A mapping of partners and stakeholders with direct and indirect stakes in Makerspaces demonstrates the complexity of arrangements required. As an 'eco-system', all the parties are interconnected with each other in a network of adaptive, interacting organizational partnerships, depending on each other to leverage the transformational change that is essential for survival.

Regional Inuit Associations - These association fall under the Nunavut Land Claims Agreement as non-profit organizations with roles that span all aspects of Inuit society. They manage land, provide social services, monitor environmental policy, and operate for-profit development corporations that invest in wealth-generating capital.

Hamlets and Service Organizations – Collaborating local organizations and governments will contribute to the cross-functional nature of this initiative. Services are often delivered by separate government and non-profit agencies alike – and their lack of coordination is often to the detriment of youth. This KMN initiative provides an opportunity to integrate efforts and resources locally to benefit youth. The 'whole person' approach to serving youth means that health, social service providers (governmental and non-governmental), recreational organizations, etc. can work together on local programming through Makerspaces.

NGOs and Non-Profits - Churches and other NGOs like education institutions, health organizations, social-serving organizations, arts and cultural organizations, could become supporters and partners with the KMN and with local Makerspaces themselves.

Private sector funders – Funding partners could be afforded the opportunity for representation on boards of local Makerspaces or KMN. Pinnguaq often plays the role of a facilitator, recently with Google's visit to Nunavut wherein Pinnguaq helped the delegation from Google understand how their CS First curriculum fits Nunavut's internet context. Pinnguaq also maintains a partnership with Canada Learning Code which hosts monthly workshops at the Iqaluit makerspace.

Federal Government - The federal government is a key partner and the accountability relationship with it will respond to all terms and conditions of funding. As elected governments are responsible and accountable to citizens for policies and expenditures, this proposal is highly sensitive to this requirement.

Government of Nunavut - GN will continue to play a key role to play in supporting self-governing, sustainable communities that serve the social and cultural needs of residents as it supports Nunavut's economic growth and social, cultural and environmental well-being. Makerspaces will be carefully aligned with policies and programs of the GN.

Other organizations - see Appendix 1 for sample list of local organizations in one sample, mid-sized community.

Community control over data and information

The KMN's purpose will be to connect the community makerspaces to each other to share knowledge, as well as to enable access to tools, resources and ongoing support for building capacity among project leaders and youth. The KMN will include a digital platform to

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

provide ongoing support for local makerspace, a platform which will evolve as the Nunavut communications infrastructure improves with added satellite capacity.

As noted above, KMN will work with the Arctic Internet Exchange to support the improvement of broadband capacity concurrently with agreements with local communities to establish a Makerspace. While it will vary from community to community, the objective will be to co-locate data centres and Makerspaces, and to arrange for their maintenance. Efforts will be made to ensure the integration of these two activities and organize single teams to manage and maintain the Makerspace and data centre facilities. Doing so will help economize on the draw on human capacity in hamlets and provide more stable and meaningful employment opportunities.

A further network objective will be to arrange for connectivity between each Makerspace and the Nunavut Research Network (NURN)– which will provide the connection to the CANARIE network. To do so will require approvals of the GN and its Arctic College, which would be a recognizable entity for CANARIE. The KMN's Digital Platform will offer be discussed in Chapter 5: Technologies.

Risks

While the core members of the proposed KMN have extensive experience in Nunavut, and in undertaking similar projects, there are always risks which should be identified and mitigation strategies developed. Some of the major risks and appropriate mitigation strategies are identified:

Underperformance on program achievements leads to lower confidence or trust by local stakeholders:

- Provide support to ensure that local decisions are realistic and well-planned for.
- Provide regular stakeholder briefings/updates to ensure knowledge gaps do not develop.
- Ensure that key stakeholders are involved in delivery and advisory functions, particularly youth, Elders and parents.

Local conflicts and consensus hamper progress

- Build formal approval procedures that place consensus at the centre of key decisions.
- Ensure the right stakeholders are at the table.
- Provide training in alternative dispute resolution and if appropriate, establish a veto right of the local organization in event of stalemate on major decisions (when it will get used, how and who will use it).

Concerns over procedural fairness by Katinnganiq Makerspace Network in allocating resources to local communities

- Be transparent as to the criteria to evaluate among different projects and to the process for arriving at the allocation decisions.
- Ensure that key decisions are taken by the board, on the advice of administrative staff – and that if affecting specific communities that the local board is properly consulted.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Ensure that the board is comprised of the right key individuals capable of taking collective or difficult decisions.
- Establish an Executive Committee of the board that thoroughly examines any issues of procedural fairness and recommends a course of action to the Board of Directors.
- Ensure conflict of interest procedures are established for recusal as necessary.
- Create a board by-law in event of stalemate that provides for a deciding vote.

Delivery bottlenecks caused by local capacity limitations

- Well-planned, practical program/project implementation that takes account of capacity limits and plans accordingly;
- Timely training and development;
- Succession planning so that key skills/competencies can be drawn upon in event of staff turnover;

Crises, and/or other community tragedies draw leadership or delivery attention away from this initiative

- Contingency plans in place early on for rapid communication responses, local spokespersons, etc.;
- Ensure "twinning" of key individuals so that there is always a back-up individual to step into any Makerspaces governance roles in event of crisis or emergencies.

Shortage of financial resources stalls implementation

- Provide a nominal annual budget to communities to support core activities.
- Require clear planning frameworks from communities that manage cashflows.
- Proactive efforts to identify additional funding;

Chapter 3: Performance Measurement

This Chapter sets out the performance measurement model that will demonstrate how Katinnganiq Makerspaces Network (KMN) will be held to account for results achieved in implementing its vision and mission. Measuring results is a key accountability of a board and is the central part of a performance management system. The metrics established to assess whether planned results occurred, and desired outcomes are being achieved are essential to a board's credibility and accountability to its funders, stakeholders, clients and partners.

Performance measurement is part of a broader performance management system with interdependent elements. The responsible and accountable entities are the KMN and the other three core participants – NAM, etc. The local Makerspaces (KMN-Ls) are integral components to the success of the initiative but are not directly accountable to the Smart Cities Challenge program.

Local Makerspaces will be supported by the Katinnganiq Makerspace Network, that provides centralized support, coordination, development and project management tools, communications technology platforms and networks, research and training to Makerspaces. As such, KMN can be viewed both as a key **activity**, as well as a critical **input** to the success of local Makerspaces.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Performance Measurement Challenges

In considering a methodology for performance measurement, the following characteristics were deemed important pre-conditions for this initiative:

- Practical and easily understood performance measurement by the community-level delivery partners, i.e. the local Makerspaces
- Results achievable by communities
- Research and fact-based framework
- Low cost, simple data collection requirements for indicators and measurement tools
- A design that works backwards from the "outcomes ('ends') we wish to achieve to the goals we set and activities ('means') we do"
- Consistent with the values set out for this initiative
- Priorities-focused (simple, cautious about overreaching and risk of failure)

Our goal is to promote life and provide positive interventions for improved mental health that (i) build capacities for young Nunavummiut,(ii) promote community ownership over Makerspaces, including providing the appropriate physical spaces, and (iii) improve youth access to digital and communications technologies. The major challenge is to link activities to affecting these ultimate outcomes, given that there are so many dimensions and causes for youth capacity, community wellness, and digital acumen[36].

Significant research has been undertaken and this proposal builds on known factors that encourage well-being in youth. The National Inuit Suicide Prevention Strategy developed by Inuit Tapiriit Kanatami, lists **six objectives to reduce major risk factors**, while improving major safety and protective factors: (i*) Create social equity, (ii) Create cultural continuity; (iii) Nurture healthy Inuit children; (iv) Ensure access to a continuum of mental wellness services for Inuit; (v) Heal unresolved trauma and grief; and, (vi) Mobilize Inuit knowledge for resilience and suicide prevention*[37]. Makerspaces' interventions will address all of these either directly or indirectly.

In recognizing that suicide is a complex issue, this initiative invests in protective factors through a 'life promotion framework' to reduce the risk of youth suicide in Nunavut. Our focus is on creating both physical and digital spaces that offer opportunities for Nunavummiut to connect with each other, learn skills, share knowledge, be creative, and express themselves in safe environments - as pathways to mental wellness. This focus springs from what can be called the **theory of change** – that life promotion in the manner outlined will positively affect the wellness of youth in Nunavut in years to come.

Our approach to **building protective factors**, understood as abilities, skills, and social supports that offer people the ability to cope with stress and spring back from crises and

---

[36] *Inuit Taipiriit Kanatamit states that achieving social equity with other parts of Canada is necessary to prevent suicide, as is strengthening 'protective factors'. Of the 11 Inuit 'social determinants' of health (Quality of Early childhood development, Culture and language, Safety and security, Education, Availability of health services, Mental wellness, Environment, Livelihoods, Income distribution, Housing and Food Insecurity), a number are beyond the scope of this project Livelihoods, Income distribution, Housing, Food Insecurity); as for the others, it is important to note that Makerspaces are but one of many possible inputs,*

[37] *National Inuit Suicide Prevention Strategy*. Inuit Taipiriit Kanatami: 2016. Web. 29 Jan. 2019. <https://itk.ca/wp-content/uploads/2016/07/ITK-National-Inuit-Suicide-Prevention-Strategy-2016-English.pdf>

trauma[38]- lies in understanding the risk factors for suicide in Inuit communities and how they add up to cause distress[39]. Research states that the risk factors and high numbers of suicide in Inuit communities correlate with the historical trauma from colonial violence, including dispossession, culture loss, and social disconnection[40]. The Inuusivut Anninaqtuq Action Plan states that "Inuit are **not** predisposed by virtue of their ethnicity to be at a higher risk of suicide than non-Inuit"[41]; indicating that legacies of colonial violence are the root cause of social inequities that affect Inuit[42].

Our proposal for implementing digital literacy initiatives as well as improving networking infrastructure and enabling new creative outlets based on technology are **important protective factors** that relate to and are aligned with the above objectives. As defined by authors Jennifer White and Christopher Mushquash, protective factors refer to experiences that "appear to reduce the likelihood of suicide despite exposure to risk"[43]. Some of the protective factors identified by White and Mushquash as key cultural and institutional practices, can strengthen social relations and promote resilient outcomes for Indigenous communities. They include:

- coping and problem-solving skills;
- experience with success;
- sense of belonging and connection;
- social support;
- interpersonal competence;
- support and acceptance;
- revitalizing language and traditional healing;
- enhancing cultural identity and spirituality;
- enhancing local control and community self-determination;

While there is a challenge to attribute Makerspace activities to the development of protective factors, Makerspaces and their programming in Inuit communities can have some effect on most if not all the factors above; and they can be used as measures to determine impact. Other research on building resilience adds other promising factors, such as optimism, altruism (helping others), faith and spirituality, humor, having a role model, social supports, facing fear, meaning or purpose in life (one believes one has a purpose), and training[44]. All together they represent a sound basis for developing performance measurement indicators.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The **conclusions** we draw from research guide our results definition and performance goals in our performance framework. We conclude that most measures of youth well-being require a broader set of indicators than this initiative can practically measure. Many are factors are well beyond the scope of Makerspaces activities and endeavours (poverty, food insecurity, school bullying, overcrowded housing, abuse, etc.). Therefore, we need to blend factors from different research sources that are more directly related to the type of programming local Makerspaces can reasonably provide. It must be recognized that Makerspaces and their activities will be but one input into these complex factors influenced by so many other aspects in the life of a youth. However, the factors selected for Makerspaces will be further vetted by mental health professionals as contributing to youth well-being and focused specifically on building the resilience youth need to adapt to life's challenges.

Finally, it is recognized that building youth resilience needs to be tackled earlier in life. While the main Makerspaces focus is on programming to support the youth experience, we will be exploring complementary programming for young children, for whom "Self-esteem is, at root, a measure of children's judgment of their own worth"[45]. Early childhood learning and child-parent digital literacy are entirely appropriate additions to this initiative, such as the e-learning for K-12. Further culturally relevant extra-curricular digital learning tools will be explored for including children through existing, proven off-the-shelf programs like Aboriginal HIPPY[46] - which could be brought into Makerspaces as a complementary activity.

Performance Measurement Methodology

This proposal adopts a Results-Based Accountability (RBA) model to assess how the vision and mission are reflected in outcomes. The performance measurement framework below will guide this work:

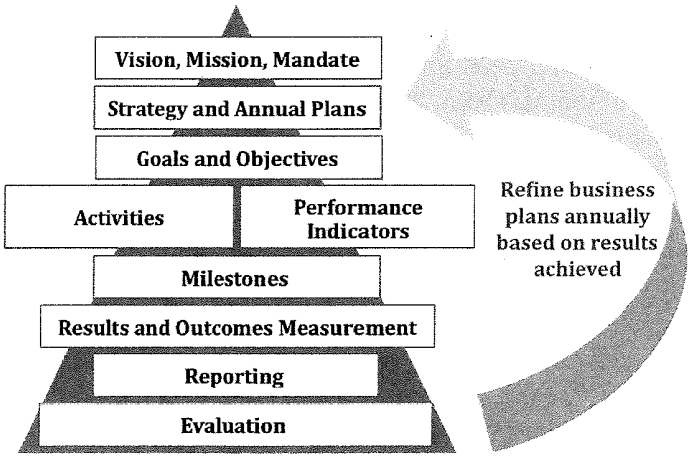

Fig 1: This image illustrates the RBA model

[45] "Nurturing Children's Self-Esteem Introduction." *MentalHelp.net*. N.p., n.d. Web. 20 Jan. 2019. <https://www.mentalhelp.net/articles/nurturing-children-s-self-esteem-introduction/>

[46] "Aboriginal HIPPY in Canada." *Mothers Matter Centre*. N.p., n.d. Web. 16 Oct. 2018. <https://www.mothersmattercentre.ca/aboriginal-hippy/>

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

From the vision articulated earlier in the Introduction Chapter, RBA begins with articulating desired 5-year outcomes and works backwards to set goals and supporting activities and define key performance indicators (KPIs) where progress can be tracked and measured for success. **KPI metrics** are proposed that focus on three areas:

- the youth experience (improved outlook, participation, and skills acquired);
- how well communities are supporting their local Makerspaces – and vice versa - as a secondary outcome (community support and participation, search for on-going funding, volunteering); and
- progress in learning and utilizing digital skills (adoption by youth, diffusion throughout the community, understanding the value of leveraging data and connected technology in such applications as Indigenous story-telling, culturally relevant games).

The approach of increasing protective factors and encouraging positive social participation through community Makerspaces will both nurture wellbeing while addressing the digital divide in the North. As articulated in our challenge statement, this proposal will use data and connected technology to increase the availability and accessibility of life promoting activities, resources and support systems like peer networks, extra-curricular educational resources, and creative outlets to all Nunavummiut.

Outcomes measurement will focus first and foremost on youth and their personal perceptions of their experiences with Makerspaces. Makerspaces will provide multidisciplinary interventions that focus on the 'whole person', to the extent possible. The observations of Makerspaces leaders and mentors who work with youth are central to measuring progress. And as collective identity is a unique part of Inuit culture, community input will also be important in recognizing success of Makerspaces. Secondly, the performance of communities in supporting Makerspaces will be assessed. Commitment to integrating Makerspaces into communities, engagement through participation, and the ability to secure on-going funding will be included. Finally, the adoption, diffusion, and impact of greater bandwidth access and new digital platforms will be addressed as a third outcome.

It is important to note that performance measurement will not track rates of death by suicide per se as a performance measure due to the multiplicity of determinants. Rather, the *'embrace life'* approach isolates certain variables that do ultimately contribute to social equity. Building youth capacities is the central purpose of Makerspaces. Therefore, outcomes measurement needs to adopt a personal approach where the life of every individual youth is honoured in the calculus of impact.

Assessment measures of change recognize that **social change will occur only incrementally over time**. Measures adopted will not specifically address the standard short, medium- and longer-term perspectives, but rather identify Stage One, Stage Two and Stage Three outcomes. This approach is proposed because length of time may not be the best measure of the *effect* of the outcome. As well, long-term outcomes are likely beyond the scope of measurement in terms of Makerspaces ultimate impacts on social equity. That would take the development of a longitudinal data base extending over generations of youth – which may well receive support and be implemented but is beyond the scope of the Challenge's program.

This initiative is ultimately about **strategic change and a change management** approach needs to be built into the strategic plan. Employees, contract personnel, leaders, partners and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

stakeholders as well as organizations in general need to be equipped to understand and manage the changes that are occurring. Tools, processes, understanding respective roles and interrelationships, and excellent communications about the change process are essential to good management of change. Different ways of doing things or seeing can be threatening to some people and sensitive leadership is needed to allay concerns and recruit champions of change. A formal change management team can be identified and change champions such as vocal parents, articulate youth, other community leaders can help 'walk the talk' within communities to actively keep supporters on side.

Identifying change and drivers in the external environment is a starting point for strategic planning. An environmental assessment can provide a baseline starting point to describe the current situation assessment from which planning will evolve and the factors likely to influence future efforts. It should be noted that due to the staged implementation of Makerspaces in the 25 communities, each will proceed on its own pace due to local circumstances.

The Goals and ultimate outcomes

Makerspaces goals proposed follow the 'SMART' rules of being specific, measurable, attainable, relevant and time-specific. Below is a table of our three overall goals and ultimate outcomes. The outcome is a five-year and beyond state of being that Makerspaces aspire to:

Overall Goals		Ultimate Outcomes
Youth are active in Makerspace 'life	→	**Capable Youth**
Communities support well-run Makerspaces	→	**Permanent, connected, safe Makerspaces**
New digital technologies are effectively used	→	**Reduced digital divide for youth**

Project activities and Links to outputs and outcomes

Activities and their inputs and outputs are linked in an integrated manner as illustrated in the graphic below. The goals will be achieved through effective implementation of the workplan for the initiative as well as a constant attention to whether the outputs are driving the targeted outcomes.

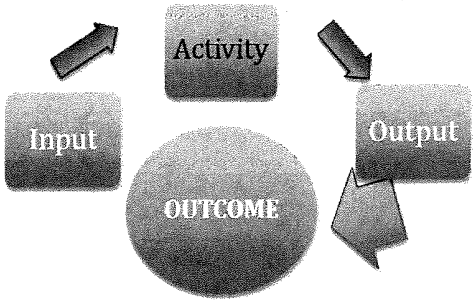

Fig 2: This image represents the input, activity, output, outcome cycle

The Makerspace programming menu adapted from the activities proposed in our preliminary application is described in the Vision Chapter, some of which are further elaborated on in the Technology Chapter. These activities will leverage the benefits of data and connected technology whose operations consist of further activities to be measured. They have been reviewed and revised in response to the feedback received at the Nunavut Association of Municipalities (NAM) AGM.

The Key Performance Indicators

Key performance indicators (KPIs) are presented below and follow the three goals and activity categories identified above. Both qualitative and quantitative KPIs can be constructed from the ones below, as long as data records are kept, and other indicator data are collected and made readily accessible for analysis. As noted above, while data is available regularly – even monthly in many cases – some long-term outcomes can only be shown long after the early participants have been through the program.

Outcome - Capable Youth

Youth capabilities will be measured and assessed through observation, assessment tools, questionnaires and one-on-one interviews, descriptive reports, participant observation, survey evaluation, sharing circles, journaling and voice/video recordings. As well as these more formalized processes to gather input, each KMN-L will be encouraged to establish a "youth council" or some other way for youth to channel feedback as to the effectiveness of the local Makerspaces.

A Personal Growth Chart will be prepared for each participant, the contents of which are a joint project between the Makerspace leader or designated mentor and individual youth. Although data and information will be stored in local data centres, it will be strictly subject to privacy rules. The Growth Chart will use the following indicators and measurement approaches as follows:

Indicators	Measurement
Has acquired new skills and activities	Engages in program activities; Expands number of activities engaged in; Shows proficiency in new skills – coping, technology, language, technology skills; Excels in one or more activities; Has career goals
Has a role model or mentor(s)	Seeks out help and support
	Listens to Elders/other role models
Established new social connections	New friends and peer groups
	Participates in communities of interest
	Participates in peer circles

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

	Intergenerational connections to work with Elders
Has a strong sense of belonging to the community	Participates in traditional cultural and language activities, including storytelling and games
	Participates in community affairs
	Exhibits leadership
Has a positive self-identity	Optimism for the future
	Good self-esteem
	Pride of self
	Feels empowered
	Expresses opinions and speaks out
	Demonstrates self-confidence
	Good eye contact
	Care in personal appearance
	Can define personal values
Perceived progress overall by community	Multiple perspectives: Elders, youth, community leaders, parents, academic institutions, hamlet, teachers

Outcome - Well-run Makerspaces actively supported by communities

Local Makerspaces will be developed through extensive consultation with each community, and community buy-in is a necessary condition to succeed. For the program to succeed, the Makerspaces need to be supported by their communities. At the same time, the way to do this for the Makerspaces is to support the communities – it is a two-way street. KPIs will be developed from the following indicators and measurement approaches:

Indicators	Measurement
Financially self-supporting	New business partners come on board with firm, planned commitments in cash and in kind
	Alternate sources of funding identified and funding streams in place
	Sound funding projections in place to sustain Makerspaces when federal funding ends
	Growing numbers of active community volunteers, partners and stakeholders and participating youth

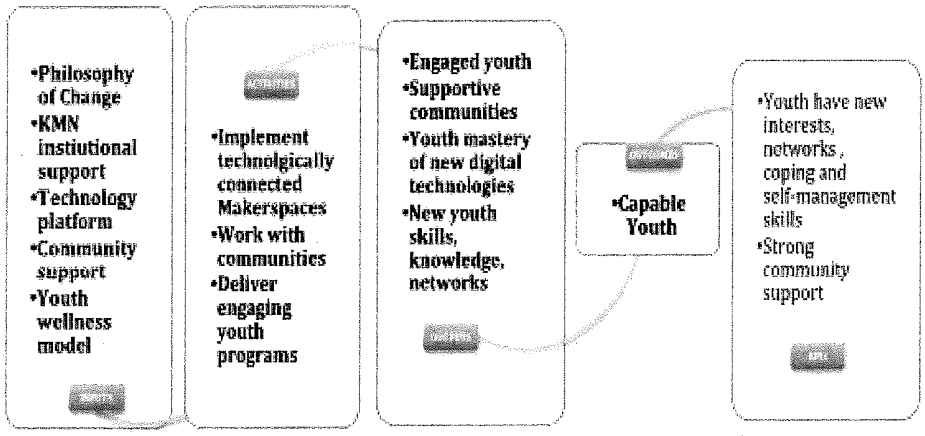
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

	Makerspaces established in all 25 communities
	Meets or exceeds evaluation criteria
	Positive public reports' feedback (exit survey from public presentations)
Increase in community volunteers, partners and stakeholders and numbers of participating youth	Number of youth attending programs at each space, broken down by activity
	Number of volunteers
	New funding/program content partners
	Active community stakeholders on advisory committees, in community consultation sessions
Makerspaces established in 25 communities	Orderly start-ups based on a readiness assessment framework
IMAGINE Canada accreditation of KMN	Plan for certification of good management

Outcome - Effective Use of New Technologies:

The focus is on youth utilization of information technologies, but as they are also members of communities and as their communities are committed to their well-being, of support, measures will include community adoption as well. For example, Elders will learn alongside youth, community data centres can have other uses, and technological learning can be infused as part of a local community's culture. Indicators and measurement approaches proposed are shown in the following table:

Indicators	Measurements
Digital literacy and Learning Practical Skills	Availability of extra-curricular learning tools and resources
	Accessibility of material in Inuktitut
	Offline and Online Accessibility
	Relevance of learning curricula to users
	Relevance of learning tools to users
	Digital art and creative software/applications
	Connection to culture and traditional knowledge
Reduced digital divide	Improved strength of network infrastructure: • Reduced latency • Increased local traffic



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

	Internships and job opportunities in technology
	Digital literacy and Learning Practical Skills
	Digital art and creative software/applications
	Active and positive participation in social media
	Greater creativity in using digital art, games, and story-telling
Increased opportunities to learn and share knowledge, ideas, and know-how	Skills in team working and adopting different roles
	Reverse teaching of digital skills to the elders
	Improving skills in trouble shooting and self-initiative
	Supporting the community through other applications
	Sharing skills, knowledge with other Makerspaces

Logic Model

The following images and tables represent the logic model for this initiative, drawing on the KPIs discussed above and the main work streams for the initiative (see Project Management Chapter). As such, they identify the **inputs, activities, outputs** and their **KPIs,** and the **outcomes** and their **KPIs.** As noted in the instructions to bidders, while these tables present the approach that best fits this initiative – with outputs and outcomes matching each activity - we have respected the requirements for the Performance Measurement Chapter. They are high level and individual KPIs at a more detailed level would be developed from the indicators listed above.

The macro evaluation logic model is presented below:

This image represents a Makerspace MACRO input-output model

For a list of milestone, deliverables, timelines and payment schedule, **please see the section on work streams and work breakdown structure and in Chapter 4: Project Management.**

Inputs	Activities	Outputs	KPIs	Expected Outcomes	KPIs
Activity Focus: KMN Start-up and Operations					
Application participants and pro tem core board members of KMN	Set up Physical Office	Lease signed, network hooked up; publicized move in	Documents for lease, operations Media coverage	High awareness generated for program launch	Positive broad reaction in Nunavut
	Assess capacity and create roll-out plan for communities	Capacity assessment template and system; relevant data acquired; realistic roll-out plan prepared	Accuracy of the data and hamlet assessment	Sets a model for rest of program life, although updated regularly	Accuracy in judgment of communities selected
Local community institutions and leaders	Engage with hamlets and gain commitment – agreements struck	Outreach to all hamlets Listen and revise approach Negotiations with reps from hamlets	Introductory communications to all 25 hamlets MOUs with some hamlets	Positive rapport struck with at least half the hamlets	At least 2/3 of communities show strong interest
Challenge program officials	Negotiate Charter with Challenge Program	Signed contract with performance measurement system and payment schedule by deliverables	Satisfies KMN's cash flow requirements Realistic deliverables	Good communication and rapport established Data capture, reporting practices & established	Initiative operating smoothly with trust relationship
Professional and technical suppliers and stakeholders	Constitute, staff, and incorporate KMN	Interim board, ED, and key staff and register non-profit incorporation	Individuals appointed and incorporation documents submitted	Board and staff model broadly lauded, and operate effectively	KMN starts on the right track ascertained by stakeholders
	Establish KMN operational systems	Put in place office systems, staffing, technical plans, Makerspace packages - complete with support guides for Makerspace space, training, and local organization documents	Installed systems run smoothly Training completed for implementing KMN-Ls	Meet early milestones in creating KMN-Ls with sustained positive hamlet relationships	Positive reactions to the nature of the KMN-KMN-L relationships

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Inputs	Activities	Outputs	KPIs	Expected Outcomes	KPIs
Activity Focus: KMN Content Development and Distribution Platform					
Apply te(a)ch to Platform	Establish initial programming and connectivity plans (e.g. te(a)ch)	Plans with targets and budgets for staging agreements with communities	Plans accepted and implemented	Well-functioning of programming with broad acceptance at youth and community	Number of communities within acceptable success parameters
Leverage te(a)ch Curriculum Train programming directors and technical support	Deploy programming to each participating hamlet	Instructors trained and learning, participation programs launched with full retention of youth participants	#s of youth users retained, good satisfaction score Activities deemed relevant by youth, Elders and community Usage growth and interest results	Programming is well received and effects being effect throughout the community and its youth	Highly satisfactory evaluation of program delivery and personnel competence
	Deploy technical facilities to each participating hamlet	Networks and data centres established, maintained	Schedule and level of detail reporting meets requirements	KMN-L leadership in well-functioning connectivity spurs wider community improvements	# of Makerspaces considered indispensable hubs for community
	Assess/evaluate program and build for sustainability	Program start-up, annual plans for revisions, add-ons Data collection and evaluations undertaken	ED, instructor reviews, youth feedback, community feedback, and KMN-led reviews with main stakeholders	Sustainability plans developed and implementation occurs throughout the program	Impact data indicates success as well as ongoing budget viability
	Develop Elder-Led Curriculum Develop Adult learning curriculum Deploy new programming and updates	New curriculum modules for adult and elder-led Produce updates for all modules according to feedback and regular reviews Distribute to affiliated KMN-Ls	Agreement on operating model, staffing, payment terms and successful roll-out with few outages	Overall combination of programs meeting goals of initiative, at least in the learning materials and their delivery	Community, youth, instructor evaluations of content and delivery effectiveness
	Develop Arctic Internet Exchange program Roll-out IXP and data centre program	Acquisition of equipment, contract with technical services and support local installation with maintenance services		Bandwidth infrastructure considered a great asset for the KMN-L and whole community	User and operational metrics and community satisfaction measures

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

	Train, recruit for follow-up years	Training through on-site and online training in the community and centrally	Cost-benefits in terms of quality and retention of trained staff	Upgraded work force throughout Nunavut for this kind of curriculum and technical elements, and Makerspace management	Operational performance of Makerspaces, community satisfaction and youth achievements

Inputs	Activities	Outputs	KPIs	Expected Outcomes	KPIs
Activity Focus: Manage Local Site Operational Start-up					
KMN advice and support	Build management & accountability structures	Functional offices & management structure	Documented policies and organizational responsibilities	Effective leadership and working relationships	Government & community confidence in KMN-L
KMN systems support	Operationalize reporting and financial management systems	Quarterly performance & financial management reports	Timely quality data that is accessible to the designated users	Accountability for results achieved	Project Charter requirements met on a year by year basis
KMN broadband connectivity requirements Staff training	Install, maintain broadband infrastructure	Advanced broadband activated in Makerspace	Timely installation, training and little downtime	Skilled support staff advance community digital literacy	Transferable skills open up new opportunities
Pilot-test new youth programs	Administer pilot tests to new programs	First cohort pilot tested and lessons learned	Reviews conducted and curricula revised as necessary	Responsive programming New elements added systematically	Satisfactory youth exit survey & parent-Elder feedback
Consultations, information material / meetings & public reporting	Manage Community Relationships	Committed and engaged community	# orgs and individuals actively involved	Long term community support	Active board & advocates; ownership for future by community
KMN support for local Privacy systems	Privacy regime established for local data	Effectively protected personal and community information	Adequate data collection, and guarded distribution practices	Trust and support of data collection and its use	Community and individual confidence in privacy protections

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Inputs	Activities	Outputs	KPIs	Expected Outcomes	KPIs
Activity Focus: Deliver Youth Programs and Activities					
Promotion activities, word of mouth	Recruit / enrol target youth	Broad youth participation	Yearly enrolment increase	All target youth are reached & involved	Youth join as a normal part of development so no one left behind
Trained, enthusiastic, committed instructors Mentoring guides and guidelines	Operate programs and activities: • te(a)ch extra curricular learning • Peer circles • Elder mentoring and traditional language / culture revitalization programs and projects • Recreation • Creative arts • Leadership training	Engaging programs and activities Stronger links to traditional culture and language; new 'interest-based' youth mentors Programming reaching at risk youth	Enrolment increases and expanded # of activities and interests Satisfied youth and parents Active program participation	Development of more capable youth	• Assumes leadership • Active, vocal participation *(attendance)* • Acquires new skills and interests • Has a role model or mentor(s) • Establishes new social connections • Takes pride in personal appearance • Exhibits altruistic behaviour • Exhibits new self confidence Δ
Personal Growth Charts as prepared by program leaders, mentors, health professionals	Document progress jointly with each youth	Record of new skills, know-how, coping mechanisms, knowledge, relationships, participation, networks	Measurable new skills, interests, knowledge, know-how, coping mechanisms, relationships	Improved youth awareness, acceptance of self, focus on community, & care for future	See above attributes of successful outcome

Δ *Assessed through (questionnaires, interviews, observation; assessment of Personal Growth Charts)*

Monitoring, Reporting, and Evaluation

Project Monitoring: This activity will be on-going throughout the 5-year initiative. Monitoring will include data reviews to ensure quality and consistency. It will include client surveys to gather information on the youth experience to make necessary improvements. If early interventions such as additional training are necessary, the monitoring system will pick up such clues through the data collection system. Public meetings are another format that will be utilized on a regular basis that can serve, among other purposes (open communications, stakeholder engagement and consultations), as input to program refinements.

Midterm Progress Assessment (year 3): A more formal external assessment is planned just past the midterm to determine how the initiative launch is shaping up, and to identify issues that need to be addressed in the latter half of the program. Any unidentified risks will be worked back into the project framework. Feedback and more qualitative insights are sought as definitive results will not be evident at this early stage. The purpose is for internal learning and course correction.

The Summative Evaluation is the final, comprehensive impact evaluation which would be carried out by government or by an independent 3rd party at the end of the initiative. As this proposal is confident of on-going sustainability, this evaluation will also be used by Makerspaces to provide guidance to the post-government phase. This evaluation would examine goals and outcomes to determine how well public dollars were spent, whether and to what extent goals and objectives were met and desired outcomes achieved. It is designed to report publicly and for government auditors to address value for money.

Such evaluations are data driven, focusing on the inputs to activities implemented and outputs from them. By definition, this is a medium-term evaluation as longer-term impacts will not likely be visible for several years after the evaluation. Summative evaluations are often used to refine future government interventions and to contribute to the public knowledge and research base for future programming and policy development. The more immediate public to which this initiative is accountable is the local community and this evaluation will be of great interest in the communities and accountability will be rendered there as well about successes and shortcomings. The logic model described in the tables above provides an initial framework for this evaluation, which will be updated according to how the initiative progresses.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Data requirements and collection: Pre-evaluation is sometimes undertaken to get a clearer baseline picture of the state of affairs. However, as there is already sufficient existing population data on the disadvantages in the North, this initiative will instead focus on pulling together **baseline data** and information profiles of communities that line up, to the extent possible, with planned activity inputs and outputs. For example, the number of youths already engaged in recreation or other community activities such as after school programs; numbers of youth with laptops, hours spent on the internet, etc. This review can form part of an 'environmental assessment' which should be undertaken as part of the start-up activities. Such an assessment will provide an opportunity for everyone to understand the environment, challenges, opportunities and risks to the initiative.

Annual audited statements (see Finance Chapter) can also look at value for money, integrity of financial systems and expenditures, risk management, internal controls and the effectiveness of governance. Business processes can be examined for consistency across communities.

Public reporting is an essential part of good governance. An annual report by KMN will be produced that summarizes progress in all the communities. Clearly these reports will be more qualitative in the earlier years. It might use youth attitude surveys and stories to convey how the initiative is unfolding. However hard data on numbers of youth involved, program activity outputs, community participation, will also be included.

One final initiative that the proponents of this initiative are committed to is the creation of a **longitudinal database** that will allow tracking of youth participants through life over a longer period of time. Such data will be important information for Inuit society where the belief is strong that decisions and activities today should result in a sustainable world for future generations. KMN will seek out separate research funding apart from Makerspaces to help design the project so that data systems can be designed at the outset to track individual progress and store additional data. Patterns and trends over a longer period of time are important to addressing fundamental societal issues associated with death by suicide. Inter-generational trauma can take generations to overcome and it is important that Makerspaces not be treated as a one-off initiative. Governments are also interested in replicability when public funds are invested. The Makerspaces model is also relevant to Indigenous communities elsewhere in Canada where rates are also high.

Evaluation Plan

This evaluation plan applies a participatory framework - a method which prioritizes collaboration between researcher and community members through joint planning, implementation, and presentation of the evaluation plan. This participatory framework is focused on collaboration for the continuous adjustment of the program to better meet its goals, and "to improve research protocols by incorporating the knowledge and expertise of community members"[47]. Throughout our plan will be a focus on process at the same time as results, creating opportunities to integrate feedback, and reflection in responses to lessons learned. This evaluation plan will be governed by the KMN board (which will include local representatives from each Hamlet as well as leaders from territorial organizations), and further

[47] Qaujigiartiit Health Research Centre. *Pathways to Mental Wellness for Indigenous Boys and Men: Movember Project Report.* 2018. Web. 10 Jan. 2019.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

developed and implemented by QHRC in collaboration with each hamlet and local delivery organization. In response to the core values of this initiative, the evaluation plan will be:

- **Community-led**: Embrace self-determination through participatory action research and the KMN governance model
- **Strengths-based approach**: work alongside and in consensus with individuals and communities to identify indicators that measure strengths to promote life and wellness through time.
- **Grounded in Inuit Knowledge**: Important that the approach is Inuit specific, holistic and positive; that it supports language and cultural capacity, where the role of Elders and young people are acknowledge and reflected in the development of indicators[48].
- **Capacity building and sustainability**; Foster autonomy and develop capacity for evaluation in the community.
- **Knowledge-sharing and collaboration**: work in partnerships with community, its members and organizations.

Data Collection and Use

Finalizing the indicators selected and clarifying exactly how they feed into medium term outcomes will require extensive community discussions, given the importance of community ownership of its own data and the story told from that data. Assumptions about data collection need to be recorded as a fundamental part of data partnership arrangements within the project management Charter so that there will no misunderstanding regarding expectations and so that any data/system limitations can be addressed early.

Aggregated data at the territorial level is essential to success of the initiative and for accountability back to the federal government. Privacy considerations will, of course, need to be addressed. Personal data will be subject to strict confidentiality rules [see Data and Privacy Chapter/PPIA].

The timelines established for local data collection need to be firmly part of the Charter partnership arrangements in order to meet quarterly reporting to funders. Funding holdbacks will be used to structure reporting in, if necessary.

Data will be collected on a mandatory basis, aggregated and reported into a central electronic database. Data will then be interpreted to assess if goals and milestones are being met. Collecting both qualitative and population or service data at local delivery points will require simple, easy to manage tools. Care will be taken to keep the data reporting system simple and training will be provided. Local Makerspaces leaders will need software to record and interpret behavioral cues as they occur on site to track youth progress in achieving wellness. Leading edge social measurement tools will be utilized through tablets with pre-loaded frameworks and data collection categories so that low literacy or language translation barriers are not deemed impediments.

Interpreting data will result in performance benchmarks over time to create standards of performance. Comparative data will be available by Year Three. Disaggregating data based

[48] *Alianait Inuit Wellness Framework*. Web. 5 Dec. 2018.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

on a small population will be a challenge and care will need to be taken not to assume trends from this data too early.

Performance management software will have to be purchased to enable data entry, storage of information in a structured way, and to provide output information. Software capabilities needed will likely include survey capability, individual case management, a central data storage hub, and data analysis. Ideally the ability to track relationships with partners and stakeholders would be included. System capacity must be able to include qualitative data (observation, attitude surveys, beliefs, values, fears) and quantitative data (services use, population comparisons with other Canadians) to demonstrate progress and measure change. An example of possible software is Efforts to Outcomes (ETO).

Risks

Risk	Description	Action
Project Management		
1. KMN and/or KMN-Ls fall behind schedule	Outcomes and funding milestones are not met	• Early warning project mgt schedule already in place. • Build flexibility into timeframes for unanticipated events. • Early alerts to funders for possible schedule changes
2. More extensive training is required than planned	Inadequate skills to do the job	• Corners cannot be cut on training. • Selection of staff must focus on ability to achieve learning proficiency required.
3. Different data systems lead to uneven and non-comparable data	Established local organizations may have their own data systems and the challenge will be to collect and collate uneven data from a variety of sources.	• Extra technical support in Year One, including provision of standard, simple templates • Good training essential to data integrity – • Up front investment in getting the KPIs is required • Pilots can help refine KPIs if necessary • Flexibility needed to amend as required
4. Data interpretation – qualitative and quantitative	Danger of interpreting meaning in small numbers; challenge to interpret qualitative data	• Good training toward data interpretation reliability • Avoid over reliance on early data interpretations for a small Nunavut population
5. Data integrity	Data will likely be managed by generalists, many with little or no	• Simply designed coding inputs • On-going support and coaching • Good training and refresher courses

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

	knowledge of data collection and systems	
6. Cost of data collection systems	Quality data and information are essential to measuring progress	• Build on existing hamlet data collection and information systems to the extent possible • Less than perfect data and information are often a reality with cost trade-off
7. Hamlets are late submitting data	Flexibility is needed due to unforeseen circumstances, but persistent lateness presents a problem	• Examine overall progress, as lateness in reporting is often symptomatic of problems or inconsistencies in delivery • If persistent, resort to funding holdbacks
Mental Wellness Model		
9. Comprehensiveness of wellness model and complexity of mental health issues	Mental wellness is a complex issue and there may be differing views on appropriate approaches	• Mental health professionals will be asked for input to further identify appropriate protective factors that have been preliminary identified as practical and workable indicators in Makerspaces • Parents and entire communities will be encouraged to be active in supporting youth • KMN model is holistic and integrates many approaches
10. A death by suicide occurs in a community	Confidence in Makerspaces may be damaged	• A death by suicide is devastating for an entire community and the country at large; some children experience extreme adversity earlier in their lives that Makerspaces cannot address. • Staff will be trained with ASIST and trauma-informed practice to provide guidance and first aid to a person at risk in ways that meet their individual safety and privacy needs. When appropriate, mental health experts will be asked to intervene. In no way will Makerspaces staff attempt to provide professional or clinical care. • Parents, teachers, KMN-L leaders, professionals and community members at large need to collaborate on holistic support for each youth – it takes a village • Counseling for parents and youth peers
Community Support		
11. Weak community support	Project stalls due to community misunderstanding or internal resistance	• Inevitable that some individuals may be off-side – important to identify change champions as essential part of change management strategy • Strong local communications and outreach strategies need to be in place to avoid information gaps

12. Engaged parents play a critical role	Parents may be too overstretched to play a strong role; home life may be a mitigating factor	• Parenting sessions and parenting tools will be offered to the community • Professionals can be alerted as necessary • Tools can be developed for parents • Someone on call 24/7 at KMN-L and/or other hotlines
13. Multitasking	Community members are often overstretched with numerous other community responsibilities	• Sufficient resources need to be available to the extent possible to hire staff • Premium to be placed on creating good, full-time jobs
14. Understanding terminology	Language barriers may pose a challenge, as well as a focus on new terminology	• Terminology used will need to be defined clearly in both English and Inuktitut

Chapter 4: Project Management

The purpose of this chapter on Project Management is to show how the initiative would be implemented and managed. It will be organized around several **work streams**, each of which will consist of activities arranged as **tasks** and **subtasks.**

The initiative will, in fact, go well beyond the resources of the Challenge Fund. However, the initiative is triggered by the Fund and thereby accountable to the Challenge Program funders. The Project Management would fulfill the mandate accorded to the Fund's recipient, and as enshrined in a **Project Charter** (or contribution agreement). This Charter would spell out the roles and responsibilities of each party, and the arrangements for releasing the funds according to a milestone schedule. As the instrument to implement the initiative, the Project Management system is situated within the governance framework. The Project Charter is the agreement between the Challenge Fund and the to be constituted Katinnganiq Makerspace Network (KMN). Please see Governance Chapter 2 for the details about the structure and authority of the proposed KMN non-profit organization.

As indicated in the Introduction, the ambition of the initiative is transformative – In that sense the initiative is all about "**change management**". Thus, the Project Management functions are very much oriented toward learning, collaborating, and innovating. An important vehicle in this desire to improve the protective factors of Inuit youth is the utilization of **technology** – improving broadband and its applications and uses to the individual hamlet communities. Accordingly, the Project Management remit includes deploying communications and IT technology - as described later in the Technology Chapter. As a change management process, the Project Management approach must clearly include effective engagement practices to help bring along the targeted communities. This **engagement process** is described in more detail in the Engagement Chapter.

Part of the success of the project will be in the collection and handling of the socio-economic and project data, which is one work steam of Project Management. How the **data generated locally is managed** in terms of maintaining personal and community privacy is discussed in the Data and Privacy Chapter.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The Project Management is governed by the resources from the Challenge as well as other financial and in-kind services supplied elsewhere. The Financial Chapter outlines the **budget** for the initiative, at least for that part that is covered by the Challenge Fund.

This Chapter outlines the proposed project management system for the 5-year life of the initiative under the aegis of the KMN. This not-for-profit organization is to be set up as the proper authority to receive the Challenge grant and be responsible for the expenditure of the public money transferred to it - see the Governance Chapter. It will extend funds and services to locally organized **Makerspaces,** which are referred to as local KMNs, or KNM-Ls in the up to 25 Inuit communities that represent the potential beneficiaries of this project. As such, a central challenge for the project management's is to manage the process of creating the local Makerspaces in each of the hamlets in which there is a locally committed entity to work with the KMN.

The process of setting up and supporting these Makerspaces will include working with partners to establish free, public peering points (Internet Exchange Points) and **data centres** in communities with a Makerspace program. The project management team would be responsible for working with partner suppliers through agreements, contracts and training to help the communities install and maintain these data centres and Internet exchange points – see the Governance and Technology Chapters.

The project management system consists of a project management office (PMO) for receiving and allocating funds, operating an effective financial control system, milestone-based accountability, and the performance management system (see Performance Management Chapter) to evaluate project performance. Through funding it will receive for the Smart Cities the project management will hire, contract, and grant money for services rendered through standard contracting purposes.

Project Management Approach and Principles

The project management approach is designed to fit within the philosophy of all the institutional elements and values describing the Nunavut Territory and this initiative. It is one of collaboration, consensus building, and learning and sharing. It is also about capacity building. The project management approaches and principles that have been followed right from the start of the application process are the following:

Effective Partnerships and Relationships - A culture grounded in common values and principles is essential to project success. These values need to guide behaviour, support customization of local delivery, and enable empowered local sites, consistent with modern management approaches.

Sound Leadership - Dialogue, good communications, supporting a cooperative culture are all dependent on strong, credible leadership committed to a culture of excellence. Selection of the KMN board Chair, members, ED and securing the best talent locally are key ingredients.

Talent Development - The Nunavut Inuit talent pool is small and talented individuals are often multi-focused. Timely development of local leadership, especially youth, is a key dependency of this project. KMN will undertake talent identification jointly with communities and develop and launch practical training programs focused on essential project skills

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

acquisition. Some outside or non-Indigenous talent will be necessary in certain specialized professional areas.

Capacity Development - Shortage of organizational capacity at the local level for management of a makerspace: in this case, the KMN will leverage its resources and work closely with the specific hamlet to support and create capacity within the community. There is also a shortage of teachers/capacity for programs facilitators – which will need "train the trainer" approaches and capacity building programs in terms of curriculum delivery land administrative support.

Self-Sufficiency - While the Nunavut culture of self-sufficiency is strong, extra efforts by both the KMN and local hamlets are essential to securing the future of Makerspaces into the future. Discussions have already been held with supporting stakeholders, and proponents of Makerspaces are optimistic about future funding prospects.

Sustainability – From the beginning it is understood that a major challenge is to ensure the sustainability of the project beyond the lifecycle of the Challenge. This initiative seeks to work with each community to create capacities and implement a sustainable plan for the long-term maintenance of makerspaces, including beyond the life-cycle of this grant.

Transition from Smart Cities Challenge Application

For the past year in the application process, project management has been carried out as a joint venture among the 4 core organizations with the active participation of a range of other Nunavut stakeholders. We have operated under a governing MOU which sets out the authorities and decision-making responsibilities. Pinnguaq has acted as project manager since the shortlist award, while NAM has acted as the financial controller.

Upon notification as a recipient of one of the $10M awards, a transition process will ensue to negotiate the Project Charter and to set up the KMN, as described in the Governance Chapter. The KMN will need at least three Board members (Chair, vice-chair and Treasurer) and one staff (Executive Director) for initial deployment, in order to launch the initiative. In recognizing that individuals wear many hats and the need to support emerging leaders, the collaboration between NAM, PInnguaq, QHRC and Embrace Life Council will act as a transitional board with the workforce capacity to set up the process.

This initial board would elect a chairperson and the board would hire a start-up executive director. As explained in the Governance Chapter, the executive director could be contracted for an interim basis, preferably someone who has been fully involved with the initiative and who has project management skills and experience.

The KMN chair, board and ED will need to set the tone of the initiative at the outset. Makerspaces integrity and securing public trust will depend on sound guardianship of public funds. The Chair will establish a culture of accountability and code of ethics from the outset and ensure that the board has a full sense of the nature of public scrutiny to satisfy donors and board constituents (partners, stakeholders, volunteers).

The KMN board will need to accelerate development of governance tools will both guide and direct key activities across Nunavut, including policies (on essential things like conflict of interest, privacy, accounting requirements, rules of conduct), by-laws, strategic planning requirements/goals with clear goals and milestones to guide the ED's business plan, clear

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

reporting structures, a funding strategy to secure Makerspaces long term future, a community consultation framework, a public communications strategy – among other start-up activities.

Project Management Staffing

Since the main purpose of the KMN is to implement the vision of the initiative, the Project Management team and the staffing of KMN are essentially one and the same. Apart from the executive director, the project management team would consist of the following positions – which could be filled through straight hires or contracts, for full or part time, and for short or long durations. Some individuals might be available for part time, or for a short time, and might be more suitable to start-up than managing the program geared to the creation of a network of effective Makerspaces in each hamlet in Nunavut. The likely early full or part-time hires would be the following:

- **Director of Finance & Development** to establish proper control systems and processes as well as manage the cash flow and accountability requirements for the award recipient, the KMN and to develop a fundraising plan;
- **Outreach and Engagement Coordinator** to work with the executive director to develop the relationships with hamlets that will encourage their starting up the Makerspaces in each community;
- **IT Manager** to work in parallel with the executive director and engagement relations director to oversee the deployment of computer and telecoms equipment and connectivity for the Makerspaces start-up and operations, along with training for staff;
- **Content and services development director** to build on the modules of t(e)ach and other curriculum (or extra-curricular) support material along with digital art and other content material to be distributed to Makerspaces;

Again, the above depiction of opening positions is pro forma only. Some responsibilities might be combined or separated; some positions might be filled by the same person; some may be assumed by a firm as opposed to an individual. The structure may change depending on priorities, and availability and skills of the individuals taking those positions. However, the functions that make up each of these positions are key to the success of Project Management.

Work streams and work breakdown structure

This Chapter translates the vision of this proposal into work streams (milestones) with multiple activities in each stream that are called tasks and sub-tasks (deliverables). The main work streams identified below place the work plan into manageable categories for performance measurement and implementation. The table below shows this work breakdown structure in brief, at the work stream and task level. This table is followed by a text that describes the tasks and subtasks in more detail.

Stream	Task

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Stream 1 - KMN Start-up and Engagement	Task 1.1 – Set up physical office
	Task 1.2 – Constitute KMN
	Task 1.3 – Negotiate Charter with Challenge Program
	Task 1.4 – Set up KMN operational systems
	Task 1.5 – Assess community readiness and select
	Task 1.6 – Create Makerspace roll-out plan
	Task 1.7 – Engage and obtain hamlet commitment
Stream 2 - KMN Content and Platform Development	Task 2.1 - Establish initial programming and technical plans
	Task 2.2 – Leverage Te(a)ch Curriculum
	Task 2.3 – Develop Elder-Led Curriculum
	Task 2.4 – Develop Adult learning curriculum
	Task 2.5 – Develop Arctic Internet Exchange program
	Task 2.6 - Roll-out bandwidth and data centre program
Stream 3 - Deliver Youth Programs and Activities	Task 3.1Deploy programming and training to each participating hamlet Task 3.2 - Operate programs and activities
	Task 3.3 - Draft requirements for interconnected web-based platform
	Task 3.4 - Deploy technical facilities to each participating hamlet
	Task 3.5 - Train, recruit for follow-up years
Stream 4 - Manage the KMN-L start-ups	Task 4.1 Support local KMN-L start-ups
	Task 4.2 – Build management & accountability structures
	Task 4.3 - Deliver training
	Task 4.4 – Support program delivery Operationalize reporting and financial management systems
	Task 4.5 - Develop a Data Privacy System
Stream 5.0 – Performance Measurement, Reporting, and Sustainability	Task 5.1 – Develop Performance Evaluation Framework
	Task 5.2 – Conduct annual performance evaluation

Task 5.3 – Report and conduct independent evaluation

Task 5.4 - Develop a plan for continued and multi-year fundraising

Task 5.5 – Raise new funds

Stream 1.0 – KMN Start-up

Task 1.1 – Set up Physical Office: Find office space for KMN or share space with the current pilot Makerspace location in Iqaluit.

- Negotiate lease, connectivity, services
- Deploy data center and IXP switches and routers at the QHRC office in Iqaluit
- Fit out (as necessary) and move in

Task 1.2 – Constitute KMN: The incorporation of the KMN and the recruitment of the board of directors and staff will take priority in the implementation sequence and will provide the platform for the implementation of the rest of the initiative.

- Incorporate KMN as a not-for-profit
- Establish Interim or first stage Board of Directors
- Set up sub-committees/create bylaws
- Set up Advisory Boards

Task 1.3 – Negotiate Charter with Challenge Program: such a document would in effect be the contract between the recipient of the award and the Challenge Program management.

- Establish negotiating roles and schedule for creating the Charter
- Develop key considerations/provisions of the Charter
- Determine constraints and flexibilities from the government side
- Develop milestones and payment schedules
- Gain board approval and sign

Task 1.4 – Set up KMN operational systems: Such policies as internal quality and financial controls will be put in place, e.g., board approval for expenditures over a certain amount; multiple financial sign-offs; purchasing processes and approvals and guardianship of physical assets; transparency through outside auditors; employee timesheets, etc.

- Develop statement of values and ethics and operating principles
- Develop financial controls and processes
- Create human resources policies, requirements, job descriptions and reporting relationships
- Create detailed budget or first quarter, and pro forma budget for first full year
- Establish organizational and decision-making structure

Task 1.5 – Assess Community Readiness and Select - Makerspaces will be deployed according to a readiness and community capacity assessment framework established by the KMN board.

- Assess community resources, availability of physical spaces, human resources and community social profiles
- Identify local delivery partner to take ownership of makerspace

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Secure agreement (in-principle) with hamlets to proceed with the investment in a Makerspace facility
- Identify communities that will launch Makerspaces in first year

Task 1.6 – Create Makerspace roll-out plan - Develop a detailed roadmap for the rollout of Makerspaces in each community, including steps for engaging communities and obtaining agreements.

- Define the requirements and identify best practices for dialoguing with the communities
- Develop a model agreement ("Project Charter") plan and define KMN's services and investment plan
- Test and modify in association with hamlet councils and other groups

Task 1.7 – Engage and obtain hamlet commitment - KMN will build on its contacts with the hamlets established over the life of this initiative and engage in further consultations. Critical to this engagement is to identify champions at the community level, as well as human resources with sufficient interest, expertise, and motivation to participate in the development and operation of a Makerspace in that community.

- Determine overall Makerspace resource requirements for years one-five and submit resource requirements and final program details to the funder, as required.
- Sign community "Project Charter "agreements staggered over 5 years. The Charter will focus on local ownership for managing delivery.

Stream 2.0 – KMN Content and Platform Development

The existing 75 modules of the te(a)ch k-12 curriculum constitute an important asset for makerspace programming that Pinnguaq Association, in collaboration with its partners, has been developing over the past year. It will become publicly available on March 5th, 2019. This program was supported by ISED's CanCode granting program and will be expanded upon in the Technology Chapter.

Task 2.1 - Establish initial programming and technical plans

- Concurrent with the deployment of Makerspaces will be the development of community data centres running Internet Exchange Points, a neutral routing location where ISP's, content and network services providers, educational and government networks meet ("peer") to interconnect networks.

Task 2.2 – Leverage Te(a)ch Curriculum

- Expand te(a)ch curriculum
- Make expanded curriculum publicly available

Task 2.3 – Develop Elder-Led Curriculum

- Work with Elders to identify preferred knowledge and skills to be worked on
- Work collaboratively with Elders to follow and document processes and create a set of modules around the topic

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Task 2.4 – Develop adult learning curriculum

- Create 40 pieces of adult learning lessons geared towards an introduction to fundamental digital literacy skills and networking

Task 2.5 – Develop Arctic Internet Exchange program

- Contract Nuvujaq, the project's telecoms services partner
- Work with Nuvujaq to leverage its staff and resources to deploy data centres in KMN-Ls as they sign up with KMN
- Work with community to onboard willing peers to the IXP
- Identify suitable location, collaborating with community makerspaces whenever possible
- Create agreement with data centre or land owner (Arctic IX)

Task 2.6 - Roll-out bandwidth and data centre program

- Ship and install data centre (if required)
- Install IXP equipment (1 switch and 2 route servers, pre-configured before shipping)
- Enable peering networks to connect fibre, wireless or satellite to building and/or setup servers and networking equipment within data center

Stream 3.0 – Deliver Youth Programs and Activities

Task 3.1- Deploy programming and training to each participating hamlet

- Recruit/enroll target youth
- Document progress jointly with each youth

Task 3.2 - Operate programs and activities

- Te(a)ch extra-curricular learning, peer circles, elder mentoring and traditional language/culture revitalization programs and projects, recreation, creative arts, leadership training
- Administer pilot tests to new programs
- Deploy new programming and updates

Task 3.3 - Draft requirements for interconnected web-based platform

- Develop user forum
- Coordinate network storage strategy and group software bundles
- Develop local source control repository (i.e. Git)

Task 3.4 - Deploy technical facilities to each participating hamlet

- Install Internet Exchange
- Install, maintain broadband infrastructure

Task 3.5 - Train, recruit for follow-up years

Stream 4.0 - Manage the KMN-L start-ups

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

This stream will be undertaken in adherence to values and principles of modern management - enabling, empowering service deliverers, a shift away from rules-based management. It is also necessary when working in different contexts/locations where a one size fits all rule may not be applicable and local solutions are encouraged.

Task 4.1 Support local KMN-L start-ups

- Recruit and onboard local executive director with appropriate training
- Procure physical space for the community Makerspaces
- Recruit and train (staff should be dedicated full-time and local to the extent possible); technical, managerial and facilitation training will be provided for staff
- Recruit and train local staff for operating the Makerspace, including broadband connectivity and links to the local data centres
- Build, retrofit, furnish, and connect the physical facilities

Task 4.2 – Build management & accountability structures

- Develop bookkeeping systems, uniform financial reporting, job descriptions, results measures, purchasing, codes of care in dealing with youth (police clearances, handling situations, etc.), technology use and training/certification requirements.
- Convert to the Manual which would include templates, processes, incorporation material (including registration and bylaws), leasing agreements (space and equipment) and pro forma budgets and for the local KMNs.

Task 4.3 - Deliver training

- Develop modules for the KMN-L staff and local board
- Administer technical, managerial and facilitation training (ongoing)

Task 4.4 – Support program delivery

- Deliver Laptops through the CFS program (where the Pinnguaq Association works to make computers available to any Nunavummiut or Nunavut based organizations that require them through the Computers for Success Nunavut Program, funded by Computers for Success Canada and ISED.)
- Support local delivery organization in managing the programming of its own space, with access to the te(a)ch curriculum through an e-learning content management system at first, and later integrated into the KMN Network.

Task 4.5 - Develop a Data Privacy System

- Consult with KMN-L and hamlet community
- Design and review with the Privacy Commissioner of Nunavut
- Implement in first year

Stream 5.0 - Performance Measurement, Reporting, and Sustainability

Performance measurement is also key to maintaining public trust. Outcomes measurement through meaningful data is essential to demonstrate that organizational mission and goals are being achieved. Metrics, both quantitative and qualitative, will be established for

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

each activity. Affordable financial systems that can deliver performance data for to guide the ED's business plan and outputs, as well as qualitative social indicators. Sustainability involves making the program attractive to an increasing number of stakeholders and obtaining sufficient revenue sources to sustain the program beyond the 5-year Challenge funding period.

Task 5.1 – Set Performance Evaluation Framework

- Modify identified metrics in collaboration with each community
- Develop evaluation materials

Task 5.2 – Undertake Annual Performance Evaluation

- Collect data for identified metrics
- Year 2 onwards, compare collected data with baseline data collected in previous years
- Incorporate feedback into service delivery and opportunities for course correction

Task 5.3 – Reporting and Independent Evaluation

- Annual public reporting is the tool for conveying this information to funders and constituents. Both written reports and community public meetings will provide the necessary transparency.
- Evaluation is a key aspect of demonstrating performance. Periodic independent evaluation will be undertaken in accordance with funder requirements.

Task 5.4 - Develop a plan for continued and multi-year fundraising

- Prepare different budget levels depending on the rate of roll-out to communities
- Assess impact of new funding sources on the realization of the plan
- Identify sources of funding for different aspects of local makerspaces

Task 5.5 – Raise new funds

- Identify new stakeholder targets for supporting the KMN infrastructure and programs
- Develop campaigns for additional support

Execute campaigns with supporting stakeholders – governments, private/public companies

Identifying and managing risks through risk mitigation strategies

Risk	Description	Mitigation Action
Project Management		
1. KMN and/or KMN-Ls fall behind schedule	Outcomes and funding milestones are not met	• Early warning project mgt schedule already in place. • Build flexibility into timeframes for unanticipated events. • Early alerts to funders for possible schedule changes
2. KMN and/or KMN-Ls fall behind schedule	Outcomes and funding milestones are not met	• Early warning project mgt schedule already in place. • Build flexibility into timeframes for unanticipated events.

		• Early alerts to funders for possible schedule changes
3. Issues arise because of programming has critics, does not fit the community	Some communities may experience problems with the content of the curriculum or its delivery to youth, or cause concern in the community	• Early course material is tried and tested • Exec directors/instructors at KMN-Ls are well trained and encouraged to report issues for resolution • Good community rapport is super-emphasized in the project to avoid communications breakdowns • Courseware will be tested before going into full use • Board members with expertise in wellness services will ensure access to proper wellness guidance
4. Complementary funding falls short, or is late – or is misused	Besides the Challenge program funding, this initiative depends on a variety of other funding sources – and shortfalls could occur; Misuse is always possible at the KMN or KMN-L levels	• Invest in strong control and fundraising skills in key KMN staff, who will take prudent measures to ensure program stability. • Treat fund raising as a continuous activity from the launch of the project • Control function will establish procedures for monitoring, tracking transaction in real time, such as multiple sign-offs on checks, at least 2 level review of bank statements, external audit, etc.
5. Persistent breakdowns of the technical infrastructure	Location of Makerspace, equipment failure, inadequate maintenance, or other causes of interactivity breakdowns	• Work with tried and tested service operators • Train, train, and train the Makerspace team, rather than rely on one maintenance person in the community • Establish an online support service to help a community to troubleshoot.
6. Staff turnover disrupts operations at KMN or KMN-L	Retention in stressful occupations is doubly difficult in the North	• Build redundancy in the overall KMN community, and bring in trainees/interns as a natural outgrowth of a sought-after employment • Bring local communities into the KMN-L family to provide other reasons to stay, grow with Makerspace
7. Youth issues prove to be intractable in some communities, thus jeopardizing Makerspace program	Because there are many pressures on youth in Inuit communities, Makerspaces and its programming may not be able to cope	• KMN's emphasis on community involvement in Makerspaces should reduce exposure to this risk • KMN will have enlisted support from a variety of stakeholders, e.g. social and medical services, hamlet officials, and other service organizations – so

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

		wholistic approach should help mitigate risk

Risk management requires advance preparations for unexpected events that are sure to arise. A two-part strategy will be utilized – prevention and mitigation. [Training and awareness are the best tools for prevention. And effective management practices that ward off any form of corruption, such as multiple sign-offs on checks, at least 2 level review of bank statements, external audit, etc.

Working with youth has unique security requirements as well as youth worker training to work with at-risk youth. Makerspace leaders will need to be knowledgeable of youth services available for referral in the community, including mental health, substance abuse, housing, vocational training, parenting requirements, etc.

Project schedule, deliverables and payment schedule

Because of the simultaneous, circular and collaborative character of this initiative, with several ongoing activities at any given time - we believe that an outcomes-based contribution payment schedule could be provided in four equal amounts, once per quarter, to account for the different ongoing (annual) outcomes, according to the budget submitted.

	Year 1	Year 2	Year 3	Year 4	Year 5
April		$ 532,750.00	$ 538,800.00	$ 526,850.00	$ 537,150.00
June	$ 364,450.00				
August		$ 532,750.00	$ 538,800.00	$ 526,850.00	$ 537,150.00
September	$ 364,450.00				
December	$ 364,450.00	$ 532,750.00	$ 538,800.00	$ 526,850.00	$ 537,150.00
March	$ 364,450.00	$ 532,750.00	$ 538,800.00	$ 526,850.00	$ 537,150.00
Sub -Total	$ 1,457,800.00	$ 2,131,000.00	$2,155,200.00	$2,107,400.00	$2,148,600.00
Total	$ 10,000,000.00				

Below is the Gantt Chart for the project tasks (milestones) according to a schedule for the next 5 years, with the first year being the most detailed one.

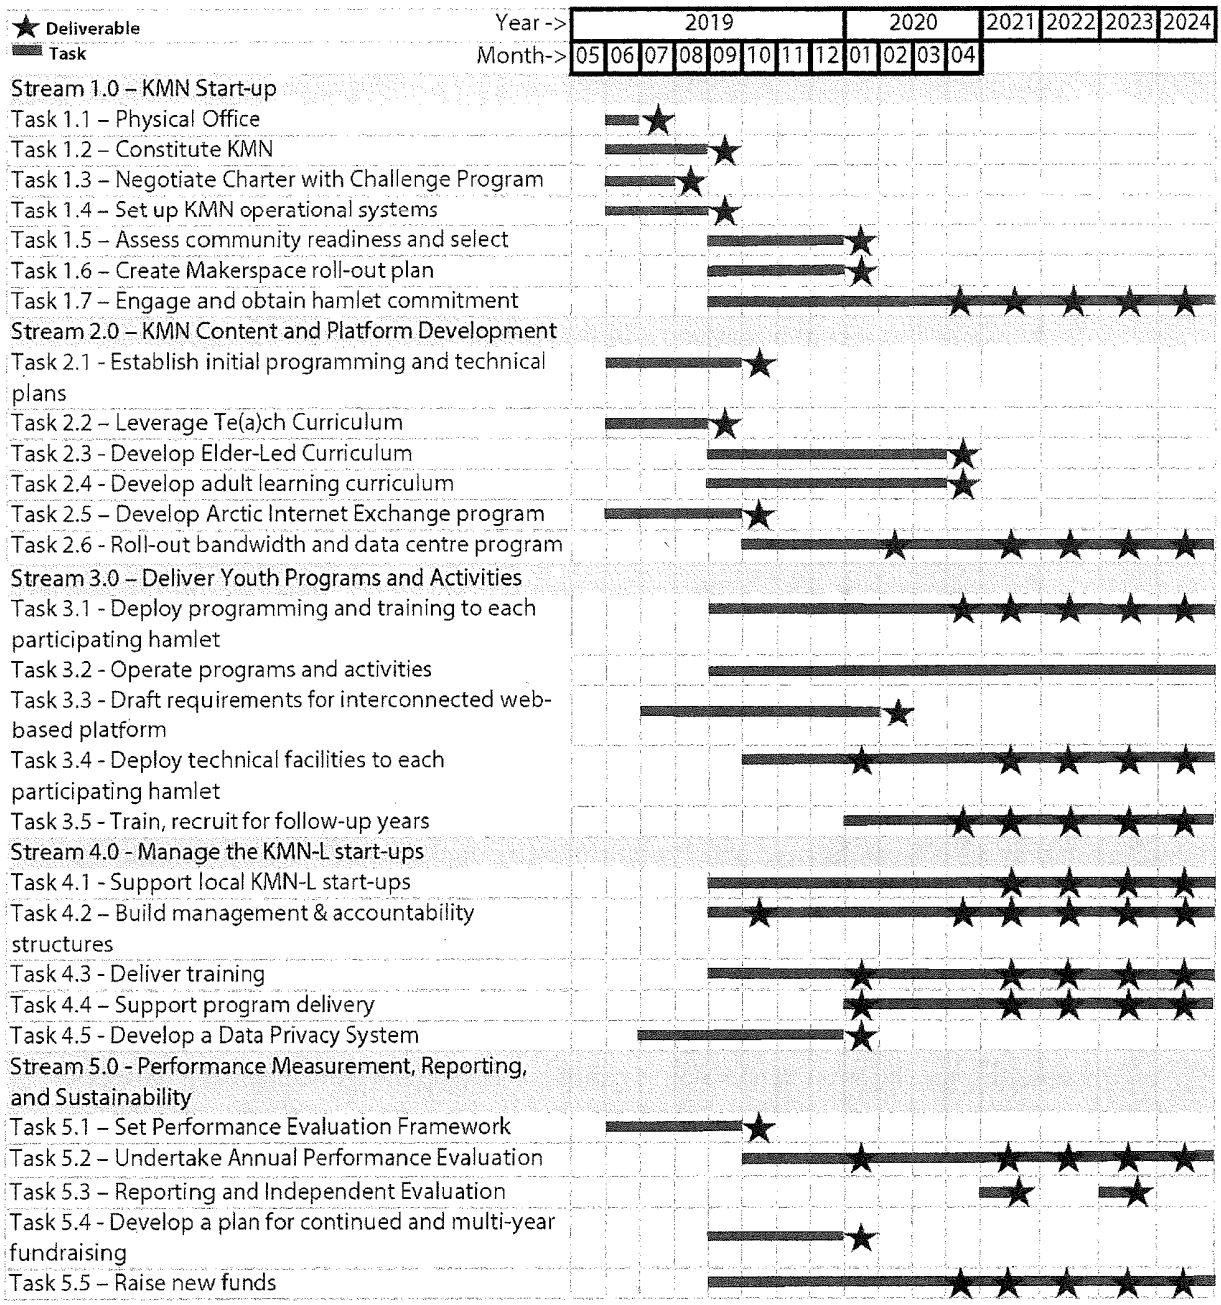

Figure 4: *This figure is Gantt chart outlining the project schedule and deliverables*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 5: Technologies

Currently, internet in Nunavut is connected by satellite, and internet connections are offered to all Nunavut communities by the internet service provider SSi Micro[49]- with connection speeds of 5Mbps delivered by Telesat's C-Band Satellite. However, the connectivity landscape is quickly changing. In July of 2018, Telesat launched Telstar 19 VANTAGE, a new generation Ka-band satellite that combines broad regional beams and powerful high throughput satellite (HTS) spot beams[50], which will service the North with connection speeds of 15Mbs. Northwestel has recently received $49.9 Million in funding from the Canadian Government's Innovation, Sciences, and Economic Development (ISED) department to build 25 new satellite earth stations to deliver this 15Mbps high-speed broadband data to every single Nunavut community by the end of 2019[51]. At the same time, Telesat will deploy a constellation of low-earth-orbit (LEO) satellites (~1,000 km from earth; ~35 times closer than traditional satellites) that will be able to provide fiber-like quality throughput anywhere on earth by 2022[52]

.

Amongst these rapid changes, The KMN will be a source of ongoing support to ensure that Inuit communities gain from these rapid technological advances, benefitting the future of Inuit youth. The technologies presented here will seek to open up local communication portals for both youth and communities to connect; build capacity in children, youth, and adults to gain technical and problem-solving skills; provide opportunities for individuals to gain access to local, relevant, and Inuit-specific content and educational materials, and to provide tools and devices to support the interests and strengths of individuals through central community hubs (makerspaces). The breakdown of activities include the deployment of internet exchange points, the creation of a digital Makerspace network platform, and the deployment and further development of learning and capacity building resources and tools.

The Arctic Internet Exchange

As mentioned, internet in Nunavut is connected by satellite through each network (Northwestel, GN, Qiniq, Ice Wireless, SSi Micro), but those networks do not interconnect, meaning that connecting to a site to and from different networks requires two satellite hops, making connections expensive and slow.

An Internet exchange is an organization responsible for running Internet Exchange Points (IXPs), a neutral routing location where ISPs, content and network service providers, educational and government networks meet ("peer") to interconnect networks. An IXP

---

[49] *Other ISP's like Ice Wireless, Northwestel offer internet services only in select communities, but that will soon change.*

[50] "Telstar 19 VANTAGE Successfully Launched by a SpaceX Falcon 9 rocket from Cape Canveral on July 22, 2018." *Telesat*. N.p., n.d. Web. 26 Feb. 2019. <https://www.telesat.com/our-fleet/Telstar-19-VANTAGE>

[51] *Canadian Radio-television and Telecommunications (CRTC) targets for urban centres as well as in rural and remote areas of Canada is of 50 Mbps download and 10 mbps upload for broadband Internet access services on fixed and mobile wireless networks.*

[52] "Why LEO?" *Telesat*. N.p., n.d. Web. 26 Feb. 2019. <https://www.telesat.com/services/leo/why-leo>

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

establishes a trustworthy location for networks to meet. It keeps local Internet traffic from leaving the community, enables greater security and network services, and often lowers transit costs.

The technology is very simple, the Internet Exchange manages traffic exchanged at an IXP over a shared Layer 2 "switch" which networks connect to and communicate using the Border Gateway Protocol (BGP). Becoming a member of an IXP requires an Autonomous System Number and a network connection from a router to an IXP switchport.

By having networks peer at local IXPs, Internet traffic routes efficiently, avoiding unnecessary long trips. This is especially relevant in remote locations like Nunavut, where Internet is slow, more expensive and often suffers huge latency and congestion over satellite. If networks in Nunavut start interconnecting, a significant portion of traffic that otherwise would have travelled over satellite (and back again) will route directly from one local network to another through the IXP. This will lower the costs to ISPs by decreasing the required satellite traffic (the largest expense for providing service in Nunavut). Not only will local users on different networks have fast connectivity when communicating to each other, but it establishes a community wide platform for high bandwidth applications, content and network services (cloud computing, storage, etc).

Currently in Canada, IXP's exist in Calgary, Edmonton, Halifax, Manitoba, Moncton, Montreal, Ottawa-Gatineau, Saint John, Saskatoon, Saint John and Vancouver. The Arctic Internet Exchange (Arctic IX) has been formed by Nuvujaq Inc and Nunageek Solutions Inc, and is sponsored by the Canadian Internet Registration Authority (CIRA) and the Internet Society. Its intention is to bring Internet service providers, government and educational institutions in the North to connect directly to each other to avoid a waste of resources, while enabling a regional and territorial wide platform for high bandwidth, low latency websites and applications within communities.

The Arctic IX has supported the Katinnganiq Smart Cities Challenge proposal in a collaboration that will see an initial installation of internet exchange points in Nuvujaq's 2 data centres (or in space rented at existing Northwetel/SSi Micro data centres) in five community Makerspaces - thus providing a repository and access point for local content, serving as a learning tool for youth in each community, and improving broadband internet service. Further deployments will be explored and supported where possible, with a hopeful deployment of 25 IXPs' throughout Nunavut communities.

Risks

Understanding and operating an Internet Exchange Point is fairly straightforward, but highly technical. One of the biggest challenges in operating IXPs throughout Nunavut will be overcoming the lack of technical expertise in the community. In order to effectively operate exchanges throughout Nunavut, we will have to provide a tiered support system that includes extensive documentation, technical support and training. This will be addressed through the IXP Network (http://ixp.network/), which promotes research and education of Internet Exchanges and IXP's, and includes building a training and support network that plugs into experts in Iqaluit and the south. Along with Nuvujaq and Nunageek, volunteers from southern exchanges (Calgary, Saskatoon and Toronto) will provide high level technology support and training to local Makerspace staff that are operating a data centre/IXP.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

At the same time one of the primary design goals of Nuvujaq data centres is operational simplicity, with the ultimate goal of functioning with no local technical expertise. We will use a capacity sharing model that relies on one KMN IT position to train makerspace staff to run and maintain the data centres (if applicable) and operate the IXP's.

It is important to note that until GN and Northwestel/Bell decide to peer, an IXP will have little impact, so the primary goal for Arctic IX and the KMN is to work collaboratively with internet service providers to peer locally.

The te(a)ch curriculum

As previously described, the te(a)ch curriculum is a free K-12 computer science program designed for Northern and Arctic communities in Canada with digital content and materials that are culturally responsive to Inuit, First Nation, and Métis ways of knowing. The te(a)ch curriculum meshes a core learning focus of computer science fundamentals with game design, animation, and physical activity grounded in cultural exploration. It is a program with benefits that extend well beyond simply teaching "how a computer thinks". The goal is to implement equitable practices in digital literacy initiatives and harness the strength of Indigenous knowledge and ways of being to build agency and ownership in the use of technology as a creative tool in informed, safe, and positive ways.

The te(a)ch curriculum developed so far comprises 75 lessons or modules designed to support both teachers and students. It has been, and continues to be delivered both through one-week workshops in communities throughout Nunavut and Mushkegowuk Aski, as well as through a custom-made e-learning content management system (CMS). Pinnguaq Association has been developing this curriculum over the past 16 months for the purposes of increasing digital literacy and computer programming skills in the North, with modules soon to be available both in Inuktitut and in English. The first 40 modules will be launched online by March 6th, 2019 at https://pinnguaqlearning.space/. The curriculum lends itself well to be scalable and transferable to other Indigenous, rural, and remote communities across the region, with current adaptations being developed with Curve Lake First Nation. The curriculum is built on the 'Train the Trainer' model, which enables participants to pass on the skills learned in the programs to other community members, and to be a significant resource for teacher training and professional development. The subjects it covers so far include game design, computer fundamentals, online safety, minecraft, art design, digital storytelling, sound design, app development, VR/AR. For a full list and outline of modules, please refer to **Appendix B**.

At the same time Pinnguaq is working to develop and feature intergenerational programming based on Elder-led curriculum geared toward youth that address specific cultural practices, for example, carving, storytelling, printmaking, sewing, and tool-making, to mention of a few - through both physical and digital mediums. The need for this curriculum was re-asserted at the Annual General meeting of the Nunavut Association of Municipalities, which included the mayors of each community in Nunavut. This curriculum will provide an opportunity for Youth and Elders to learn from each others' strengths, build connections and intergenerational support for learning, while expressing cultural identity, documenting traditional practices, and building technologies and resources that support a particular craft and skill. These workshops will introduce the use of new digital skills that preserve and animate

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Inuit cultural heritage and create cultural continuity in a digital environment, while at the same time creating capacity for youth to gain a set of employable and transferable skills.

Additionally, the Pinnguaq Association will be working throughout the next year on adding 40 modules or lessons that will be developed under the principles of adult learning to support digital literacy for community members beyond the k-12 age range. These will address foundations of computing such as *The Absolute Basics*, *Introduction To Coding*, *The Efficient Workplace*, *Web Safety*, *Web Development*, *Online Banking* and *E-Commerce*, *Search Engines, Wikis and Research*, and *Social Media and VoIP Applications,* among others. We also anticipate that as Makerspaces gather momentum and take shape in Nunavut there will likely be a demand for specific learning resources and curriculum to be developed, such as computer networking with an emphasis on BGP/IXP and network maintenance for the KMN Digital Platform. The KMN will work with Pinnguaq Association, along with other partners like Nuvujaq, Nunageek (Arctic IX), and Canada Learning Code to create the appropriate resources and deliver training programs.

Digital tools

Each makerspace will be set up with the necessary tools and equipment to support the programming priorities defined by each community. This will likely include a mix of technologies, including a tiered system of computers (laptops, high end desktops, VR machines), printers, cutters, tablets, cameras, speakers and A/V equipment, robotics, sewing machines, art supplies, electronics, hand tools, carving tools, printing press, etc. While a standard will be developed to support the te(a)ch curriculum, each community will have the flexibility to decide what tools and equipment will be needed, and that is appropriate for their space.

The KMN Digital Platform

The Katinnganiq Makerspace Network (KMN) digital platform has as its purpose to support social connections and collaborations digitally - as well as to enable access to tools and resources for building local capacities among teachers, youth, adults in technical functions. In every makerspace that will feature a computer lab; a digital platform will be setup in conjunction with network architecture that will allow administrators the ability to create individual accounts through a network authentication protocol like Kerberos. Through a Single-Sign-On authentication, community members may gain access to the network platform on any machine, featuring: 1) user forum, 2) network attached storage (NAS), 3) a local source control repository (i.e. Git), and 4) software tools and learning resources.

A user may request a network account by visiting a makerspace and completing a brief orientation. The orientation includes an explanation of the Online Code of Conduct (expanded on in the Data and Privacy chapter) to the user which they must agree to at that time, and an on-site tutorial on how to use the network safely and responsibly. User membership provides access to the resources on the network which are mirrored across all communities, and it also supplies users with storage where they can explore and manage their content. The KMN digital platform includes:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

1. User Forum:

The user forum will enable Makerspace users in different communities to connect with each other to discuss ideas, works in progress, ask questions, propose answers, and learn from each other. The form will be a custom solution based on a tailored LAMP stack application. The site will leverage caching and local storage to accommodate in areas where connectivity can be sporadic. In addition we will be tying users to their unique makerspace account ids to allow for seamless authentication to the forum.

2. Local Lab NAS (Network Attached Storage):

Each space will have a NAS (Network Attached Storage) solution. A NAS system is a storage device connected to a network that allows storage retrieval of data from a centralized location for authorized network users. NAS solutions are low-cost, scalable, and flexible This hardware will maintain a RAID[53] type configuration such as Synology Hybrid Raid (SHR) which will maintain data integrity for the local lab and also be responsible for synchronizing individual user data on individual machines with the master copy in the lab - as well as containing the latest version of a software bundle. If the internet connection is down, user data will still exist in a central location (not on an individual machine) and the NAS will later be able to synchronize data updates with a cloud solution such as google drive when the internet becomes available. This will ensure that it will be feasible to store all user related data in a way where it can synchronize with the NAS and users are free to use any machine and still maintain access to their data

3. A Local Source Control Repository:

The digital platform will host a Git server, which could host multiple repositories for the projects of the program as a whole; providing more reliable, local git access for advanced coders who take advantage of the Makerspace and encouraging collaboration between users. A source control like Git is a fundamental coding skill which is important to teach early to enable students to collaborate on projects, and work on the same code. Some of the options we have been considering are Gogs (100% open source and free of charge; all source code is available under the MIT license on GitHub), and GitLab Community Edition (an open source end-to-end software development platform with built-in version control, issue tracking, code review, CI/CD, and more).

The decentralized nature of Git will facilitate collaboration between Indigenous coders and developers across Makerspace sites, eliminating the requirement of a centralized server and adapting to the uniqueness of rural and remote regions where constant internet access is not always guaranteed. With Git, there is no single point of failure; Data redundancy is intrinsic to the Git decentralized model.

4. Software Bundles and Learning Resources:

---

[53] *RAID (Redundant Array of Independent Disks) is a storage technology that combines multiple disk drive components into a logical unit.*

The network will host quick and easy download bundles for all relevant open source software used in the te(a)ch curriculum (the lessons themselves are built entirely around open source solutions). A master bundle containing all the software to be deployed on each machine will be updated and maintained on a regular basis by the IT Manager of the Katinnganiq Makerspace Network. The software bundle will be intelligent enough to do simple version checks and only update software as necessary when a new version is required, or install new software as it gets added.

Deployment to Master from Cloud: This bundle will live on the cloud. Each space will have one "Master" machine which will be responsible for being in sync with the latest version of the software bundle. We will use a "Team" cloud drive which can be mapped and synchronized with the master lab computer in each space. This would normally be done via an internet connection, however it will also be possible to connect an external harddrive to a NAS (Network Attached Storage) to perform a manual update when necessary.

Deployment to Lab machines from Master: The Master computer in each space will be responsible for deploying the updated bundle to each clone machine. Each machine will essentially be a mirror of the software that lives on the master computer. Whenever there is corruption, an administrator simply needs to re-clone the master machine software onto a new harddrive to install on one of the clone machines.

We can also leverage google drive or similar cloud solutions to synchronize individual user data. Every user will have an account which is connected to cloud storage, and therefore any individuals work, code, saved application settings and customizations will be stored in the cloud and portable to any machine in the lab or at any other space.

For example, open source software available on the network to complement educational resources will include but not be limited to:

- Scratch 3: The latest in the world's most popular 'introduction to programming' software.
- Python: Advance programming for users ready to move beyond Scratch.
- TWINE: Open Source narrative storytelling engine.
- Lua/Love: More advanced but accessible programming engine for advanced programming.
- GraphicsGale: An open source pixel art program that is the subject of at least 5+ te(a)ch lessons
- GIMP: An open source competitor to the Photoshop series.
- Voxel Busters: An open source voxel art program for the creation of voxel based 3D models.
- Blender: An open source 3D modeling program used throughout the te(a)ch curriculum.
- LibreOffice: The latest version of the open source project to compete with the Microsoft Office Suite
- Inkscape 0.92.4: An open source professional vector graphics editor for Windows, Mac OS X and Linux.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Additionally, we will approach existing major companies to provide educational and/or offline versions of their software to the KMN digital platform, which will be complement with curriculum and workshops. These include **Google Suites, Unity, Unreal Engine, Gamemaker,** and others. The KMN digital platform will be built on a number of core principles:

- Replicability: The open source code for this network will be transferable to any new or existing community makerspace that wants to connect (depending on connectivity at each site, this can be done online or through the physical transport of content via airmail on a USB stick), at the same time that it can be used by other rural communities in Canada to create their own network
- Sustainability: With the development of curriculum on networking and network maintenance, alongside the te(a)ch curriculum – local capacities and transitioning plans will be built to monitor and maintain the network
- Offline Accessibility: Given the challenges of regular and consistent Nunavut connectivity, the network will be built to function both online and offline - with updates scheduled when internet is available.

Risks

The biggest risk to these projects are: the availability of internet access at a given time, human capacity to maintain and run these networks, and privacy issues as it relates to open source and connected community networks.

Limited internet access for users: We are addressing this mainly by making the makerspaces public places where technology tools, software, and internet connectivity can be accessed for free – with the support to learn how to use them in creative ways.

Unreliable networks: Connectivity in the Nunavut is unreliable at the best of times. As such, we are building tools that that work as well offline as they do online and that can connect and exchange information at times that don't tax the network. At the same time, we will contribute to improving broadband connectivity by working with the Internet IX to install local data centre and IXP's to improve latency and local traffic

Sustainability and Human Capacity: As addressed throughout the proposal, our focus will be on building technology/infrastructure not just as as end products but as constant learning tools.

Privacy Issues: This initiative will be develop the parameters of data sovereignty within an open source context by developing a strong privacy and data management plan.

Partnerships

The core technology partners in the development and maintenance of the Katinnganiq proposal will build the Katinnganiq Network, networking curriculum, as well set up the Internet Exchange Points and the Nunavut Research Network (with the support of Nunavut Arctic College as a requirement). The core team technology partners include partnerships with both the private and public sector to support the projects as a whole. These are:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- **The Pinnguaq Association:** As a not for profit technology startup and the lead developers of the te(a)ch curriculum,, Pinnguaq will bring its six years of experience delivering technology education in Nunavut to bear in this project.
- **Nuvujaq** is a Nunavut based not-for-profit society incorporated to advocate for improved connectivity in Indigenous, Northern, rural and remote regions and communities.

Chapter 6: Data and Privacy

This chapter addresses the need to develop processes, protocols, standards and agreements that prioritize privacy, safety, sovereignty and Inuit knowledge in data management and sharing design.

While our proposal embraces knowledge sharing, collaboration and open source technologies as processes grounded in Inuit values, our approach to data and privacy also acknowledges the detrimental impact that the prevalence of a colonial approach to research has had on Inuit, "as the most studied Indigenous peoples on earth [...] subjected to egregious abuses by researchers"[54]. This approach has placed Inuit's own role in research as marginal, while the beneficiaries of the research in terms of access to funding, data, research outcomes and career advancement lay with the researchers themselves. As a result, the notion of "open data in the context of indigenous peoples is a double-edged sword. On the one hand, open data could be used to inform development, allocate resources and set a future vision—and to influence wider public opinion and debates. On the other hand, opening up data may be accompanied by concern about protecting indigenous cultural information, rights and intellectual property"[55].

This proposal's approach to research, data and privacy embraces the notion of Inuit data sovereignty, which aims to situate Inuit self-determination at its core by focusing on priorities that are established by, and serve the needs of Inuit in terms of the governance and management of data (including intellectual property) as well as the use of data to support governance and informed decision-making. This proposal, and this chapter focuses on developing data sovereignty networks and parameters to ensure that the creation, collection, analysis and ownership of data is led and owned by the communities themselves.

As it concerns the interrelationships between technology and capacity building - our proposal recognizes that the ability to develop technology and innovation research that reflect Inuit self-determination and data sovereignty is largely contingent on the access of Inuit to digital literacy and capacity building, tools, educational resources and peer and research networks, as well as funding. With a focus on training, capacity-building and ongoing support for both Makerspace staff and users, the KMN will play a pivotal role in supporting individuals in data collection, use and analysis, as well as community ownership, control, access, of the data generated through the different stages of this initiative.

The existing laws governing privacy or personal information and data that are to be considered in this scenario are the Personal Information Protection and Electronic Documents

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Act (*PIPEDA*), and the *Access to Information and Protection of Privacy* (ATIPP) act. PIPEDA is the federal privacy law for private-sector organizations. Though the KMN will be incorporated as a not-for-profit, we will adhere to its principles. On the other hand, the Nunavut ATIPP governs public and governmental bodies and provides the framework for the right to access public records, as well as to protect the privacy of individuals whose personal information is collected, used and disclosed by public bodies. The KMN and its relationship with municipalities and hamlets, along with funding from public bodies provides sufficient context for regulation under ATIPP.

Our data management plan outlined below is aligned with the ten principles outlined by PIPEDA for the protection of personal information by adhering to and promoting the following principles: 1) Accountability, 2) Identifying purposes, 3) Consent, 4) Limiting collection, 5) Limiting use, disclosure, and retention, 6) Accuracy, 7) Safeguards, 8) Openness, 9) Individual access, and 10) Challenging compliance[56]. Our data management plan outlined below is also aligned with Nunavut's Access to Information and Protection of Privacy Act's (ATIPP), as outlined in the chart below.

Data Ecosystem

The KMN staff and board will provide the governance structure and capacity to work with each hamlet/municipality on collecting and analyzing the data and KPI's necessary to effectively manage the design, development, implementation, maintenance, improvement, and evaluation of this initiative.

In terms of the data life cycle, we will comply both with PIPEDA and ATIPP as described in the following outline. At the same time, we acknowledge that some aspects of this outline will require more detailed solutions as community-led projects are developed - and we look forward to working with the Privacy Commissioner of Nunavut to flesh them out as we move forward.

The data ecosystem in this proposal is broad, and is organized below to provide more clarity on what data elements will be collected.

Data Life Cycle	**Makerspace Data** (registration and attendance)	**Digital Platform Data** (User forum, Local storage NAS, Git, e-learning resources and participants work)	**Consultation & Evaluation Data** (KPI's)	**Authority**
Elements	Name, contact information (or that of parent/guardian), age, community/location, sex, ethnicity, food allergy information	E-mail address, username, user-generated data (messages, photos, code, art projects)	Quantitative and qualitative (opinions + thoughts) data relating to KPI's as outlined in Chapter 3: Performance Measurement. Data will	

[56] *Privacy Toolkit for Businesses*. Office of the Privacy Commissioner of Canada. Web. 8 Feb. 2019. <https://www.priv.gc.ca/media/2038/guide_org_e.pdf>

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

			be collected anonymously through simple and easy to read and manage tools (accounting for varying literacy levels and staff capacity)	
Collection	Seek written, valid, and informed consent from each individual for the collection of personal information and data. Outline who is collecting the data and for what purpose. At any point in time, an individual has the right to revoke their consent for the use of their personal information, along with the right to correction.			ATIPP - Part 2, Articles 40 and 41. ATIPP - Part 2: Articles 45
Use and Analysis	Data will be used to design programs catered to age group of attendees, as well as to protect individuals from possible contamination and risk to known allergens at each local makerspace.	Data will be used locally at Makerspace, according to individual desires (such as for feedback, collaborations or problem-solving) and sharing preferences. Interface design will enable users to delete their own content.	Evaluation data will be used and analyzed locally by staff working closely with central KMN partner for performance measurement. The data will be used to inform decision-making and improve programs.	ATIPP - Part 2, Article 43, 44
Storage	Physical (forms) and digital (spreadsheets) files stored at each Makerspace. File formats will conform to open standards and software whenever possible	Individual user data will be synchronized and stored both locally on an encrypted Network Attached storage device and on the cloud using a service such as Google Drive with data encryption.	Data will be stored and centralized within a central electronic database particular software (for example Efforts to Outcomes)	ATIPP - Part 2, Article 44
Trans-mission	Data will only be accessed by authorized staff at the Makerspace.	All data transfers will feature end-to-end encryption using software such as Synology Cloud Sync	Data will only be accessed by authorized staff, in password protected computers. Data will be encrypted in software like..	ATIPP - Part 2, Article 42

Sharing (disclosure) & distribution	Makerspace registration data will not be shared with any third-parties, and remain for the sole use of Makerspace staff to deliver programs.	Each individual will own their own data in the Network and share with others at will.	Data will be shared privately through accountability reports to funders, as well as internally with the KMN board and each Hamlet council. It will also be publically through published reports.	ATIPP - Part 2, Article 47, 48, 49
Re-Use and derivative production	Derivative production will be determined by individual users or communities as the owners of their own data. If the KMN will take on any derivative production or re-use of data (for example to improve services and performance with the creation of new tools, services, or products), it will do so with valid and informed consent, and through the principles of consensus with affected communities.			ATIPP - Part 2, Article 43, 44, 47, 48, 49
Archiving and Preservation	The data and personal informational elements will be kept on file for at least 12 months, and will adhere to the right to be forgotten.	The long term archiving and preservation of data utilized throughout this project will be collected in digital and physical exhibitions, integrated into curriculum, form part of working projects and used in evaluation and published (and/or peer-reviewed) papers or reports. Data will be archived in the user forum under each person's account indefinitely or until the user deletes it or requests it to be deleted.		ATIPP - Part 2, Article 44
Disposal	We will adhere to the right to be forgotten by erasing personal data and information on file as requested by individuals.			Right to be forgotten
Security	Files kept secure in administrative files on secure computer. Makerspaces will be locked after-hours and equipped with alarm where possible.	Single-Sign-on authentication (Kerberos) and NAS synchronization with encrypted software (Synology)		ATIPP - Part 2, Article 42
Access	Each individual and community will maintain their right to access a copy of the data to see how it is being used, and as preliminary step to the exercise of further rights like rectification and erasure.			Right to Access

A big part of this project and of defining the parameters for Inuit data sovereignty will include the development of a more detailed framework that outlines clear protocols with respect to indigenous intellectual property rights, which identify the consents required to access and use high-value cultural information[57]. At minimum each community will have control and oversight of how the data collected is used, and will be supported by the KMN IT Manager through hands-on training, along with reference materials like the KMN Operating Manual.

[57] Smith, Diane E. *Governing Data and Data for Governance: The Everyday Practice of Indigenous Sovereignty*. Australia: ANU Press, The Australian National University, 2016. Page 131. Web. 10 Dec. 2018.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The KMN will provide direction on how to collect, analyze and use the data to inform-decision making, improve program delivery, reporting, and evaluation that ties back to specific agreements between the KMN and local makerspaces regarding performance measurement, with a priority on supporting community-owned data. At this stage, data may be aggregated and de-identified so that anonymity is guaranteed, thus protecting release of data from a specific community

We recognize the importance of user safety on a community network. To keep both physical and digital spaces safe, the KMN will develop a code of conduct as part of the operations manual as a resource for every makerspace to modify and implement. The user forum's content will also need to be centrally moderated periodically by the KMN IT Manager to make sure it is free of aggression or harassment, and are users abiding by the code of conduct.

Risks

Breach of security by staff or through insecure and vulnerable devices: We will prioritize staff training on privacy issues, set up confidentiality clauses as part of employment contracts and provide training for troubleshooting procedures to increase privacy settings of computers and devices. The technicalities in data collection need to be addressed through simplicity and training in the face of limited human capacity.

Users breach others users privacy: to mitigate this risk we will also provide training on how to use the network responsibly, as well as how to use adequate safeguards and practices. Additionally we will strictly require that everyone adheres to the privacy and code of conduct for both physical and digital spaces, highlighting and enforcing an environment of respect.

Cyberbullying: to mitigate the risks of cyberbullying we again, highlight an environment of respect and enforce our code of conduct, while at the same time integrating forum moderation into a staff position, most likely the IT Manager position at KMN. The moderator would be able to flag and take-down content that is deemed to be inappropriate, offensive or trigger-sensitive. At the same time, the te(a)ch curriculum contains a few modules on online and media safety that could be delivered by staff.

Chapter 7: Engagement

Inuit Cultural practice and the principals of Inuit Qaujimajatuqangit (the Inuit way of knowing) guide the Katinnganiq project in every step of its implementation plan and governance framework. These principles serve as guidance for our engagement philosophy, providing a check for our team who are both non-Inuit and Inuit, to ensure we are wrapping ourselves in a methodology that reflects the way Inuit have shaped the direction of their own success. These principals, when embraced as a core engagement philosophy ensure a process that will be collaborative and responsive to the needs of Nunavummiut. Specifically we root our engagement in the following principles:

Inuuqatigiitsiarniq (Respecting others, relationships and caring for people): At the core of any project centered around health, wellness and suicide prevention is a need to ensure that

respect and care for the people we're working with is centered at our engagement process. This means engaging in a care based model of listening, and challenging one's own assumptions of what is a 'best' or necessary approach.

Aajiiqatigiinniq (Decision making through discussion and consensus): From the beginning we have practiced acceptance in that we don't know the answers that will work for every community. The proposal that you are reading today was arrived at through lengthy discussions and involved collaborations between the four organizing partners, taking into account community feedback. Moving forward, the implementation and success of this initiative will require that discussion and consensus be placed at the heart of the decision-making process and govern the relationships between the KMN and each community. When engaging with partners and individual residents, our reliance on the principal of *Aajiiqatigiinniq* will mean we are first and foremost listening and adjusting our outcomes for each unique community and the vision they identify.

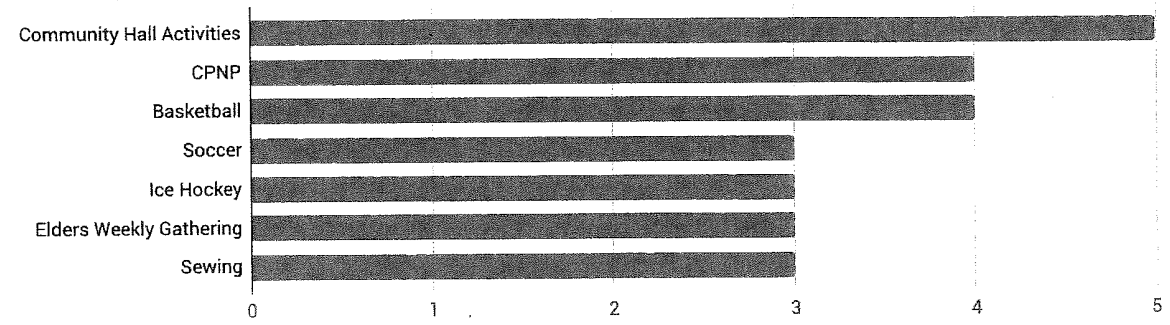
Piliriqatigiinniq/Ikajuqtigiinniq (Working together for a common cause); The challenge statement identified in this initiative is one that resonates throughout the Territory with all Nunavummiut. Throughout our engagements past and future, our focus will remain on working together for this common cause, understanding that a unified, collective and holistic approach will have the most impact.

Moving forward, the KMN will work specifically with each community through conversations with Mayors, Senior Administrative Officers and Hamlet Councils, as well as with Recreation coordinators and community residents of all ages to identify their strengths and desires. It will conduct consultations and environmental assessments with each community to develop an implementation plan that responds to their vision, resources, capacity and readiness. The success of local makerspaces and of this initiative as a whole will be built on meaningful dialogues and engagements that enable a community-led approach to systems change through Makerspace deployment.

The proposal that is presented in this document was shaped in significant ways not by one or two pivotal moments but through a series of meetings, phone calls and conversations between the four collaborating organizations that brought forth for discussion their particular mandates and areas of expertise. These discussions were informed at different points by feedback gathered from our outreach efforts. During the preliminary proposal stage, every community provided a support letter for the initiative, but one of the most important opportunities we had this year was the chance to present, in person, the vision of the Katinnganiq proposal to the Mayor's at the Nunavut Association of Municipalities Annual General Meeting in Cambridge Bay (which also coincided with Infrastructure Canada's site visit). After our presentation we heard feedback from Mayors that included the following:

- A re-assertion of the need for space for youth and youth services in their community, since in most communities the majority of people are young
- A desire to see these spaces engage Elders as well as Youth - and facilitate teachings between them; A need for physical space where Elders and Youth to come together, learn Inuit traditions and work together to help each other go forward.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

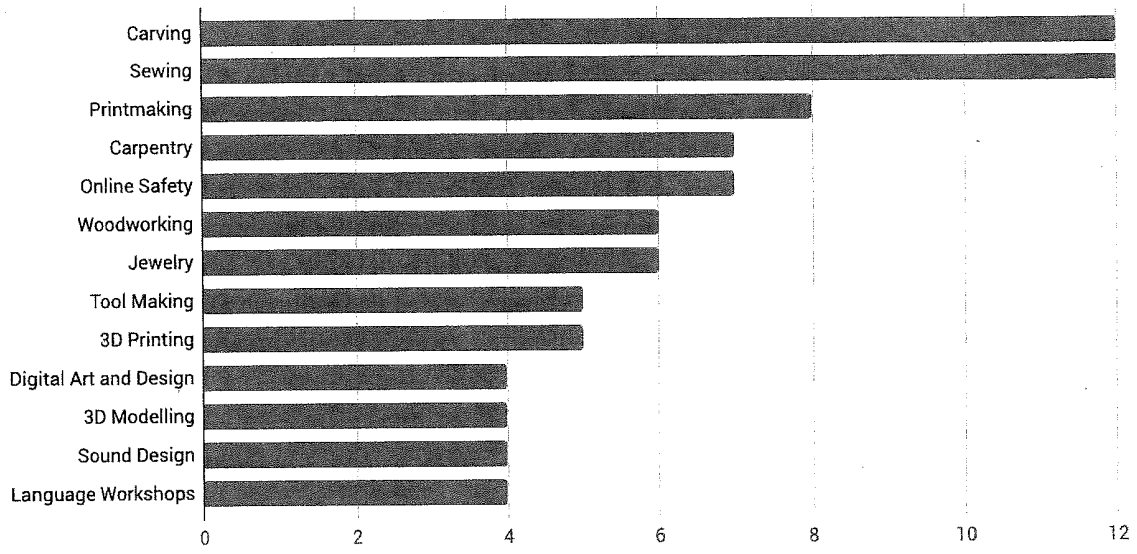


- A need for this initiative to reach the most vulnerable youth in every community - in terms of both space and curriculum - to give them a space to be and to learn. This is especially important for the pilot Makerspace in Iqaluit and the need to diversify inclusion approaches
- Curriculum must engage Elders and allow for Elder-led learning, on topics of their choice.
- Spaces need to address tool making between Elders and Youth, especially for hunting, and assist Elders in delivering those skills
- There is a need to teach Youth how to survive on the land, so there is a need to leverage technology for use on the land
- The proposal needs to expand definition of technology to include Inuit tools and skills
- That there is need to work together between communities - and that this project can be an avenue for working together
- That technology, curriculum, tools and learning environment needs to support language revitalization, to maintain the use of one's own dialect and support traditional knowledge

This feedback at the NAM AGM resonated with the internal conversations we were having, and became a framework for which to ground the proposal in. Throughout the following months, we've attempted to articulate the above and integrate this feedback into the vision of what a 'smart city' looks like in Nunavut.

Throughout the finalist phase we communicated by phone and by email with each municipality to share more information on the proposal, to request their input through a community survey, and to ask for a letter of support for the finalist phase. One of the other important opportunities for face to face consultation was when in January 2019, two members of our team travelled to Pond Inlet, Pangnirtung, and Qikiqtarjuaq to conduct consultation sessions with community members as well as with Senior Administrative Officials and Hamlet employees. In this trip, our team led a community session in Pond Inlet, but the rest of the trip was marked by adverse weather and travel conditions which delayed and cancelled flights, forcing them to reschedule travel plans. At the community consultation in Pond Inlet, 31 community members attended and provided answers to a set of four questions, which have been compiled below:

1. ***What general activities or wellness activities does your community already have?***



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Additional Answers

Volleyball (2) • Kids hockey (2) • Floor hockey (2) • Badminton (2) • Public arena (2) • Men's group (2) • AA meeting (2) • Indoor sports (2) • Pre-school (2) • Holiday square dancing (2) • Playing games (2) • Outdoor games • Game competitions • Tea party • Annual meetings for games • Prenatal • Art • Community wellness centre • School • Dances • After-school programs • Hunting and learning survival skills • All season hunting • Family grieving, healing • Fishing competitions • Science camp (summer) • Need more showing art and making Amauti

2. What are activities for wellness that you want to be doing?

Game Design (3) • Digital storytelling (3) • Computer Fundamentals (3) • Games (2) • App Development (2) • AR/VR (2) • Art (2) • Design • Beading • Crocheting • Knitting • Making Amauti • Leather making • Photography • Tools, stones and a proper facility for safe and proper learning skills in livelihood and economic benefits • Drop-in centre for children and youth • Teach young children about the dangers of drugs • Out on the land, hunting • Anything that includes training • Fishing • More activities for kids (6-10 year olds) • Homemade clothing to sell or something useful • Small engine repair training • Youth engagement with the land and parks • Language training for both Inuit and non-Inuit • Supper-making for children and youth (bringing home ingredients and left-overs)

3. What would you like to see be part of a makerspace in your community?
Theater (2) • Swimming (2) • Youth centre (2) • More public space to gather • Coffee • Office administration skills • Life skills • Cooking • Need house or workshop to do most of the above • Blacksmiths • More general activities for the youth • Marketing skills • More funding that suits local needs for betterment of the beneficiaries • Sewing • Printing art • Traditional Inuit stories made into cartoons • Getting ready for jobs for youth (how to make resumes, how to be prepared for a new career) • Making traditional clothing with youth • Youth involved with adults who are willing, and learn from them and the skills they have • Teach teenagers how to make homemade stuff • Carving • All ages learning something together • Storytelling • Courses on heritage and history • Making resumes • A shack and more staff • More public space for children and youth • Young people telling stories in their community

4. Do you have a skill that you would like to teach, support and mentor youth with?
Sewing (4) • Out on the land programs (2) • Yes, to tell and to show • Photography • Arts • Carving skills for over 18 years • Marketing art • Quarrying stones • Safety skills • Making Amauti and Parkas • Exploring patterns of clothing • How to work with leather (but no tools, etc) • Hunting, Fishing • Baking • Different kinds of design for hats, parkas, mittens and kamiks • Skinning seal and polar bear skin • Counseling and Healing • Talking with youth • I would like to learn too • We need to learn more

This information is part of the community level consultation that will be continued throughout the implementation of the initiative and inform each community's vision for their makerspace.

Another engagement opportunity we had was regarding Elder-led curriculum development. In Nunavut, Elders have said that strong relationships are the most important factors in child development. The *Inuit Qaujimajatugangit (IQ Principles)* identify a set of values and beliefs which they feel are critical to positive personal development, as well as essential guiding principles essential for all Inuit. Over the course of one week, our curriculum development team from Pinnguaq Association and QHRC travelled to Arviat, NU to meet with the Aqqiumavvik Society to discuss the process of developing Inuit-specific culturally-based curriculum based on the principles of *Inuit Qaujimajatuqangit*.

Over the course of of this week our curriculum development team met with Shirley Tagalik, Joe Karetak and Elder Louis Angalik to learn about Inuit Qaujimajatuqangit Education Framework, and did a land trip with the Arviat Young Hunters Association and the Smart Ice Programme[58]. They also met with local business owners to learn how they are using technology. This included Eskimo Point Lumber Supply (a local hardware and construction and maintenance business), the Arctic Co-operatives Limited, Hunters and Trappers Organization, Kiluk Ltd. (a local business focused on the production of fur and leather clothing), and the Hamlet of Arviat.

Lessons learned include the re-assertion that every community has their own unique needs and approaches to education and that curriculum development must be Nunavut-Inuit focused, and implementation must be responsive to the differing needs of each community. It not only helps preserve important knowledge and tradition, but also provides an Inuit

[58] *SmartIce is an award-winning technological innovation for the North, it's the world's first climate change adaptation tool to integrate cultural knowledge of sea ice with advanced data acquisition and remote monitoring technology to study climate change. This was a great example of an organization that works with local experts.*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

perspective on personal growth and development, and how we relate to each other, to other living beings, and to the environment.

In the past few months we have also onboarded an Advisory Committee to provide feedback on the proposal as it was being developed. There were 7 members of the Advisory Committee included: Kathleen Gomes (First Nations Bank), Alisa Praamsma (Mental Halth Commission of Canada, Lynn Stevenson (Canadian Foundation for Healthcare Improvement, Mara Grunau (Centre for Suicide Prevention), Charlotte Borg (Board of the Nunavut Kamatsiaqtut Helpline), Jesse Mike (Nunavut Literacy Council), and Joshua Nash (Canadian Federation of Medical Students). The Advisory Committee met twice through teleconference. The first meeting was on November 19th, 2018 which presented the revised vision of the proposal. The second meeting took place on January 22nd, 2019 which presented progress done to date. In both cases the Advisory Committee was able to provide feedback and resources for continued development of the proposal.

In general, our project engagement focused on three major strategies, all three of which will continue as the project moves forward.

- Territorial Gatherings

Getting together representatives of all 25 communities in Nunavut is an expensive and rare thing, but a few key events throughout the year allow the Katinnganiq team to share and request feedback on the project. The major gathering for consultation at the municipal level was the NAM AGM. With the participation of NAM on the board of the KMN, this will continue to be an important meeting moving forward to be able to report, request feedback, and have face-to-face conversations with Mayors and Senior Administrative Officials to address any collective action to be taken. Additionally, the KMN will seek to be present at other gatherings such as the Nunavut Economic Developers Association annual meeting to engage face to face whenever possible.

- Community Engagement

In the development of this proposal, engaging with community members at large in community visits were an excellent method to talk to individuals and learn about what they would like to see as part of this initiative. These opinions will shape the vision for their local makerspace as it is being developed. At the same time, one-on-one meetings with Hamlets were productive in understanding the intricacies of each one's unique situation, and will be necessary for the planning and implementation of this initiative into the future. With a governance framework that includes the broad representation of municipalities, Inuit organizations and leaders in both the public/private sectors of each community we will continue to build on consultations and engagement as a necessary and essential part of what this project hopes to achieve.

- Technology as a Connector

Already Nunavummiut are utilizing technology to share and expand their cultural practices, and the Katinniganiq project will leverage those existing uses for engagement in the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

project. Facebook is a good example, with high usage in the North. Our engagement strategy includes a heavy use of Facebook and social media, along with our website as important information and outreach tools.

Though our experiences have been positive so far, consultation does not come without criticism. It is important to note that the constructive feedback we received, along with lessons learned through our team's experience, be processed and utilized to better improve our efforts. For example, though the spaces proposed in this initiative are intended to be led by and serve Inuit communities, it has been vocalized by leaders that these spaces need to include the most vulnerable sectors of each community, including individuals from low-income households, those who are un or underemployed, individuals who have not graduated from high-sch individuals who are differently abled. To address this, it should be important to make sur outreach and access is continuously part of the administrative process, and that accessib and inclusivity be integrated by design into both the physical spaces and the technologie utilized so that inequalities are not exacerbated or maintained.

With regard to accessibility, and underscoring that a part of this initiative concern language revitalization, it is important to acknowledge the role of language and unilingu speakers. Throughout the engagement processes of this initiative, we have developed ou materials in both Inuktitut and in English, as well as relied on live interpretation when ne

Another important point that has been made is the need to support economic development and career opportunities in the territory through the funding that is made available by this prize or other fundraising initiatives. To address this, it will be necessary for the planned incorporation of the KMN organization (that will manage the smart cities and other funds) to be based in Nunavut and hire Nunavummiut, prioritizing Nunavut Land Claim beneficiaries. At the same time - the KMN will fulfill its role to support training for local staff and integrate capacity building through its services.

Risks

This is a project of immense magnitude that is faced with particular obstacles in terms of access to technology, distance, and human resources to coordinate communications and engagement. Below is a description of some of the major risks we have identified for engagement, along with the mitigation strategies we will be incorporating:

Restricted Communication Channels: Every community and every individual experiences things differently and no one mode of communication can be taken for granted. Our teams understands the value of a multi communications approach and will focus on ensuring engagement can be done equally through community radio, social media, email newsletters, and personal engagement, with a priority on written and verbal content in Inuktitut.

Distance and Travel: Travel to each of the 25 communities is incredibly expensive for anyone in the territory. While engagement will be ongoing and regular with a budget for necessary travel from a base in Iqaluit, this project prioritizes a community-led approach supported with training and digital communications to collaborate and achieve results.

High Turnover/Skills Capacity: Staff Turnover in Nunavut is always high as people move from opportunity to opportunity. Maintaining consistent staff and building capacity in each community to see these projects through will be a constant challenge. Throughout the proposal, our approach includes training and capacity building for both participants and staff through a 'Train the Trainer' model - and budgets to prioritize well paid employment opportunities.

Feedback integration: Consultation and engagement yield important feedback for project managers and leaders to consider - yet there is always a risk that feedback provided won't be incorporated into project design and implementation. We will strengthen a community-led process, with individual Hamlets, local organizations and community members as the ultimate decision makers with the power to integrate aspects of the proposal that have not been considered.

Chapter 8: Implementation

The jurisdiction of this entry into the Smart Cities Challenge is governed by the the Nunavut Land Claims Agreement and represents an Inuit population of 84%. This section will lay out how the implementation of this initiative will be built in alignment with the articles of the Nunavut Lands Claim Agreement, alongside the values of Inuit Qaujimajatuqangit. The principals themselves are intuitively compatible with duties to consult, employment benefits and respect for the land through a process that complies with all our requirements under global, federal, territorial, municipal and Inuit law.

Duty To Consult with Indigenous Groups

As detailed in Chapter 6 on Engagement, the duty of the Katinnganiq proposal to consult with our communities is a central piece for the implementation of the project. NAM, as the lead proponent for this initiative is key. The group provides a single voice for mayors and municipal administrators of the territory's 25 communities. NAM leads this duty to consult at the highest level, working daily with municipal leaders on every decision and soliciting feedback throughout the process. The association was formed to make important contributions to decisions about Nunavut communities and capital projects, with Katinnganiq fitting naturally into that discussion. As noted in the Engagement chapter, we lean heavily on Aajiiqatigiinniq (decision making through discussion and consensus) which means that the duty to consult extends beyond just this initial phase of the development of a proposal and is a core value that spans the entire project.

Modern Treaty Obligations

Nunavut sits on the largest settled land claim in the entire world. The respect for the terms of that land claims agreement will be a core tenet of the implementation phase. Given the size and scope of this proposed project and the source of the funding, this project as a whole and the proposed KMN organization in particular will adhere to the articles of the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Nunavut Land Claims Agreement[59] as they relate to the project's implementation. There are certain obligations under the NLCA that are relevant to this project. They include;

Article 23: Inuit Employment Within Government[60]: While this article directly relates to employment within the Government, Katinnganiq is committed to support and encourage a workforce that is reflective of the population it serves by prioritizing Inuit in leadership positions and building capacity for emerging and young leaders. We will develop an Inuit employment plan that specifically focuses on training and support in the ICT sector, along with training in administration, bookkeeping, management and program facilitation - with both digital materials and in-person delivery.

In addition to the types of education and employment plans that stakeholders organizations in this project already have in place, we developed employment strategies modeled on the Government of Nunavut's own hiring policies which put priority on Inuit hiring and are rooted in Part 4 and 5 of Article 23 of the Inuit Employment Plan.

Article 24: Government Contracts[61]: This Article will govern how the KMN project commits to administering and distributing any government funds. We will actively seek out and encourage Inuit firm involvement as primary partners in delivery, and support local businesses. While much of the NLCA is designed to discuss the interaction between Inuit and various levels of Government, the spirit of the agreement remains relevant and vital to what we are aiming to do. Respect for the NLCA in the implementation of the Katinnganiq project is paramount.

Community Employment Benefit

Implementation of this initiative will adhere to and complement the CEB as outlined by Infrastructure Canada. Our implementation of the Nunavut Land claims Agreement will address both employment and procurement opportunities for Indigenous peoples (specifically Inuit) and Inuit firms throughout the life of this project. At the same time, we will encourage and support the participation of women (and Inuit women in particular) in leadership positions influencing both the design, management and delivery of programs.

At the same time, our proposal carries with it a strong emphasis on capacity building programs for youth, which will be more concretely integrated into career opportunities through internships programs with the KMN and within each community. The Pinnguaq Association will support internships (where applicable and in-line with eligibility criteria) through the delivery of the Digital Skills for Youth internship wage-matching program it administers on behalf of ISED. Other wage-subsidy programs (like those that exist as part of Canada's Youth Employment Strategy, and the Kakivak Association), will be sought after to support internships, mentorships, apprenticeships and youth leadership.

With at least 5 staff positions at the KMN not for profit, and 2 positions at each Makerspace, along with possible interns, this initiative has the potential to create a significant amount of employment opportunities and economic development in the territory. While the

Makerspace and te(a)ch program both host content targeted at adults, it is designed with K-12 youth in mind. Some of the most prevalent feedback we've received in our community consultation was around the need for consistent and positive youth programming. Coupled with our focus on health and wellness, this project is well positioned to provide that.

The very existence of the proposed program and the infrastructure it will create serves as a boon to small and medium businesses, as well as social enterprises. Already in the six months since the Iqaluit Makerspace opened we have welcomed in small businesses and shared both what we can offer to them, but more importantly, what they can offer to our attendees. This project is about supporting the already vibrant culture of innovation in the territory.

As it relates to reporting on these statistics and the stories that accompany them, Katinnganiq is committed to expanding on them as part of the performance measurement framework outlined in Chapter 3.

Chapter 9: Financial

This chapter provides a detailed financial breakdown of a five-year implementation plan for this initiative. In serving 25 unique communities, we recognize that the prize of $10 million dollars will not cover the costs of independently opening and sustaining fully realized makerspaces in 25 communities throughout five years. The prize of $10 Million will be a substantive amount that will help launch this initiative, but as has been the focus throughout this proposal, the end goal we seek is one of financial sustainability beyond the timeline of this grant, predicated on a multi-level collaborative framework that breaks down silos and harnesses community, territorial and national efforts and capacities to support the outcomes of this project.

The KMN's role in this sense is key to attracting more funding from municipal, territorial, federal and private/corporate dimensions, and integrating this support while working with each community to create local capacities for the long-term maintenance of community makerspaces. With the mission to serve each community, we have included those projections into the design of a 5-year budget plan that allocates the $10 million dollars in start up costs for both the KMN Not For Profit, as well as for 24 individual makerspaces[62], in a phased sequence, spread out as follows:

- FY 2019-2020: KMN Not-for-profit, 4 Makerspaces
- FY 2020-2021: KMN Not-for-profit, 5 Makerspaces
- FY 2021-2022: KMN Not-for-profit, 5 Makerspaces
- FY 2022-2023: KMN Not-for-profit, 5 Makerspaces
- FY 2023-2024: KMN Not-for-profit, 5 Makerspaces

This phased approach will see implementations in each community in ways that respond to their resources, capacity and readiness, with the KMN allocating the funds accordingly. In this budget, estimates are allocated each year to a group of 4 or 5

[62] *The Iqaluit Makerspace has not been budgeted for because start-up funds have already been directed to it from the preliminary application grant, and though it will remain part of the Katinnganiq Makerspace Network, it will be managed and funded by the Pinnguaq Association.*

communities (depending on the year) for start up costs, with the projection that in subsequent years, Makerspaces will be running with additional funding provided collectively by local municipalities, a local organization, as well as by KMN funds obtained through additional fundraising efforts beyond that of this prize. The estimates included in this budget are based on the following assumptions:

Salaries

Due to the high cost of living in Nunavut (high housing rents, high cost of food, and high utility costs), an average salary in Nunavut needs to adequately reflect a living wage. According to payscale.com an average salary in Nunavut is $72,715[63], while an average salary at the GN is $99,000[64](not including staff housing). To remain competitive, KMN and local Makerspace salaries are budgeted to receive market rate salaries that correspond with their duties and responsibilities, and their respective FT or PT commitments. For the first year, salaries have been prorated with the assumption of a September start date

KMN Operations Manual

As a new not-for-profit organization providing ongoing support, the development of an operations manual will be an essential tool for its success, and the success of local Makerspaces. It will outline managerial, financial, and administrative processes, develop statement of values, ethics and operating principles, internal and human resources policies, and others as outlined in the project management chapter. We have budgeted $30,000 in smart cities award costs to hire an experienced consulting firm, along with $20,000 in in-kind labour from the 4 collaborating organizations to produce these deliverables in a reasonable timeframe.

Rent and Utilities

Though office space in most urban centers is high, the context in Nunavut also includes the added challenge of scarcity. Available spaces are scarce, and as much as we will work to combine resources wherever possible, we have projected an annual rent of $60,000.00 (or a monthly fee of $5,000.00) in each community (based on the rent paid for the Iqaluit Makerspace from August 2018 to February 2019). For the first year, rent and

[63] "Average Salary in Iqaluit, Nunavut, Canada." *PayScale*. N.p., n.d. Web. 27 Feb. 2019. <https://www.payscale.com/research/CA/Location=Iqaluit-Nunavut/Salary>
[64] "Average Government of Nunavut Salary." *PayScale*. N.p., n.d. Web. 27 Feb. 2019. <https://www.payscale.com/research/CA/Employer=Government_of_Nunavut/Salary>

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

utilities costs have been prorated to 75% of the full costs to account for the timing of Makerspace deployment in the late summer, early fall.

Internet

The internet context in Nunavut has been addressed throughout this proposal and more specifically in the technology chapter. Independent of our initiatives, each makerspace will offer a wireless internet connection purchased by one of the Internet Service Providers available in each community. For example, SSi Micro/Qiniq offers Internet Plans in every community of 150Gb at 5Mbps for a monthly fee of $399.00, before tax; and over usage prices of $120 per 10Gb. Northwestel is not available in every community just yet, but are mandated to offer their services in all communities by the end of 2019 through Telesat's new Ka-band high throughput satellite. Right now, in Cambridge Bay or Iqaluit for example, their monthly plans for 100Gb are priced at $129/month before tax, with over usage fees at an extra $4/Gb. We have budgeted an average annual fee of $4,800 (or $400 monthly) for enough bandwidth to support Makerspace users in each community. Though we see these fees adapting with the changing connectivity landscape over the next few years.

Travel

Travel to and within the territories is prohibitively expensive. Nunavut's land area is 1,936,113 sq. km (or 20% of Canada's land mass), with 25 fly-in only communities. For example, one return flight from Iqaluit to Ottawa in September of 2019 costs, at the lowest price, $1,585.00[65]. Airfare from Iqaluit to Cambridge Bay costs approx $3,448.00 and a ticket from Cambridge Bay to Kugluktuk is priced at $1,704.00. An annual budget of $50,000 for the KMN Not-for-profit will be able to support consultation, implementation and performance measurement.

Evaluation

Evaluation is a key aspect of measuring the performance and outcomes of this initiative. We have budgeted for a bi-annual independent evaluation to be undertaken in accordance with funder requirements to assess the performance of this initiative as a whole. Simultaneously, in the first year we have budgeted $25,000.00 for the development of a comprehensive evaluation framework that will work with communities to further develop the key performance indicators that have been set out in this proposal, along with the development of the evaluations tools and materials appropriate to this context.

At the same time we have budgeted annually to carry out data collection, analysis and reporting

Curriculum Development, Facilitation and Training

[65] *Flights priced through Expedia.ca on February 27, 2019 for travel between September 17 - 29, 2019.*

Much of the curriculum development involved in this initiative has and is being produced by the Pinnguaq Association, with funding confirmed from other granting programs (such as ISED's CanCode and Digital Literacy Exchange Programs), as well as through support from various partners. As the curriculum and learning resources are expanded to serve this project and each community's needs, we anticipate that there will be a need to adapt and create materials that respond to a specific demand. With a focus on digital literacy for adults as well as Elder-led curriculum, Pinnguaq will leverage its resources to support this initiative - while responding to the demand of its services with smart cities funds where needed through nominal fees.

The Embrace Life Council staff will provide training in ASIST and Trauma-informed practice for Makerspace staff. Based on their registration and facilitation fees, we have budgeted $5,000 per training session, per community.

KMN Digital Network Architecture

The development and deployment of the Network Architecture has been quoted at $70,000.00 for its development and deployment, with an additional $10,000.00 quoted for the preparation of curriculum and learning materials regarding its management and maintenance.

Startup Materials

Each Makerspace will require a set of startup materials to run its programs. With the assistance of programs like Computer for Success Nunavut, Computers for Success Canada, and Computers for Schools we can provide in-kind refurbished government laptops to each space. A selection of additional materials that will be essential for running programs include high capacity desktops, VR headsets, VR Camera, high end 3D printer, 3D scanner, inkjet printer/cutter, document cameras, speakers, DSLR cameras, video cameras, speakers, art supplies, hand and carving tools, books, robotics tools (dash and dot), and electronic learning materials (Makey Makey sets, Lego Mindstorms, Elenco Snap Circuits, MicroBits, Raspberry Pi's, and Arduino, along with other basic materials, like conductive thread, wires, LED lights, etc). With a budget of $40,000 for start up costs, each community space, with assistance from KMN can procure the tools and materials that are right for them.

Internet Exchange Points (Arctic Internet Exchange)

The cost of an IXP Nunavut is primary based on the accessibility to a data centre. If the GN or one of the ISPs (Northwestel or SSI Micro) will donate or rent Arctic Internet Exchange space in their data centre, the setup costs can be as little as $10,000 in each community. If a data centre is required, the most cost effective option will be one of Nuvujaq's □2 data centres, which will cost roughly $200K including installation. Nuvujaq will have a data centre in Iqaluit (funded through other means) this spring and has another data centre available to deploy in the community makerspace. At the same time, the

equipment needed to setup an IXP at a data centre (1 switch, 2 routers) is priced at $10,000 for each setup. Additional IXP setup labour and training delivery will cost $10,000 per instalment.

Other Sources of Funding

The Finance Committee of the KMN Board, along with the Executive Director, the Finance Director, and the Development Coordinator the KMN will be an organization capable of fundraising to further support this mission at the federal, and territorial levels, while also working with the private sector. Expressions of interest from non-government funders have been positive. We have had a positive rapport with the Internet Society and CIRA, both of whom have funding programs. We have relationships with Google and Microsoft, and will also be pursuing funding from RBC Future launch and TD Ready Commitment. We will also be pursuing wage matching internship programs from Kavikak Association, or the Digital Skills for Youth program (administered by Pinnguaq association) and the Technical Work Experience Program (TWEP), which is administered by Computers for Schools (CFS) and part of Canada's Youth Employment Strategy.

In general, with funding for a Finance director and fundraiser, we will be utilizing an accrual method of account, performing annual audits, and building a fundraising campaign to further sustain this initiative beyond lifetime of this grant.

Risks

The major financial risks of this project rests in being able to secure the support from other sources of funding to be able to provide a sustainable path forward for each community makerspace. The mitigation strategy for this major risk factor is addressed throughout this proposal, and it includes a strong vision, governance framework, and project management strategy (including performance measurement) that builds in costs for fundraising and development. The strong leadership and management of the KMN will centralize fundraising to further support local Makerspaces, while also assisting in applying for and sourcing funding at the local level.

Finalist Grant

Smart Cities Challenge		Report on $250K Grant to March 2018
	Total	**Details**
Outreach Coordinator Salary		
Outreach Coordinator Salary	$38,000	*Chelsea Singooriee/Nunabox Media*
Subtotal	$38,000	
Outreach + Consultation		

Room booking fees, door prizes, snacks + refreshments for community sessions + live interpretation fees	$3,120	*Bookings and Cancellation fees at Pond Inlet, Pangnirtung and Qikiqtarjuaq*
Subtotal	$3,120	

Travel, Accomodations, Per Diems		
Travel to Iqaluit, Pond Inlet, Pangnirtung, Qikiqtarjuaq communities for outreach	$11,380	*Team of 2 people*
Travel to Jury Presentation	$4,200	*Pinnguaq, ELC, + QHRC (1 rep each)*
Travel to NAM AGM	$6,800	*Team of 2.5 (1.5 of team financed through Pinnguaq)*
Travel to Arviat for Curriculum Development consultation	$5,000	*(some additional fees also supported by Pinnguaq)*
Travel to Ottawa for CIRA/IXP meeting	$2,925	*Team of 2 (Pinnguaq + QHRC)*
Subtotal	$30,305	

Marketing		
Website	$4,000	
Branding	$1,500	Nunavut Artist hired for logo design
Communications/Advertising/Design	$2,800	
Subtotal	$8,300	

Translation		
Translation of project brief	$1,200	
Translation of press release	$1,200	
Translation of preliminary proposal	$3,475	
Translation of brochures, website and other outreach material	$2,600	
Translation of Final Proposal and Video	$7,000	Budget for Translation to be done after March 5th
Subtotal	$15,475	

Pilot of Mesh Network		
Equipment	$3,000	
Research		in-kind Fleming Student project
Coordination of Fleming students	$2,000	
Subtotal	$5,000	

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Administration		
Administration overhead	$27,000	$6,750 for each of the four partner organizations
Advisory committee	$2,800	*$200 fee per meeting per Advisory Committee Member (7 members total)*
Subtotal	$29,800	
Final Proposal Development		
Research and Proposal Development labour	$30,000	
3rd Party Consultants fee	$30,000	*Hired Consultant Team*
Subtotal	$60,000	
Makerspace Pilot		
Rent, Utilities	$30,000	*$5,000 a month for 6 months*
Basic furnishings		Pinnguaq in-kind
Hardware (computers)		Pinnguaq in-kind
Staff Salaries contribution	$30,000	*Pinnguaq supported most salary costs in-kind*
Software/Tools		Pinnguaq in-kind
Subtotal	$60,000	
TOTAL	**$250,000**	

The months of preparing this proposal with support of the finalist funding was a mix of practical research and development, along with the installment of a pilot Makerspace in Iqaluit, and travel and consultation. The $250,000 provided for the finalist phase was used consistently with the budget proposed with one major change, and adjustments for actual scope of expenditures. The major adjustment was in the redirection of funds budgeted for mesh network research and implementation, to the hiring of a consultant firm to assist in the writing of the final proposal. What follows is a description of the funds that were spent.

Outreach Coordinator: $38,000

An outreach coordinator for the project was hired in early November 2018, bringing on Chelsea Singoorie of Nunabox Media to the project. Chelsea, a trilingual Inuk from Pond Inlet brought a knowledge of not only the communities we were visiting as apart of this project but

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

also extensive community development experience through her experiences with Nunabox. Chelsea travelled across Nunavut hosting consultations and helping craft the final project based on the feedback of those we met with.

Outreach and Consultation: $3,120

Originally, a budget line of $15,000 was created specifically to provide funding for participation in our consultation. This included to pay for room bookings, the purchase of prize giveaways for our consultations and honorarium for specific consultations. Creating incentives for participation is a standard practice in Nunavut consultation and this budget was expended in that fashion, however, it was significantly reduced due to the limited time for travel, concurrent with the writing of this application for our staff.

Travel: $30,305

Nunavut is the most expensive place to travel in Canada, with some community visits running close to $10,000 for a two day session. The $40,000 in the travel that was originally budgeted was reduced due to reduced travel and the combination of additional funding through Pinnguaq's te(a)ch program to consultation and te(a)ch workshops We ended up being able to visit;

- Pangnirtung
- Pond Inlet
- Arviat and;
- Cambridge Bay

It also included funding for Katinnganiq members to consult at major meetings in Ottawa and Toronto both with the purpose of bringing on additional partnerships to help compliment the initiative.

Marketing: $8,300

Promotion of the initiative was vital throughout the process and this included the development of a website, a new logo for the initiative and Facebook/social media outreach. Facebook is the most popular form of communications in Nunavut and the purchase of advertising through the service was a key part of spreading the word to those that could not attend.

Translation: $15,475

Our primary audience for this project is Inuktitut speaking and a $14,000 translation budget was created to ensure that all project materials are available in Inuktitut. Our news, alerts, project briefs and project proposal documents are all translated and available in English/Inuktitut, as is the website.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Pilot of the Mesh Network: $5,000

Pinnguaq partnered directly with Sir Sanford Fleming College in Peterborough, Ontario to bring on four students of the Wireless Network Technology program to explore Mesh Networks. These students, along with staff from Pinnguaq, conducted research on Mesh Networks, and some experiments to determine the value of bringing Mesh Networks to this project.

As is explored in this proposal, this research, along with input and expertise from Nunageek Solutions Inc and Nuvujaq, ultimately highlighted the flaws on any heavy reliance on Mesh Network in this proposal and this is why it has been scaled down so significantly.

Administration: $29,800

An Administration budget was created to cover the costs of the four key organizations involved. Nunavut Association of Municipalities, Qaujigiartiit Health Research Centre, Embrace Life Council and Pinnguaq all received $6,750.00 each to help cover administration of the project. Another $2,800 was put aside for the Advisory Committee to support their involvement.

Research and Final Proposal Development: $60,000

This funding covered the actual writing of the proposal. This primarily was absorbed in wages but also in the hiring of the consultant firm Nordicity who came on to help finalize the proposal.

Pilot Makerspace: $60,000

$60,000 was provided to the Pinnguaq Iqaluit Makerspace to help cover the costs of operating the space in 2018/2019 as apart of the pilot project. This included rent, utilities and wage subsidies. The space helped shape the direction of this project more than any other individual initiative. Pinnguaq contributed an additional costs for salaries, furniture, and materials between September 2018 and March 2019 to support the staff and the space itself.
